When you receive your card that notifies you of your portfolio's new scheduled routing, check that date you are to receive it! If it falls within a period that you plan to be away from home, immediately notify your circle secretary so that he, or she, will have ample time to re-route the portfolio and keep it moving.

If you fail to do this the portfolio will go forward to you on the date scheduled and will either lay in the Express Office building up storage charges or perhaps a kind, well meaning neighbor will pay for it and take it in—holding it until you return, perhaps a week or even a month or so later.

In the meantime your hard working circle secretary is tearing out his hair and burning up the wires with telegrams and the mails with Air Mail Special Delivery letters—to neither of which, as a rule, they ever receive an answer; but they keep on trying to pull every string that seems to have even the remotest possibility.

No, the job of a Circle Secretary is never on easy one, but you could help so much by carefully checking those arrival dates and sending a notification that you plan on being away from home—a post card will serve the purpose. The cost to you—a mere 2¢ and a couple of minutes of your time. The saving to your Secretary—hours of work and a dozen new grey hairs!

How about it? Won't you please give us—and yourself—a break!

Letter from an Unknown Commentator

Reported by JOHN R. HOGAN, FPSA Commentator, Portfolio # 19

The other day I had an interesting talk with an old time Commentator I'll call Yehudi because he doesn't want anybody to know who he is, and he asked me to write this letter to his group because he hasn't the heart to do it himself. He says he is the Little Man who sometimes wishes he wasn't there, but sticks it out because he thinks the members of his gang are a wonderful lot of folks who mean well even while they are showing some of the less attractive facets of human nature. Just a group of diamonds in the rough.

Says Yehudi, "Uncle John, you don't know how lucky you are to have such an outstanding membership in No. 19, either you are a genius for licking them into shape or else you must have worked on Eldridge to give you the pick of the crop. My bunch now, I just can't seem to figure them! I thought some of them joined to get help in improving their work, they said so, anyway, but after five years of toil and trouble by me and the fest of the crowd there isn't enough improvement to stick in your eye. For example, we hammer in the fact that a good picture needs a center of interest, and we do it round after round, year after year, in words of one syllable and words of many syllables, good naturedly and wrathfully, in a round-about way and right to the point, and what happens? The next time around they stick in another example of the same old stuff, made by pointing the camera in the general direction of a very general picture and let fly without a second's thought as to what they are going to get. Then they make a straight enlargement, not even spotted, and put it into the portfolio, and the other members and the Commentator point out once more that there is no center of interest, and how come?

"We point out the unnecessary light and dark spots around the edges of a picture that are harmful, and tell the maker a dozen different ways to subordinate them, and time after time the new prints come around with the same careless handling and not the slightest attempt to do the things that have been recommended. We explain the importance of making clean prints, and we see the same dust spots and lint and scratches the next time with no evidence of any effort at all to spot them out. Why? You tell me! The same thing is true of every other point we bring up to make better pictures, no attention is paid to what we say, and not once in a blue moon does the maker of a criticized print make another to see whether the critics were right.

"Of course we get an occasional member who says he will do better, and really does, and you should see how quickly his work improves. You would think this would stir up ambition in some of the others, but you know the answer, it doesn't. I think that when a lot of people say they want to improve their work they don't really mean it, they think their work is plenty good enough as it is and they don't have to take nothin' from nobody. Why they should waste time in the portfolios, I dunno, maybe they have other reasons.

"I suppose a lot of people join the portfolios just for entertainment, nobody can blame them for that because it is a legitimate reason and they have come to the right place to get it. But what do they do themselves to help entertain the other members, who also expect to be entertained? You know the answer, John, nothing! They make no effort to be really helpful in analyzing the other prints but just write a short sentence that means nothing and didn't take over three seconds of thought. if you can call it thought; they scribble it in such a hurry nobody can read it, and they won't write anything in the notebook except that they are too busy to write anything this time. Nuts! I'll bet the folks who do a real job of commenting on the prints and write interesting things in the notebook are busy people, too, but it has been my experience that the really busy people are the ones who do the best job. The people who brag about being busy are often that way because they are not willing to ait down and get the job done, right now. You always have time to do the things you really want to do.

"Of course, it isn't just the portfolio members who think they can get a lot out of PSA without putting anything into it; you know the people who drop out because they say, 'What do I get for my ten bucks?' John, when I think that for everybody who pays ten dollars dues and then sits back on his fanny waiting for the moon with a fence around it to be laid at his feet on a silver platter there are several others putting in much more than ten dollars of their own money and many hours of valuable time trying to do it for him, I—well, let's get back to the portfolios before I blow my top altogether!

"Perhaps some of our members join up just because they are natural joiners who like to try out anything new that comes along. They get into a portfolio for a year, put nothing into it and then drop out. They never found out what a portfolio can really be because they went into it with the idea of what they could get out of it rather than what they could put into it. If everybody who joins a portfolio would say to himself, 'what can I do to make this portfolio more successful' and then go to work and do it, the number in circulation would triple in a year and nobody would ever drop out. You know, Uncle John, I think several members of my own group that have been holding back are just about ready to crawl out of their shells and give, and as soon as they do it will be just as interesting as your's. Wanna bet?"

Nope, I wouldn't make a sucker bet like that, I know too many Commentators who have seen it happen and their portfolios are now as interesting as the best. How about your's?

Portfolio Profiles

The following excerpts from the Notebook of Circle #59 for Circuit #6 were sent in by El Corchran, Secretary for that Circle. First, may we introduce DR. V. A. PERTZHOFF:

"Greetings to the members of Circle #59 from a member who was born near the 59th parallel in Siberia. That makes our member in Montana a real southerner. To make a long story short, I spent my youth in shooting communists in Siberia during the civil war. In 1920 I was stationed just north-east of Korea. There was a lot of machine gun work, tramping on snowshoes and in spare time piloting an old plane, Farman 20. The last was the coldest job of all. The plane had an open cockpit and the only way to survive (we only stayed in the air 11/2 hours) was to bundle yourself as well as possible and cover your face with castor oil. Great stuff against frost-bite but hard to wash off.

"After losing the darned war I came to the U. S. by way of Japan. I went to Harvard University and then to other institutions of learning and collected a few scientific degrees. I got my Ph.D. in Physical Chemistry working with polarized light, which means a lot of lenses and prisms. I taught at Harvard and the University of Virginia here, and lately did research under the auspices of the U. S. Navy and U. S. Public Health Services. Some of it was with radio-active substances and on that occasion I visited the Oak Ridge Atomic establishment. (Sorry no pictures . . .)

"I made several trips abroad, particularly to France, on which I took many

pictures, 95% of them snapshots of the post-card variety. It is hard not to take them. . . . Did some enlarging before the war but two years ago I bought a Federal enlarger and made myself a darkroom in the cellar and took the job more seriously (not too seriously)."

You will find some very good words of advice in the following by DICK CART-WRIGHT. This is also from the Sixth Circuit of the Pictorial Portfolio #59.

"I think it should be the duty of every circle commentator to try to pass along something helpful to the group on each turn and so I wish to start by clarifying a few very important points in pictorial photography.

"This bugaboo of composition is always cropping up and it really scares the folks. Some of them feel that it is a real stumbling block and that they can never master it.

"Please forget the word 'composition' and just substitute the words 'good taste.' "If you have good taste in your subject

matter, try not to have it too commonplace.

"Have good taste in the point of view

or angle from which you take your picture.

"Have good taste in avoiding a cluttered

appearance in your pictures by not including too much subject matter.

"Have good taste in the balance of your subject matter by not having too much weighty material on one side of the picture. Arrange your picture as you would the furniture in your living room.

"Have good taste in the print quality and in your toning, also carry this on to the mounting of your print.

"Yes, good taste is all that is necessary to be successful in pictorial photography.

"The fellow that believes that there are some deep, dark secrets that are not told is very wrong. Making a good print is based on knowing the fundamentals of photography, not the secrets."

With the kind cooperation of the Portfolio Secretaries, we hope that from time to time we will be able to introduce you to other members of the Portfolio Circles.

A. LYNNE PASCHALL, Associate Editor

"For what is so rare as a day in June?" queries the poet. "The twenty-ninth of February!" answers my secretary, and she ought to know because it's her birthday.

June has fewer days than some of the months, but Old Sol makes amends by crowding in more daylight. And it is well for us photographers that he does, for this is a busy month. Surrounded by sweet girl graduates, June brides, and roses, what can the inspired pictorialist do but work, and the days, long as they are, still haven't

hours enough. Besides, vacation days are not far away, and the PSA Convention is in August this year, so we'll have to begin saving pennies and film for that.

In most clubs the season for meetings is about over, but we must have programs for next year and it isn't too early to be thinking about that. If you are a new officer, or expect to serve on a program committee, now is the time to be making plans. There are a lot more open dates in June than there will be in September.

American Exhibits

These one-man shows were very popular last year, and you are advised to write to Fred Fix, Jr. for the latest list. There may be some new ones since we last heard from him.

Recorded Lectures

This activity has been growing rapidly and some new distribution centers have been set up.

All your club needs to put on one of these programs is a projector and a tape recorder, each with an operator. The outfit will come a few days before your meeting date, so that the operators can have a practice run if they like. Select the program desired from the block that is printed elsewhere in the Digest.

Portfolian Clubs

In March, the Miami Valley Portfolian Club received the travelling show which the Lincoln Portfolian Club prepared and sent out to the other clubs.

There were twenty-nine prints, and about all the members of the Lincoln club were represented.

The Miami Valley club is very small and the members live far apart but when they assembled on March 11th to view the prints, they realized that such a light should not be hid under a bushel and they saw to it that the exhibit got around so that other interested people could see it.

It was shown at the regular March meeting of the Troy Camera Club, an old organization that has PSA affiliation, and then a few days later, it was made the program for the Hobart Camera Club, a new organization that has been formed at the main plant of the Hobart Manufacturing Co. in Troy, Ohio.

On March 19th it was sent on its way to the Portfolian Club of Louisville, Kentucky. Stickers on the backs of the prints showed that they had already visited two other places before coming to Ohio.

A notebook similar to those in the regular portfolios travels along with the prints, telling all about the photographers who made the pictures. In addition to this we had a group picture of the members who attended the Christmas party in Lincoln, Nebraska, last winter, and we found that interesting too.

And while we are on the subject of Portfolian Clubs, we find that we have never told you about the club in St. Petersburg, Florida. It was organized in February and the officers are as follows:

C. R. L. Snow	President
Leslie Weaver	
Lucille Salter	
John Argyros	
George J. Tilton	
Mrs. Dorothy Goding	
Marion P. Ziegler	Director

That last name brings up memories to me. I wonder if that is the Marion P. Ziegler who was a classmate of mine way back in the early years of the century. Did you ever attend Wittenberg, Marion?

The sponsor for the Petersburg group is J. M. Endres.

AN INVITATION

This is an invitation to every PSA member to participate in the PSA American Portfolios.

Enrollments are now being received in the following specialized groups:

PSA Pictorial Portfolios
PSA Portrait Portfolios
PSA Miniature Portfolios
PSA Control Process Portfolios
PSA Star Exhibitor Portfolios
(For PSA Award of Merit Winners)
PSA Nature Portfolios
PSA Photo-Journalism Portfolios

For information concerning any of the foregoing activities and for enrollment blanks, write to the Director of the PSA American Portfolios, Eldridge R. Christhilf, Hon. PSA, APSA, Suite 406, 800 Davis Street, Evanston, Illinois.

Camera Club Print Circuits

Circuit 52-B is now on the road with the following clubs participating:

Torrington Camera Club, Torrington, Connecticut La Crosse Camera Club, La Crosse, Wisconsin The Focus Club, Colorado Springs, Colorado Billings Camera Club, Billings, Montana Film Pack Camera Club, Cames, Washington Galesburg Camera Club, Galesburg, Illinois Champion Shutterbug Club, Hamilton, Ohio Sparta Camera Club, Ossining, New York

Commentator: Edward F. Raynolds, APSA

William Hutchinson, Director of the Camera Club Print Circuits, has been casting his own critical eye over the many prints that have passed through his hands and has written the following comments:

Seeing the hundreds of prints that travel in PSA Camera Club Print Circuits from clubs all over the country, we find most of the prints are of good quality and acceptable standards. There is no doubt that many club members use thought when planning a picture. The variety of subject matter is interesting too. Only in one instance have we seen a duplication of subject matter and then the arrangements were quite different.

Some of the prints could only be classified as "Fair", possibly due to the inability of the maker to recognize pictorial interest. Knowledge of composition, and the proper use of light and shade are sometimes lacking too. Some prints we have seen would have been greatly improved by a better selection of paper. Our commentators do a fine job of pointing out these defects. We hope club members will follow the suggestions written by the commentators in the note book.

Apparently, some workers do not place enough importance on mounting. This is unfortunate, for a good clean mounting job adds to the presentation of any print. We have seen some prints where the rubber cement was discolored and definitely showed

around the edges. In some cases where drymounting tissue was used, the makers falled to apply the iron evenly all over the print. Casequently the print came loose from the mount, sometimes at the edges and frequently in the center. Prints in Circuits are handled by many people and the allp-in type of mount is therefore not too good. Prints often come loose in such mounts and get out of position. Sometimes the front and back of a slip-in mount will come apart.

Many prints have failed to come up with a title.

This is unfortunate too, because the title is often
the key to what the maker had in mind when
taking the picture. On the other hand, on some
prints carrying a title the maker had gone overboard by making the title so bold it could be read
at a ten-foot viewing distance.

These are little things, but we believe the presentation is important enough to receive the same care that has been given to making the print itself.

W. R. H.

INTERNATIONAL CLUB PRINT COMPETITION

Robert J. Lauer, Associate Editor

With summer now here and club activities pretty well drawn to a close for another three months, officers and directors tend pretty much to put their plans aside until fall, and head for the great outdoors and picture taking. Many organizations have just finished holding elections to decide who will be at the helm when meetings commence in the fall. Perhaps committees are appointed and then everyone hibernates for the summer. (With the exception, of course, of those hard working New Yorkers making plans for the August PSA Convention.) Those of you who are responsible for your camera club's forthcoming activities will have the opportunity of getting one important item off your list early. That's your club's entry in the International Club Print Competition. Entry forms are ready, giving complete rules, as well as outlining the objectives of this P-D activity. Although the closing date of the first contest is still some months away, it's well to strike while the iron is hot, and get your club's name on the list so that later on there can be no last minute slip-ups. So write now for an entry form for your club.

This month we wind up another season of the International Club Print Competitions. The June judging is being held at Chicago under the direction of the Fort Dearborn-Chicago Camera Club. This judging will determine the clubs who will finally rank in first place, at least until the new contest season gets under way. Chosen this month, too, will be the print of the year, selected from among the first place winners of the bi-monthly competitions. Its maker will receive a gold medal inscribed with the PSA emblem.

Listed below are the club rankings as of the February competition. Next month you will have the results of the April competition.

Now, before you head for the great outdoors, here's just one more reminder that this P-D activity is waiting just for your club. It's the only print competition of its kind designed expressly for camera clubs. So join in, won't you?

Club scores are as follows:

CLASS A

Club	Feb.	Cum.	Club	Feb.	Cum
Oakland Camera Club	79	247	Queen City (Cincinnati)	67	189
Baltimore Camera Club	93	232	Berkeley Camera Club	77	185
Photo Guild of Detroit	88	227	Memphis Camera Club	68	184
Science Museum (Kenmore, N. Y.)	83	213	Rock Island (Illinois)	83	184
Blackhawk Camera Club (Iowa)	81	211	Ft. Dearborn-Chicago	67	183
Green Briar Camera Club (Chicago)	78	208	St. Louis Camera Club	69	180
Tiro de Los Padres (Calif.)	76	203	Germantown (Philadelphia)	62	174
Delta Camera Club (New Orleans)	76	201	Shorewood (Milwaukee)	48	174
Academy of Science & Art (Pitts.)	77	200	Venango (Oil City, Pa.)	45	161
Western Reserve (Cleveland)	73	200	San Luis Obispo (Calif.)	61	159
Grosse Pointe (Detroit)	77	199	Club Fotografico de Cuba	70	70
Lawson Camera Club (Chicago)	88	199	Niharika (India)	62	62
Niagara Falls Camera Club	70	192	Photo Pictorialists of Milwaukee		53
Jackson Park (Chicago)	61	190			-

CLASS	B

Southern Ohio (Cincinnati)	54	142			

GEORGE GREEN, Associate Editor

Helpful Hints from PSAers

Dorothy E. Kilmer, 31 Chestnut St., Gloversville, N. Y. sends along her special sepia toner formula. This formula has aroused so much interest that Miss Kilmer has literally been swamped with requests for a copy. The P.D. will save her all that laborious letter-writing by passing it along right now.

Solution A (Bleach)
Potassium Ferricyanide

Solution B (Redeveloper)
Sodium Sulfide7.5 grams or ¼ oz.

Then wash until yellow traces from the solution have disappeared. Redevelop in solution B until brown tone is obtained.

Then wash for 20 minutes and reharden in regular hypo for 10 minutes. Wash

again in running water for 40 minutes . . . then dry.

Incidentally, Miss Kilmer has been ill for quite a period of time with rheumatic fever and is unable to continue with her photography. If any of you PSAers have a few free minutes why don't you drop her a line or a get-well card? She'd love to receive mail because its sure is tough being confined with nothing to do.

$$H+S+A-H-L=PP$$

Why a guy like me who used to spend his math hour writing verse instead of trig problems should suddenly blossom out with an algebraic equation is beyond me—even though I could place the blame on the wonderful weather which has finally evaporated the frozen lethargy of the past winter. What is H plus S plus A minus H minus L which equals PP?

Well, raid the refrig for a cool bottle or an apple or a tall wet one, draw up a chair and let's look into it.

So many "authorities" have been spouting about Pictorialism and how it has served to hold back the advancement of true photography that Mrs. Green's doughraiser simply has to get his two cents in. Photography is pictorial because it is graphic. It presents to the viewer a picture which invariably carries a message . . . because of the manner it is presented it tells a story with a minimum of words. The means used: camera, lens, film, technique, etc. are immaterial. What is of prime importance is the effectiveness of the photograph.

If you aren't of the above school then may we suggest a test? Take your prize print and show it to a few people. Listen to their first question. Are any of them concerned about the equipment used in taking the shot and/or in processing the print? Nnnn-h! All that they are interested in is the technique. And that should be evident in the print . . . else it won't hold interest. So that brings us into the first part of the problem.

H is an important part of the formula. Without it many a print has died of boredom. It is not a basic part of the formula because many prints have won awards despite the apparent lack of it. What is it? Just Highlights. The critical analysis of the light—the way it falls upon the subject and what it does to the mood of the print and subject is as necessary as S.

S like H is important to the formula. As a matter of retrospection it is my opinion that it is more important than H because it is the bugaboo of most camerists. S is the opposite of H. And where the mind's eye is quick to see highlights it is as prone to notice the density of the shadow areas. Therefore insufficient compensation for desired effect usually hangs the camerist upon the pole of mediocrity.

Light helps make pictures. Highlight and shadows, which is a part of light, is the rouge daubed into a girl's cheek-line, the delicate shadow of the hair falling in softness, and the sheen of eye-appeal in the print.

The camerists approach to the picturetaking is another part of the formula. A is for his ability to approach it from the correct angle. How the shot is madefrom a high or low position—is the proof of the camerist's creativeness. The same subject matter changes with each position change. Oftimes the slightest change of camera angle can make the difference between an "eh" and an "aaaahhh" print. That is why the formula contains -H and -L which means High or Low angle. It might pay off in a prize winning print by determining whether you should step a few paces to the left or right or to kneel or stand on an elevation in order to get the rest of the problem.

Highlights plus Shadows plus Angle minus High or Low equals PP. What is PP? Why, I've just given you the answer! PP means prize prints which are only obtained by controlled Printing Processes.

PP does not mean Photographic Perfectionists. Neither does it signify a Pictorial Prig. PP means a perfect photograph... a prized print... photographic pleasure. And what gives one this PP? Technique or know-how. How do you get it? By experience... application... discernment and the desire to get the most out of photography.

And, that's where we, The Print Analysis Service can be of service to you members of the Pictorial Division of PSA. Follow the rules as outlined in your previous editions of the PSA JOURNAL and send the enlargement and contact print with sufficient first class return postage to J. Elwood Armstrong, Director of the Print Analysis Service. He'll analyze and suggest changes and give you the constructive criticism so important to the growth of the photographer.

Revision of PSA Minimum Requirements for National and International Print Exhibitions Effective July 1, 1952

When the Minimum Requirements were first published in the May 1951 JOURNAL (pages 292 and 293), the promise was made that the individual rules would be changed when and if experience proved this to be desirable.

After a year's experience by about half of the world's print exhibitions it now seems desirable to make a few changes, the most significant of which are summarized below:

- 1. Final responsibility for PSA approval of print shows other than "pictorial" or "monochrome" sections is left with the divisions involved, e.g. shows having color print sections will look to the Color Division; nature sections to the Nature Division; technical sections to the Technical Division for approval of such sections.
- 2. Some overseas exhibitions desire to exhibit accepted prints in more than one city. As a result, the maximum allowable period for the retention of prints by a committee has been extended from eight to twelve weeks, under this particular condition.
- 3. Because some committees having commercial sponsors wish to hold print shows without entry fees whereas others find it difficult to finance their exhibitions even with the \$2.00 maximum fee applicable during the past year, it appears desirable to remove this item as a requirement and to cover this subject under the forthcoming "Recommendations."
- 4. Prizes or awards may be made, offered, and accepted without penalty provided the value of each does not exceed \$10.00.
- 5. Jury decisions no longer need to be recorded on the back of individual prints. While this is still desired by many exhibitors and will be covered in the "Recommendations" when issued, this is largely a duplication of the information provided on the notification card and is found to be objectionable by many print makers due to the frequent use of rubber stamps and grease crayons in making this record.
- 6. Committees hereafter have three business days after the close of the judging to get notification cards in the mail (instead of two).
- 7. Committees failing to hang prints under glass for their exhibitions may still qualify for PSA approval by taking out indemnity insurance to cover severe damage or theft of prints during exhibition or by guaranteeing payment up to \$10.00 per print in lieu thereof.
- 8. Catalogs must hereafter be printed within two months after the opening of an exhibition (where mimeographed or similar lists are used during the show) and must be furnished to each and every entrant.
- Because a salon board consisting of three experienced exhibitors and salon committee workers has been authorized to grant or withhold PSA approval, based on

(Continued on page 384.)

PSA MINIMUM REQUIREMENTS FOR NATIONAL OR INTERNATIONAL PRINT EXHIBITIONS

Note: Asterisks indicate changes in text effective July 1, 1952.

SPONSORSHIP: Each exhibition shall be sponsored by a recognized institution, camera club or association sufficiently interested to guarantee the execution of the many details incidental thereto, including the careful handling and prompt return of exhibitors' prints and the payment of all expenses.

CHARACTER OF THE EXHIBITION: Each exhibition shall be open to all possible contributors, amateur or professional, without restriction as to residence. * If it consists of more than one class (i.e. pictorial prints), final PSA approval for the other sections will rest with the division involved (Nature, Color, Technical, etc.).

PLACE: Each exhibition shall be held in a public or semi-public building, with facilities for the proper display of the number of prints likely to be accepted by the jury. If the building is a club or of similar semi-public character, it must be kept open to the public at least eight hours a day during the period of the exhibition.

PERIOD: The minimum period of each exhibition shall be one week; the maximum, one month.

JURY: The jury of selection shall consist of three or five qualified judges. The two-jury system, whereby two juries of 3 judges each pass on all prints submitted, is also acceptable. * If more than one class of prints are accepted, additional juries may be required, based on the qualifications of the jurors selected.

SCHEDULE: A schedule shall be developed for each salon consisting of the closing date or dates, the date notification cards will be mailed to entrants, the dates the show will be on exhibition, the date total rejects will be returned, and the date by which all prints will be returned. The objective for the overall length of this schedule shall be six weeks (closing date to return of last prints), with a maximum allowable period of eight weeks. * Where a salon is shown in more than one city and so announced on the entry form, the maximum allowable period will be 12 weeks.

ORIGINALITY: All prints submitted shall be the sole work of the contributor,

mounting excepted.

ACCEPTABLE PRINTS: Four prints in any recognized photographic process or medium, including color, may be submitted. The acceptability of hand-colored prints is left to the discretion of the committee and the good taste of the jury. Prints may be in any size up to the maximum size of acceptable mounts.

MOUNTS: The maximum size of the mount shall be 16 x 20 inches. Prints may be mounted either vertically or horizontally. The color and weight of the stock is left to the choice of the exhibitor, although light colored mounts are recommended. All unmounted accepted foreign prints shall be mounted temporarily before being placed on exhibition.

FEES: *(Deleted. See Recommendations)

PRIZES OR AWARDS: * The practice of giving prizes or awards is not recommended, but maybe offered without penalty provided the value of each such award does not exceed \$10.00. If a larger award is made and accepted by the contributor, the print or prints involved must be permanently surrendered to the salon committee as evidence of value received.

ENTRY FORM: The entry form shall carry a statement concerning sponsorship, character of the exhibition, place and period of the exhibition, the names of the jurors, the salon schedule, a statement regarding originality of work submitted, acceptable prints and mounts and *fees, as well as space for information concerning the prints submitted, the name and address of the maker and necessary return or forwarding instructions. General distribution of the entry forms must be complete two months prior to the closing date (four months for foreign exhibitors).

LIGHTING DURING JUDGING: *Either the spotlight method (June 1951 PSA JOURNAL) recommended by the PSA Standards Committee or the standard PSA light box may be used during the judging. If the light box is used, the wattage should be cut to 160 (four 40-watt daylight type bulbs) and room lights left on to provide approximately 10-foot candles overall illumination. Committees having facilities to judge prints from the regular exhibition walls may do so provided the general lighting intensity is on a level substantially equal to that provided by the spotlight method or the modified print box.

RECORDING JURY DECISIONS: *(Delcted. See Recommendations)

PRESENTATION OF PRINTS TO JURY: * If more than one class of prints are to be judged, the prints shall be judged separately by class. Prints shall be presented to the jury in ascending order as to size: 11 x 14 and smaller, first; foreign prints, second; and finally the 14 x 17 and larger prints. Prints by the same maker shall not appear before the judges in consecutive order. All prints, including those rejected on the first round of judging, shall be reviewed a second time.

NOTIFICATION OF JURY DECISIONS: Postal cards shall be mailed to all entrants within * three business days after the close of the judging indicating the final

decision of the jury regarding each print submitted.

HANGING: All prints shall be hung under glass under lighting conditions approximately equivalent to that used at the judging. * This requirement may be waived where the sponsoring organization secures indemnity insurance to cover damage or theft by exhibition visitors or where it guarantees payment up to \$10.00 per print for substantial damage to or theft of prints during the exhibition. If more than one class of prints are accepted, each class shall be hung separately and so designated by placard or sign.

CATALOGS: Catalogs (or their equivalent) shall be available at the opening of the exhibition and shall be sent to each entrant. *Where prints are being returned direct to the maker, they may be included in the package with the prints; otherwise they shall be mailed under separate cover. * Where only a list is available at the opening of the exhibition, a catalog shall be prepared and distributed to all entrants

within two months after the opening of the show.

CARE AND RETURN OF PRINTS: Reasonable precaution shall be taken at all times to insure the safety and proper appearance of all prints submitted. This applies especially during the check-out and repacking period. Prints shall be packed and mailed pre-paid as soon as possible after the close of the exhibition. *In no case shall they be retained beyond the maximum periods specified under "schedule" without specific authority.

PSA APPROVAL: Salon committees, agreeing to meet the foregoing minimum requirements may indicate on their entry forms: "Conducted according to the Recommended Practices of the Photographic Society of America." PSA recognition will be accorded such salons provided, of course, that the requirements are met, * and that the members of the salon board (Messrs. R. L. Mahon, 260 Forest Ave., Elmhurst, Ill., C. A. Yarrington, 50 Church St., New York 7, N. Y. and Jack Wright, c/o San Jose News, San Jose, Calif.) receive copies of entry forms when mailed and of catalogs mailed not later than the closing date of such exhibitions.

the best information they can secure regarding actual adherence to Minimum Requirements, committees using the phrase "Conducted according to the Recommended Practices of the Photographic Society of America" should make sure that these men receive copies of entry forms and salon catalogs when issued.

A restatement of the revised Minimum Requirements effective with exhibitions closing on and after July 1, 1952 is published elsewhere in this issue.

The salon board welcomes constructive criticism at all times and will develop further revisions as their need is demonstrated. Additional copies of the Minimum Requirements and of the Recommendations (when issued) may be obtained by writing to the board representative nearest you.

> R. L. Mahon, APSA Director, Salon Practices

Coming Salons Agreeing to Follow PSA Recommendations

Note: M-monochrome prints, C-color prints, T-color transparencies, SS-stereo slides, L-monochrome slides, A-architectural prints, S-scientific or nature prints. Entry fee is \$1.00 in each class unless otherwise specified. Recognition: The monochrome portions of salons listed have initial Pictorial Division approval. Check salon list of appropriate division for recognition of other sections.

PSA Recorded Lecture Program

The Recorded Lecture Program of the Pictorial Division offers the following programs for your club.

No. 1. An Analysis of Recognized Salon Prints by Ragnar Hedenvall,

No. 2. Commentary on Recognized Salon Prints by Morris Gurrie No. 3. Outdoor Photography by D.

Ward Pease, FPSA No. 4. Still Life by Ann Pilger Dewey, APSA, Hon. PSA.

No. 5. New Prints for Old by Barbara Green, APSA

SPECIAL Photography of the Nude by P. H. Oelman, FPSA

A deposit of \$25.00 should accompany an order. A service charge is made for each Lecture. The SPECIAL costs \$10.00 and should be ordered directly from Mr. Oelman. For clubs which are members of PSA but are not affiliated with the PD the charge is \$6.50. Clubs which are affiliated with the PD will be charged \$5.00. Clubs or groups not members of PSA will be quoted prices on request to the Director.

For Nos. 1 to 5 order from Philip B. Maples, Director, Recorded Lecture Program, 29 Spring Street, Brockport, New York.

For the SPECIAL please contact: P. H. Oelman, FPSA, 2505 Moorman Avenue, Cincinnati 6, Ohio.

London Salon of Photography, 26-27 Conduit St., New Bond St., London W.1, England. Luxembourg (M, C, T) Exhibited Aug. 9-20. Data: Geo. Stell, Salon Secy., Case postale 174, Luxembourg (Grand Duchy).

Copenhagen (M) Exhibited Aug. 10-24 at Char-lottenborgs Art Gallery. Data: Aage Remfeldt, Pres., Society of Pictorial Photography, Hav-

drup, Denmark.

Edinburg (M) Exhibited Aug. 6 to Sept. 6 at YMCA Exhibition Hall. Data: J. M. YMCA Exhibition Hall. Data: J. M. Cameron Binnie, 16 Royal Terrace, Edinburg, Scotland.

Zaragoza (M) Closes Sept. 15. Exhibited Oct. 5-28. Data: Secretary, Sociedad Fotografica de Zaragoza, Plaza de Sas 7, Bajos, Zaragoza,

SPE SYMPOSIUM

The Society of Photographic Engineers is holding a symposium on June 4 and 5 at White Oak, Maryland, as guests of the Naval Ordnance Laboratory.

The subject of the symposium is "Photographic Instrumentation" with sessions covering Instrumentation in Aerodynamics, Instrumentation in Guided Missiles, Data Reduction and Special Techniques.

Downtown Headquarters will be at the Shoreham Hotel which will also be the location of a banquet, cocktail party and commercial exhibits of photographic equip-

More detailed information may be obtained from the symposium Chairman, Mr. D. Max Beard, NOL, White Oak, Silver Spring (19), Maryland.

Wildlife Photographic Contest

Comes word from the International Game Council announcing the first International Wildlife Photographic Contest conducted by this organization.

For your information, as its name implies, The International Game Council (Conseil International de la Chasse) is an organization of international character, in which all the countries in the world participate, with the exception of those under the influence of the Soviet Union. The primary purpose of the Council, because of its semi-official status, is to suggest hunting laws, regulations, seasons, bag limits, etc., and to encourage conservation and propagation of desirable game species, as well as to assist big game hunters in making the proper contacts and arrangements in the countries in which they plan to hunt, such as India and Equatorial Africa.

The Council receives the financial support of the governments of the participating countries, and its conventions are held in different countries under the auspices of the local government. This was the case last May at The Hague where a four-day session on Migratory Birds and Large Game Predatory Animals was held. This fall another convention, devoted primarily to Big Game, may be held at Madrid. This information is to give you an idea of the scope and status of the Council as background for the photographic contest.

Sportsmen are taking an ever-increasing interest in wildlife photography of big game and wild fowl. The council is conducting this contest to encourage the sport of "shooting with a camera," a sport which will make all forms of game better known, appreciated, and protected.

The terms and conditions of the contest are as follows:

TYPE OF COMPETITION: This competition for *still photography* (not movies) of live game will be divided into four classes:

- 1. Big Game of Asia, Africa, etc. (exclusive of Europe and North America)
- 2. Big Game of Europe and North America
- 3. Mountain Game
- 4. Small Game (i.e., that shot with a gun).

WHO MAY ENTER: Any individual taking pictures of wildlife, either amateur or professional may enter this contest. No membership in any club of any kind is required. An entrant may enter a maximum of three pictures in any one or all of the four classes.

KIND OF PICTURES ELIGIBLE: Only photographs of live game are eligible. Only prints should be submitted. The Council cannot assume any responsibility for loss of prints entered in the contest. The name and address of the person submitting same should be shown clearly on the back of each print.

Prints may be either in color or in blackand-white.

Size: Maximum 10" x 13"; minimum 5" x 7".

For the first competition (1952) pictures taken at any time in the past may be entered, but in subsequent competitions, only photographs taken during the two years immediately preceding can be entered.

Pictures entered in any competition cannot be entered a second time in a subsequent competition.

PRIZES: There will be a gold medal and a silver medal for pictures in each class.

JUDGES: A jury chosen from the members of the Commission for Wildlife Photography of the Conscil International de la Chasse will be the sole judges as to the winning pictures in each of the four classes.

WHERE TO SEND ENTRIES: All pictures, should be addressed to:

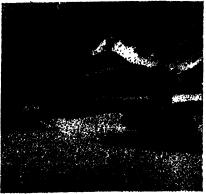

Commission for Wildlife Photography, Conseil International de la Chasse, 5 Rue de Pomereu, Paris 16, France.

WHEN TO SEND ENTRIES: All entries must be received in Paris before October 1, 1952 so that the decision of the jury may be reached before December 31, 1952.

STATEMENT TO ACCOMPANY PICTURES: It is highly desirable that each picture have an accompanying statement indicating the date, location, and conditions under which it was taken; the type of camera used and details of the exposure; and what, in the opinion of the entrant, makes the picture of particular interest.

Entrant must certify that the picture is his own property.

NOTE: All entries become the property of the Conseil International de la Chasse and will be incorporated in a collection

VOLCAN LLAIMA Eric Bertens
From 1951 Chicago Exhibition

at their Paris office which will be open for inspection by any interested parties. However, no pictures will be published or reproduced without formal prior consent on the part of the entrant.

June for Roses

As June is the month for roses this columnist sees an opportunity to get in a double plug to the nature worker. First for the Fourth International Rose Color Slide Exhibition which will be coming up next January in Reading, Pa. (closing date January 18, 1953), and secondly for the Nature Division Color Slide set for circulation among the garden clubs of the country.

The International Rose Color Slide Exhibit, which is sponsored jointly by the Reading Rose Society and the Berks Camera Club, usually divides its show into classifications for single blooms, arrangements of blooms, and rose gardens in bloom, so if you contemplate entering this show it might be advisable to keep these classifications in mind.

As slides of the same nature and classifications would be most welcome additions to the collection of slides which the N.D. is gathering for distribution among garden clubs for a program, how about making an extra shot of each and sending them to the secretary of the Division for inclusion in this traveling set?

We give you this suggestion at this time because June is the month of the first bloom of the roses, and as the first bloom of the rose garden is usually the most striking display of color and form, now is the time for work with the roses.

Good News

On March 20th Ralph L. Mahon, APSA, Director of Salon Practices for PSA Pictorial Division, received a communication from Dr. G. Thomas, of Bangalore, India in which Mr. Thomas indicated that their society was going to include a Nature and Color section in their Fifth International Salon, and requested information concerning minimum requirements for PSA recognition.

Mr. Mahon referred the request for N.D. requirements to the writer and they were forwarded to Dr. Thomas by air mail along with the master mailing list of the Nature Division. It looks like there will be another nature exhibition for you to enter during the coming year.

Who's Who

To date the secretary of the Nature Division has received the salon catalogues from all but one of the PSA recognized Nature exhibitions. The remaining exhibition, The Fourteenth International Exhibition of Buffalo, opens on May 6th, and as our secretary is a member of the salon committee of that exhibition, there should be no delay in the receipt of their results.

This means that it should be possible to compile the nature Who's Who listing in time for the August issue of PSA JOURNAL. At least Ruth Sage advises she will try real hard, and who can ask for more?

PSA COLOR DIVISION

Forestry Building, State College, Penna.

Color Division Mail-Bag

Out of the mail-bags of recent weeks has come interesting news on many projects conducted for Color Division members.

The first CD International Color Slide Circuit has been formed with the news from Holland that ten workers there have assembled their slides to be sent to the United States for circulation among ten workers here. The slides will circulate among the 20 members of the circuit within the United States and abroad in much the same manner as CD Slide Study group now operate in this country. John Moddejonge, APSA, 7414 Manhattan Ave., Cleveland, Ohio, is in charge of this project.

An impressive record for efficiency was set by Les Mahoney and his staff in Phoenix, when the March International Color Slide Competition for Individuals was completed within eight days after the closing of entries on March 2C, in fact only five days after the judging on March 23. It was no small job, either! A total of 383 transparencies were received from 96 exhibitors in 20 states in addition to Korea, Cuba, Hawaii, and Canada. George Steck of Oil City, Pennsylvania, received the silver medal award on his slide entitled "Fog on the Farm." This series of five competitions is supervised by Charles B. McKee, APSA, 5030 Del Rio Drive, Sacramento 18, California. If interested in entering these contests in 1952-53, contact Mr. McKee. No entry fee is charged Color Division members.

The three February contests (Class AA, Class A, and Class B) in the National Club Slide Competition attracted 701 entries from 119 Clubs. The contests were conducted separately by the Green Briar Camera Club of Chicago, the Plainfield Camera Club of New Jersey, and the Woodland Camera Forum of Davis, California. More than 400 Camera Club members and guests witnessed the judging. Leading Clubs and individuals at the conclusion of the five bi-monthly contests are awarded plaques, medals and ribbons. Any new club interested in entering this competition in 1952-53, should contact the Supervisor, Merle S. Ewell, APSA, 1422 West 48th Street, Los Angeles, California. No fee is charged Color Division Club members,

The Color Division Color Print competition for February attracted 40 prints, the products of three color processes: Flexichrome, Dye Transfer, and hand coloring in oils. The contest was conducted by the Chicago Color Camera Club. The first award went to Wellington Lee, New York City, for his print entitled "Beauty in Spring." This Color print competition for

Individuals is held in November, February, and May, with Warren H. Savary, APSA, R.D.D. #2, Box 221, Plainfield, New Jersey, as supervisor. There is no entry fee for Color Division members.

Interest Value

In earlier articles we have referred to the "stellar performance" your slide must give to gain the attention of the judges.

The three basic points upon which the judges must rate your slide during its brief appearance upon the screen were composition, interest value, and technique.

Which of the three is of prime importance?

Our most capable judges tell us that they are most influenced by interest value.

The most common error by makers of slides and less competent judges, alike, is in confusing the term interest value with subject matter. We have been told by experts that subject matter is unimportant, that it is what we do with the subject that counts.

Yet, how few of us really consider the meaning of this statement and seriously attempt to do something eye-catching with ordinary subject matter.

Perhaps you are saying, "Yes, but the judges seem to judge subject matter. They reject sand-dunes, babies, most scenics, etc., because they don't like them, or have seen too many of the same subject. Why?"

While this may be true to some extent, let us analyze such rejections. For instance, were the sand-dunes taken under the most effective or unusual lighting conditions? Did the maker choose the most interesting angle making use of this lighting? Did he choose one small part to portray the outstanding characteristics of these particular dunes that caused him to want to capture their beauty on film? Or, did he take in the whole area of dunes with background mountains thrown in, as have thousands of camera fans before him?

Were the baby pictures just more of those grab shots of our baby at its worst, or our baby all dressed up and sweetly posed before Grandpa's camera? Or, did they tell an interesting story of a child (anybody's child) doing something any child its age might be doing, background carefully considered and with interesting lighting?

Were the scenics of the usual picture postcard type taken by thousands of tourists and seen in any curio store? Or, were they a scene of sheer beauty portraying a definite mood created by an interesting view-point with interesting lighting? Something that created interest and pleasure without awareness of its geographical location?

Granted that some of our less qualified judges reject slides on subject matter alone,

even these will not fail to accept a good picture.

If we will evaluate a few accepted slides, carefully and honestly, we will find that in nearly every case eye-arresting interest value was the major reason for its acceptance.

If we expect our slide to be a "star", we must first give serious thought to its immediate impact upon judges. Its fate is in our own hands. The time to decide it is before we click the shutter.

We cannot create an acceptable picture without good composition and good technique. Neither can we create a good picture with good composition and good technique, alone. We must have that prime ingredient "interest value" before we have an acceptable picture.—Vella L. Finne.

Club Color Slide Sets

As the Club Color Slide Set Directory which appeared in the September 1951 Color Division Feature of PSA JOURNAL has proven both popular and useful, it will be repeated in the September 1952 PSA JOURNAL.

Clubs having sets available for lending to other clubs either on an exchange basis or without exchange, which were not listed in the 1951 Directory, or in Color Division Bulletins since, should immediately contact (a postal card will do) Karl A. Baumgaertel, 353–31st Ave., San Francisco, California, for a simple form which when completed and returned to Karl will insure your set or sets being properly listed in the directory. Your cooperation will be deeply appreciated by other clubs and will result in pleasure to all concerned. This activity is for clubs only.

"Tobs" in Color Shown

Again this year, the Metropolitan Camera Club Council of New York put on "Tops in Photography"; this time in the Grand Ballroom, Hotel New Yorker, on Monday, March 24th. The show consisted of an invitational print exhibit, with all parts of the world represented; a talk by Alan Fontaine, leading illustrator, on various phases of his work, which is in the modern vein; a 16mm motion picture in color and with sound, by Frank E. Gunnell, APSA, FACL, entitled "River of No Return," which received enthusiastic acclaim; and our own color show.

Our part of "Tops" was a specially gathered group of slides from the top exhibitors; it received enthusiastic approval by the audience.

Almost two years ago, the Color Division assembled another set known as "Today's Best in Photography" which was shown at "Tops" in New York last year, and which has been circulating as a part of the "National Tops in Photography" program for the past six months. That assemblage of fine slides made, and is making, history. When it was shown at "Tops" in New York in the Spring of 1951, the critics raved about it, saying that it set a new high, a goal for others to shoot at. So, in getting together this year's show, Paul J. Wolf, APSA, under whose direction the program

was produced, sent letters to those exhibitors who had received 40 or more acceptances in the latest "Who's Who in Color Slide Photography." To that select group were added a few names of people noted for the excellence of their work. but who do not exhibit consistently. In spite of the time being the busiest season of the year for exhibitors, with over a dozen exhibitions all held within a short time of each other, the response was terrific! A total of 88 slides were received, all topnotchers, and after looking them over, it was felt that last year's success could be reneated.

In order to add a bit of continuity to the presentation, the slides were separated into six groups: Human Interest; Travel; Commerce and Industry; Pattern; Mood and Sophistication. While many of the slides could have been put into more than one of these groupings, it was felt that they would make up a good presentation, on this basis.

The assistance of Dr. Richard B. Pomeroy, immediate past-president of the New York Color Slide Club, and of Ludwig Kramer, president of the Color Camera Club of Westchester, was of great help in this job. A musical background of appropriate melody was selected by Dr. James Jay, vice president of the New York Color Slide Club, and was recorded on tape. On the big night, the projection committee, consisting of Alois Chrastil, projection chairman of NYCSC, and Dr. Pomeroy, ran the slides on a 20-second headway. Since the 1952 PSA International Color Slide Exhibit will be shown in the same auditorium, and by the same group, this was a swell chance to get a line on what could be expected in August.

Color Division members whose slides were shown, and who received Certificates of Merit to attest their participation, were:

Louise Agnew, Chicago; Karl A. Baumgaertel, APSA, San Francisco; Robert S. Beese, State College, Pa.; George W. Blaha, APSA, Chicago; Mildred Blaha, Chicago; Glenn E. Brookins, San Bernardino, Cal.; Eugenia Buxton, APSA, ARPS, Memphis, Tenn.; Angel de Moya, FPSA, ARPS, Havana, Cuba; Joseph M. Dixon, Roseville, Cal.; Howard E. Foote, ARPS, APSA, N. Y.; Robert J. Goldman, Great Neck, N. Y.; Henry W. Greenhood, Hollywood, Cal.; Harry Haimes, APSA, New York, R. B. Horner, Chicago; Charles Albee Howe, Homewood, Ill.; George F. Johnson, Al'SA, State

Homewood, Ill.; George F. Johnson, APSA, State College, Pa.; G. Lewis Johnson, Winthrop, Me.; Joe E. Kennedy, Tulsa, Okla.; O. A. Kidwell, Pasadena, Cal.; Blanche Kolarik, APSA, Chicago. Elloyd Cal.; Emil Muench, Santa Barbara, Cal.; Floyd Cal.; Emil Muench, Santa Barbara, Cal.; Floyd Norgaard, Los Angeles, Cal.; Arthur W. Papke, Western Springs, Ill.; Dr. Richard B. Pomeroy, Scarsdale, N. Y.; B. B. Randall, Orinda, Cal.; Dr. Frank E. Rice, APSA, Chicago; Poarl Schwartz, Rice, Chicago; Dr. Fred J. Ruch, Plainfield, N. J.; Warren H. Savary, APSA, Plainfield, N. J.; Art F. Shea, Dayton, Ohio.
S. Wayne Smith, M.D., Salt Lake City; R. W. Soper, Port Arthur, Ontario; George F. Stack, Oil City, Pa.; A. Stewart, Santa Barbara, Cal.; Mrs. Sandra Thaw, Washington, D. C.; Mrs. Bertha S. Townsend, Johnstown, Pa.; Adolf Vignale, New

Townsend, Johnstown, Pa.; Adolf Vignale, New Toronto, Canada; Sam J. Vogan, West Toronto, Canada; Mrs. Amy M. Walker, Brooklyn, N. Y.; Paul J. Wolf, APSA, Hawthorne, N. Y.

In addition to these makers, who contributed slides by invitation, there were six other slides abown, which had won the Slide of the Month in the competitions of the Metropolitan Camera Club Council, by three makers: Samuel M. Benford, Yonkers, N. Y. (2 slides); Thomas J. Flaher, Staten Island, N. Y.; Jack A. Goldsack, Forest Hills, N. Y. (3 slides).

Coming Color Exhibitions

Southwest, June 27-July 6, deadline June 13. Four slides (up to 2½ mounts), \$1 Forms: R. J. Smith, P. O. Box 578, Del Mar, Calif.

Momphis, July 5-19, deadline June 14. Four slides, \$1. Forms: D. Carrol Turner, 899 Madi-

Salt Lake City, June 29-July 10, deadline June 14. Four sildes (up to 3½ x 4), \$1. Forms: Douglas Brown, 2232 Westminster Av., Salt Lake City, Iltoh

Hertford, July 2-20, deading rune 17. Four alife, \$1. Forms: R. J. LeBlanc, 234 S. Quaker Lane, West Hartford, Conn.

PSA (New York), August 13-17, deadline July 10, Four sides (any size), or four color prints (any process). Entry fees: \$1 for alides, \$2 for prints. Forms: Amy Walker, 25 Monroe Pl., Brooklyn 7, N. Y.

Sacramento, Aug. 28-Sept. 7, deadline Aug. 7, Four slides, \$1. Forms: Grant Duggins, P. O. Box 2036, Sacramento 9, Calif.

Tulsa, Oct. 13-14, deadline Sept. 30. Four slide Forms: Ruth Canaday, 1779 S. Victor, Tulsa Okla.

PSA STEREO DIVISION

DON BENNETT, Assoc. Editor

28 Leonard Street, Stamford, Conn.

So much material on the hook and in the mailbag that there probably won't be room for all of it, but here goes.

First, a letter from Jack Norling on the subject we passed over rather lightly last month in speaking of stereo slide mounts, birefringence.

Dear Don:

A lot of fans have stereo projectors and some of them have run into strange difficulties. baffling trouble they may have experienced comes from a phenomenon called birefringence, which may be partially defined as a twisting of the polarization axis of polarized light. With some transparent colorless materials each color in white light may be turned a different amount and several colors may appear one after another as the Polaroid analyzer is turned. Other materials placed between crossed polarizers may behave differently and show clear at one angle and as the material is turned, appear opaque at 90 degrees to this angle

Polarizing filters should be placed in front of the film and not between film and light source as is done in most stereo projectors. They can be placed between lenses and film, built into the lenses, or be placed in front of the lenses. If they are put in the preferred place there would be no birefringence such as results, in greater or less degree, when the polarized beam has to pass through some films. Anyone can perceive the effect by placing a clear film, having a cellulose-acetate base, between crossed polarizers. It will be noticed that the film changes the polarized light.

If the film is turned at a certain angle to the polarization axes the area covered by the film will oe clear; at a different angle there will be no apparent disturbance in the polarization. The base Kodachrome film has been said to produce birefringence to a small degree but I have not come across any such effect in the Kodachrome film I have inspected.

But there are photographic materials on the market that produce such a strong birefringence that it is impossible to project them satisfactorily in atereo projectors which have polarizers between light source and film. It could be said that there is an almost complete cancellation of polarization and the viewer sees double images through his Polaroid viewers just as if he loooked at the screen without viewers.

Mounts using clear plastic instead of glass will undoubtedly come into wide use but if they have windows of plastic that cause birefringence they will be useless in projectors having polarizers between film and lamp.

Some day I'll have some comments to make about the way stereo slides are mounted by various mounting services and may throw in some ideas of my own on this subject.

TACK NORLING

Thanks, Jack, for your clear explanation of what I gave the once over lightly last month. Incidentally, your remark about plastic screens for rear projection in the November Journal has caused some interest. (In another letter Jack says the screens are often guilty of birefringence and we should wait awhile. However, a note from Chicago suggests a way out.)

Stereo Projection

For those who have stereo projectors and are interested in improving the quality of projection, the answer lies in rear projection through a ground glass screen. With this method, the screen is placed between the projector and the audience. The viewing audience wears polaroid glasses as always, but they may sit directly in front of the screen without interfering with projection and they are no longer looking through a beam of light but rather into the light direct from the projector. The brilliance of the projected picture is amazing.

The screen is so masked that it is in the same proportions as a slide mask and by increasing the size of the projected picture larger than the ground glass window all non-stereo edges can be eliminated. It is also easy to change the homologous position of foreground objects as to place them in front of or behind the window as desired. By superimposing foreground objects (those taken about 8 feet from the camera) these will appear exactly at the window. The spread between pictures at infinity will be correct and will vary depending on the size of the projected picture.

The writer uses a variation of the above method of projection in which he places the projector in front and to one side of the ground glass screen. He then projects into a front surfaced mirror and back through the screen. This method enables the operator to sit with the audience and make adjustments as required. It also reduces by one-half the distance required for projection.

Naturally there are limiting factors with this method of projection, the most obvious being the size of screen which would limit mobility and ease of handling. However, a screen 30" by 30" will accommodate a group of 40 to 50 persons. It is certainly the ideal way for judging the quality of stereo slides.

FRED T. WIGGINS, JR.

Now for the regular monthly communication from Frank Rice, along with the complete list of Founder Members of the Stereo Division.

Letter from the Chairman

Dear Don:

Things are moving along in our SD organization-something new every day.

Somewhere around March 18 the 100mark was reached in signed up members of the Stereo Division. In an appended memo I am reporting on that matter.

Stereo Division Committee

Some new members have been added to our Committee lately. Here are their names together with their assignments. They will be glad to hear from anybody who has suggestions or questions: (addresses can be found in the PSA Directory)

Don Bennett-Stereo Column in PSA Journal George Blaha-Individual Slide Competition L. B. Dunnigan—Stereo Slide Circuits Charles A. Howe—Library Earl E. Krause—Vice Chairman Bruno Menin—Engineering and Standards
Norman Rothschild—New York Convention Ar-Owen K. Taylor---Membership

New York Convention

Norman Rothschild reports some interesting events that are to be on the program at the New York Convention. There will be one or more showings or slides accepted in the First Annual Exhibition. Paul J. Wolfe, APSA (Butler, Pa.), will put on a stereo show of slides made on a recent trip to Mexico when he and Aubrey Bodine, FPSA, did the country. Then there will be stereo round tables and clinics, stereo movies, and a lunch for stereoists. Norman has really been busy.

> FRANK E. RICE, APSA, Chairman Stereo Division

P.S. Special Bulletin No. 2 to members of the Stereo Division is now in the mails. It alone will be worth the dollar it costs PSA members to join the Division. Stereo photogs who have not done so already

Founder Members—Stereo Division

It was announced originally that the first 100 to sign up as members of the Stereo Division of PSA would be designated as Founder Members, and that the names would be published in PSA JOURNAL. As it turned out, there was a flurry of applications received at PSA Headquarters and by the Chairman of the Division just as the line was crossed. It was impossible to determine just who was the 100th person. Consequently we decided the fair thing to do was to include everybody whose dollar was received near the period when the magic mark was passed. So here they are-123 enthusiastic "Founders":

Henry E. Aldrich, Wilma S. LeVan Baker, Malcolm E. Barron, Don Bennett, Allen J. Blair, R. Breidenbach, Saul Brooker, William J. Burger. W. B. Camp, Jr., Adrien Chazulle, John T. Chord, Bernard T. Christopher, Dennis A. Ciulow, Mrs. John B. Colwell, D. R. Conklin, Henry C. Crowell.

Russell E. Darby, William C. Day, A. W. M. Dickens, Roy S. Drier, L. B. Dunnigan, Joseph W. Duroux.

Bed Side Camera Club, Veterans Hospital, Tucson, Arizona; Concord Camera Circle, New York City; Light and Shadow Camera Club of San Jose, Cupertino, California; Miami Lens Club, Peru, Indiana; Shorewood Camera Club, Milwau-kee, Wisconsin; and Tyler Camera Club, Tyler,

That leaves us just about enough room to report an interesting development at the Stereo Society of America. Since the problem of mounting for projection is everpresent, this group has been trying to do something constructive about it. Acting on suggestions by Bruno Menin and Owen Taylor, SSA member Ben Spanier devised a mounting target or guide consisting of two sets of four lines ruled in a space about 1/4" wide and centered 61.5mm apart.

When the mounted pair is cut apart and adjusted so a foreground object or line cutting the edge touches matching lines in the guide, and is fastened into the mount that way, a uniformity in projection is achieved. To maintain a uniform window,

MARINE ROMANCE H. J. Ensenberger, APSA

Taylor suggested the use of a second mask, using the David White close-up mask, over the regular mounting mask.

Full directions and a sample target are for sale by the SSA at \$1.50. Order from Owen K. Taylor, 274 Pearl St., New York 38.

Your Editor has seen one demonstration of this method and while it was good, he is not completely satisfied that it is the answer to all projection problems. We'll say more later.

BPA CONVENTION

The 22nd Annual Meeting of the Biological Photographic Association, Inc., will be held at the Hotel New Yorker, New York City, from September 10th through 12th (Wednesday through Friday).

The Meeting of the BPA, an organization composed of medical, biological, clinical, scientific and research photographers, will be conducted under the auspices of the New York Chapter of this national

While detailed plans will be announced at a later date, certain papers to be given at the various technical sessions by experts in each of the above fields are already known. These include Three-Dimensional Motion Picture Applications in Medical Photography; Latest Methods of Scientific Data Reproduction; Recent Developments in Color Motion Picture Processes; High Speed Photography; Graphic Arts in Scientific Presentation and Magnetic Recording on Film. One special feature on the program will be an illustrated lecture on how the eye can be used as a camera to take an actual photograph.

In addition to the papers sessions, the Meeting will include exhibits by manufacturers of the latest scientific photographic apparatus and materials, discussions and group demonstrations on various techniques of scientific photography, such as photomicrography, color correction of transparencies, retouching of color prints, etc. The Association is also planning an actual darkroom set-up to enable BPA members and guests to watch the most up-to-date printing procedures. Another demonstration will be on methods of preparing charts, titles and simple animated diagrams for motion picture production.

A number of eminent speakers will give addresses at the Official Luncheon on September 10th and at the Annual Banquet on Sept. 12th at the Hotel New Yorker.

Part of the Annual Meeting will also be the Annual BPA Salon—a collection of the best photographic work done by BPA members on a wide variety of subjects, in color and black-and-white. As usual, many of the technical sessions will include the most recent motion pictures made in the medical field and related fields.

Advance registration blanks for nonmembers may be obtained from the National Secretary of the Biological Photographic Association, Inc. . . . Mr. Lloyd E. Varden, c/o Pavelle Color Incorporated, 533 West 57th Street, New York 19, N. Y.

PSA JOURNAL, Vol. 18, June 1952

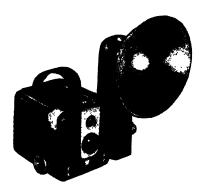

Giving a Gift?

... give HAPPY MEMORIES

Perhaps your daughter will soon graduate from high school... your son is bubbling with plans for summer camp...a close friend will soon start his honeymoon... your own wedding anniversary, or an important birthday, is near. For each, the perfect gift is one that keeps on giving. A gift that stores up memories, that treasures today's happy moments for tomorrow. A Kodak camera.

FOR THE TEEN-AGER... the traveler... the vacationer... for anyone who wants good pictures without fuss or arithmetic—choose a Kodak Duaflex Camera. The f/8 model has a 3-element, color-corrected lens—excellent for Kodacolor. Exposure is simplified—lens settings are marked "Hazy Sun, Bright Sun, Brilliant Sun" as well as "8, 11, 16." Picture composition is made easy by the big, crystal-clear finder. Close-ups are easy—the Duaflex f/8 focuses to 3½ feet. Loading is easy. Flash is easy—the Duaflex Flasholder clips on, making direct electric contact, and the shutter is synchronized. Handling is easy—the square reflex body nestles easily into the user's hands, for a firm, solid grip. Operation is thrifty—12 shots 2½ x 2½ to a 620 roll. A shutter-locking device prevents accidental double exposures. It's a most satisfying camera in every detail—and only \$22.30. Simple-lens Kodet model, \$14.50. Field case, \$2.65. Flasholder (with complete flash exposure guide on back), \$3.00.

FOR THE BEGINNER... for the small boy or girl who needs a small camera that takes big pictures... choose a Brownie Hawkeye Camera, Flash Model. It's sturdy. Easy to load—the loading instructions are right on the camera. Thrifty—12 shots 2½ x 2½ to a 620 roll. Easy to use—everything from 5 feet to infinity is in focus, and the big brilliant finder is a delight to beginners. The shutter is synchronized for both M and F photoflash lamps—so the beginner can use No. 5, 25, SM, or SF lamps without setting anything. Flash instructions are right on the Flasholder. What combination could give a beginner a more happy start—for only \$7.20? Flasholder, \$3.39.

FOR COMPACTNESS... for the family's travels... for a woman's personal camera—choose a Kodak Tourist II with Kodet Lens. Simple to use as a box camera—as smart in appearance as the most expensive folding cameras, and just as sturdy—carries handily on a neck strap—gets 8 big 2½ x 3½ pictures to a 620 roll. Can be used wide open at f/12.5 for most shots... or stopped down as far as f/32 when desired... and has snapshot, T, and B shutter settings. Flash synchronization is built in. Extra-steady shutter release on camera bed helps beginners get sharp pictures; bed folds down to protect lens during the family's travels. A wonderful anniversary or wedding gift—and only \$26.25. Kodak Snapsack with hand strap, \$4.25; De Luxe Field Case of fine leather, \$11.25. Standard Kodak Flasholder, with complete flash exposure guide on back, \$10.55.

Give the gift that does the most—that GIVES the most for the longest time. Give a Kodak cameral

Prices include Federal Tax and are subject to change without notice.

EASTMAN KODAK COMPANY, Rochester 4, N. Y.

In picking a film or filter, only one question counts...

"What will it <u>do</u> for me?"

To the beginner, film is just film, and filters are a mystery. But experience quickly develops discrimination . . . a selective attitude . . . a desire to choose the best film for a specific purpose, and team it with the right filter for a specific effect.

That's why Kodak makes not one, but many films, and many filters—to satisfy the needs of those who would produce finer work. Here, at the start of a new season, is a brief resurvey of the basic black-and-white films and basic filters, and what they offer you.

KODAK PLUS-X FILM offers . . .

Fine grain plus high speed plus full, well-balanced panchromatic sensitivity ... high-ratio enlargements from small and moderate-sized negatives ... convenient sensitivity range for both out-door and flash work ... adaptability to use with most filters ... all-around utility in shooting; and crisp, brilliant quality in your prints. In packs, rolls, and miniature sizes.

KODAK SUPER-XX FILM offers . . .

Extreme speed plus full panchromatic sensitivity plus moderate grain . . . extra sensitivity that gets you a well-exposed negative where slower films fail . . . that lets you shoot fast action at higher shutter speeds or small lens apertures . . . that permits extra lamp-to-subject range in your flash or flood shots . . . that often permits you to make snapshot exposures indoors at night by ordinary electric light, at the larger lens apertures. Works with most filters; yields superb enlargements; and comes in sheet, pack, roll, and miniature sizes.

KODAK VERICHROME FILM offers . . .

High speed plus orthochromatic sensitivity . . . top quality in your flash shots of people, where faces sometimes "burn out" or "chalk up" on other films . . . superior flesh tones . . . finer atmospheric quality in your landscape work, and crisp sparkle in marine and snow scenes . . . excellent tonal scale and shadow quality in contrasty outdoor subjects . . . plus the convenience and satisfaction of development

- ★ WHERE speed is of paramount importance, choose Kodak Super-XX or Super Panchro-Press, Type B.
- ★ WHERE fine grain is paramount, for high-ratio enlargements, choose Kodak Plus-X or Panatomic-X.
- ★ WHERE all-around performance is paramount, choose Plus-X or—especially for flash—Verichrome.
- ★ WHERE orthochromatic quality is paramount, choose Kodak Verichrome Film.

 AND FOR dramatic landscape work, choose Kodak Infrared Film.

by inspection under a red safelight. Use with yellow or light-green filters, but not red filters. Standard rolls only.

KODAK PANATOMIC-X FILM offers . . .

Very fine grain plus full panchromatic sensitivity plus moderate speed . . . extreme-ratio enlargements from small negatives . . . crisp, brilliant scale . . . high resolution of detail which, along with the fine grain, fits it well for your architectural and record shots, textural studies, copy work, and all other subjects in which fine detail is of primary importance. Sheet film only.

KODAK INFRARED FILM offers . .

Dramatic scenic effects . . . infrared sensitivity which, with a Kodak Wratten A Filter, gives you intense dark skies, brilliant white clouds, and silvery deciduous foliage. This film also has important applications in scientific, detective, and documentary work. Sheet and 35mm. only.

KODAK SUPER PANCHRO-PRESS FILM, TYPE B, offers...

Maximum sensitivity plus brilliant tonal scale plus full panchromatic sensitivity plus moderate grain . . . the extra speed you need for sure performance under extremely difficult conditions . . . snappy, sparkling negatives especially suited for reproduction prints . . . extra exposure latitude . . . exceptional quality in flash shots. This press-type film comes in sheets only.

EACH FILTER HAS ITS OWN SPECIAL

A few carefully selected Kodak Wratten Filters will achieve most of the pictorial effects you desire in black-and-white work. There are dozens of others—but designed for special commercial, industrial, graphic arts, color, and research applications.

From the beginning, Kodak Wratten Filters have been the world's standard. They are made of scientifically dyed gelatin sheets, held to

close color-transmission tolerances, and sealed between disks of top-grade B glass.

Prices: Kodak Filters, Series IV, \$1.65; Series V, \$1.75; Series VI, \$2.07. Portra Lenses from \$2.59 each; Pola-Screens from \$2.75.

BASIC, The K2...

This yellow filter is the basic filter for normal outdoor work. It screens out excess blue; helps reproduce all subjects in their true black-and-white values. Use it with either panchromatic or orthochromatic films—on virtually all outdoor subjects—when your aim is a natural rendering.

This deep-yellow filter helps cut bluish haze in long-range scenic views; makes skies a little deeper than normal. Use it with "pan" films. But don't use it when you want to retain the haze of distance for pictorial effect.

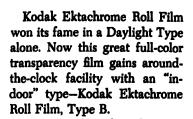

Kodak Announces

Kodak Ektachrome Film

TYPE B

IN NO. 120 AND 620 ROLLS

Here is color of professional quality . . . color indoors or out, day or night...color at its convenient best, both in processing and viewing. Here is the satisfaction of larger transparencies-superb originals for Dye Transfer and Kodachrome Prints, for direct viewing, for projection in standard lantern-slide projectors. Here's speed in seeing resultsfor scores of commercial processing laboratories, all over the United States, now offer rapid Ektachrome service-or you can process Ektachrome yourself, immediately, in your own darkroom.

ANY HOUR, ANY LIGHTING

Kodak Ektachrome Film, Daylight Type, is balanced for daylight use. If all your shooting is outdoors, this is the film to choose. No filters needed. Where shadows require "fill," use blue flash lamps to supplement the daylight.

If you switch back and forth from outdoor to indoor subjects, load with the new Kodak Ektachrome, Type B. It's color-balanced for 3200K studio lamps. Add a Kodak 81C Filter for clear-lamp photoflash shots... or an 81A for photoflood... or a Kodak 85B Filter for daylight shots... and your Type B becomes an any-hour, any-situation film. These filters simply readjust the color balance, with very slight effect on the film's effective speed.

FOR CRITICAL WORK

Kodak Ektachrome Film's superb quality, its beautiful gradation and exquisite color rendering, make it the natural choice of discriminating workers who prefer precision techniques. Therefore, in addition to the standard filters, each Type B instruction sheet carries exact filter recommendations for 1-second and flash exposures, individualized for each batch of film. The basic filters, however, serve for all average work.

Along with all its other qualities, Kodak Ektachrome offers you thrifty color. A No. 120 or 620 roll, either Daylight or Type B, gives you eight 2¼ x 3¼ or twelve 2¼ x 2¼ transparencies . . . yet is only \$1.79, including tax.

These are films with a future . . . a brighter, better future in color for you. See your Kodak dealer, and get acquainted with them today.

EASTMAN KODAK COMPANY, Rochester 4, N. Y.

Prices, subject to change without notice, include Federal Tax where applicable.

WORK TO DO

FOR DRAMA, the A...

Use this red filter with "pan" or infrared film for intense, dark-sky effects, with brilliant white clouds and vigorous contrast in landscape details. Use it, with moderate underexposure and subsequent deep printing, for moonlight effects in daylight shots of landscapes and marine scenes. But don't use it for close-ups of people.

FOR PEOPLE, the X1...

This green filter is preferred by many users for the natural quality it yields in outdoor portraits against the sky, and in pictures of blossoms and foliage. Use it with any "pan" film.

The Kodak Cloud Filter produces an effect approximating that of the K2, but is so designed as to require no increase in exposure when used on Brownie and other simple-lens cameras.

FOR COLOR...

With color films, the Kodak Skylight Filter helps eliminate excess blue in certain outdoor situations; yields pleasing warmth. The Kodak Pola-Screen helps control the depth of blue in the sky; brings out clouds; and is useful, both in color and black-and-white work, for controlling surface reflections.

AND AT THE SAME TIME...

Kodak Portra Lenses aren't filters—they're closeup lenses—but they fit the same Adapter Rings your filters use, and they belong in your filter kit. These lenses can easily double your enjoyment of your camera.

MOTION PICTURE DIVISION NOMINATIONS

The Nominating Committee of the PSA Motion Picture Division, consisting of Nestor Barrett, Chairman, C. N. Conley and Carroll Dunning, has submitted the following slate for 1952-53:

Chairman—A. Millard Armstrong, Columbus, Ohio

Vice-Chairman — Dr. Harold Lincoln Thompson, Los Angeles, Calif. Sec.-Treas.—Alfred S. Norbury, Kansas

City, Missouri.

WILLON NATIONAL LECTURE PROGRAM

A radiogram has just been received from Francis Wu, FPSA, FRPS, FIBP, Hon. MPS, Hon.SFF, Hon.TPS, etc., of Hong Kong, accepting the invitation from Barbara Green, Chairman of the PSA National Lecture Program, to give a limited number of lectures under NLP auspices following his appearances on the convention programs of PSA and PAA.

This will give some of those unable to attend the PSA Convention in New York an opportunity to hear the Chinese master. generally regarded as the foremost pho-

tographer in the Orient.

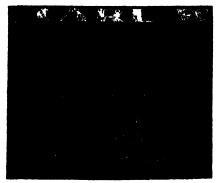

Although a professional in whose studio many personalities both European and Oriental have been photographed, he has a high reputation as a teacher and mentor of Chinese amateurs. He is an enthusiastic worker for PSA and serves the Society as Honorary Representative for Hong Kong and China. His exotic pictures are widely known in this country and his recently published book, "Classical Chinese Beauties," has added to his laurels.

The NLP tour will begin in the Midwest early in September and will end on the Pacific Coast from which he will embark for his return journey late in the month. The charge for his appearances will be \$75 which includes transportation Most of the limited dates will probably be booked by the time you see this announcement but some may still be open.

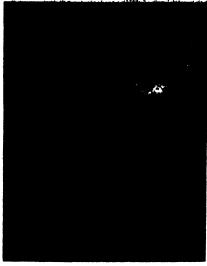

Any organization interested in booking Mr. Wu should immediately wire or write airmail to Mrs. Barbara Green, 30 Willow

St., Brooklyn 2, New York.

Your attention is also called to the NLP September tour of Maurice H Louis, who will discuss the general subject of portraiture. Mr. Louis will travel from coast to coast and reservations are being handled by Mrs Green.

OFFICIAL NOTICES

Summary of Board Meeting No 5

The fifth meeting of the Board was held at the Hotel Cleveland, Cleveland, Ohio, on March 8, 1952, and was called to order at 10 10 a m, with Carlson, Harkness, Oelman, Phelps, Reich, Ruchhoft and Weber present Millard Armstrong represented the Motion Picture Division.

As a correction to past minutes and also to reafirm the Action of a past meeting, the Board voted unanimously to permit separation of the offices of Secretary and Treasurer within Divisions Mr Oelman reported for the Regional Activities

Mr Oelman reported for the Regional Activities Committee, which report was discussed in detail. Mr Oelman was asked to continue working on the problem

The Publications Committee reported that a Sub Committee consisting of Costa, Lerner, Harkness and Youran had obtained estimates for the printing of the Journal from a number of printers and had decided that a change was necessary. By Action 343 the Board voted to approve the decision of the Sub-Committee of the Publications Committee and approve their selection of a new printer for the Journal

The financial report of the Detroit Convention Committee was read, including notice of the return of the \$500 00 advance to the PSA treasury and the sending of a check for \$3800 00, which was the profit from the Convention It was suggested that the New York Convention Committee reduce its price, to the membership wherever possible

its prices to the membership wherever possible Mr Carlson reported on the work of the By-Laws Committee and there was considerable discussion on the proper definition of the four regions in PSA

The Treasurer's report as of March 1, 1952, showed a present operating deficit of \$1,237.00, which was expected to be reduced to the break-even point by the end of the fiscal year

Mr. Heller reported that the membership on January 31, 1951, was 5,859 and now totals 6,442, showing a net gain of 603 Mr Heller also reported that Headquarters is going to need additional funds, and added "I would venture to say that it is doing nearly fifty per cent more work today than it did a year ago Only a part-time employee has been hired up to the present time, but it is not going to be possible to maintain this pace, nor is it fair to the employees."

There was a long discussion of the relationship of the Board to the Honors Committee, a problem which is now in the hands of a special committee

for study.

The value of the Recorded Lectures Program was also discussed together with the need for proper review of such programs to be out under the PSA name. Mr. Oelman was asked to work on the problem and to make suggestions at the April meeting of the Board.

The meeting adjourned at 3 50 p.m. The next,

The meeting adjourned at 3 50 p.m. The next, the semi-annual meeting of the Board, will be held at Headquarters on April 26.

Per Son Mittes

Serial ling new has been added: a name for this formerly headless column. It's the brainchild of Kay Lowrence (Falmouth, Mass.) whose photo by PSA member Robert Besse (State College, Pa.) appears

KAY LAWRENCE

here. Kay is secretary-treasurer of the Falmouth Camera Club. She's devoted to pictorial and color photography and "loves the challenge of flower portraiture" in which she's specializing. She does sailing and fishing photos, lighthouses, trees, swamps, dunes, beaches—"almost all a pictorialist could desire," she admits. Thanks, Kay, for our head! "PerSonAlities" now needs more body items from all the PSA folks.

Ralph E Gray, FPSA (Houston, Texas), attended the gala night of the Movie Makers Club of Oklahoma City on April 22: then he went to Tulsa for his third personal appearance at the Tulsa Amateur Movie Club; after that, says he, "I'll be completely out of touch with anyone until I decide where I'll spend the summer months". . . Sincere sympathy to the Rev. Herman Bielenberg (Oil City, Pa.) whose color slides were destroyed in a train wreck in Utah, en route to the recent San Francisco International. . . Mrs. Vella Finne (Long Beach, Cal.) is president of the Professional Photographers of Long Beach for the fourth "and definitely the last" year. . .

Since Charles B. ("Brad") McKee's little girl is beginning to walk, there in Sacramento, Cal., rumor has it that he is thinking of putting his cactus garden in the play pen... Dr. Louis Eilers (Rochester, N. Y.) is nominated by the Rochester Technical Section, PSA, for chairman; John J. Belter is up for the first vice-chairman's post; there's to be a choice between Dr. Richard O Edgerton and Hubert Scheffy for second vice-chairman...

G. Lewis Johnson (Winthrop, Maine) was in the audience of the Tops Show at the New Yorker Hotel on March 24. . . The loan of a Detroit photographic show called "Women of Achievement", by Rus Briggs (Detroit, Mich.), is being requested by other states, . . Robin J. Garland (Rochester, N. Y.) gets around; he was in North Carolina, Nebraska, Colorado, Kansas, Pennsylvania, and Texas-in that order-on Graflex business during April, and still managed to spend a few days at home on two occasions. . Fred Quellmals, Jr. (Kutztown, Pa.), is the newly-elected president of the Parent-Teacher Association of the Kutztown State Teachers College Laboratory School.

This column is aimed to help PSA members know who is doing what. Won't you

RUGGED COAST Philip Cass, Hon.PSA

Du Pont WARMTONE gives your pictures. You'll take real pride in them . . . enjoy showing the fine results of your own photographic skill.

WARMTONE is an easy-processing paper that's perfect for portraits, pastorals, landscapes, seascapes . . . in fact, for all your choicest negatives. WARMTONE has speed . . .

allows ample flexibility in print exposures. It's ideal for coloring or tinting and tops for toning.

These eight double-weight surface textures of WARMTONE offer you a wide selection:

B White Semi-Matt BT White Semi-Gloss DL Velvet Grain Natural White

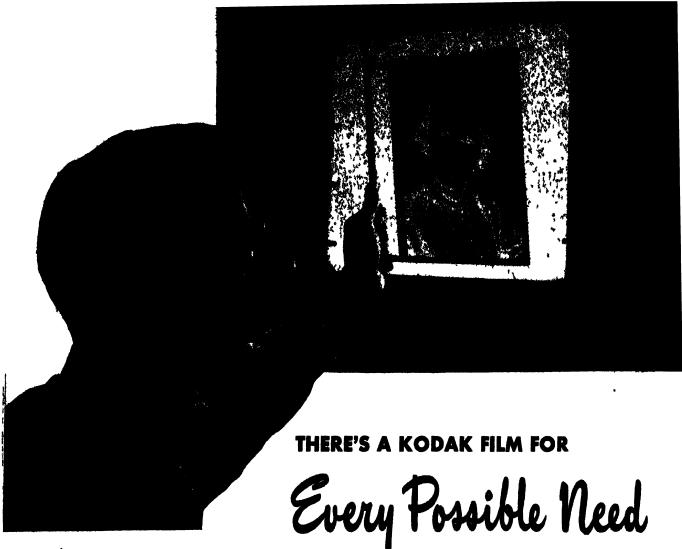

EL Voivet Grain Buff Luster DDL Natural White Rough Luster DS Velvet Grain Natural White High Luster

QL Cream Super Rough Luster Y Cream White Silk

Ask your favorite photo dealer for Du Pont WARMTONE by name. . You'll be glad you did. E. I. du Pont de Nemours & Co. (Inc.), Photo Products Dept., Wilmington, Del.

Here's an exceptionally fast, allpurpose sheet film of extreme latitude. It enables the photographer
to wank more printable negatives
and at speeds exceeding those rated, it's a fine film for
pless; and electronic flash photography. Develop High
relations of a film the photography. Develop High
relations of the flast film.

Du Pont Photographic Products BATTER THEMES FOR BATTER LIVENS ... THROUGH CHEMISTRY

General Use

Kodak Super Panchro-Press Film, Type B. Whether it's fast action or portraits, you'll find that Kodak Super Panchro-Press Film, Type B, complements your skill perfectly. Excellent with all types of lighting, it works especially well with electronic flash equipment.

Special Uses

Kodak Commercial, Commercial Matte, and Commercial Ortho Films—Medium Speed, Medium Contrast Pilms. Kodak Commercial Film works welf in copying black-and-white photographic originals. Commercial Matte is similar, but it has a matte emulsion and back, allowing pencil art work on either-side. Commercial Ortho is used for copying

some types of colored continuous-tone originals, for photographing light-colored furniture and other work not needing a panchromatic film.

Kodak Contrast Process Ortho, Kodak Contrast Process Panchromatic Films—Fast, High Contrast Films. These films are for line copy work. Kodak Contrast Process Ortho Film is fine for copying black-and-white line originals along with certain colored line copy such as telegrams, maps, and drawings—wherever yellow, green, or blue-green hues are the dominant colors. Can be used with any yellow filter. Kodak Contrast Process Panchromatic Film is useful for copying colored originals, such as maps, drawings, and documents, as welfas for photographing faded continuous-tone originals, such as old photographs. Most color correction and contrast filters can be used with this film.

These and other Kodak Films are stocked by your Kodak dealer.

Engineering Aspects of the New G.E PR-30 Massey: Photoelectric Exposure Meter

Allea Stimson, APSA*

HE SMALL SIZE and light weight of the General Electric Mascot meter are made possible by the use of an instrument mechanism that is radically different from the mechanism of conventional photoelectric exposure

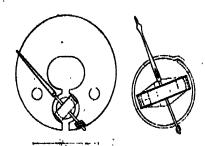

Fig. 1. In a conventional d-c electrical instrument, shown at the left, the poles of the permanent magnet surround the moving coil. In the Mascot instrument mechanism, shown at the right, the permanent magnet is small in size and located entirely within the moving coil.

meters. In Figure 1 is shown a conventional instrument mechanism in which the wire-wound armature coil is surrounded by a large C-shaped magnet. This magnet generates magnetic flux throughout its entire length, and as a result, leakage flux spews into all the surrounding space. Only about 15% of the total flux is useful in operating the instrument.

The inefficiency of conventional instrument magnets has been a source of concern to designers for many years. Due to the development of greatly improved magnetic materials it has been possible to increase the efficiency by 300%. If the mechanism shown at the left in Figure 1 is turned inside out, the arrangement shown at the right results. In this newer design the magnet it entirely within the moving coil, much of the leakage flux threads the coil and is effective in operating the instrument. Instead of having a soft iron core to complete the magnetic circuit, a soft iron ring is provided around the periphery. An inexpected advantage of this construction is self-shielding of the instrument. The meter, therefore, does not produce any significant stray field.

With this arrangement the efficiency is increased by 3 fold and only 1/16 of the amount of magnetic material

is used. The compact arrangement of the instrument makes possible a commensurate reduction in the dwer all size of the exposure meter. The magnet saves about 2 ounces of weight, and the smaller size case needed to house it saves an additional 2 ounces. For this restor, the Mascot exposure meter weighs only a little over 2 ounces compared to 6 or 7 ounces for conventional of posure meters.

The Instrument Mechanism

In Figure 2 is shown the cross sectional view of the Mascot instrument taken in a plane through the magnet and the moving coil. The moving coil is mounted on pivots in jewel bearings. The internal control springs conduct the current from the cell to the moving coil, and also, provide the restoring torque of the instrument. It is largely the strength of the control springs which determines the sturdiness of the instrument. If relatively

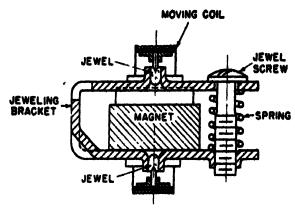

Fig. 3. Jewel suspension for the moving coil showing the method of holding and adjusting the bearings.

weak control springs were to be used the instrument would be quite sensitive because the moving coil does not meet such opposition. However, the friction of the bearings would then be large compared to the control spring torque, and any injury to the bearings might cause serious errors in accuracy of indication. On the other hand, if the control springs are relatively strong, the friction torque of the bearings may be almost negligible and the instrument will continue to perform accurately regardless of rough handling. Instruments having strong control springs, therefore, are exceptionally sturdy though at some small sacrifice of sensitivity.

The method of holding and adjusting the bearings in the Mascot exposure meter is also novel. In Figure 3 is shown a cross section of the instrument taken transversely across the magnet and the coil. The jewels are shown supported in a C-shaped bracket. The distance between the jewels is controlled by the jewel screw. Due to the leverage arrangement, the jewel moves half as far as the adjusting screw. This contributes to greater precision in setting the jewels and provides security of adjustment.

The Photosensitive Cell

The primary detector of the exposure meter is the photovoltaic cell. Photovoltaic cells have a relatively high quantum efficiency. The quantum efficiency of the G-E photocell is 0.5. This compares with the maximum obtainable in a primary photoelectric process of about 1.0. The quantum efficiency of 0.5 means that only two quanta or photons of light are required to knock out each electron of electricity. One footcandle of green light is produced by 4,000,000,000,000,000 photons per second per sq. ft. This would produce 2,000,000,000,000,000 electrons per second which is equivalent to about 1/2 milliampere. If the thermal efficiency of the cell were 100% the photovoltaic cell would give about 1/2 MA per sq. ft. per footcandle. The overall thermal efficiency, however, is only about 3%. While this does not sound very high compared to 20% for a steam-electric plant, it is exceptionally high for direct conversion of radiation to electric current. Compared to this 3% a common thermocouple has a thermal efficiency of a fraction of 1%. If the thermal efficiency of photovoltaic cells could be increased to 10% or 15%, they could become important sources of power for industry.

These photovoltaic cells are made by a multiplicity of operations carried out in a high vacuum in which the materials are added layer upon layer of molecular thickness. The manufacture of these cells is one of the most closely controlled and one of the most critical of processes used in industry. The cells are sealed with a transparent plastic coating to protect them from moisture and injurious fumes, such as sulphur. The cells are pre-aged at 75C for many hours. Because of this treatment, exposures to abnormal temperatures in the course of ordinary use do not have any permanent effect upon the accuracy of the exposure meters.

The Meter in Use

The G-E PR-30 Mascot meter has been designed in accordance with American Standard for General-Purpose Photographic Exposure Meters (Photoelectric Type) Z38.2.6-1948 with respect to accuracy, performance, and quality. The meter scale is very simple in appearance. It shows (Figure 4) only a scale of f/numbers

Fig. 4. The new G. E. Mascot Exposure Meter owes its extremely small size to an unusual construction of the instrument mechanism.

and a single number denoting film exposure index for that scale. Four of these scales are provided but only one appears in the window at one time. To select a new scale for use with a film of different sensitivity, a knob on the front of the meter is turned until the desired scale appears.

When the exposure index of the film in the camera is the same as the scale number, the instrument pointer gives the correct f/number for a shutter speed of 1/25 second or 16 frames per second. Values not shown on the scales may easily be obtained by interpolation. For example, if the photographer carries two cameras, one loaded with color film and the other with moderately high speed panchromatic film, the scale marked 10 can be used for both cameras. The shutter of the color camera can be set at 1/25 second and the shutter of the other camera at 1/100 second. By use of the simple computer dial attached to the instruction card, the meter can be used with most common shutter and film combinations.

Technique for Evaluation of Color Reproduction of Color Negative Monopacks

J. B. Taylor*

THE QUALITY of color reproduction in a negative-positive color process is dependent upon many factors-sensitization, dye absorption, interlayer filtration, relative layer speeds and the contrast of both the negative and positive images. Changes in the system can be evaluated mathematically or by direct comparison, requiring matched test and reference coatings. These methods are costly and time consuming and, in addition, undesirable interactions may make accurate evaluation difficult. In the search for a system of analysis that would not only minimize these shortcomings, but also yield reliable quantitative results, the so-called Single Layer Technique was evolved. This technique is discussed in its application to color negative integral tripack material.

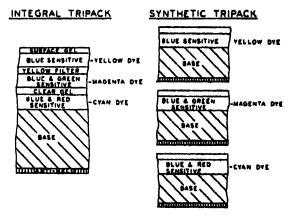

The Single Layer Technique

In brief, the Single Layer Technique is a method for simulating camera exposure of a color integral tripack by construction of a synthetic tripack (Figure 1) with three separate dye image layers, each coated on its own support. Each layer is given separate exposure through appropriate filters, developed, then superimposed in register and printed as a tripack on a suitable print material. The procedure can be described in the following detailed steps:

1. Selection of a suitable subject. Color charts reflect a large amount of white light which dilutes saturated colors and makes accurate comparisons difficult. Therefore, a system of direct transmission of the color densities was selected. A 5x7 master platen was prepared containing a calibrated silver step wedge and a set of six selected color patches-yellow, magenta, cyan, blue, green and red. (The 5x7 size was selected because it offered ease of processing and simplicity of registration, yet gave sufficient image size to permit visual evaluation as well as color densitometer and spectro-photometer readings.) The entire area around the patches and wedge was masked with opaque tape to provide in the print a dark "surround" for greater ease in observing the positive film color patch reproductions. The negative-positive system should record accurately a density range of 1.5 (a brightness range of 32:1). The color patch densities were therefore modified by adding color compensating filters and silver neutral density where needed so their maximum and minimum transmittance fell within this range (.60-2.10 density).

2. Negative material was obtained consisting of Ansco Color Negative Type 843 single layer coatings on clear base with anti-halo backing. The basic sensitivities of these negative layers are shown in Figure 2, together with the sensitivities of a three layer integral tripack that includes its filter.

3. The method of exposure is shown in Figure 3. An enlarger was used as a light source. The single layers were contact printed through the appropriate interlayer filters which were placed either between the film and the platen or next to the light source. (To retain simplicity of exposure it was necessary to disregard certain optical and photographic effects encountered in integral tripack materials where layers are in optical contact.)

 Layer arrangement of a typical integral tripack (left) compared to a simulated tripack (right).

4. The exposed material was then developed according to standard procedures for Ansco Color Negative Type 843.

5. By adjusting both exposure and development, sensitometrically matched simulated tripacks were made with layers of equal speed and contrast as read on a color densitometer. These tripacks were then superimposed and punched in a registration easel.

6. From these tripacks, contact prints with matched grey scales were made on Ansco Color motion picture positive Type 848 processed according to standard procedure. The light source of the printer consisted of a set of sharpcutting tri-color separation filters. (Wratten #29-Red; #61 + #15-Green; and #49-Blue.) This "additive" method of color printing was used to keep color degradation to a minimum.

Ansco Division of General Amiline and Film Corporation, Binghamson, New York. Presented at the PSA National Convention, Detroit, Michigan 13 October 1951. Received 29 January 1952.

2. Basic blue, green and red sensitivities of negative single layers used in synthetic tripack construction compared to those of a typical color negative integral tripack with its yellow interlayer filter.

Obtaining Quantitative Data

Where differences in results were large, visual interpretation usually sufficed but where quantitative evaluation of the original patches and their print reproduction was necessary, the following procedure was applied:

- 1. Spectrophotometric curves of the transmittance of the original and reproduced color patches were obtained by use of a G.E. Spectrophotometer.
- 2. These curves were scanned on a special Tristimulus Integrator.
- 3. The data derived was converted to "x" and "y" values and located on I.C.I. Chromaticity Diagrams.
- 4. Further integrator data afforded a relative brightness value.

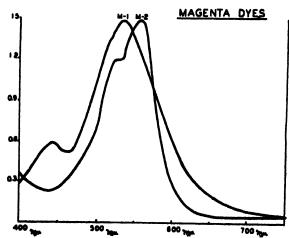

METHOD OF EXPOSURE "212 ENLARGING BULB IN ENLARGER ANSCO "10 CONVERSION FILTER LENS 5-7 MASTER PLATEN INTERLAYER SEPARATION FILTER/S SINGLE LAYER TO BE EXPOSED MINIMUM. PRINT FRAME

Exploded illustration showing the method of exposing single layer material. This system affords easily varied light output.

· Application of the Technique

This technique has been applied to many of the fundamental problems of color reproduction in the negativepositive system such as:

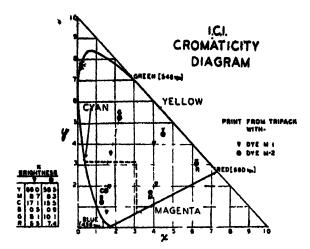

- The effect of yellow filter hue and density.
 The effect of shifting the sensitivity of one or more negative layers.
- 3. Comparisons of magenta image dyes with differing blue absorptions.
- Comparisons of cyan components ranging in hue from bluish-cyan to greenish-cyan.
- 5. The effect of changing relative speeds and contrast of negative layers.
- 6. Evaluation of dye and silver masking.

4. Spectrophotometric absorption curves of two magenta layer dyes used in testing the effect of dye "pur-ity" on color print quality.

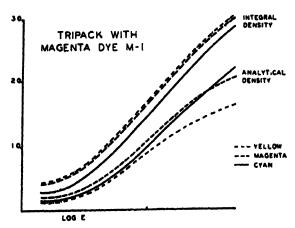

Use in Magenta Component Evaluation

The Single Layer Technique was applied to the evaluation of the quality of color reproduction obtained from two tripacks matching in layer speed and contrast but with different magenta image dyes. The spectrophotometric absorption characteristics of the two magenta dyes are shown in Figure 4. Dye M-1 has a greater blue absorption and more red absorption than dye M-2. To determine the effect of this absorption difference on the color quality of the print, special single layer coatings were prepared containing the two dyes to be tested. A pair of matched synthetic tripacks were prepared and a matched print made from each. Comparative color quality is shown in the I.C.I. Chromaticity Diagram, Figure 5. The print from the tripack containing dye M-2 showed a significant increase in yellow saturation, a blue that was less magenta in hue, and a green reproduction that was less cyan in hue. The supplementary table shows relative brightness values indicating a lighter blue and red and a denser yellow.

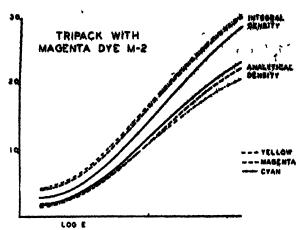

5. A method of evaluating color print quality. The Relative Brightness value in percent may be obtained from the table at the left of the diagram. Higher % indicates greater brightness of the color. This diagram illustrates the difference in color quality resulting from tripacks using the magenta dyes in Fig. 4.

The reason for this improvement in color quality can be found in a brief analysis of the individual monolayers used in making up the matched tripacks. Figure 6 shows sensitometric curves of both the analytical densities of the monolayers and the integral densities of this tripack containing dye M-1, i.e., the red, green and blue densities red with the three monolayers superimposed. The analytical densities show the yellow layer noticeably lower in contrast than the other two layers and the magenta layer slightly lower than the cyan layer. Because the magenta dye, and to a lesser extent the cyan dye absorbed some of the blue light passing through the finished negative, it was necessary to lower the yellow layer contrast so that the total blue density

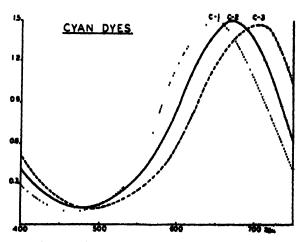

6. Color densitometry of a synthetic tripack showing the effect of reading the color density of each layer separately (Analytical Density) as compared to the effect of reading the color density of the same layers when superimposed (Integral Density). Note the low yellow layer contrast shown in the Analytical Density curves. This tripack was made using dye M-1 in Fig. 4.

7. Color densitometry of a tripack using dye M-2 in Fig. 4. The analytical density of the yellow layer shows improved contrast.

gave a tripack of equal integral density layer contrasts. The cyan dye absorbed some green light and therefore the magenta layer was made slightly lower in contrast than the cyan. In terms of print quality this meant that the yellow layer of the negative was no longer effectively modulating all of the blue light passing through the negative when it was printed. It is this loss that accounted for the yellow desaturation and the denser blue found in the print from the tripack with dye M-1. All greens contained less than the desired amount of yellow and were therefore shifted in hue toward cyan.

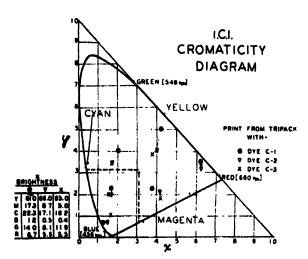

8. Spectrophotometric absorption curves of three cyan layer dyes varying from shorter wavelength bluish-cyan dye (C-1) with fairly low blue absorption at 400 mm, to longer wavelength greenish-cyan dye (C-3) with high blue absorption.

Figure 7 shows the sensitometry of the tripack containing dye M-2 which has less blue and red absorption. Here the monolayer analytical density contrasts are somewhat closer to being ideal. The yellow layer conforms more closely in contrast to the cyan and magenta layer. The net effect was an improvement in yellow-blue relationship over the tripack with dye M-1.

Use in Cyan Component Evaluation

Another example of dye component evaluation is found in the selection of one of the dyes C-1, C-2 or C-3 as shown in Figure 8 for best all around results. Color reproductions, (Figure 9) were plotted in the I.C.I. Chromaticity Diagram from three matched tripacks each using one of three cyan dyes. Although dye C-1 gave the best yellows and blues, the magenta and red reproduction were inferior. In addition, this dye, due to the shorter wavelength peak absorption, printed with less than normal contrast with normal positive film sensitization. A compensating increase in cyan layer contrast in the negative exaggerated defects in the magentas and reds of the print. On the other hand dye C-3 closely matched the red sensitivity of the print film but gave inferior yellows and blues due to its relatively high blue absorption. Dye C-2, which printed with good contrast and did not cause inferior blue-yellow reproduction was adopted for this printing system.

9. Diagrammed evaluation of color print quality from negative tripacks using the cyan dyes shown in Fig. 8. Dye C-2 is seen as a favorable compromise in overall color quality between dyes C-1 and C-3.

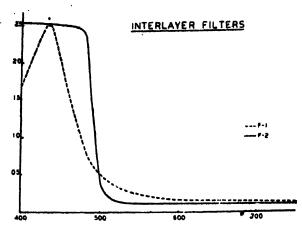

Determination of Interlayer Filter Efficiency

A final example of this monolayer technique was comparison of two interlayer separation filters of different efficiencies. Spectrophotometric curves of these filters are shown in Figure 10. Filters F-1 and F-2 are yellow filters used between the yellow layer and the magenta layer in a color negative.

Here, the preparation of matched tripacks required no changes in monolayer contrasts or dye components as the variations involved only the method of exposure.

Figure 11 shows the quality of color reproduction in prints made from tripacks using the two filters.

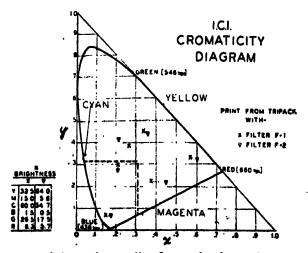

The use of filter F-2 produced improved color reproduction, most noticeable in the increased saturation and density of the magenta and to a slight extent, the red of the print.

10. Spectral absorption of two yellow interlayer separation filters used in integral tripacks, showing the difference in filter efficiency. Filter F-2 affords greater blue density over the range of $400-490~\text{m}\mu$ with a sharper cut-off in the $500-520~\text{m}\mu$ region.

Conclusion

We have attempted to give, in this paper, a useful explanation of the color film evaluation method known as the Single Layer Technique. As examples of its versatility, we have shown two applications in the analysis of the effect of image dye component changes and an application of evaluating differences in interlayer separation filter efficiency. It is obvious that this method is easily controlled and simple to use. As research ideas come forth, we feel this technique will find ever wider application in measuring color film improvements.

11. Color print quality from tripacks made with filter F-1 as compared to F-2 showing the overall improvement obtained by using filter F-2.

INDUSTRIAL PHOTOGRAPHY SERVES IN CHEMICAL MANUFACTURE

Richard C. Kinstler*

OOMEONE has said that if we attempt to conceive of a world without photography, we can easily imagine that (journalism, art, and sentiment would feel the loss acutely) but science would simply have to close up shop until it had invented photography again. To this pre-diction we might add that in chemical industries, where science works so closely with productive endeavor, photography is also becoming an essential activity. The click of the camera has become a common industrial sound heard often in the offices, laboratories, and factories in many industries.

We have long used photography in research, engineering, and production at P. & G. In addition, of course, the Company's advertising program has made extensive use of illustration photography. I would like to discuss the means by which photographic applications have been found useful to our manufacturing departments—the uses of photography as a means of communication within the organization. Such usage has been called 'Functional Photography.'

Our use of Functional Photography dates back to about the twenties when someone in the analytical service laboratory decided that the future set-up of complex equipment could be facilitated through the use of record photographs made in the laboratory. A technician used his own camera for this purpose.

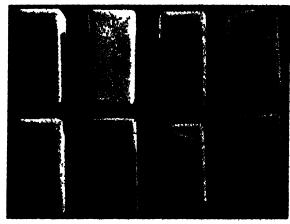

Soon the need for such photographs arose at such a frequency that a camera was purchased by the Company. About the same time, photomicrography was undertaken in both physico-chemical and metallurgical investigations. The first step toward a central photographic activity was made with the establishment of a dark room for developing photomicrograph film. The technician who processed photomicrographic negatives soon was taking the routine photographs of equipment and materials under test. About 1933 the Industrial Engineering Division began to make motion pictures of factory methods.

About the close of World War II, the interest in wider use of photographic methods within the Company had grown and it was felt that a study of the then existing facilities for picture making should be made. Up to this time the photographic work had been centered in a number of departments. Three basic shortcomings stood out. First, photography often consumed more than its share of the time of staff members, engineers, and others, and interfered with their normal activities. Second, photographic quality was inadequate due to lack of responsibility for quality standards as well as the limited skill of those doing the camera work. Third,

equipment was very limited and often the equipment which did exist was duplicated in the various departments. New techniques had been extremely slow in adoption, and individual departments had difficulty in justifying new or improved equipment.

These objections were overcome and other advantages of lower costs and better service achieved through the organization of a central photographic group in 1946. The three major responsibilities of our central photographic group have been outlined as follows:

- 1. To apply photographic techniques to the Company's manufacturing activities wherever such applications can be proved to increase efficiency or effectiveness
- of operations.
 2. To supply a photographic service of the highest quality consistent with lowest practical cost.
- 3. To provide a clearing house for information on photographic and related technology.

Texture lighting photographs of extruded soap bars provide engineering data for the guidance of P & G soap manufacture.

It is not a stated purpose of the group to do all the photographic work. It is merely responsible for the work done and is concerned primarily with the promotion of practical usage of photography.

We now recognize that there are two sources of photography other than the services of our central laboratory. I refer to purchases from outside commercial studios and a second very important source which we call "Inci-

dental Photography.

The use of commercial studios for many industrial photographs is limited by considerations of speed and cost. However, we have found it worthwhile to use outside studios on occasion even at our home plant. Our factories outside Cincinnati use commercial photography a great deal. Often assignments given to commercial studios are facilitated through suggestions given by the central photographic group.

The Procter & Gamble Company, Photographic Laboratory, Cincinnati 17, Ohio. Presented at a meeting of the American Institute of Chemical Engineers in Rochester, New York 18 September 1951 and released to the PSA for publication through the kindness of F. F. Van Entwerpen, Editor of Chemical Engineering Progress. Received 4 January 1952.

Incidental Photography

The term "Incidental Photography" refers to all photography performed in the Company by individuals on the job and incidental to their regular duties. While it is felt that one result of the organization of a central photographic group was to provide trained men for photographic work and release others from picture taking activities, it is nevertheless true that every photographic operation in all of the offices, laboratories, and factories cannot reasonably be performed by a central group. Therefore, an important phase of the work of the P&G Photographic Laboratory is the placing of cameras and other photographic devices in the hands of other people for their use on their job, issuing instructions for such use, and maintaining photographic quality in relation to the need of the application.

In general, it is felt that a centralization of responsibility for photographic applications has demonstrated three basic advantages. These are economy, increased quality of service, and broadened application. Lower costs are realized in a central photographic service, when compared to buying commercial photography, through the elimination of such items as advertising and selling expenses, and the savings in time by having people on the job and in close contact with the work to be done. We have also realized economies through the elimination of equipment and facilities duplicated in various departments of the Company. Centralization of darkroom and other production work also led to the purchase of time and labor saving mechanical aids. Using trained photographic personnel to do photographic work replaced less efficient and in many cases more costly help who made pictures on a part-time basis.

Quality increased materially through the employment of specialists in a central department. Particularly notable is the uniformity of quality so necessary in the production of sequence photographic records of materials under tests which are taken over a period of time and must then be compared. Every endeavor is made to standardize and simplify darkroom procedure to the end that a photographic record made today can be compared with one made later without making allowances for differences in photographic sechalisms.

for differences in photographic technique.

In broadening the practical application of photography to a great number of Company problems centralization has really paid off. Often someone within a given department may recognize the value of a photographic technique applied to his job and use it. Too often the application stops there. Besides being experienced in industrial photography it is, perhaps, even more important that the members of a central photographic group possess the knowledge of all of the Company's experience with the medium of photography and have the opportunity to spread that knowledge Company-wide.

The work of the Photographic Laboratory falls into four broad classifications. These are:

- 1. Still photography (black-and-white and color).
- 2. Motion pictures.
- 3. Visual aids.
- 4. Microfilming and miscellaneous services.

We divide still photography into four types: Conventional record photography, specialized applications,

Photomacrographs made with short focal length lenses and long bellows extension provide 10 to 20 diameter photographs like this study of detergent particles used to show size, texture, and uniformity of spray tower products.

"incidental" photography and illustration. The bulk of our work consists of record photography using conventional techniques. Examples of such subjects might be machine parts, bars of soap, bakery products, and other materials under test. Further examples are factory views to show where improvements can be made in equipment or materials handling, or a step by step sequence used to transmit detailed information concerning methods in the factory, or a photographic record of the size and appearance of animals undergoing

tests in a biological laboratory.

A second type of still photography we call "specialized applications." These are best described by the following examples: 1. Extreme close-up or photomacrographs of materials or sections of materials. (Photomacrographs made with short focal length lenses and long bellows extension are not to be confused with photomicrographs which are made through a compound microscope.) Photographs of human skin observed during a skin research survey called for a special photomacrographic set up. A Leica camera was used with sliding focusing attachment and extension tubes to make 4 diameter photographs of a portion of a subject's face held in place in a clinical head and chin rest. Since some slight movement of the subject was unavoidable, and prevented the long exposures usually encountered in photomacrography, a Xenon discharge lamp was used as the light source. The film, exposed at 1/10,000th second at an effective aperture of f/32, was Panatomic-X developed 45 minutes in Microdol to a very high gamma. We have also been successful in making 3 dimensional photographs of this type of subject using two cameras in conjunction with a binocular microscope and Ibso attachments. Metallurgical specimens showing corrosion, wear, pitting, welding defects etc., are also common subjects for photomacrography.

Specialized Application of Photography

Photographic records made by means other than visible light are classed as specialized applications. Infra-red has been used for the recording of certain subjects.

Some of our products contain fluorescers and in this laboratory photography of fluorescence under ultraviolet radiation is not an uncommon assignment.

We also class under specialized applications unconventional methods of lighting such as exaggerated texture lighting used, for example, to study minute variations in the surface of extruded bars of soap. In the many cases where results of laboratory experiments are shown in varying turbidity of solutions, we have developed a standard lighting arrangement which emphasizes the variations in clarity or interference caused by the presence of undissolved particles, or emulsified oils.

It has been found that the loan of cameras to be used as a tool by others for "incidental" photography is one of the most important services the Photographic Laboratory can perform. As a result we have available for lending standardized equipment which experience has shown can be used by persons without special photographic skill. The usual procedure in the placing of a loan camera begins with a request by a department of the company for some type of photographic help in the recording of communication of facts If, after discussion of the problem, the economics and quality requirements involved indicate that this is an "incidental application," the necessary equipment is assembled (and at times specially designed and built), instructions in its use are issued and the equipment loaned to the department for the duration of its need. In some cases this has meant the permanent installation of a camera within an office or laboratory

The advantages of this system of lending cameras seem to be: First, once, the technique is established many routine photographic operations do not require a skilled photographer for their success. Second, picture making needs are met with a minimum of equipment. Also a larger variety of specialized equipment is available when needed by any department. Third, quality of photography is checked and maintained through inspection of exposed film.

Typical Camera Equipment

Wide use of 35mm cameras has been made by engineers from our manufacturing headquarters in connection with visits or inspections at our factories throughout the world. The Leica camera is used where the ultimate in portability and speed is the requirement. We prefer a reflex camera for general use by our mechanical as well as methods engineers who are supervising machinery or processing equipment installations or recording methods and other factory subjects. The reflex camera with flash has proved to be the camera most capable of producing consistently good records even when used by persons who never before held a camera in their hands.

An example of a camera which was specially designed to do a routine job is one we call the 'Cake Camera.' It was built according to our specifications which required that no adjustments be necessary for its correct operation. It does the one job of making consistently good photographs of test cakes under fixed conditions so that volumes and texture of these bakery products can be compared. Recently 200 record photographs of cakes baked in a consumer survey were made in less than two hours with this equipment. Besides photographing cakes the camera can be used for other purposes such as

routine records of laboratory tests. Laboratory applications of the camera become most enough all the class as photographs take the place of written description in data books and reports.

Our technical people who attend leatures new are equipped with Leica cameras and high speed film and instructed to snap photographs of slides at 1/2th second at 1/2. When they return the film is processed for maximum speed and contrast. The resulting photographs find wide use in rapidly and accurately reporting information gained by attendance at technical meetings.

In addition to more prosaic subjects, the Central Photographic Laboratory is called upon to do illustration work. We are allowed to let our aesthetic natures come to the fore now and then in supplying eye catching photographs of company manufacturing and technical activities. We maintain a large file of indexed and classified material of this type for use in employee recruiting, institutional advertising and company publications.

One advantage in having our central photographic group undertake illustration photography has been that responsibility for security of information is fixed. All photographs made in our factories and laboratories which may appear in publications or in external use are either made by the central photographic laboratory or are cleared through manufacturing headquarters before release.

Photographs dramatically record the presence of hard water effects on glassware washed with soap and the clarity of glassware washed with a modern synthetic detergent.

Color Photography Applications

With color photography becoming more popular and more practical all the time it cannot go unmentioned. The underlying principle to which we adhere in using color photography is to avoid color merely for the sake of color alone. Due to the excellent job the film manufacturers have done in fostering amateur enthusiasm for color photography, a great many users of our service assume photographs they need must be color photographs. We are quick to use one of the color processes when black and white photography will not do the job but economy and speed rule out color photography when its only advantage is that it is attractive.

Fluorescence photograph under ultraviolet illumination to study the efficiency of a soap mixer. The fluorescer was added upstream of the mixer and the photograph made of a block of cooled soap taken from below the mixer.

Motion Picture Photography

Motion picture photography undertaken at the P&G Photographic Laboratory comprises the three types which we call: 1. Record, 2. Full Scale Production and, 3. High Speed.

Factory methods are the major subjects coming before the two motion picture cameras used by our central group. However, data concerning transient phenomena occuring in laboratories and pilot plants are also recorded via the motion picture camera. The file of Industrial Engineering films of factory methods contains over 1000 fifteen minute reels of 16 mm film, 90% of it in color. These films are made for the purposes of methods analysis and improvement, informational use as a means of standardizing methods in the factories, training of operators, and films used to train engineers in methods, thinking, or attitude building, in Work Simplification and similar programs.

One feature of our Industrial Engineering film program is the use of microchonometers or decimal timer attachments that, by means of a system of mirrors, placed at any spot on the movie frame a continuous and highly accurate record of the elapsed time of a filmed operation. This device was designed and put into use by our photographic group.

We also have on hand a simple magazine camera which Industrial Engineers carry with themforincidental movie making on factory visits.

A number of full scale productions, or films suitable for showing outside the company have been made. A typical production of this type would be a 1/2 hour sound color film used to present to our sales group as well as the consuming public the performance characteristics of a new product. We are not self sufficient in such full scale movie production. Script and photography and editing are done in the Company. Sound recording and laboratory services are purchased outside. For a cost comparison, a typical movie of 35 minute length

cost \$4200 total labor and material. An outside production cost of \$25,000 and more for films of a similar standard has been quoted.

Outside of our studio view cameras and the Speed Graphics, the Kodak High Speed Camera Type III is the busiest piece of equipment we have. Each week seems to bring some problem which can be solved by the time magnifying properties of the 3000 frame per second speed of this camera. We have used it in machine design and development, which is by far its greatest field of usage, as well as in study of fluid flow, and other physical and chemical phenomena.

In the communication of progress reports to management and the exchange of information with each other in group meetings our technical people are rapidly learning the superiority of pictures over oratory. As a result the central photographic group is called upon for an increasing amount of production of visual aids such as

lantern slides and film strips.

Motion pictures have been recognized as an ideal medium to be used in the field of employee relations. We, like many others, use motion pictures for this purpose. When, however, we want to tell a limited story to small groups, we use color sound slide films. Our photographic group produces these for a fraction of the cost of motion pictures or outside production. These films do an effective job of communicating to employees a better understanding of Company aims, policies and especially Company plans affecting the employee's security.

We are now engaged in the production of a series of films of this type, covering such Company plans as profit sharing, disability benefit, and guaranteed employment. These films are made entirely within the Company using Company talent for script writing, acting, narrating as well as photography and sound. The average cost of these films is \$1200 total, as compared with a quoted outside production cost of over \$5000.

Organization of the Photographic Laboratory

Our group normally consists of six persons. These are: The Head of the Laboratory, Assistant in charge of camera work, Assistant Camera Man and movie technician, three Technicians, two of whom are constantly on darkroom work. We have added two temporary microfilm camera operators at times. The group functions as a service group to the entire Manufacturing Department, but is organized under the direction of the Chemical Division.

A typical year's production includes: (1) the fulfillment of over 1,500 separate orders ranging from a request for one photographic print to the production of a half hour sound color movie. (2) The exposing and processing of over 12,000 negatives and color transparencies. (3) The production of over 50,000 photographic prints. (4) The preparation of 500 lantern slides in black and white and color. (5) The production of three ½ hour color sound slide films. (6) The production of 1 full scale sound color motion picture. (7) Making about 10,000 feet of high speed motion pictures and over 10,000 feet of record motion pictures and (8) Handling 300 rolls of microfilm.

Cost Accounting and Charging

These totals are not in themselves significant without considering the wide variety of problems approached and the diversity of photographic skills applied to achieve this production. Accurate records are kept of the costs involved in all work performed by the department. This is done for two reasons. First, it is felt that photographic usage must be justified on an economic basis. It is desirable for those who are to use our service to know in advance what it will cost. Second, since we operate as a service unit, the costs of the work we do is borne by the departments using the service. We, therefore, cross charge by an internal accounting procedure, the direct costs of labor and material and an allowance for indirect costs.

In order to simplify accounting procedure and record keeping, standard costs have been calculated on repetitive jobs and these standard costs are used in cross charging. Cross charging of costs seems to have the dual effect of discouraging too enthusiastic and inefficient use of photographic service, and at the same time encouraging other applications which might not be undertaken if realistic cost information was not available.

If the chemical industry is to find a place for the successful application of the powers of functional photography to show, record and reproduce the information which it must communicate internally, attention given to organization on a broad company wide basis is desirable. An important advantage of a central group used to correlate photographic usage within the company is the utilization of available sources of photographic service with fixed responsibility for their successful and economical application. Photography long thought of as necessary to the fields of promotion, art and journalism, has now progressed to the status of a valuable aid to science and industry and is ready to contribute its share to the increasing effectiveness of chemical industry in a changing world.

PRACTICAL PHOTOGRAPHIC ENGINEERING FIELD RECORDS

D. C. Jardine*

The Engineering Departments of many industrial plants often have need of a photographic record which might be called a "memory jogger." This is especially true of heavy equipment manufacturers, whose products are used under outdoor conditions, such as diesel-powered shovels and cranes, earth movers and similar equipment. Failures in the field often necessitate design changes, shop procedure changes, or other changes to prevent costly recurrences. Equipment failures in the field often require field engineering investigation and the recording of data.

When a field engineer arrives at the location of the equipment failure, he often needs record data in addition to his notes and sketches. Photographic records that do not forget a single detail are particularly useful. The services of a professional photographer might be used but, unless a professional photographer is really needed, he will not be called upon, for two reasons: The cost would be too high (equipment often fails many miles from the nearest studio) and the average professional photographer seldom has an appreciation and understanding of the engineering problem at hand. A particular type of photograph is called for; the recording of factual engineering data.

Suppose, for example, a shovel engaged in strip mining coal 40 miles from the nearest town fails. The engineer, along with the dealer's repairman, studies the failure and fills out his customary reports. During his study he sees the need of photographs for use in various

places back at his plant. He could go to the nearest town and bring back a photographer. However, suitable record photographs can be made on the spot by the field engineer himself if he is suitably equipped.

With suitable equipment and instructions, field engineers have made satisfactory record photographs, including general views and details of the failure, plus details of the repairs. A 2¹/₄ x 3¹/₄ inch reflex-type roll-film camera with flash attachment using No. 5 flash lamps was provided by one organization. A portrait attachment was added later to permit working in restricted areas. The flash attachment proved of great value where close-ups were photographed in addition to the advan-

Field record photograph of engineering material failure taken with a flash-synchronized box-type camera by a field engineer.

Received 14 January 1932. The author, before becoming an instructor at RIT, managed the photographic department of the Locomotive Shovel and Crane Divisions of Lima-Hamilton Corp., Lima, Ohio.

tages of measuring illumination where dull days and details in the shade or shadows required recording.

The plant's photographic department processed and printed the negatives. The films were developed in the usual amateur tank, using D-23 developer. Many of these field negatives are excessive in contrast. Standard 5 x 7 prints were made, with the same care that would be exercised with similar negatives made by the depart-

ment in the plant. The result has been photographs that served a purpose and performed a needed function at a reasonable cost that would justify their industrial existence.

The reflex-type box camera was chosen for its simplicity of operation—a "must." The use of No. 5 flash bulbs and standard $2^1/4 \times 3^1/4$ roll film, which can be easily obtained at most local stores, is also desirable.

FLASH SYNCHRONIZATION WITH STILL CAMERAS

S. H. Duffield*

Synchronization is defined as "the act of causing to take place at the same time." When applied to flash photography this means causing the camera shutter to be open when the transient illumination is at its maximum value.

Using time-to-peak as a criterion for classifying flash sources, there are five general types. The three most important are:

1. X-type, with a time-to-peak of less than 1 millisecond, is found only in Strobe or gas-discharge lamps operated from high voltage sources.

2. F-type, with a time-to-peak of 3 to 7 ms, is found only in the midget lamps, and is used chiefly in the amateur field.

3. M-type, with a time-to-peak of 16 to 23 ms, is the most common type and has the widest application in both amateur and professional work. This type will serve as the example for the following discussion.

In addition to these three types, there is a special high-output S-type lamp with a time-to-peak of about 30 ms and usually used with "open flash," and the FP-type lamp in which the light output is held nearly constant during the transit time of the slit in a focal-plane shutter.

All of these, except the X-type, depend on the burning of material for their light output, and may be obtained in several sizes to meet various demands.

The data presented here are based on a laboratory study of the lamps of one manufacturer which are widely distributed to the photographic trade and representative of the product available at the time of the study, about a year ago.

Construction and Operation of M-type Flash Lamp

The tangled mass of fine wire or shredded foil in the M-type lamp burns rapidly in an atmosphere of oxygen

to provide the light. The total amount of light emitted and the burning time of the charge are controlled almost entirely by the amount of material and the oxygen pressure in the lamp and these contents are held to close tolerance by the manufacturers. This wire or shredded foil is ignited by the primer which is coated on the ends of the two leads where the filament is attached.

When sufficient electric current passes through the filament, it gets hot enough to ignite the primer. With a lower current it is possible to heat the filament until it burns out without generating heat rapidly enough to set off the primer. This is what happens when weak batteries are used.

The three events in the firing of a flash lamp are: First, the filament is heated rapidly by the electric current; Second, this hot filament ignites the primer; Third, the burning primer kindles the mass of fine wire or shredded foil and the metal burns, producing light.

Our experiments have shown that the time interval between the ignition of the primer and the maximum light output of the burning wire is constant, but that there can be a large variation in the first step of the process. The time between the closing of the circuit and the ignition of the primer is influenced greatly by the magnitude of the current delivered by the power

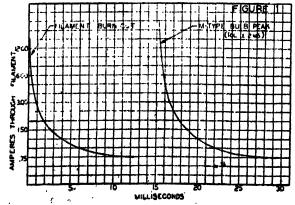

Fig. 1. Filament burn-out time and time to peak of Mtype flash lamps operated at different amperages.

^{*} Development Department, Eastman Kodak Company, Rochester 4, New York. Presented at the PSA National Convention in Detroit, Michigan, 13 October 1951. Received 13 March 1952.

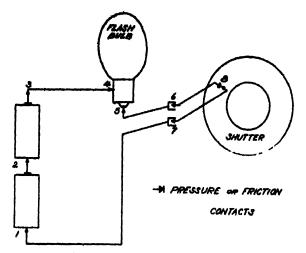

Fig. 2. The simplest possible flash circuit using two battery cells has at least eight unsoldered contact points that develop electrical resistances.

source. Obviously this factor must be accurately controlled if accurate synchronization is to be achieved.

In Figure 1 the filament burn-out time in milliseconds is plotted against the current through the filament in amperes. These, and other data given in this paper, were obtained from photographs of numerous oscilloscope traces giving current flow, filament burn-out, and light output of the flashbulbs against a calibrated time base. The electrical circuit was so constructed as to minimize variables due to circuit resistance, contact resistance and contact hatter.

It is evident that, with currents below one ampere, the burn-out time is extremely variable and in the neighborhood of ⁴/₄ ampere some failures must be expected. With currents above three amperes the burn-out time is less than three-fourths of a millisecond. Obviously, if the current can be kept above this value under all conditions, good synchronization should be obtained

Factors Involved in Good Synchronization

From Ohm's Law we know that current equals the voltage divided by the resistance. Therefore, in a sample flash circuit using two dry cells as a three volt power supply and a filament with a resistance of approximately one-half an ohm, the current should be 6 amperes. (3/.5 = 6.) On actual measurement the current is usually found to be much less. This decrease in current is caused by additional, and often obscure, resistances in the circuit.

In the simplest two-cell flash circuit there are at least eight unsoldered contact points, as shown in Figure 2. Three are in the battery and case, two at the bulb, two at the camera, and one within the shutter. Each of these contacts offers additional resistance, from a fraction of an ohm under the best conditions to several ohms in the case of corrosion on battery contacts or corroded solder at the base of the bulb. These resistances can be minimized only by the selection of good equipment and by adequate maintenance.

Within the battery itself there is resistance, called the "internal-resistance", which becomes dominant when the external resistance is low. The electrode and electrolyte materials are responsible for the voltage of the battery,

but the internal resistance is determined by the condition of the electrolyte and materials separating the electrodes.

In some batteries made especially for flash work, this resistance is very low when the battery is fresh, but increases with storage time or with use. In other batteries, designed primarily for illumination applications, the internal resistance is somewhat higher when new, but does not increase so rapidly as heavy currents are drawn. From this it may be seen that the type and condition of the battery may be critical factors in synchronization.

Ohm's Law may be expanded to cover all these additional resistances.

Current =
$$\frac{\text{Voltage}}{R_1 + R_2 + R_4 + R_4}$$

R₁ - Fixed resistance of the circuit (leads, filament, etc.)

R₂ - Internal of the battery

R; - Contact resistance between battery cells

R₄ - Other contact resistance (plugs, sockets, shutter, etc.)

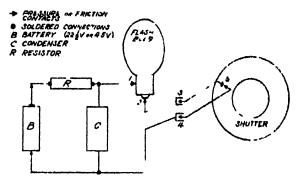

Fig. 3. Typical B-C flash circuit including resistor to limit the current drain on the battery

The voltage factor is unchanged, so why not double or triple it and raise the current proportionally? This is exactly why some flash outfits have provision for adding more cells, but adding more cells increases the resistance below the line (R₂, R₃) and so gain is not as great as might be expected.

There is a way to increase the voltage without increasing many of the resistance factors, and this is by the use of a condenser, which may be soldered permanently into the system. In a flash circuit it acts as an electrical storage tank, and has the same voltage as the charging source but practically no resistance to the discharge of its stored energy. It may be charged directly from the battery or through an external resistance, s nce the resistance of this portion of the circuit can influence only the charging rate and not the final result. This combination of a battery and condenser forms the power source of the "B-C" (battery-condenser) circuit. Historically, it appears that this system was first proposed for flash synchronization by the Kalart people, but the first work published in detail was done by W. H. Fritz and coworkers at National Carbon Company.1

In a typical B-C circuit, Figure 3, the condenser acts as a storage unit which can be filled slowly, regardless of the internal resistance of the battery, battery contacts, etc. In fact, the batteries usually used in B-C units will not stand large current drains, so a limiting resistor of several hundred ohms is deliberately put into the charg-

ing circuit to limit the current. As mentioned before, the condenser, when fully charged, has the same voltage as the charging battery but practically no resistance to the discharge of current, and hence we can increase the voltage applied to our circuit without, at the same time, appreciably increasing the resistance. By actual measurement the effective resistance may be lowered by the elimination of all resistances associated with the batteries, since they occur only in the charging circuit, not the firing circuit.

Figure 4 shows the discharge curve of a typical 45-volt B-C unit. Discharge current in amperes has been plotted against time, for four different values of external resistance. While the current falls rapidly, the initial value is so high that the filament would be expected to burn out consistently in a few tenths of a millisecond and this is exactly the case. Even with 8 ohms in the external circuit, the current exceeds three amperes for ³/₄ millisecond, which was the filament burn-out time noted previously. Note that 8 ohms are roughly equivalent to six well-designed twenty-foot extension flash units. Increased voltage, therefore, will pay dividends.

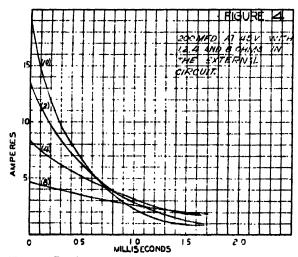

Fig. 4. Discharge curves of a typical B-C unit at different values of external resistance.

Figure 5 shows the time-to-peak for M-type bulbs fired with a B-C circuit with various values of external resistance. The 200 mfd condenser was operated at 22½ volts and at 45 volts. Note that at 45 volts with 8 ohms resistance the time to peak is 17 ms. Remember, this was a laboratory setup and many sources of resistance normally present in commercial equipment were missing.

Of course, all this gain cannot be obtained without some bad features. The most serious is high initial current, which may be over 15 amperes if the external load is low. Such currents could easily damage delicate shutter contacts unless provision is made to avoid them. One means of doing this is to build into the circuit a protective resistance to keep the current down. Of course, when extensions are added, this protective resistance should be removed.

Extension connections, operating on the principle of a duplex phone jack with the protective resistance across the secondary contacts, as shown in Figure 6, may be

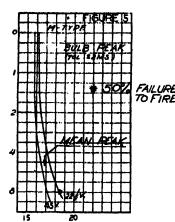

Fig. 5. Time to peak of M-type flash lamps B-C fired using a 200 mfd condenser operated at 22.5 and at 45 voltas with different values of external resistance.

used. When no extensions are used, the current flows through the resistance wire, which is just enough load to reduce the initial current to a value that can be handled safely by the shutter. When the extension is plugged in, the resistance wire is cut out of the circuit and the extension acts as the protective load. In this way the shutter contacts are always protected from serious overload.

The variations in the characteristics of the flash bulb, namely the bulb manufacturer's tolerance for the burning time of the charge, and the filament burn-out time, together with the variations in the flash circuit responsible for the latter, are only part of the synchronization problem. The camera shutter and the amount of variation to be expected there, must also be considered.

First, for flash shutters, there is the manufacturer's tolerance in setting flash contacts. Tests on numerous shutters of various manufacture show that, for a well-made shutter of a given size and make, the variation in delay time will fall within ± 2 milliseconds, and an individual shutter will repeat within $\pm 1/2$ millisecond.

In the case of solenoid-synchronized non-flash shutters, the accuracy of synchronization depends not only on the current through the solenoid, exactly as in the case of lamps, but also on the mechanical adjustment of the solenoid. This is complicated from the standpoint of accuracy by the need for getting the required delay and at the same time suitable tripping action.

One of the better solutions to this problem is again the use of B-C as a power source, to provide fast positive action. If this can be coupled to a mechanical synchronizer that controls only the contacts supplying

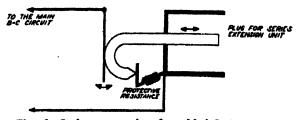

Fig. 6. Series connection for added flash units with protective resistance across the secondary contacts. When no extensions are used, the resistance wire reduces the initial current to avoid burning the shutter contacts. When the extension is plugged in, the resistance is cut out of the circuit and the extension serves as the protective load.

current to the solenoid and to the bulb, an ideal unit is provided. The solenoid can then be adjusted to give the best tripping action, and the synchronizer adjusted

to take care of the delay.

Such a synchronizer can be built on the principle of a box camera shutter with the shutter blade carrying the common contact. This contact sweeps first over the M-type bulb contact, then over the solenoid contact, and then over the F-type bulb contact. Of course, provision must be made to by-pass the M contact if the F is to be used.

Inasmuch as the difference in time-to-peak between M and F type bulbs is a constant under similar conditions of current, the relative position of these two contacts may be fixed and only the solenoid contact need be adjustable to provide correct synchronization for both types.

In order to have adequate current available to both the flash bulb and the solenoid, it is advisable to use a parallel arrangement of two condensers such as shown in Figure 7. This has the advantage of providing es-

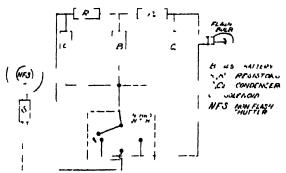

Fig. 7. Parallel arrangement of two condensers to provide independent current for both flash lamp and solenoid.

sentially independent sources for each operation so that neither robs the other of power, as is so often the case with conventionally powered units.

There is one more shutter characteristic that can have a significant effect on synchronization, namely the shift in the delay required for various shutter speeds. Figure 8 shows a plot of the shutter speed curves when all are correctly synchronized for an M-type lamp. Note that the delay time, measured from the closing of the contacts to the first full-open position of the shutter, is a variable as shown by the bars at the upper left. Such synchronization can be obtained with a completely variable, synchronized shutter, but the delay must be changed whenever the shutter speed is changed.

The more common practice is to set the delay once, for some one speed, and take whatever one can get for other speeds. Figure 9 shows a plot for a fixed delay shutter set for perfect synchronization at 1/100 second. Note that all other speeds are more or less out of synchronization, the faster speeds being early and the slower speeds being late.

The variables in connection with synchronization

may be summarized as follows:

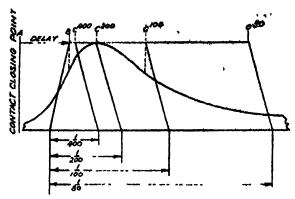

Fig. 8. Synchronization of M-type flash lamps with camera shutter opening characteristics at different operating speeds. The delay time, from the closing of the contacts to the first full-open position of the shutter, is a variable.

Dulb time-to-peak variation

Shutter-manufacturer tolerance

Shutter speed (¹/200 to ¹/50)

Power source (weak batteries to B-C)

⇒ 2 ms

⇒ 3 ms

Taking the statistical average $(\sqrt[3]{a^2 + b^2 + c^2} ---)$ of these figures, we find a probable variation range of ± 4.6 ms. Just what does this mean in terms of exposure?

Taking a fixed delay shutter operating at 1/100 second and the average M-type lamp curve for calculation, we find a maximum amount of light caught under conditions

of perfect synchronization.

All other conditions being constant, perfect synchronization allows the maximum amount of light to enter the camera, and any change in synchronization can only reduce the amount of light admitted. It follows, therefore, that perfect synchronization should yield, not the optimum exposure, but rather the maximum tolerable exposure, since any change in synchronization can produce only less. If this is not done, then the upper range of useful exposure latitude of the film would never be used and the latitude of the film would, in effect, be reduced accordingly.

If the lamp curve is shifted so that it peaks 4 ms later, only 60% of the light obtainable under conditions of perfect synchronization will be obtained, or a change in exposure of .7 lens stop. A similar shift in the other direction would give 75%, or a change in exposure of .4 lens stop, since the lamp curve is not symmetrical. Assuming the exposure latitude of the shortest scale materials to be \pm one-half stop, then perfect synchronization is one-half stop over, and a 4 ms shift is almost perfect in one direction and about 1/4 stop under in the other.

Using circuits that furnish sufficient current to fire bulbs consistently, the probable variation is reduced to ± 3.5 ms and all exposures are well within $\pm 1/4$ stop, which is excellent for even the most critical materials.

From these considerations it can be seen that while good results can, and for a long time have been obtained with flash equipment normally furnishing 1 to 4 amperes to the bulb, much more consistent and therefore generally better results could be obtained from equipment furnishing more than 3 amperes under all conditions. At the moment B-C seems to be the best answer.

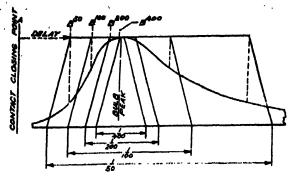

Fig. 9. Fixed delay shutter synchronized at 1/100 second showing all other speed settings more or less out of synchronization.

Series Versus Parallel Circuits

Since the time-to-peak is a function of the current and since all portions of a series circuit get the same current, they must all fire the same, and so the series circuit is preferable, particularly where multiple extensions are to be used. More voltage is needed, of course, to operate a series system, but B-C gives more voltage easily.

Another topic of general interest in connection with flash circuits is the question of the synchronization of strobe lights. While the details of the circuits used to control flash tubes may show infinite variety in detail, dictated by the specifications of the individual units, they all may be reduced to three basic circuits.

In the first type the shutter contacts control the current to the coil of a relay which in turn controls the power to either the self-energizing tube or the primary of the trigger coil of a "stand-off" tube. Such systems

TECHNICAL BOOKS **RECEIVED**

Color in Business, Science, and Industry by Deane B. Judd, John Wiley & Sons, Inc. New York 16, N. Y. (1952) 401 pages, \$6.50.

This is a practical book for the technical man to whom color problems are frequent occurrences but not his main concern. The physicist and the scientific worker in color will find it useful too.

Ready reference material on color characteristics, measurement, reproduction, standards, classification and terminology is provided in understandable language. Out of his 25 years experience in the U.S. Department of Commerce (National Bureau of Standards), Dr. Judd has completed a valuable desk companion for the Industrial Engineer, Printer, Designer, Photographer, Advertising Manager, Stylist, Illustrator, or the industrial technician concerned with production, product packaging, identification, and quality control. The book will be reviewed in detail later.

are capable of variable delay but not X-type synchronization. In general, these circuits are subject to day-to-day variation in synchronization caused by the relative instability of a relay under various operating conditions. In addition, the back e.m.f. or "kicker-coil" action of the relay when the circuit is broken may produce an arc between the shutter contacts. This causes heating and pitting of the contacts, early failure, and frequent shutter repairs.

The second type uses the shutter contacts to control the current to the primary of the trigger coil of the stand-off type tube. If the proper kind of coil is used, the back e.m.f. is considerably less than that developed by a relay and the danger of burning of the shutter contacts relatively slight. This system, however, is limited to

X-type synchronization.

In the third circuit the shutter contacts control the voltage applied to the grid of a thyratron or cold cathode tube.2 In such a circuit the plate current energizes the trigger coil. Note that here it is primarily voltage that is controlled, not current, and in a properly designed circuit the shutter contacts are not damaged at all. With simple auxiliary components, this type of control is capable of exact synchronization for all delays. This appears to be the most satisfactory circuit for strobe tube synchronization although it is slightly more expensive.

LETTER TO THE EDITOR

Dear Sir:

The Photographic Laboratory has experienced considerable difficulty in finding a means of captioning photographic prints. This is our problem: Most of our 8 x 10 industrial photographs and our 8½ x 11 laboratory report photographs must carry titles of explanation.

To date we have used two methods for making titles. First, by typing the written material on onion skin paper, and then contact printing this positive on Adtype paper, we produce negatives that are attached to the picture negative. Second, by cutting a stencil on Stenalith material which is cut into strips to fit the negative for contact printing.

The first method is time consuming because we have the extra processing of the title. The second method is better with respect to the time element, but the Stenalith material is fragile and the characters are not cut evenly by the type bars. Possibly you can tell us of another method, not involving photographic processing, that we can use to produce the titles.

PSA MEMBER

NOTE: The Editor will be glad to receive suggestions inspired by the above request for assistance on Tacantous for Professionals. Samples illustrating proposed methods should be enclosed, if they are satisfactory for reproduction. Recommended methods will be published in a forthcoming issue.

Properties of Developing Agents. I. Hydroquinones*

R. W. Henn

SUMMARY

The developing properties and rate of oxidation of hydroquinone, chlorhydroquinone, toluhydroquinone, methoxyhydroquinone, and sulfohydroquinone (hydroquinone monosulfonate) were investigated over the pH range of 7 to 13. The build-up of image density was found proportional to the logarithm of the developing time. The rate of increase of development with pH varied among the several agents, but in no case did it increase pronouncedly at pH values above 11.5. The rate of aerial oxidation did not necessarily parallel the developing rate and continued to increase progressively with pH, most of the developers losing activity more rapidly than they discolored. The agents produced increasing fog as the pH was raised and methoxyhydroquinone lost much of its selectivity. Some solubility measurements are included.

o comprehensive investigation of the simple developing agents has been made in recent years, since the great importance of the degree of alkalinity, or pH has been understood. Levenson has dealt with p-n-ethylaminophenol sulfate and hydroquinone over a limited pH range and James has investigated the paraphenylene-diamines over a wide pH range. The present investigation uses an approach similar to that of James in that developing rates are studied over a wide pH range, but a particularly wide range of developing times, and measurements of the rate of aerial oxidation and of solubility have also been included. It is hoped that the data gathered with these simple developing agents will contribute to the general field of photographic knowledge and to a better understanding of how the agents may best be adapted to a specific problem.

This paper is confined to a group of hydroquinones which are sketched in Table I. Considerable effort has been spent in their purification, and they probably represent much purer samples than the early investigators were able to obtain. The methoxyhydroquinone was prepared by Dr. C. F. H. Allen, of these Laboratories; the others, by the laboratories of the Tennessee

Eastman Company.

Experimental Conditions

The developing agents were employed at a moderately low concentration in a medium-sulfite, bromide-free developer, with buffer added to stabilize the pH in the desired range (see plot of buffer characteristics, Figure 1). Sodium hydroxide was added, as required, to peutralize the acidic effect of the phenolic groups, which is appreciable, even at a pH as low as 10.0. These data are given, together with the developer formula in Table I. The pH values were measured with a carefully standardized, high-pH, glass electrode.

This work has been confined to a simple positive emulsion of low fogging propensity (Kodak Fine Grain Positive Film). In addition to simplicity, this emulsion offers the advantages of considerable physical hardening and a very high maximum density. Following exposure to a step wedge, this film was cut into 1- × 10-cm strips and placed in test tubes containing 10 ml of developer.

*Communication No. 1464 from the Kodak Research Laboratories. Received 12 December 1951 These tubes were rotated in a water bath at 68 F (20 C) to produce a high rate of development and good uniformity.

It was found that the developing agents were not as well characterized by measurements of contrast or emulsion speed as by density for a fixed exposure, and it is the measurement of this value which was used in the plots of Figure 2. The exposure (the fourth step of the wedge employed) has been selected so that the density lies on the straight-line portion of the characteristic curve, and the development of this exposure to a density of 2.0 agrees with the degree of development normally employed for this product.

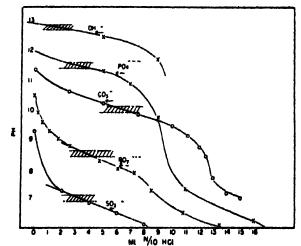

Fig. 1. Titration curves of buffers. These ions were employed to maintain the developers in the desired working range. (1) Sulfite, pH = 7.0 (2) pyrophosphate, pH = 8.5 (3) carbonate, pH = 10.0; (4) orthophosphate, pH = 11.5; and (5) hydroxyi, pH = 12.8. The shaded area indicates the buffering range employed, which is usually in the flat midpoint of the "pK" region, where the pH will be but little affected by slight variations in concentration.

The rate of oxidation was measured by exposing 50-ml. quantities in unstoppered 120-ml flasks, the level being restored when made necessary by evaporation. The photographic activity was determined by strips developed periodically in these solutions, the time selected being sufficient to give a density of about 2.0 in the fresh developer. Discoloration has been expressed

in terms of the transmission of a 1-cm. layer at 450 m μ ,

as measured on a suitable spectrophotometer.

The solubility of the developing agents was measured in a high salt solution, as being more characteristic of concentrated developers for which solubility values are usually required. This comprised sodium sulfite, 1.0 molar; sodium carbonate, 0.5 molar; sodium bicarbonate, 0.5 molar; sodium hydroxide was added as needed to keep the pH at 10.0. Increasing concentrations of the developing agent were tumbled in this solution until the saturation limit was reached.

Experimental Results

1. Activity. The image density (of the fourth step) is plotted against the logarithm of the developing time in Figure 2. Note the highly linear character of the resulting curves. This linearity does not seem to be translatable into any simple kinetic expression, however. In addition to the linear relationship, the curves are noteworthy in the strikingly similar slope, which varies only slightly from 3.3 density units per 1.0 log time unit. This value is not, however, as will be shown later, a general property of all developing agents. The steeper slope of the hydroquinone monosulfonate in Figure 2d is a characteristic of restrained development, and slopes of 4 to 5 density units per log time unit were also obtained with bromided developers of low activity, such as hydroquinone at a pH of 10, and chlorhydroquinone at a pH of 8.5.

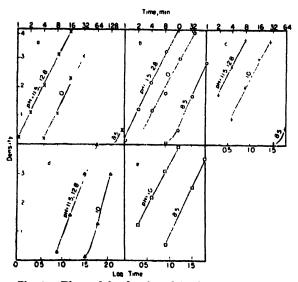

Fig. 2. Plots of the density of the fourth step against the log of the developing time. Figure a applies to hydroquinone, figure b to chlorhydroquinone, figure c to toluhydroquinone, figure d to hydroquinone monosulfonate, and figure c to methoxyhydroquinone.

Since, with the above exceptions, the density: log time curves are essentially parallel, the chief factor controlling the image formed at any time is the magnitude of the induction period, and this could be used as a measure of the activity. However, a more "practical" value, applicable also to curves of varying slope, is to make the measurement for some fixed degree of development. The image density of 2.0, as mentioned above, corre-

sponds to the degree of development normally obtained with this emulsion in practice, and it is the time required to reach this density value which is plotted against pH in Figure 3 and used as a basis for the activity figures of Table II.

SO₂Na 0.015 0.030 0.04

A study of the pH response curves (Figure 3) discloses other differences between the agents in addition to those of rate. Hydroquinone, toluhydroquinone, and the monosulfonate are all similarly dependent on pH, a change of 1.0 pH units in the range of 8.5 to 10.5 making a large change (10×) in developing time, while a similar pH change produces only about half of this effect with chlor- and methoxyhydroquinones.

However, all respond similarly at the high end of the pH range and none of the hydroquinones were any more active at a pH of 12.8 than at 11.5. This behavior is probably connected with the ionic character of the development mechanism of hydroquinone, ionization being completed in this range. The data of Reinders and Beukers also show this leveling off at high pH, although their values did not extend as high.

2. Fogging Proposity. The tendency of the agents to give increasing fog, or non-image development, as the

activity of the developer rises, is indicated in Figure 4, where the fog level is plotted against pH for constant image development, density = 2.0. This increase in fogging propensity becomes very important for methoxyhydroquinone, which loses much of its selectivity as the pH is raised. This might be connected with decomposition to hydroxyhydroquinone. In general, plots of fog:time were found to give a linear result as compared with the density:log time plots of Figure 2.

3. Contrast and Emulsion Speed. The contrast produced by the unrestrained developers was very similar, except where fog interfered, gamma values of 1.9 to 2.2 being measured for development to density = 2.0.

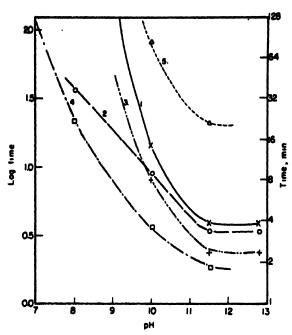

Fig. 3. Plot of activity against pH. Curve 1 applies to hydroquinone; (2) to chlorhydroquinone; (3) to toluhydroquinone; (4) to methoxyhydroquinone; and (5) to hydroquinonemonosulfonate. Note the tendency to level off at high pH and the variations in slope in the rest of the range.

However, higher contrast was obtained by restraint produced either by (1) lowering the pH so that the rate of development was very low, or (2) by the addition of bromide. Under these conditions, the contrast rose to the range of 2.5 to 3.0. The emulsion speeds produced by the several developers were also very similar, and in the absence of restraint ranged from 75 to 140% of an empirical "100" figure.

4. Bromide Effects. An 0.01 molar concentration of potassium bromide, or about 1.2 grams per liter, was added to the basic developer formula over most of the pH range. Density: log time slopes were similar to these given by the unbromided developer, although they were occasionally steeper, but displaced by about 0.3 log unit corresponding to an approximate doubling in developing time. The gamma-speed relationship was altered so that at equal fourth-step density the bromided developers produced more contrast (2.6 to 3.0) and about half the toe speed. The bromide effectively restrained the fogging propensity of the toluhydroquinone and somewhat reduced that of the methoxyhydroquinone.

Rate of Oxidation

1. Loss of Activity. The rate of oxidation was found dependent on (1) the pH, and (2) the nature of the de-

veloping agent.

While both oxidation and activity increased with pH, the functions were not completely parallel, as shown in Fig. 5a, where the time of acration in which the activity is reduced by one-half (half the normal density produced) is plotted against the pH. It will be noticed that, where data are available, the acration life continues to decrease with increasing pH, although developing time was shown to reach a maximum.

The rate of oxidation of a given agent is not related directly to its developing activity. Thus, chlorohydroquinone is appreciably more active than hydroquinone over the pH range examined, yet it was oxidized at one-third to one-half its rate. Also, while toluhydroquinone and methoxyhydroquinone were active developers, their

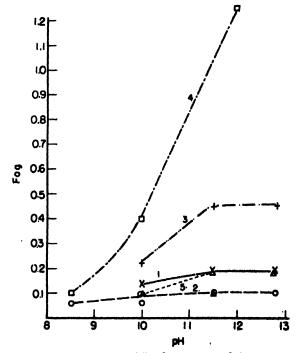

Fig. 4. Fog vs. pH. The fog, measured for a constant degree of image development, is seen to increase with pH, that is, the developers become less selective. However, like rate of development, fog formation does not increase above pH = 11.5. Curve 1, hydroquinone; 2, chlorhydroquinone; 3, toluhydroquinone; 4, methoxyhydroquinone; 5, hydroquinonemonosulfonate.

Table III

SOLUBILITY OF HYDROQUINONES (High Salt Developer, pH = 10.0)

2	Grams per Liter			
Agent	Not More Than:	Not Less Than:		
Hydroguinone	40	60		
Hydroquinone Chlorhydroquinone	300	400		
Toluhydroquinone		20		
Sulfohydroquinone	250	330		

rate of oxidation was disproportionally rapid. Developing activity was found frequently to decrease linearly with the time of aeration, but, characteristically, persistent residual traces of activity were noted, presumably due to the developing properties of the oxidation products, the hydroquinone sulfonates.

2. Discoloration. The developers, when freshly mixed, were essentially colorless and transmitted 90 to 95% as much light as distilled water. As they oxidized to yellow, these values fell to half and then through brown to values of the order of 1 and 2% transmission before oxidation was complete.

However, the hue of the solution did not indicate developing activity. Thus, hydroquinone solutions lost 80% of their activity while decreasing only 20% in transmission, that is, discoloring but slightly. On the other hand, the brown color of the oxidized methoxy-hydroquinone closely paralleled the decreased activity of this agent.

Solubility

The solubility of a developing agent is often of interest, particularly in the preparation of concentrated developers. In such cases, the salt content is likely to be particularly high, reducing the developing agent solubility to a minimum. The alkaline nature of the developer will, however, tend to increase the solubility, and it is a balance of these factors which is considered in Table III, where a high salt developer and a moderate pH (10.0) was employed. Note the wide range of solubilities of the several agents. While the high solubility of the sulfohydroquinone appears reasonable, it would have been difficult to predict the high solubility of the chloro- and methoxyhydroquinones by purely structural considerations.

Discussion

- 1. Direct Comparison. The developing agents might be compared on several bases, but a logical one is at equal degrees of activity, adjusting the pH as necessary. This comparison is shown in Table IV. It will be seen that, even when adjusted to equal activity, the oxidation rates and fogging propensities of the several agents differ considerably.
- 2. Theoretical Aspects. The linear relationship between density and log developing time does not appear to have received much attention in the literature, although such a relationship is shown for gamma by Elvegards and appears also to have been recognized in practical sensitometry, where a series of developing times is usually selected to progress in a more or less exponential

fashion. A logarithmic time plot has been used by at least one group of investigators to characterize developeremulsion combinations.

It has not been clearly pointed out previously that the developing activity of hydroquinone solutions reache; a maximum at a pH of about 11.5, corresponding possibly to complete ionization, and, while this property is apparently clearly shown for these agents under this one set of conditions, it will be checked with other emulsion-and-developer combinations. Also of interest from the theoretical viewpoint, although not previously unrealized, is the evident difference between the aerial oxidation and development (or silver halide oxidation) mechanisms. Thus changes in pH do not produce the same effect on oxidation as on development; also, the relative rates of oxidation and of development of the several agents show no correlation. Quite disappointing from the theoretical viewpoint is the apparent lack of relationship to one another of the degree of ionization or acidity (indicated in Table I), structure, activity, and solubility.

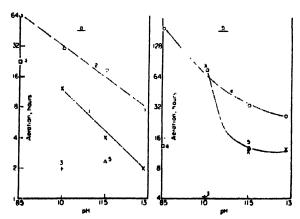

Fig. 5. Aeration properties. (a) Activity, (b) discoloration. (1) hydroquinone, (2) chlorhydroquinone, (3) toluhydroquinone, (4) methoxyhydroquinone, and (5) hydroquinonemonosulfonate. The time to lose (a) half of the activity as measured by the image density produced, or (b) to decrease 50% in light transmitted, has been plotted against pH. Note that the discoloration has, in general, proceeded more slowly than the drop in activity.

3. Practical Considerations. The indication of an upper useful pH limit for hydroquinone developers has practical implications, since no gain of activity is indicated beyond a pH of about 11.5, and higher values may decrease the aeration life.

It is also interesting to note how a given end may be frequently attained by alternate means. Thus, Table IV shows that the same level of activity may be obtained by employing hydroquinone at a pH of 10.5 or toluhydroquinone at a pH of 9.9. The hydroquinone developer would have the advantage of better keeping properties, but a much better buffered developer could be obtained with the common carbonate and borate alkalies at the lower pH value, and this factor would favor the selection of the toluhydroquinone.

Chlorhydroquinone appears to offer some advantages over the other hydroquinones examined, being quite active, very soluble, slow to oxidize, of low fogging

COMPARATIVE CHARACTERISTICS OF HYDROQUINONES AT EQUAL ACTIVITY D = 2.0 in 8 Minutes

Agent	pН	Gamma	Speed	Fog	Aeration Activity	Life Hue
Hydroquinone Chlorhydroquinone Toluhydroquinone Methoxyhydroquinone Salfohydroquinone	10.5 10.2 10.0 9.0	2.0 , 2.0 1.8 2.2	85 110 100 100 None	0.15 0.09 0.21 0.20 that active	8 hours 28 hours 2 hours	24 hours 60 hours 4 hours

propensity, and less sensitive to variations in pH. However, these results do not necessarily apply to the impure chlorhydroquinones which have frequently been marketed, some of these showing poor keeping properties. Specifically, solutions of one such commercial sample displayed only one-half of the aeration life of the pure chlorhydroquinone.

Also, the relative properties of the several hydroquinones examined here are greatly modified, as will be shown later, by the common practice of combining them with other developing agents, such as p-methylaminophenol. In such combinations many of the advantages of the chlorhydroquinone are lost.

MICROFILM IN INDUSTRY

Fred F. Basom*

OUR WIDTHS of film are in general use as microfilm; 8mm, 16mm, 35mm, and a more or less newcomer to the field, 70mm. The 16mm film, because of its narrow width, is limited in use to the photographing of cards, checks and office records; things to which reference need not be made too often. It has a specific advantage in that it is inexpensive for work which would not often need to be reproduced again in the original size. Due to the narrowness of the 16mm film, the inherent curl caused by spooling is a detriment. Kinking, causing excessive breakage and damage to the film, frequently results.

The 35mm film covers a much larger field to more practical advantage than can be done with 16mm film. Books, both single and double spread, newspapers, music, courthouse data, legal papers, office records—all things from which it is likely that sometime in the future a client may possibly want a full-size reproduction -are satisfactorily photographed on 35mm film. For high quality reproduction 35mm microfilm is probably the most widely used size today.

Recently 70mm film has come to be used for microfilming. The 70mm film is ideal for engineering drawings,

* University Microfilms, Ann Arbor, Michigan. Presented at the PSA National Convention in Detroit, Michigan, 10 October 1951. Received 14 April 1952.

reproduction of artist paintings, maps, and larger size originals which would suffer greatly through loss of resolution by photographing on 35mm microfilm. It is entirely possible to reproduce an engineering drawing in full size from a 70mm microfilm negative. In certain cases, by proper selection of filters, it is even possible to improve the legibility of the originals.

Shrinkage

Microfilm requires a wet process and material when wet and dried again tends to shrink. In some cases it may shrink slightly in one direction and increase in size in the other direction. This is inevitable, although film manufacturers have made considerable progress in decreasing the amount of shrinkage in their negative and positive materials and are still working in that particular field.

Shrinkage actually is of very minor importance, Every engineering student is taught not to scale a drawing. All toolmakers and shopmen are taught nor to scale a drawing. If the drawing lacks dimensions it is sent back to engineering for correction. Consequently shrinkage is of little importance in a full-size reproduction of engineering drawings from a microfilm.

Acetate base motion picture film, which has completely replaced nitrate base films in this country, tends to swell

during processing, to shrink back again during drying, and continues to shrink at a decreasing rate throughout the life of the film. During the last few years improvements in the manufacture of film base have reduced these effects to about one half of their magnitude 10 or 15 years ago. Shrinkage is classified as "permanent," (irreversible) and "temporary" (reversible). Both types are largely dependent upon the nature of the film base, although the emulsion, since it is considerably more hygroscopic than the base, has a marked influence on reversible shrinkage. Permanent shrinkage occurs from loss of residual solvents, loss of plasticizer and also to a slight extent to the gradual climination of strains introduced during the manufacture or processing. Permanent shrinkage is accelerated to some extent by high humidity, probably because the diffusion of solvents is aided by the presence of moisture, and to a much greater degree by high temperatures. The relative humidity of the air in contact with the film is almost the sole factor in determining the moisture content and this in turn governs the amount of temporary shrink

Like most materials, photographic film expands with heat and contracts with cold. Film will expand about ^b/₁₀₀ths per cent in length for every 10 degrees Fahrenheit increase in temperature, at a constant moisture content. However, it generally happens that the relative humidity drops in cases where film is exposed to heat. Since the effect of humidity is greater than that of heat, the net result is usually shrinkage.

Microfilming Equipment

There are several microfilming cameras on the market that will handle both 16mm and 35mm and also 70mm film. Some cameras will handle 16mm and 35mm film, others are built to handle just one specific width of film. Processing equipment is something that is slightly less perfected at the moment than are the cameras. However, it is possible to purchase continuous processing equipment for the processing of microfilm in all three sizes.

Microfilm Readers

It was only in the last year or year and a half that a really satisfactory 35mm film reader was placed on the market. This reader of course is easily adaptable to the use of 16mm film. However, the reader for 70mm film is manufactured by only one company, is expensive, and I believe some improvements can be made in its design.

It is quite possible to purchase all of the necessary things with which to make the exposures, print the film, and do the completed job of processing both 16mm and 35mm film. This of course includes cameras, developing tanks, printers, rewinds, spools, and the entire complement of necessary material and equipment. However, 70mm film is an entirely different problem. One may purchase 70mm cameras, printers, processing tanks and there we have it. From here on we are on our own. We must in order to have rewinds rebuild standard 35mm equipment. Likewise we must do the same with splicers. I know of none on the market today.

The 70mm film presents little difficulty in processing due to the fact that we are able to purchase water-powered or electric-powered developing tanks. However, the problem of drying the film is troublesome. It is possible, however, to dry the film on large diameter drums. These of course take up plant space and they are necessarily slow. We have designed and built for our own use a drying cabinet with automatic controls which we are currently running at 3750 feet an hour. We have operated at 6,000 feet per hour.

Relative Sizes of Microfilms

It might be interesting to compare the relative sizes of 16mm, 35mm, 70mm microfilms. The 16mm frame is .058 square inches. It is \(^1/\)_{10}Td of the area of 35mm frame. The 35mm frame, in turn, is \(^1-^2/\)_8 square inches in area. The 70mm frame is 8.43 square inches. We find the 70mm frame 6-\(^1/\)_10th times the area of the 35mm frame. The 70mm film has an area 145 times greater than does 16mm film.

Microfilm in industry presents many economies. For example, if engineering drawings are stored in a frame building of the military barracks variety the insurance rate would be \$1 per \$100 valuation per year. If the same drawings are stored in a brick or fireproof building of modern construction the insurance would be 10 cents per \$100 per year. If we should take a hypothetical case of 25,000 drawings valued at one million dollars stored one year in a barracks type building, the insurance would be \$10,000. In a fireproof building the insurance would be \$1,000 per year. As many of you know, the actual value of such drawings may be little. The reproducing of these drawings by the manual method might cost in the vicinity of \$40 per drawing.

Something might be said about the amount of room consumed in the storage of engineering drawings. For example the standard D size sheet which is 24 by 36 inches would require for the storage of approximately 310 drawings 2 cubic area about 3 x 24 x 36 inches. The same number of drawings photographed on 70mm film, stored in individual acetate envelopes would occupy a cube 3 x 4 x 6 inches. The pile of original drawings would occupy 2592 cubic inches. The microfilm only

72 cubic inches of file space.

If 25,000 engineering drawings measuring 24 by 36 inches were stored in a cabinet of the 5 section variety, each section containing five drawers 2 inches deep, the 25 drawers holding 150 drawings per drawer, the entire cabinet would hold 3,750 drawings. A unit such as mentioned above lists on the market today as \$396.40. The above mentioned number of drawings would require 7 cabinets at a cost of \$396.40 each or a total of \$2,774.80 for cabinets alone. It would be entirely possible to place this entire file, if photographed on 70mm film and each drawing cut up and placed in an acetate envelope, in a fireproof microfilm file cabinet costing \$215. This cabinet provides 9 drawers divided into four sections totaling 874 lineal inches of storage space. One cabinet costing \$215 can easily accommodate 44,640 70mm negative in envelopes, thus saving \$2,489.80 on cabinets alone and still provide approximately 70 per cent additional room for further expansion of the original file.

PHOTOGRAPHY IN MEDICINE AND BIOLOGY

The following invited papers will be presented at the 1932 PSA National Convention at the Hotel New Yorker on August 12th. The symposium presents photography at work in the medical and biological fields. Emphasis is on the numerous ways in which general and specialized photographic techniques aid in advancing, documenting, and teaching these sciences. Some specific techniques are included for variety and for pointing up the technical skill needed in solving some of the problems. Nevertheless, the important role of routine, conventional methods is made obvious by the diversity of uses. Outstanding authorities in educational, medical, and photographic fields will not only present the material but will also be on hand for a discussion period.

The Changing Ideology of Medical Teaching Metion Pictures, David S. Ruhe, M.D., Medical Audio-Visual Institute of the Association of American Medical Colleges, Chicago, Illinois.

ABSTRACT. This field needs individuals who combine basic training in the medical sciences with talent for audio-visual communication and teaching. Thorough training and experience in the audio-visual skills are required to avoid the risks of haphazard apprenticeships. Discovery, training, and placement of such individuals require a well-conceived audio-visual program based on modern knowledge and vigorously applied. Educators will be convinced of the merit of medical teaching films as soon as medical motion pictures achieve acceptable quality and have been scientifically tested by integrated teaching programs in the classroom, the staffroom, and in the clinic. Good production will only result from good methods. New film patterns must be devised that are different from the present verbal-imitative ones.

Purposes of Photography in the General Biological Sciences, Wayne M. Hull, M.D., Omaha, Nebraska.

ABSTRACT. Various applications of photographic procedures employed in recording the technical features of biological specimens in educational and research activities. Various techniques in high magnification photomicrography by infrared, ultraviolet, and fluorescent illumination are demonstrated and the value of dark field, phase contrast, and polarized illumination, utilizing direct and transmitted lighting arrangements. Specialized equipment including the electron microscope and centrifuge microscope are described and a 16mm motion-picture film will be shown illustrating time-lapse photography of the vital processes. The use of photographs in the study of growth processes, cellular physiology, reproduction, genetics, and the effects of drugs, chemical agents, and environmental influences will be emphasized.

Photography in Medical Research, Merrill W. Chase, Ph.D., The Rockefeller Institute for Medical Research, New York, New York

ABSTRACT. The purpose of a medical research photograph may be for record or for illustration of experiments. Subjects include both lifeless and living specimens and the latter may be more valuable than film or the photographer's time. Special technical aspects include lighting problems, light source problems, time-sequence studies, seriatim views, etc. Specialized equipment may be required.

Applications of Photography in a General Hospital, Leonard A. Julin, FBPA, Mayo Clinic, Rochester, Minnesota.

ABSTRACT. In the popular mind, photography in a general hospital means "before and after" pictures of patients. There are many other applications, depending on the size of the hospital staff and the nature of its activities. Various applications of photography in a general hospital are explained: staff conferences, case histories, laboratory reports, progress records, scientific papers, exhibits, instruction, and public relations. A description of some special photographic equipment and technique is included.

Medern Photomicrography, Oscar W. Richards, Ph.D., FBPA, American Optical Company Research Laboratory, Stamford, Connecticut.

ABSTRACT. The nature of the specimen and the needs of the investigation determine the choice of the microscope. The camera adds a light-tight holder for the sensitive film and means for focusing. These may be simple or conveniently elaborate; of fixed or variable magnification. Assuming proper specimen preparation, illumination is fundamental to success. It is usually easier to use standard Kohler illumination than to approximate good lighting by trial and error. An ideal source should be uniform, of proper color temperature, readily magnifiable to fill the field and aperture of the microscope, and intense enough

for short exposures. Use of zirconium and electronic flash sources of illumination will be described. Problems of color and of special microscopes (polarizing, fluorescence, ultraviolet, infrared, and phase) will be discussed briefly.

The Place of Photography in Ophthalmelegs, Dan M. Gordon, M.D., Cornell School of Medicine, New York, New York

ABSTRACT. The camera has become one of the most important medical instruments of our day. Photographs are valuable as teaching aids and also as permanent records. It is becoming almost axiomatic that anywhere that the doctor can go visually the camera should be able to go photographically. The ophthalmologist can easily photograph the external eye with the still camera, the eye and its movements as well as eye surgery with the movie camera, and the internal eye with the fundus camera. With the aid of newer techniques, the structures which are accessible with the slit lamp microscope are now becoming accessible to the camera. It is the purpose of this paper to demonstrate the broad spectrum of photography within the fields of ophthalmic teaching and practice.

Elimination of Shadows in Macrophotography, Louis J. Dogin, Nutley, New Jersey.

ABSTRACT. One of the problems ever present in photographing bone and tissue sections of treated experimental mice is that of eliminating the shadows caused by the close-up flood lamps. Another problem is the evaporation of volatile liquids used as the media. By the use of a circular mirror, the center of which was cout and the lens of the camera inserted, it was possible to eliminate both problems. Color film slides will be shown of some of the work done with Cortisone and other research products used in arthritis and gout under the direction of Dr. Alexander B. Gutman, medical and research director of the Mt. Sinai and Goldwater Memorial Hospitals.

The Application of Color Photography to a Cloft Lip and Palete Research and Training Program, Frederick T. Sharp, Division of Services for Crippled Children, University of Illinois, Springfield, Illinois.

ABSTRACT. Several years ago, through a grant from the United States Children's Bureau, the University of Illinois set up the Cleft Palate Center of the Division of Services for Crippled Children. The role of photography in this program of education and training is an indispensable one. The technique of obtaining the photographic records with a one-shot camera and special lighting setup will be discussed.

Autoradiography, Patrick J. Fitzgerald, M.D., Sloan-Kettering Institute for Cancer Research, New York, New York.

ABSTRACT. The discussion covers practical applications of autoradiography in treating diseases. Radioautographs demonstrate radioactive iodine (1¹³¹) in diseases of the thyroid; radioactive gold (Au¹⁸³) in the study of patients with carcinomatoses; and radioactive phosphorus (P¹⁸³) in patients with leukemis. Supplemental studies have been made of nucleic acid in metabolism, using the C¹³ label in adenine, guanine, and 2-6 diamino purine, with yeast, paramecia, and animal tissue. Points of technique and other applications are sloodealt with.

Close-Up Photography in Insect Research, Roman Vishniac, New York, New York.

ABSTRACT. The photomacrography of insect phenomens, such as the metamorphosis of the cecropis recently described in Life magazine, requires a careful technique. The resolving power and depth of field at close working distances are critical. Setups and methods will be discussed.

Endescapic Photography, C. Graham Eddy, FBPA, U. S. Veterans Administration, Washington, D. C.

ABSTRACT. It is difficult enough to construct instruments for visualizing conditions inside the human body through various orifices. It is even more exacting to produce cameras with which to record such fields. Methods will be discussed and the value and applications of such photography described.

High-Speed Metion-Picture Photography and the Human Subject John H. Waddell, Wollensak Optical Co., Rochester, New York

ABSTRACT. A review will be given of high-speed photographic efforts in photographing and portraying the action of numerous organs. The techniques and results from the high-speed photographs of the larynx, cardrums, heart, and muscular actions will be discussed. A motion picture will be shown covering these typical subjects.

PSA TECHNICAL DIVISION SYMPOSIUM

PHOTOGRAPHY IN ENGINEERING AND SCIENCE

This symposium is a result of the success of the Symposium on Industrial Photography held at the 1951 Detroit PSA Convention. It will be given at the 1952 PSA Convention in New York City on August 13th in the Hotel New Yorker North Ballroom. In some respects an amplification of the 1951 meeting, the Symposium on Photography in Engineering and Science is broader in scope yet more specific in approach. Selected applications demonstrate the ability of photography to record physical phenomena so that they can be evaluated with the required degree of precision. Included are examples of the use of still and motion pictures as tools in doing instrumentation jobs which cannot be accomplished so efficiently, if at all, by other means. Other examples show the types of information derived from photographs, together with the role of photographs in disseminating such information.

Industrial Photography as a Tool For Engineers, G. H. Gustat, Eastman Kodak Company, Rochester, New York.

ABSTRACT. The limitations of the human eye in seeing the details of what is happening during a fast operation (either mechanical or chemical in nature) makes the use of photography a highly valuable tool. Training programs and instructional macerial become clearer and more effective if they are supplemented by still or motion pictures, or both. Ideas are easier to sell if pictures are used to implement the sales technique. The engineer, particularly to sell factual information, finds photography a convincing medium.

Photography in Steel Research, Robert A. Buchanan, United States Steel Company Research Laboratory, Kearny, N. J.

ABSTRACT. This paper deals primarily with the use of high-speed motion-picture photography in steel research. Several applications are mentioned and illustrated, but the major portion of the paper is devoted to the photographic study of the combustion zones of blast furnaces. This application is considered the most important, and it is one in which the author has made the first use of full color. The photographic problems encountered in filming blast furnaces are discussed, as well as the valuable technical data derived from the films.

Photography in the Taxtile Industry, Melvin Siegel, Jean Ribbon Mills, Inc., Paterson, New Jersey.

ABSTRACT. High-speed still and motion pictures, and time-lapse and other types of photography, have aided in the design of textile machinery, permitted the observation and recording of various phenomena otherwise impossible to study, and facilitated recording of all types of data. Research studies of various types have been aided materially by electron micrographs, x-ray diffraction, and fluorescence, ultraviolet, and infrared photographs. Examples of such applications are discussed and illustrated.

Photography in Electronics, H. P. Mansberg, Allen B. DuMont Laboratories, Inc., Clifton, New Jersey.

ABSTRACT. The electronics industry in its continuous advancement has made increasing use of photographic processes and techniques, both in the manufacture of electronic equipment and in the application of electronic devices. The marking of control panels, nameplates, and dials by photographic methods is a well-established field in itself. More recently, photography has made possible the printing of entire circuit wiring and even electrical components such as resistances, capacitances, and inductances. One of the most important applications of photography is its use in recording traces from cathode-ray tubes, not only for television but also for radar, telemetering of guided missiles, and recording of radioactivity and oscillographs.

The Photography of High-Speed Cathodo-Ray Oscilloscope Truces, Harold J. Peake, Naval Research Laboratory, Washington, D. C.

ABSTRACT. In the electronic art, the need is for means to record waveforms representing ever-faster rates of change of voltage or current. The best means of recording is photography of the trace pro-

duced on the screen of a cathode-ray tube. When the trace velocity is increased, increased sensitivity of the oscilloscopic recording system is required. To meet this need, a study has been made of camera lenses, film types, and processing methods, to determine the best combination. The camera developed as a result of this work is the Edgerton, Germeshausen, and Grier Type 3114, equipped with a Wray f/1.0, 2-inch lens. In all, about a thousand combinations of film types, developer composition, and development time were tried. By pre-exposing the film and developing it to a background density of 0.3 to 0.4 in DK-60a developer (about 25 minutes at 20C), it has been possible to show clearly changes in voltage which occur in one ten-billionth of a second—the time taken for a light ray to travel about 1 inch.

The Use of Photography in Tolevision, Herbert Barnett, General Precision Equipment Corporation, New York, New York.

ABSTRACT. The extensive uses of photography in television are described. Motion-picture photography is widely represented; applications include standard feature films, films made specifically for television, films carrying commercial messages, films for integration with live sequences, and films for background projection. Still photography is represented by slides and "opaques" (prints) for commercial messages, for titles, and for special effects, as well as scenic studies for the designer. Estimates are given of the volume of use of photographic materials.

Photography in Highway Research, Allie C. Peed, Jr., Commonwealth of Kentucky Highway Materials Research Laboratory, Lexington, Kentucky.

ABSTRACT. Many applications of photography contribute to the advancement of highway technology. Conventional applications such as aerial photography, photogrammetry, and map and plan reproduction make up the bulk of photographic use in highway engineering work. In highway research, however, unique photographic techniques make possible the advancement of studies that are well documented, clearly illustrated, and backed with permanent photographic records which can be easily interpreted. These records are often made in locations or at time intervals which are unavailable except through photography.

Metien-Picture and Flash Photography for Mechanics Research, Clifford C. Hauver, Naval Research Laboratory, Washington, D. C.

ABSTRACT. In the work of the Mechanics Division of the Naval Research Laboratory, the usual need has been for high-speed motion pictures by reflected light without significant loss in detail, to show, for example, the fracture of transparent plastics. On a few occasions, time-lapse motion pictures—the opposite of high-speed pictures—are desired to show, for example, the motions involved in the creeping advance of a crack in ductile metal foil under a tensile load. The important problems from a practical viewpoint are sharpness and depth of focus over the entire image, accurate sequence of events in time, and shorter time intervals between frames. The methods employed to reduce these difficulties, principally improved illumination, improved timing techniques, and certain new arrangements of equipment, are discussed.

Hand-Held Tracking Gamera, R. L. Kaplow and M. Beard, U. S. Naval Ordnance Laboratory, White Oak, Silver Spring, Maryland.

ABSTRACT. In the process of testing and evaluating new weapons, it became apparent that existing instrumentation methods were entirely inadequate to study the behavior of aircraft mines during launching and air flight. The Photographic Division of the Naval Ordnance Laboratory undertook the development of photographic equipment which would permit visual observation and evaluation of the various tests. A camera mount was finally evolved which permitted precision manual tracking of the missiles from release to water impact. The unit was designed for use with a 15-power telescopic lens and a slow-motion camera. The resulting films are evaluated by means of a standard motion-picture projector.

Photography Helps Develop Rockets and Guided Missiles, R. W. Herman, U. S. Naval Ordnance Test Station, Inyokern, China Lake, California.

ABSTRACT. Photography plays an important role in the testing of

rockers and guided missiles. The theory and history behind various data-gathering methods are described. The principal balliatic parameters are classified and basic techniques for measuring them are described, together with some of the problems involved in applying these techniques. This study forms the basis for a discussion of new and future developments in the field of measurement photography.

Photography in Rocket Research, Henry M. Cobb, Ballistics Research Laboratories, Aberdeen Proving Grounds, Aberdeen, Maryland.

ABSTRACT. Methods of obtaining ballistics data on guided missiles are reviewed with emphasis on recently developed equipment used to fulfill data requirements of guidance problems. The use of photographic techniques, the advantages and limitations of the photographic method, and the scope of the optical instrumentation program have had a considerable influence upon the guided missile test program carried out at White Sands Proving Ground in New Mexico.

PHOTOGRAPHIC SCIENCE AND TECHNIQUE

Technical papers in the field of photography scheduled for presentation at the 1952 Annual Convention of the PSA, Hotel New Yorker, New York City, August 12th to 16th.

Cold-Cathode Light Source Potentials in Photography, David B. Eisendrath, Jr., APSA, Brooklyn, New York.

ABSTRACT. The characteristics of cold-cathode light sources make them particularly applicable for photographic use. Factors which contribute to the increasing popularity of this illuminant are: accurate shaping of small-diameter tubing to any design and any length; control of color emission by variation of gas or phosphor, and selective filtering; constancy and evenues of illumination with continuous or intermittent use; and long life with minimum heat. Several examples of photographic applications will be shown.

Developments in Variable-Contrast Controls, W. J. Cannon, E. I. du Pont de Nemours & Company, Inc., New York, N. Y.

ABSTRACT. The history, current uses, and future possibilities of variable-contrast sensitized materials. Equipment and procedures developed for the progressive photographic use of such materials are described.

The Depth of Focus and Depth of Field of Photographic Optics, John D. Hayes, Bausch & Lomb Optical Co., Rochester, New York.

ABSTRACT. Two of the most frequently confused and misused terms in photography today are depth of focus and depth of field. This paper attempts to set forth in a nontechnical manner the correct differentiation between the terms, and at the same time illustrate their interdependence. Graphical rather than mathematical means of illustration are used, though formulas representing more rigorous interpretation of the phenomena are included for the benefit of those who wish to make calculations of their own. The meaning of circle of confusion as it applies to both depth of focus and depth of field is illustrated and explained. The effects of lens aperture, focal length, subject distance, and image magnification are also reviewed.

Resolution—Sharpness—Photographic Quality, Duncan E. Macdonald, Boston University Physical Research Laboratories, Boston, Massachusetts.

ABSTRACT. Focal settings for maximum resolution and minimum flare do not necessarily coincide. Previous work has shown that the setting for maximum image contrast is a function of the image station. This paper presents experimental results showing probability of detection (and recognition) of photographic detail as a function of focal setting for the case of a lens exhibiting spherical aberration. Various image sizes are treated to illustrate that neither a single resolution nor single sharpness criterion relates to the ability of the photographic system to detect random symbols in pictures. The results are employed in a re-examination of the objectives of technical photography.

Submarine Periscope Photography, J. C. Milligan, Kollmorgen Optical Corporation, Northampton, Massachusetts.

ABSTRACT. A brief description is given of the space in which a photographer must work when he is using the periscope as a camera. The problems of record and reconnaissance photography are discussed and the available externally mounted cameras are described. Exposure determination, focusing procedures, the use of ray filters, and the processing and printing of film aboard a submarine are discussed, illustrations showing equipment as well as examples of results accompany the text.

Evaluation of Photographic Lens Performance on the Basis of Laboratory Tests, Frank G. Back, APSA, The Zoomar Corporation, New York, New York.

ABSTRACT. In recent years, it has become apparent that the old methods of lens testing with resolution chart and optical beach do not give sufficient indications of the photographic performance of the objective. Since photographic tests involve the uncertainties of film emulsions and processing, it is desirable to have dependable testing methods that are purely optical. Reasons for the failure of the old methods will be discussed and practical supplementary methods for ascertaining lens performance without photographic tests will be described.

Simplified Calculation of Steres Interscular Distance, Samuel Kitrosser, Polaroid Corporation, Cambridge, Massachusetts.

ABSTRACT. A calculator, in the form of a circular slide rule, has been designed for determination of the proper distance between the two taking stations in stereo photography. The scales take into consideration various factors, such as the near and far subject-to-camera distances, the focal length of the taking lenses, the width of the negative images, and also the conditions under which the stereogram is to be viewed. The theory of the calculator and its practical application in still and motion-picture stereo photography will be discussed.

Kinetics of Development of Liquid Photographic Emulsions. Part II. Development by Hydroquinene, T. H. James and L. J. Fortmiller, Kodak Research Laboratories, Rochesser, N.Y.

ABSTRACT. The kinetics of development by hydroquinone in the pH range 9-13 have been studied by the liquid emulsion technique previously described. The course of development shows a marked induction period during which the slope of the density: time-of-development curve increases. The rate is approximately proportional to the concentration of hydroquinone and decreases to a minimum as the concentration of sulfite increases. The pH dependence of the reaction indicates that the bivalent ion is the effective developing agent in the later stages of the reaction. The univalent ion plays some part during the induction period, but the specific rate of development by she bivalent ion is greater by at least two orders of magnitude.

The Use of Presselytic Enzymes For the Removal of Geletin From Film Base, Eugene Gansel, Ansco Research Laboratories, Binghamton, New York.

ABSTRACT. In the reclamation of used film base, the process of separating the emulsion and noncurling gelatin layers from the plastic support must be controlled if the recovered material is to be re-usable. The most common methods of reclaiming film scrap have been evaluated. The use of proteolytic enzymes for the removal of gelatin layers from photographic films has been investigated. Economic use of these new "organic catalysts" and the need for satisfactory evaluation procedures and rigid process controls will be discussed.

Extension of the Vector Method for Sentitometric Evaluation of Color Film and Paper, S. A. Dolin and M. H. Sweet, APSA, Ansco Research Laboratories, Binghamton, New York.

ABSTRACT. Extended applications of the vector method (described earlier by one of the authors) to various phases of sensitometric evaluation have been investigated. The vector method has been found particularly suitable for daily plotting of large amounts of color test material. Quality-control limits can be set more satisfactorily than by the usual methods of plotting the integral density readings directly. Two transformation grids have been devised. One is used for obtaining analytical density data from the vector plot, the other to interpret the characteristics of a print material in terms of the color correction filters necessary for modifying the printing light to yield a balanced reproduction.

Materials of Construction For Photographic Processing Equipment, L. E. Muehler and J. I. Crabtree, FPSA, Kodak Research Laboratories, Rochester, New York.

ABSTRACT. The variety and number of materials of construction for photographic processing equipment have increased notably with advances in the development of stainless alloys and plastic and other nonmetallic materials. Materials can be selected by laboratory testing correlated with practical experience. Only a few single metals can be utilized, and these only for specific purposes. Alloys can be classified according to relative corrosion resistance and general photographic utility. Stainless alloys generally require special care to insure long usefulness. In fabricating stainless-steel equipment, proper welding is the preferred method of joining. Some suggestions and precautions about equipment and its use will be presented.

Persennel Identification Photography, T. T. Holden, APSA, Graflex, Inc., Rochester, New York.

ABSTRACT. The requirements for photographic identification of personnel and the types of equipment used in making the pictures will be reviewed. Different types of identification badges and passes will be discussed, as well as the various safety and tamper-proof features available.

Some Design Features of a Wide-Film Continuous Processing Machine, J. S. Goldhammer, Wright Air Development Center, Dayton, Ohio.

ABSTRACT. Design features of the Air Force Type A-9 Processing Machine are described and explained. This machine achieves high capacity and flexibility through the application of unusual design features combined with elements of conventional nature. The processing machine is 10 feet long, including the drier. However, aerial film can be immersion-processed at 20 feet per minute in normal D-1 Developer used at 85F and without added hardener.

A Persus-Platen Processor For Processing Photographic Materials in Reem Light, R. G. Rudd, Kodak Research Laboratories, Rochester, New York.

ABSTRACT. Simple equipment has been developed for processing Kodagraph Autopositive and Repro-Negative Papers in a business office in normal room illumination. It consists of a printer, applicator sponges, a porous processing platen, windshield-wiper squeegees, and blotters, all contained in one small file drawer. The two processing solutions are applied with the sponges while the paper is held in contact with the porous platen. A satisfactory porous platen can be made easily and inexpensively from plaster of Paris, and it can be used for processing a hundred or more prints.

Quality Color Prints Preduced in the Camera, John R. Kane, Ansco Division, Binghamton, New York.

ABSTRACT. High-quality color prints can be obtained by exposing Ansco Prints in the camers. Since no intermediate negative or transparency is used, the problem of effecting lateral reversal of the image is

involved. Exposure indexes double those of transparency color film (needed for practical portrait exposures) are made possible by proper adjustment of the exposure-development relationship. Color prints can be exposed by all light sources normally used in color photography.

Improved Lacquers Por Increased Life of Prints and Transparencies, Hubert O. Ranger, South Hadley Falls, Massachubetts.

ABSTRACT. The protective powers of lacquers have been investigated. By taking advantage of the unique characteristics of recently developed chemicals, including resins, it has been possible to formulate satisfactory lacquers. Commercially available chemicals have been found valuable in contributing to the life expectancy of photographs. The investigation demonstrates the usefulness of lacquers formulated specifically for color materials and the need for greater emphasis on the use of lacquers where permanency is desired.

Some Aspects of Two-Bath Fixation, J. I. Crabtree, FPSA, R. W. Henn, APSA, and R. F. Edgerton, Eastman Kodak Company, Rochester, New York.

ABSTRACT. The useful life of a print fixing bath it largely determined by the silver content. The accumulation of silver in the second of two fixing baths is dependent on the allver content of the emulsion and the amount of image developed, but is shown to vary greatly with the rate of carry-over from the first bath. It is customary to advance the relatively fresh second bath to replace the first at the end of each cycle. More silver is introduced into the system on succeeding cycles, but equilibrium is soon reached with possibly a one-third increase in the silver content of the second bath. The possible introduction of contaminants prevents indefinite replacement, and a limitation of five cycles is suggested. Nevertheless, the economy of two-bath fixation is considerable.

Procedural and Technical Details Important to the Expert Photographic Witness, R. C. Hakanson, Cleveland, Ohio.

ABSTRACT. Specific work methods are described which have proved effective in legal evidence photography. These include the identification of the photographs which the specialist has taken under the general rules of evidence and avoiding the pitfalls of ambiguity and obscurity which might result from technical phraseology. Easily understandable methods are described by which the photographer may identify his own work, from the stage of making an exposure up to the description in open court of the circumstances attending the exposure.

Uses of Kedalith Film in the Examination of Questioned Decuments, Joseph Tholl, Cleveland, Ohio.

ABSTRACT. Kodslith film has proved a valuable medium in the examination of questioned documents. When developing, lighting, and exposure are properly controlled, this film yields satisfactory results in document problems such as the photography and decipherment of paper textures, mechanical and chemical erasures, faint and illegible writing, pencil writing, embossed impressions, etc. Reasons for effectiveness are discussed, and special applications such as photomacrographs, ultraviolet photographs, bas-relief photographs, shadowgraphs, and test plates and graphs are described. Case examples and illustrations are included.

Expecure Meters in Action—A Survey of Practical Experience, Allen Stimson, APSA, General Electric Company, West Lynn, Massachusetts.

ABSTRACT. A controversial item of photographic equipment has been evaluated statistically. Individual experience and circumstantial tests have proved to be of little significance in prescribing the use of an exposure meter. Averaging the results of reading 24 different meters in making 1100 pictures of 300 scenes has clucidated the principles involved. A summary of these results obtained after four years of esting and analysis is given. The data show when to measure reflected light, when to measure incident light, where to point the meter, and how to interpret the reading.

New Medium and Process for Photoengraving, S. Donald Stookey, Corning Glass Works, Corning, New York.

ABSTRACT. A photoengraving procedure has been developed which utilizes acid etching but requires no acid-tesistant surface coating. The method consists of forming in a special type of photosensitive glass an acid-soluble three-dimensional photographic image, then etching the image to any required depth with dilute hydrofluoric acid. The rate of etching is up to 50 times faster in the exposed and developed image than in the unexposed glass. Possible advantages over photoengraving of copper and kinc for halftone reproduction and applications in letterpress and gravure printing will be discussed. Examples will be shown.

This camera gives you A FINISHED PICTURE IN 60 SECONDS

That's the magic of the Polaroid® Land Camera—no waiting to see your pictures! Just snap the shutter, pull a tab, and one minute later there s your picture in brilliant black and white It's printed inside the camera. No tanks, no liquids

For a new vacation thrill, take a Polaroid Camera with you You'll label each picture as you make it, while the fun and the facts are fresh in your mind You'll write newsy illustrated letters. You li

make new friends because people love to see their pictures right away

Of all fine cameras, the Polaroid Land Camera is simplest to use Easy drop-in loading Single dial controls lens opening and shutter speed

Hard to believe? Just ask anvone who owns a Polaroid Camera. Or better still, ask a camera expert—your photo dealer. He'll be glad to demonstrate the world's most exciting camera.

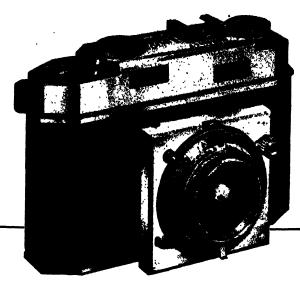

60-SECOND PHOTOGRAPHY IN BUSINESS

Businessmen exerywhere are using the Polaroid Cimeri to speed siles reports and appriisals to solve purchasing and many other problems. To learn how others in your business are saving time and money with one minute pictures, write for free literature. Address Polaroid Corporation, Dept. PS 10 Cimbridge 39. Massichusetts.

YOU'LL WONDER WHY YOU EVER WAITED!

POLAROID Land CAMERA

YOU GET ALL THESE REFINEMENTS IN THIS FINE 35MM CAMERA!

- ★ Famous hard-coated Schneider f2.0 Xenon lens, fully corrected for color.
- ★ 1/500 second Compur-Rapid shutter, with builtin synchronization for all flashbulbs and electronic discharge tubes.
- ★ Split-image, lens-coupled range finder and view finder combined in single window for easier, faster focusing and framing.

*	Finger-tip film transport
•	cocks shutter, permitting
	closely-spaced rapid
	sequence shots.

- ★ Velvet-smooth shutter release button helps get sharper pictures at slower shutter speeds.
- All-metal body with genuine leather covering and chromium trim.
- ★ Deprh-of-field dial.
- * Accessory clip.

A Real Ansco Value		\$164.10
Top Grain Cowhide	Case .	12.50

Compare them all to the 35mm Ansco Karomat

Take a fresh look at the 35mm camera field and you'll find that the Ansco Karomat gives you *more* of everything you want in a quality camera!

You'll discover that the Ansco Karomat has the "feel", the careful detail and high finish of a truly fine instrument. Your fingers fall naturally into place on the smoothworking controls arranged for faster, surer picture taking.

Yet you get all this at a price far less than you'd expect to pay for a really fine camera.

Do yourself a favor one day soon—get acquainted with the Ansco Karomat!

YOU GET MORE FOR YOUR MONEY WITH ANSCO!

ANSCO SPEEDEX f4.5 SPECIAL Makes 12 21/4 x 21/4" Negatives on 120 Film

You get tremendous value in the Ansco Speedex Special! This quality camera comes equipped with a hard-coated Agfa Apotar f4.5 anastigmat lens in a 1/300 second shutter synchronized for all flash. Many real refinements, including double exposure prevention, depth-of-field dial, accessory clip and satin chromium trim.

A real Ansco Value at\$	48.65
Speedex f4.5 with Agnar lens	36.50
Top Grain Cowhide Case	6.95

The Brand New ANSCO FLASH UNIT

One Flash Unit and Cord that Fits ALL Your Cameras with Regular 3mm Continental-Type and Standard ASA Bayonet Shutter Contacts!

You'll find every feature you want in the new Ansco Flash Unit! Ingenious screwon cord tips that fit nearly all standard flash shutters. Built-in outlet for flash extensions... Uses flashlight batteries or B-C unit... Positive bulb ejector... Reflector spreads light evenly over full picture area—no hot spots.

PSA HEADQUARTERS: 2005 Walnut St., Philadelphia 3, Pa. Randolph Wright, Jr., Headquarters Manager

Correspondence relating to editorial matters should be sent to the Editorial Office or to your Division Editor. Change of address notices should be sent to Headquarters, giving both old and new addresses. Two months advance notice of change of address is desirable in order that our records may be changed and you may roceive the JOURNAL without interruption. PSA JOURNAL is sent to ell member clubs and affiliated organizations. It is for the use of the entire club and not solely for the individual in whose care it is sent.

News items about Division scrivities should be sent to the Division Editor whose name appears above, or at the head of the Division news section in the back of this issue. News of camera club scrivities should be activities should be activities should be activities of articles of a divisional nature

should be submitted through the Division Editor concerned and manuscripts of a general nature abould be submitted to the Editor. The PSA JOUR-NAL does not pay for srticles or pictures; all fanctions of the Society are hased on voluntary activity. Manuscript paper for the JOURNAL will be sup-

Manuscript paper for the JOURNAL will be supplied free on request. Glossy photographs are preferred but good reproductions can be made from any picture of suitable contrast. Submission of an outline of a proposed article will result in a prompt editorial opinion of its suitability.

Copyright 1952 by the Photographic Seciety of America, Inc. Reproduction or use of any material contained herein without permission of the Editor is forbidden. Views expressed in the PSA JOURNAL are those of the authors and do not necessarily represent the views of the Society.

The President Reports . .

With this issue, THE JOURNAL turns a new page and goes into a new chapter. There will be changes as you suggest them. After all, it is published solely for PSA members, and both the Publications Committee and the Editor have asked me to invite your suggestions and criticisms. Also, it is hoped that this will be the last - or nearly so of the 48-page issues, and that we can soon expand THE JOURNAL to include just about everything any member could want. Everyone concerned is eager to make THE JOUR-NAL serve PSA in every way possible which can be done only if all of the members express their ideas. Let's hear.

'Way up in the front is your combined invitation and registration blank for what looks like the busiest PSA Convention in history. A careful inspection of the tentative program indicates so many Division programs of intense interest that I think no member will be able to attend every lecture that sounds appealing to him. The scope of their material covers just about everything anybody could ask, and it covers a wide level of interest from that of the less advanced photographers to the specialties of the most advanced worker in every field. The exhibition end of the Convention is larger this year and includes special shows from several Divisions as well as invitational exhibits from professional associations.

The Friday evening "Special" and the Honors Dinner will have extra appeal for members who have always wanted to camera. Both of these evenings have that "special" quality.

Perhaps as important as these splendidly conceived instructional programs-to many members who have always wanted to photograph New York - are the scheduled trips to the city's most popular camera spots under the leadership of some of the PSA'ers who have built at least part of their reputations on city pictures. Some of these "guided tours" are planned for the days before the Convention itself and some for the following weekend.

The Committees are to be congratulated for what they have planned both educationally and on the social and fun side, and those who can not or just do not attend will be missing a real treat.

One of the most gratifying factors in the current picture is the intense interest in all the elements of the "grass roots" plan of PSA activity in every major center of photographic population. Tape recordings of meetings of enthusiastic members in the northeast, the far west, and the deep south all speak of the keen desire to have PSA doing things locally for the members and the community, and the mail keeps up the proof of the need and the want for such activity. When such a move and so important a program is discussed from the "we hope" standpoint by the Board and then suddenly is strongly alive in towns all over the continent, we have a "natural" that cannot be ignored and cannot fail.

But we can go into that at the Convention. See you there.

NORRIS HARKNESS

NEW AIDS FOR BETTER PICTURE-MAKING

_ By Jacob Deschin, APSA __

New Cameras

Not now, but sometime in the future, civilians may expect to get the first camera to use 70mm-width film, a designer's dream of a decade or more. The Army Signal Corps at Fort Monmouth, N. J., recently announced the completion of a development model of a so-called "combat camera" yielding fifty 21/4 x 31/4-inch pictures per loading and incorporating features characteristic of the top-bracket 35mm miniature camera. The camera was made by Graflex, Inc., under contract to the Signal Corps, and will be put into production as soon as O.K.'d by the military powers that be. If and when the camera does get rolling on the production line, civilians will get a chance to have some if any are available after the Signal Corps has fulfilled its needs.

Equipped with its normal 4-inch f/2.8 lens, the camera, which has a magnesium body and aluminum lens mount, weighs 5½ pounds. Fully equipped, with three lenses, the other two being the wide-angle 2½-inch f/4.5 and the long-focus 8-inch f/4 lenses, four cassettes, flashgun and miscellaneous accessories, in an aluminum carrying case, the weight is 22 pounds. Without lens, the camera measures 9½ inches long, 2½ inches thick and 5 inches high.

Other features include the taking of as many as ten pictures in five seconds with a single winding of the shutter spring; automatic film advance and shutter cocking: automatic exposure counter; a built-in knife for cutting off a few exposures at a time if required; and a combined viewfinder-rangefinder which adjusts automatically for the different lenses. Among other miniature camera features, the camera has a sports-type viewfinder adjustable for the fields of view covered by the different lenses; a red flag that pops into the viewfinder peop hole as a signal for reloading when the last film frame has been exposed; and 3x5-inch plastic note-taking slates that fit on the back of the camera.

A diminutive edition of the Kodak Retina 35mm camera, the Kodak Retinette recently announced by Eastman Kodak is a pocket-size version of the popular original and costs only \$59.50. Features include a Schneider Reomar 50mm f/4.5 coated three-element lens; a flash-synchronized shutter that yields speeds of one second to 1/300ths; flash synchronization permits the use of Class M or F flash lamps or speedlight equipment; delayed-action release; automatic film stop, exposure counter and double-exposure prevention; hinged camera back, and a die-cast aluminum alloy body, satin-finished chrome metal parts.

A new Edinex III 35mm camera, announced by Camera Specialty Co., Inc., 50 West 29th Street, New York, has a coupled rangefinder combined with the viewfinder in a single window; built-in flash synchronization; double exposure prevention, and other familiar features of this camera. With the f/2.8 Steinheil Casse coated lens in

Prontor-S shutter, speeds of one second to 1/300th, and built-in self timer, the new Edinex costs \$74.95. Other lens-shutter combinations at higher prices also are available.

An improved synchronized Model VX of the single-lens reflex Praktica is offered by the Sterling-Howard Corp., 561 East Tremont Ave., New York 57, at \$149.50 with coated 1/2 Zeiss Super Biotar lens, with pre-set diaphragm. The camera has built-in flash for regular and speedlight lamps, focal plane shutter speeds to 1/500th, automatic film transport and other automatic features, and convenient ground glass viewing and focusing.

A Zeiss Ikoflex Ia, with most of the features of the Ikoflex IIa, has been introduced by Carl Zeiss, Inc., 485 Fifth Avenue, New York 17. With a Tessar 1/3.5, the camera is \$152, with the Novar f/3.5, \$125, each with eveready case. The shutter in both cases is the Prontor-S with speeds to 1/300th, built-in flash and self-timer.

The Goerz Minicord 16mm still camera, made by C. P. Goerz in Vienna, has been brought to the American market with some features that are new in this classification. The camera is imported by King Photo Import Co., 1133 Broadway, New York 10, and costs \$149.50. Unusual features for 16mm still cameras is the Minicord's Helgor coated 25mm f/2 lens and ground glass focusing and viewing. The camera has a number of automatic features and loads daylight film cassettes containing forty exposures in a twin container (no rewinding necessary). The camera weighs 12 ounces and measures 3x3\\x1\\\4 inches. The metal focal plane shutter speeds are 1/10th to 1/400th, plus bulb.

In case you've been wondering, the Linhof 2½x3½ Super Technika is now available from time to time, but they go fast. As everybody now knows, the camera has everything besides amazingly good looks. According to Kling Photo Supply Corp., 235 Fourth Avenue, New York 3, the importers, the camera is sold as an outfit. With three Schneider coated lenses, the Xenar f/3.5 105mm, the Angulon f/6.8 65mm wide-angle and the Tele-Xenar f/5.5 180mm telephoto, each lens in a fully synchronized M-X Compur Rapid shutter—all for \$575.

Lighting

General Electric's lamp division announces a new photofiash blue lamp. The latest addition to its line is the No. 11B, for use with daylight type color positive and color negative film. According to the company, the new lamp, which sells for 19 cents, delivers about 820,000 peak lumens of light with a color temperature of 6,000 degrees Kelvin, the rating of daylight type color films.

A new Synchro-Sunlight Guide for efficiently combining daylight with flash lighting has been published by the Kalart Company, of Plainville, Conn. The guide gives

Take it easy

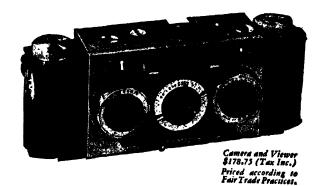

WITH STEREO-REALIST

Get better results easier with "the camera that puts 3d dimension on film"

TAKING beautiful, true-to-life pictures with Stereo-REALIST is amazingly easy. It's the one fine, American-made camera which exactly reproduces what you see with your eyes. Thus, if the original scene is pleasing, it will be equally as pleasing when viewed in a REALIST Viewer.

People who never before handled a camera find it simple to take good pictures with a REALIST on their very first roll of film. The REALIST does the work... they get the enjoyment of thrilling, lifelike depth and full, natural color.

But seeing is believing. If you haven't discovered the excitement of REALIST pictures, ask your camera dealer to show you some. Then see for yourself how you, too, can "take it easy" with the REALIST. DAVID WHITE COMPANY, 387 W. Court St., Milwaukee 12, Wisconsin.

ANOTHER PHOTOGRAPHIC LEADER

RAPTAR LENS in RAPAX SHUTTER

for the new, deluxe PATHFINDER CAMERA

After extensive tests Polaroid Corporation selected the Wollensak Raptar lens in Rapax shutter for its new, deluxe camera; the Pathfinder. The Pathfinder, the finest "pictures-in-a-minute" camera, required the finest lens and shutter (the heart of every camera). Polaroid found, as have so many other leading camera manufacturers, that there is no finer lens and shutter than Raptar lens and Rapax shutter. For a new thrill in photography try the new Pathfinder camera by Polaroid with the Raptar lens in Rapax shutter by Wollensak.

at a glance the required shutter speed, disphragm opening and distance from flash lamp to subject for all conditions. Printed on heavy board, with varnish finish, the guide measures 3½x5 inches and costs 25 cents.

The Ansco Readyflash Camera announced last fall as part of an outfit may now be bought separately at \$6.30; flash unit \$2.75. The camera takes eight pictures 2½x3½ inches on 620 rollfilm and is made mostly of metal.

A new inexpensive boom light at \$6.95 is offered by Mayfair Manufacturing Co., 55 Eckford Street, Brooklyn 22, N. Y. The unit is adjustable a full 360 degrees for overhead spot and bounce light illumination. The boom fits any light stand.

Movies *

A dial-type Kodak IIome Movie Organizer, one of the most novel ideas in quite a while, is the principal feature of Kodak's newest pocket-sized reference guide. It is the Kodak Cine Photoguide (\$1.75), the same in size and format as the Master Kodaguide, measuring 4x4% inches, ring bound, and contains a group of well-indexed data cards that give information on exposure, story and lenses. The exposure section has dial-type calculators and useful charts. The story section, which contains the "story organizer", helps the moviemaker make better films. The organizer lists the where, the what, the who and the why of what is taking place in front of the camera, plus other helpful aids. The section on lenses offers practical help on close-ups, depth of field, etc.

Ansco has introduced an improved version of Ansco Hypan panchromatic movie film in 16mm rolls of 50 and 100 feet; Twin-8 rolls of 25 feet. Reported features of the new film arc A.S.A. rating of 40, medium brilliant gradation, clear whites and blue-black image tones.

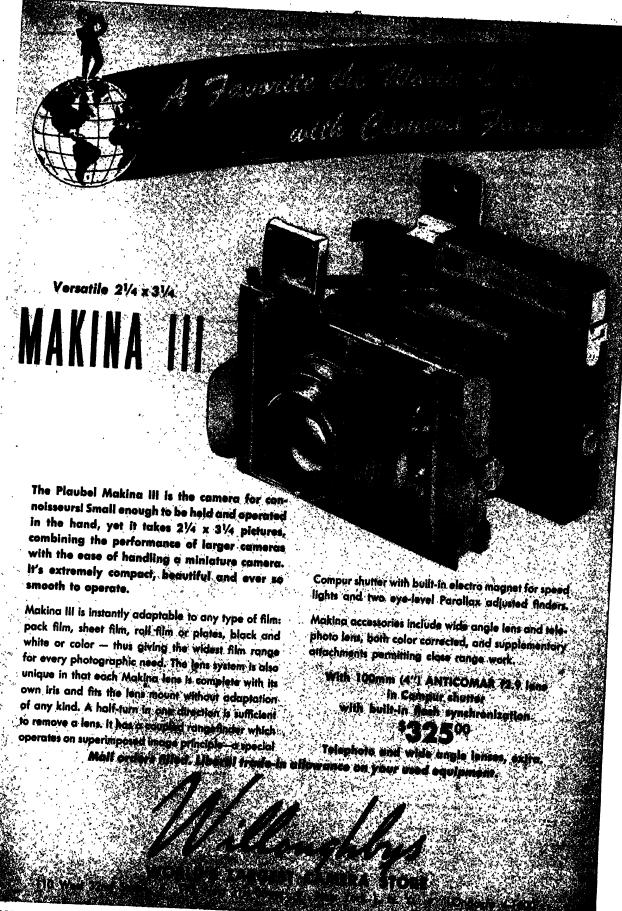

Clingtite Letters, pliable red plastic letters for titling slides and home movies, are announced by Clingtite Products, 4844 S. Ashland Avenue, Chicago. They stick without adhesive on glass, steel and other non-porous surfaces. A complete kit consisting of two 8x10-inch title boards and 157 1-inch letters, numerals, symbols and animated characters, costs \$2.95.

A new line of 16mm lenses made by Kinoptik Company, of Paris, France, has been introduced in this country by Victor Kayfetz, 130 East 56th Street, New York. In C focusing mounts, coated, the six-element lenses are available in focal lengths of 20mm, 25mm, 32mm, 50mm and 75mm. The lenses have T and f stops and a new system of aperture markings.

Radiant Manufacturing Corp., 2627 West Roosevelt Road, Chicago 8, offers the "Jiffy", a compact projection screen designed for use on tables or desks and costing only \$7.95 for a 36x36-inch size. Features include the company's new Perma-White Matte Surface with many durable qualities, collapsible supporting arm for quick opening and closing, rubber-tipped feet and six-pound weight.

Accessories

If you've been overburdening your coat with those camera gadgets, here's a helping hand from Jacob Finkelstein & Sons, of

Woonsocket, R. I., who have placed on the market a "Foto-Jac" expressly designed by "photo bugs" for "photo bugs". The jacket is made of satin twill with a durable water repellent finish. It has eight pockets, comes in three sizes—amall, medium and large; in four colors—gray, tan, skipper blue and green—and cosis \$9.95. The pockets are designed to hold such varied items as an exposure meter, filters and lens hood, extra lenses, flash lamps, film, film holders, etc. Six of the pockets have a zipper with grip for quick manipulation. The maker adds that either of the two bottom slash pockets can take a miniature camera, a reflex camera can be slung through shoulder epaulets.

A new eye-correction lens mount designed for spectacle wearers who use the Contessa 35, Contax IIa or IIIa, Super Ikonta B or BX cameras, permits the photographer to use the view-rangefinder eyepieces without glasses. The mounts are sold at \$1.80 without lenses; the lenses are obtained separately by the purchaser from his local optician or optometrist, who will grind the lenses to fit individual requirements.

A new type of reversal photographic paper that allows production of positive prints, without an intermediate negative and conventional equipment and processing, was introduced at a recent meeting by Frederic A. Tompkings, of Eastman Kodak. The new paper is now being supplied by Photostat

Corporation for use with Photostat equipment. Other uses may be found later.

The new paper emulsion differs from ordinary photographic paper in the way it reacts to light. When the reversal paper is exposed to light and developed in a fogging developer, the unexposed areas turn black, the exposed areas produce a positive image, the fogging action of the developer being inhibited in those areas. Because the reverse is true in the case of conventional paper, an intermediate negative is needed to produce a positive image.

EdnaLite Optical Co., Inc., 200 N. Water Street, Peekskill, N. Y., has a new line of universal filter kits for still cameras. The kits include the company's solid optical glass filters coated on both sides, adapter, dual-retainer, lens hood and plastic kit. The filters are medium yellow, medium red, Chrome Haze Skylight and Chroma Conversion. Kits are priced from \$13.50 to \$17.95 depending on the camera. The company will mail filter information on request.

Enteco Industries, Inc., 610 Kosciusko Street, Brooklyn 21, N. Y. have fitted with adapter rings and combination lens hood and filter holders a total to date of thirty-nine different Schneider lenses from the 40mm Isogon to the 360mm Tele-Xenar. Thirty-three of the lens attachments screw into the Schneider lens mount. "Grip-On" attachments also may be had. Write the company for detailed data.

Audience To Help Determine What Makes Picture Pictorial

Doris Martha Weber, A.P.S.A., who is doing such an outstanding job in preparing the program to be presented by the Pictorial Division at the P.S.A. Convention (New York, August 12th to 16th), urges all members who plan to attend to really participate in the roundtable discussion on "What Makes a Picture Pictorial?"

AUDIENCE PARTICIPATION, in caps, is desired for lively discussion, debate, and argument, with a sound opinion here and there, will make the event one long to be remembered and one that will be most helpful to all who take part.

Miss Weber says to bring your pictures too. That will be fun and education all in one bundle. Print makers will get opinions from the expert print makers on hand—the Convention will teem with such. And you can say what you like about the other fellow's prints out loud if you have the urge.

P. H. Oelman, originally scheduled to be among the experts, will be unable to attend. This is to be regretted. However, on receipt of the news the others on the panel insisted that Miss Weber take the seat left vacant by Mr. Oelman. Not only take that seat but become the Moderator. This decision is to be applauded.

Others on the panel, as stated in earlier releases, are John R. Hogan, Hon. P.S.A., F.P.S.A., Arthur M. Underwood, F.P.S.A., J. Philip Wahlman, A.P.S.A., and Sewell Peaslee Wright, A.P.S.A.

Come ready to air your opinions and ask your questions from the floor, and don't forget to bring some prints for general discussion. Miss Weber writes that she is sorry she made an error when sending the original information. Seems she did not give the full title of the talk to be given by Boris Dobro. The talk was listed as "Techniques" whereas it should have been "Techniques of Creative Photography". That listens much better for there seems to be an enormous amount of interest in creative photography these days and without a doubt Mr. Dobro will have a packed house.

I also learn that Robert L. McFerren will be unable to take the part of the prosecutor on the mystery program called "Trial By Jury". Miss Weber promises this program will be terrific. She will not spoil its effect by giving out one single clue in advance. The part of the prosecutor will be taken by J. M. "Jake" Endres. As you have heard before, the other two characters will be J. Philip Wahlman, A.P.S.A., judge, and Dr. Carlton J. Marinus, A.P.S.A., defense attorney.

Last by but no means least, a most important substitution is the presenting of Dr. Francis Wu, F.R.P.S., F.P.S.A. of Hong Kong in place of the Pictorial Division General Meeting. Dr. Wu, whose work has graced many a salon in this Country, will speak on "Pictorial Photography from a Chinese Viewpoint". He will use his own beautiful pictures to illustrate his words.

So you don't forget the date and place—August 12 to 16 at the Hotel New Yorker in New York City. Have you made your reservation?

SAMUEL GRIERSON, A.R.P.S.

Look For This Badge

Look for the folks wearing the big round badges when you arrive on the mezzanine floor of the New Yorker Hotel next month to register your presence at the first vacation-time PSA convention.

They won't be hard to find because there are a lot of them, 48 to be exact. And chances are they will spot you before you do them. They are members of the convention reception committee, under the inspired leadership of Mrs. Olga Irish, all pledged to help you plan convention days full of pleasure and personal comfort and productive of new friendships.

"Regular convention goers may be self sufficient, even in this big metropolis," says Mrs. Irish. "But we want all to feel the warm pulse of this convention's spirit whether or not they need occasional help or advice. We'll be on hand to do more than greet you. Each of us will be happily at your service for the duration."

The Reception Committee membership is made up of some of the most famous people in photographic circles. They want to meet you. They want to help you meet other people you may want to meet. They know most everyone in the organization. They come from many different states.

Any time you have any question, any problem, look for a Reception Committee committee member, to be identified by the special big round badges they will be wearing. You'll get personal attention.

Serving with Mrs. Irish on the reception committee are: Dorothy Harkness, vice chairman; Franke Fassbender, secretary, and the following members:

Amy Close Catherine Dorr Harold Davidson Dorothy Eidlitz Adolph Fassbender Antoinette Gibbs Henry Goldsmith Barbara Green Eleanor Rost Chet Wheeler John Hogan Gottlieh Hampfler Hilda Hampfler Charles Heller Doris Heller Thomas Firth

Arthur S. Mawhinney, FPSA, FRPS, has been named to supplant Dr. Roman Vishniac as a member of the board of judges for the Nature Section of the 1952 PSA International Photo Exhibit. Dr. Vishniac found it necessary to ask to be relieved because his photographic activity requires his presence in the Florida Gulfstream on the dates of the judging. He will return, however, in time to speak at the convention.

Will this sticker be on any of your prints? It could be, if you've sent them off already. Beautifully printed in blue on silver, this is one you'll want to have . . . or at least, try for.

Mystery Program

news through "first time" presentations by

By way of example, the Motion Picture Division will demonstrate "How Amateurs

Can Now Produce Stereo Movies" as easily

as flat stereos. Floyd A. Ramsdell will make

the demonstration and will accompany it with a showing of three dimensional movies

that have never been exhibited anywhere

The Color Division has expanded its pro-

gram in keeping with the vastly increased

interest in this field, featuring among other

things a much needed discussion of Color

Filters with special emphasis on the amateur's point of view, by Charles A. Kingsley. Two showings of the color slide exhibit

are being planned to insure everyone an

opportunity to view it. "Nature's High-

lights," a 16 mm film on photomacrography

and photomicrography, by John T. Fox,

also will be shown.

before.

the Motion Picture and Stereo Divisions.

The Pictorial Division has a mysterious program entitled "Trial by Jury," with which to surprise the convention. Advance details are secret. The division also is moving boldly in an effort to resolve the most argued subject in the field. A panel of experts will try to determine "What Makes a Picture a Pictorial." A standing-room-only attendance is confidently expected for this definition-making session.

Among other important firsts at the convention is a symposium on Photography in Medicine and Biology, an opening day event which already has stirred a great deal of interest among professional men.

The Photo Journalism Division is working on some sensational "firsts," among them one for presentation of an evening, so that everyone may attend, that will have you sitting on the edge of your seats.

Details of this featured event, however, will have to await formal government clearance, which has been assured, before the announcement can be released. We suggest you watch your daily newspapers for this one if you want to know about it before the next issue of the Journal.

The P-J division will furnish plenty of advice in its program, on how to make money out of your photography, which may help some of us to realize handsomely on our convention going investment.

convention going investment.

The magazine "Photography" is making a contribution along these lines by offering \$500 in prizes for the best picture story of the vacation-time convention.

Space limits a more extensive preview here of the sumptuous banquet of photographic fare that awaits you at the first vacation-time convention in PSA history. See other pages for more details.

But there is more than "meat and dessert" a cookin' for this unprecedented convention. There's fun and hospitality and entertainment and the opportunity to make new friends and a lot of exciting new pictures too. No one will be left to shift for himself.

P.S.—Tell your friends who are not yet members of PSA that they may attend the convention on payment of regular registration dues. Let's make them welcome too.

Convention Program To Be Best Yet; Trips, Salon, Meetings and Fun

The finishing touches are being put on the program for the first vacation time convention of the Photographic Society of America.

The convention, just for the sake of reminding you, is scheduled to start one day earlier than ever before, on Tuesday, August 12th, and continue through Saturday, August 16th, at the New Yorker Hotel in New York City.

A truly sumptuous banquet of photographic fare featuring a long and impressive array of fact-filled demonstrations and illustrated lectures, many based on first time revelations of the newest in photographic progress, is just about ready to be served, as "cooked up" by the separate divisions.

An enticing array of desserts, in the form of New York Harbor steamship cruises and Coney Island field trips; special personally-conducted picture-making safaris to any spot in this most photogenic area of the country; tours through glamorous studios and famous laboratories, also on the menu, help make this the most perfect photographic holiday anyone could imagine.

But before giving you a high spot preview of what has been programmed up to this writing, it is suggested that you heed the advice of Registration Chairman Richard Hunt, without further delay.

Register Now

Make your convention reservations in advance—today—if you haven't already

The distinction of having been the first to submit an entry in the 1952 PSA Photographic Exhibit, to be held in conjunction with the New York convention, goes to George C. Simmons, 506 Federal Building. Salt Lake City, Utah. Mr. Simmons entered several slides in the Color and Nature sections.

done so.

Dick Hunt has estimated, on the basis of the flow of registration blanks mailed back to pre-convention headquarters up to late in May, that attendance at this vacation time convention in photogenic New York, will run in excess of 2,000. This will mean an all time record.

It also means that everybody who is anybody in photography, is sure to be at the convention. And in addition it means that late comers may find the accommodations at the Hotel New Yorker taxed beyond capacity. Rooms will be found for them elsewhere if necessary.

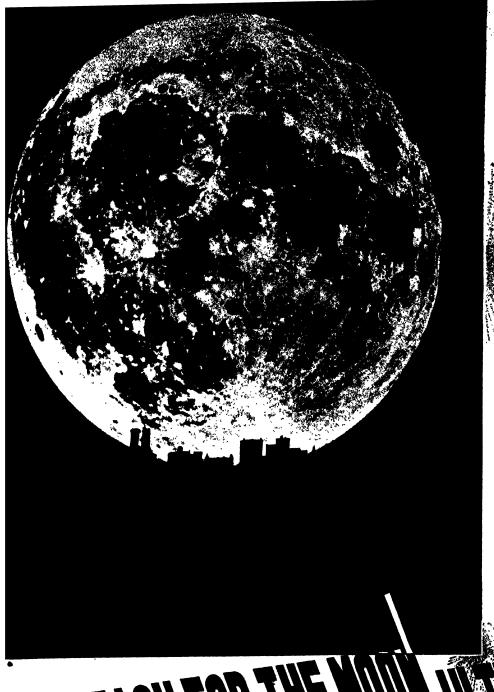

New York has achieved a new high record of popularity for conventions this summer. The Elks, among others, are coming to town just before the PSA convention. The American Legion is coming just after the PSA convention. Simultaneously with the PSA convention, many smaller ones are scheduled in the city.

Carl Sanchez, Jr., chairman of the annual PSA International Exhibit, which for the first time in its history will be conveniently housed under the same roof as the convention itself, issues a reminder that July 10th is the deadline for entries in all divisions. He urges you to act promptly to make sure your entries get in under the wire.

Divisional Offerings

By way of previewing some of the major main courses on the sumptuous six day banquet of photographic fare being readied for you, we direct your attention first to the double spread in this issue outlining and illustrating the fascinating schedule that has been set up by the Technical division.

And then—to move on— Three-dimensional photography will make

Aerial Photography Without A Plane

On the Coney Island Field Trip you will get a chance to try your hand at aerial photography by riding the parachute jump. A smooth ride up, then you come sailing down. Take pictures while traveling in either direction! Take along plenty of film, you may be lucky enough to get stuck up there! It happened last week when a power failure blacked out most of Brooklyn. Steeplechase Park photo by Harold J. Nisnoff.

Coney Island Trip on Tuesday To Highlight Convention Fun Session

The "kick-off" event of the 1952 PSA Vacation Time Convention will be the Coney Island Field Trip. Nothing we can think of is more typically New York than this playground where rich and poor, young and old all gather for the express purpose of having fun. A trip to New York without a visit to this opulent oceanside resort is definitely incomplete.

Here's one field trip that really accentuates the negative, if you'll forgive the pun. Take it from one who has conducted many field trips to this Island of fun and frolic, there is more here on which to focus your camera than a hundred three-ring circuses. The picture possibilities are tremendous. Human interest material, architecture.

beaches, people at play with almost complete abandon, these and more you'll find at this ocean playground.

Although the date for this field trip was originally set for Saturday, the pressure from PSAers to make it earlier so that it would not be missed, has now pushed the date forward to TUESDAY, AUGUST 12TH, the opening day of the Convention. It seems everybody wants to shoot Coney Island and for good reason.

Buses provided

Buses will be ready to whisk you directly from Convention Headquarters, the Hotel New Yorker, in the heart of mid-town Manhattan at 1:30 P.M. Tuesday. The trip

FBI Talk Feature of P-J Session

There's a real photographic thriller awaiting everyone who attends the vacation time convention in New York, August 12 to 16th.

D. J. Parsons, Scientific Chief of the F. B. I. laboratory, has been scheduled by Robin F. Garland as the Photo Journalism Division's contribution to the long record of "firsts" to be featured at this convention.

Mr. Parsons will talk on "Photography Serves in Security and Crime Protection in the U. S. A."

The appearance of Mr. Parsons, who began his career with the Federal Bureau of Investigation as a Special Agent, back in 1934, was arranged by Bob Garland in direct negotiations with J. Edgar Hoover, from whom clearance was required.

down Manhattan Island will be a virtual sightseeing tour in itself. The string of buses will then wind their way thru the new Brooklyn-Battery Tunnel from the southernmost tip of the Manhattan on to a fast, smooth parkway directly to Coney Island. Inside of an hour you'll be transported from your Hotel to the playground more New Yorkers and visitors frequent than any other attraction.

Guides and models

Upon arrival, competent photographic guides will be ready to take you on a conducted tour of the most interesting and photogenic places which you'll find here in abundance. The high spot of the tour will be a long visit to Steeplechase, where you'll find a city of fun all under glass. For those who require the additional touch of a figure . . . and a very attractive figure . . . placed at just the right spot, your Committee has arranged for a group of models to be on hand. These models have been selected for their ability and willingness to pose under all conditions so you really get them in action doing the things one would expect to find at a place like Coney Island. "Nothing has been overlooked to make this field trip complete," says Ed Wilson, the Committee Chairman.

Shoot what you like, black and white, color and stereo. But because Coney Island is just teeming with opportunities for brilliant color shots your Committee recommends color film particularly.

Light is excellent at that time of the year and you'll be able to capture plenty of action with fast shutter speeds. Depend on the guides, who have had considerable experience, to help with any exposure problems that may develop and to direct you to the most desirable material to shoot. Flash, although it may not be necessary, might here and there for fill-in light or for capturing action in some dark or shaded corner. So, if you have flash, bring it along.

Pictures and fun

This will be one field trip where pictures alone is not all you'll get. Nothing has been said so far about visitors participation in the many breath-taking rides and thrills which you'll find at this playground. No distinction here between grownups and children. Everybody plays and has fun. You'll have an opportunity, perhaps for the first time in your life, to make an actual parachute jump. It's the same, safe device which has thrilled many thousands at the World's Fair in New York, now transported and reconstructed at Coney Island, the only one of its kind in the world. The drop is from a considerable height and you can take your camera along on the trip.

Side shows, hot dog vendors, barkers and novel refreshment offerings will compete for your attention. And people, perhaps more than you've ever seen before, crammed into a few hundred acres, will complete the picture. Small wonder that almost everybody who comes to New York, goes to Coney Island.

Fun and Pix

In the Fun House at Steeplechase Park the flash-bulb boys can have a field day. Maybe you won't get many salonworthy shots, but you certainly will get Young America in action. There will be models to pose, and guides to help.

Be sure to make your reservations early for the Coney Island Field Trip you can't afford to miss. Bring along the family as there is no better place for inexpensive fun for everybody. It will be a day you'll long remember and the \$2.00 cost for the bus trip will pay plenty of dividends in the large number of wonderful pix you're bound to take home with you.

Names Are News; Get Yours in Paper

Names are news. Editors of most hometown newspapers prefer items about people more than any other kind of news. You should be able to determine from your reading of your hometown paper whether this is true in your locality.

Your name in the paper in association with your photographic activities can mean favorable publicity for your camera club, for photography in general, and for P.S.A. as well as for yourself.

Since you are planning on coming to the vacation time convention in New York, you have a legitimate news item to offer to the city editor of your local newspaper, or to the camera club editor if the paper is big enough to have one.

Names Are News

If you are coming to the convention with a group of photographers, amateur or professional or both, from your locality, the news item that you can offer your local editor is so much the better. The more names the more he will like the item because this makes it possible for him to tell abent what is happening to more local people.

If someone from your hometown is taking an active part in the convention program as a speaker or a member of a committee, or is an officer or committee member of P.S.A., or otherwise distinguished photographically, the news item you have to offer your local paper increases in value as far as the local newspaper is concerned.

Just type out the information on a plain sheet of paper and send it to the city editor or camera club editor of your home town newspaper. Do this a full two weeks before you leave home for the convention. Be sure to sign your name. Give your address and telephone number.

The editor may want to assign a reporter to call you back for additional information.

If you are doubtful about how to put the facts on paper, telephone the city editor or the camera club editor and say you have some news to offer. They will be courteous and gracious about it if you will.

Make Pictures

Don't forget, when you do either of the above, that you are a photographer, and that you know just how to make a picture. Offer to make a picture of your group just before its departure for the convention, for publication in the paper. Home town newspapers like to publish pictures of people mentioned in their news items. Usually they want a 8 by 10 glossy print. Sometimes they prefer a 5 by 7 print. In either case they want it fast, while its still

Don't be modest. On the other hand, don't be too aggressive about it. Just do it.

Use this same formula for news about

East Meets East in West

Harry Shigeta, Hon. FPSA meets Hisakichi Kikuchi, PSA and President PSJ during the latter's visit to Chicago several months ago.

your local photographic activities—but don't overdo it—and you will cultivate a welcome from your hometown newspaper for more news about yourself, your photographic activities, your club and P.S.A.

When you come to the convention be sure to let the reception committee know you have arrived and where you are etaying. It is just possible that things you do, things that happen to you while you are at the convention, will make pleasant and happy news for publication in your hometown newspaper.

If so, the Publicity Committee will want to get in touch with you quickly in order to get the facts and send them back home to your hometown paper.

PHOTOGRAPHY Magazine Offers

\$500

In Awards

PHOTO-JOURNALISTIC COVERAGE

OF THE

1952 PSA CONVENTION

The Awards:

1st				 • • • • • • •	\$200.
4 priz	es of	\$50 ea	ch	 	
•				Total	\$500

Plus certificates of honorable mention.
In the event of a tie duplicate prizes will be awarded.

RULES

- Open to all who attend the PSA Convention in New York. Competition opens August 12, 1952 and closes Sept. 10, 1952.
- Subject: The annual convention of the PSA as told in a SERIES of pictures and captions.
- 3. Prints to be no larger than 8×10 .
- Entries to be unmounted or in portfolios, all prints with captions attached and bearing the name and address of the maker.
- Entries to be judged for reportorial value with major emphasis on the use of the minimum number of prints to tell the story.
- Entries to be addressed to Photography Magazine Convention Awards, PSA Headquarters, 2005 Walnut St., Philadelphia 3, Pa.
- Closing date-all entries must be postmarked not later then September 10, 1952.
- Award winners to be announced in the November issue of the PSA Journal.
- Judges: Bruce Downes, Editor of PHOTOGRAPHY magazine; David Eisendrath, Chairman PJ Division, and David J. Marshall, Professor of Journalism at Fordham University.
- 10. Photography Magazine and the PSA Journal reserve reproduction rights on all prize-winning entries.

AND - - - The Photo Journalism Division

offers more cash awards

Thru-the-Lens Tours of High Sierras & Canada

Four "Thru the Lens" Vacation Tours of the High Sierras and eleven in the Canadian Rockies have been announced by Merle S. Ewell APSA, and Eric L. Ergenbright, both veteran exhibitors and experienced tour managers.

The Sierra tours are by pack train and will traverse the entire Sierra between Mineral King and Lone Pine. This region is famed for its towering granite-fanged peaks, tremendous canyons, flower-carpeted alpine meadows and gem-like lakes. Mineral King is an historic old mining camp situated at an elevation of 8000 feet.

The Canadian tours will start from Calgary and include two weeks of intensive picture making. Camera spots include Lake Louise, Yoho Pass, Paradise Valley, Ptarmigan Valley, Jasper National Park, Maligne Lake, Banff, Angel Glacier and other points of interest.

Most of the tours are hiking tours but transportation is provided on big jumps. Full information is available on request to Merle Ewell at 1422 W. 48th St., Los Angeles, Calif.

Wu Lecture Planned

A radiogram has just been received from Francis Wu, FPSA, FRPS, FIBP, Hon. MPS, Hon. SFF, Hon. TPS, etc. of Hong Kong, accepting the invitation from Barbara Green, Chairman of the National Lecture Program, to gi.e a limited number of lectures under NLP auspices following his appearances on the convention programs of PSA and PAA.

This will give some of those unable to attend the PSA Convention in New York an opportunity to hear the Chinese master, generally regarded as the foremost photographer in the Orient.

Although a professional in whose studio many personalities both European and Oriental have been photographed, he has a high reputation as a teacher and mentor of Chinese amateurs. He is an enthusiastic worker for PSA and serves the Society a-Honorary Representative for Hong Kong and China. His exotic pictures are widely known in this country and his recently published book, "Classical Chinese Beauties" has added to his laurels.

The NLP tour will begin in the Midwest early in September and will end on the Pacific Coast from which he will embark for his return journey late in the month. The charge for his appearances will be \$75 which includes transportation. Most of the limited dates will probably be booked by the time this announcement reaches print but some may still be open. Any organization interested in booking Mr. Wu should immediately wire or write air mail to Mrs. Barbara Green at 30 Willow St., Brooklyn 2, N. Y.

The Photographic Society of Japan (P.S.J.)

To: Mr. Norris W. Harkness, President of the Photographic Society of America

Message of President Kikuchi of the Photographic Society of Japan

O^N BEHALF of the Photographic Society of Japan (P.S.J.) formed by all influential organizations connected with photography in Japan, I feel it a great privilege to be able to transmit to you this message.

The Photographic Society of Japan comprises approximately fifty thousand members, and is composed of groups and organizations of people engaged in scientific study of photography, manufacture of cameras and photo-materials, sales thereof, professional photography, medical, typographical and press activities, and amateur photography.

It is no exaggeration to state that almost all Japanese have a passion for photographs and photography, and consequently, industries and technologies related thereto, as well as its artistic side, have in recent years made great strides. The aim of the Photographic Society of Japan, therefore, consists in a further improvement and development of photography and photographic activities in Japan, and in close co-operation with its sister societies throughout the world, so as to be enabled to contribute to the cause of peace. For the achievement of this objective, the Photographic Society of Japan is active in the following fields: collection of various materials concerning photography, preservation of documents and archives, publication of literature, awarding of honours in recognition of services; exchange of materials related to photography with foreign countries, maintenance of close contact with photographic organizations abroad; holding of study circles, photographic concourses, lectures, exhibitions large or small; annual functions on June 1, the Photography Day of Japan, inaugurated in commemoration of the taking of the first pictures in Japan in 1841, the day of the first page in the history of photography in Japan, when the daguerreotype was introduced. On June 1, 1951, the Photographic Society of Japan passed a resolution expressing gratitude to ten Western pioneers, including Daguerre and Niepce, and three Japanese pioneers. Also trees were planted in commemoration of the occasion and scientific lectures, exhibitions and the like were held in many places in Japan. Approximately twenty thousand people interested in photography participated in an unprecedentedly large concourse in Tokyo.

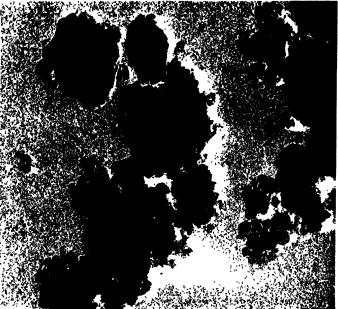

In view of the conclusion of the Peace Treaty and the prospects for its taking effect at an early date, Japan would shortly be accepted as an independent member of the community of nations, and a comprehensive plan for the coming Photography Day is now being drawn up for various colourful functions.

These are the activities of the Photographic Society of Japan, whose sincere desire it is to look for contact with you, and to set up close co-operation for the world-wide development of photography and the noble cause of peace.

Tokyo, March, 1952

(S) H. Kikuchi

Engineers of the Draper Corporation use high speed photography to find out exactly what happens in bobbin transfer. You'll hear about it in the T.D. symposium on industry and science.

Enlarged here about 20,000X, this electron microscope shot of a clay separation helps Kentucky highway engineers learn more about their materials.

Wham! goes the concrete test block and a microphone hears it, triggers a flash tube and the engineers see how it fractured. Another from the TD symposium on industry and science.

An Invitation

An open letter from Bill Swann,
Technical Division
Chairman, inviting you to partake of the
TD Convention
Program . . .

Dear PSA-ers:

For many months the Program Committee of Technical Division has been busy writing letters, placing phone calls, and paying visits to the country's leading experts on scientific photography and photographic science.

Now the results are in, T.D.'s program is all set, and I have to share with you my excitement over it.

On Tuesday—a major symposium on photography in medicine and biology. You will see and hear how time-lapse photography is uncovering new knowledge of growth processes, cell behavior, reproduction, and the effects of drugs. You will learn of the tremendous impact that motion picture techniques have had on the teaching methods of medical schools. There will be a representative of the University of Illinois to tell how they use color photography to help children suffering from cleft lips and palates. Roman Vishniac, the scientific photographer, will disclose his techniques for close up photography in insect research. You'll even be able to pick up some practical pointers on elimination of shadows from Louis J. Dogin, another scientific photographer specializing in macrophotography.

On Wednesday—an even dozen experts rounding up for you the latest developments on photography in engineering and science. They will include a textile man, a television man, a metallurgist from U. S. Steel Corporation, an electronics engineer from Allen B. Du Mont Laboratories, an industrial engineer from Eastman Kodak Company, a highway engineer from the Commonwealth of Kentucky, and photographic specialists from the Naval Research Laboratory, Aberdeen

Delicate traceries, enlarged about 250X by the bright contrast phase microscope of Oscar W. Richards, reveal data about the head of this Daphnia. Photo from American Optical Co.

to Learning

Proving Grounds, the U. S. Naval Ordnance Test Station at Inyokern, and the U. S Naval Ordnance Laboratory at White Oak.

On Thursday—a PSA clinic on equipment, materials, and processing, with the conversational ball being tossed back and forth between representatives of General Electric, duPont, Graflex, Ansco, and Kodak.

On Friday—another big PSA clinic on color techniques, materials, and procedures, led by Lloyd E. Varden. There will also be a group of papers in the mornings on photographic optics. Here a Bausch & Lomb man will bring you up to date on depth of focus, a physicist from Boston University will explain the relationship between resolution, sharpness, and photographic quality, an engineer from Kollmorgen Optical Corporation will show what's involved in submarine periscope photography, a stereo expert from Polaroid will show you a simplified way to calculate interocular distance, and the president of The Zoomar Corporation will discuss the evaluation of photographic lens performance on the basis of laboratory tests.

I am sure that for many, particularly for those who take a broad view of photography as an art, Friday night will mark the high spot of the convention. With the help of over 100 color slides which, in effect, do his talking for him, Ralph M. Evans of Kodak will show you how subtly and yet thoroughly the existence of photography has influenced the way man's brain ir.terprets for him what his eyes see. Mr. Evans does a terrific job along these lines and leads into some highly interesting speculations on future creative directions in color photography.

On Saturday we shall wind up with a revelation by Corning Glass Works of a new medium and process for photoengraving, a revelation of techniques by two experts on legal evidence photography, and helpful papers on techniques in various branches of photographic work.

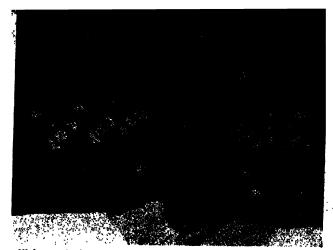

All of these important discussions will, of course, be open to everyone who is registered.

Cordially,
BILL SWANN
Chairman, PSA Technical Division

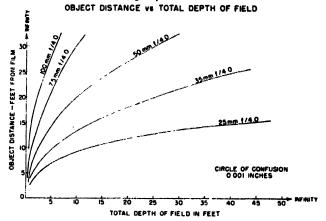

High speed cameras set-up in U. S. Steel Corp. lab in Kearny. N. J. Note use of flashbulbs in motor driven holders. This provides continuous high intensity light for the short exposures.

If these globes were one-fiftieth this size you might recognize them as the brilliant line on a highway at night! Reflectors beads or abstraction, take your choice.

High speed photography plays an important role in medical research as John Waddell will explain at the TD symposium on medical and biological photography. Photo courtesy Institute of Medical Research, Los Angeles, Calif.

Not a lens, but a smoke box demonstration of light passing through a highway reflector bead. No wonder they shine so.

SALON JUDGE

TURBULENCE

HUMOR

and pictorial photography...

By Floyd C. Piper

H ow often have we heard critics condemn salons and photographers for their repetitious, trite and uninteresting work? After sitting for several hours watching hundreds of pictures pass through the viewing box, one comes to the conclusion that perhaps part of what they say is true. You see S curve landscapes by the dozens and baby and animal pictures by the hundreds. Then along comes a picture with real humor and interesting content and the whole atmosphere changes immediately.

The interest of the audience and judges alike is again aroused and the judging proceeds with new vigor. This in itself goes to prove that this type of work is greatly appreciated by all, and anyone who has taken pictures of humorous situations will tell you that their rate of acceptance in salons is usually high and for contest winners they are hard to beat. The work of the late Stuyvesant Peabody is a good example. Here was a man who could look upon and appreciate the lighter side of life and his work has been hung in almost every exhibition in the world and reproduced in all photographic magazines and annuals.

Regular salons average between 700 and 1500 prints. and a national prize contest may see 40 to 50 thousand pictures pass before the eye weary judges. Therefore it's easy to see why something different and fresh will get a favorable reaction. American people like to laugh; it's part of their physical makeup. And don't think it's only appreciated in this country. "Young In Heart" and "Turbulence", which accompany this article have hung in both Canada & South America, so you can readily see that humor has a universal appeal.

"How do I go about making such a picture?" you ask. The formula to follow for this type of work is rather hard to define. The message must be simple and direct and vet not have a tendency to the corny side. And most important it must never lean toward vulgarity. Any picture containing the latter will find its way into the discard pile in short order. and any esteem the photographer may have had will be jeopardized.

The first thing to do is think of a humorous situation or saying which you want to use. There are literally hundreds of ideas available. Just think back over many of the pranks you pulled or situations you got into as a boy. Follow the work of famous illustrators such as Norman Rockwell and you can get many suggestions. Don't, however, try to imitate work of others. These should just be used to stimulate your

Next decide upon the best method to get your point across as quickly as possible. Don't expect your title to carry the idea by itself; although a good title will help a good picture; and by all means don't be so subtle that the viewer must hunt to find your meaning. He will not be able to appreciate it when he finally does.

A few simple props help most of all in putting across the story in your picture. In "Young In Heart", the only things needed were the copy of Police Gazette and a pair of glasses, minus the glass. In "Turbulence" the only prop is the pipe, and in "Salon Judge", a piece of dime store ribbon for a tie, an old pair of glasses and my own suit jacket. The

(Continued on page 444)

Letter from the Editor

You won't get many of these . . . in fact, we'd much rather print letters from you . . . they make more interesting reading.

In his column "The President Reports. . . " Norris Harkness predicts changes in the JOURNAL. Don't look for all of them in this issue. Oh, there have been changes in type faces, but that's because we changed printers, and there have been some minor changes in the layout of the pages, but essentially, this is the same JOURNAL you have been getting right along.

The biggest change you will find is in the general make-up of the JOURNAL over a long period. As you have been told, each issue will be balanced to contain something for everyone. The special Divisional Issues must be foregone, for a while anyway, principally because of the cost. While the book remains at 48, pages, and, quite possibly, until it grows to 100 we will keep the balanced format.

I can't let the opportunity pass for words of praise for Fred Quellmalz. In turning over the job of Editor to the present holder of that title, Fred has been helpful in getting material transferred quickly from the old printer to the new, in making suggestions, and in offering to continue as a book reviewer. Thus his name does not disappear from the masthead.

While you are reading these words, your Editor will be busy working with the Division Editors in planning for the months ahead so that we can send you each month a JOURNAL packed with interest and with good pictures. Our plans include something for everyone, for the beginner, the salonist, the technician, the movie maker. We have a marvelous file of good manuscripts from which to choose, but we're always looking for more. Your Division Editor will always be glad to see an outline or an article.

One new feature we have already started, the "Maybe You'll Like" listings of features in next menth's photo mags. We've often missed a good article by not hearing of it until the issue was sold out. Now, through the cooperation of the Editors of these magazines, you have a preview of their contents in time to assure getting your own copy.

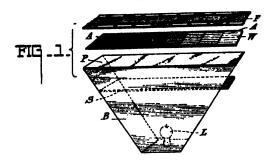

In closing, a word of credit to Jack Sullivan of Ansco for our new cover design. He submitted hundreds of sketches and this was chosen as best suiting our needs. There are several variations that we will also use from time to time. Thanks, Jack, for a swell job.

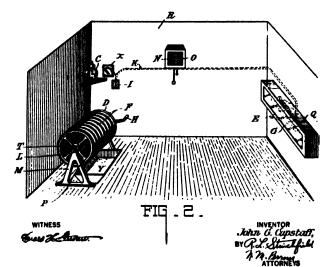

Let me hear from you.

don bennett,

Editor

J. G. CAPSTAFF
PHOTOGRAPHIC REVERSAL PROCESS
Filed March 2, 1921

THEN A reversal laboratory as visualized in the first patent application. Note the light control in Fig. 1, items A and W.

NOW The modern reversal laboratory looks somewhat different with thousands of rolls of film following one another through the tanks. Second exposure control is automatic.

The Father of

By Harris B. Tuttle, F.P.S.A. and

When you make home movies and see the wonderful results you get on the screen, do you ever stop and wonder about the man who started it and made it all possible? It's difficult sometimes to identify the man who starts an idea, but we can easily identify the man who is credited with being the real "Father of Home Movies."

He is a tall, lanky gentleman of British descent and known in the U. S. Patent Office as John George Capstaff; to the people in Kodak where he is employed in the Research Laboratories, as Mr. Capstaff; and to the fellows who have worked with him for the past forty years, as "Cappy."

Since we have been associated closely with Mr. Capstaff for a number of years, we will refer to him in this article as the endeared and intimate "Cappy."

Cappy was born in Cateshead-on-Tyne in Northern England on February 24th, 1897. After an education in the Heaton Science and Art School of Rutherford College, Newcastle, he studied at Armstrong College, specializing for the most part in subjects relating to physics and engineering. His family was connected with the shipbuilding industry, for which the Tyne is so famous, and he himself intended to study engineering, but as the shipbuilding industry was suffering from one of its periodical waves of depression. he started as a young man to work for a very famous photographer of Newcastle, Mr. Lyddell-Sawyer. There he took an interest in everything that was being done and seized every opportunity to learn different branches of the photographic art, and so got an excellent grounding in photography, finally specializing in the handcoloring of prints. His interests, however, were largely in mechanical devices, and after he started his own studio, he spent much of his spare time with a group of friends in the consideration of engineering problems, especially those relating to aeronautics, which was then beginning to appear as a fascinating field for the engineer.

Early Experiments

While he studied these mechanical problems, Cappy was also working on experimental photography and invented several modifications of photographic processes, some of which were later of use to him. One of these was of the same type as the now well-known Carbro process, by which prints in carbon tissue could be produced from bromide prints. Another was the production of photographs which were invisible until the paper had been exposed to light, thus forming an advertising novelty.

In 1912, Cappy became associated with Dr. C. E. K. Mees and the firm of Wratten and Wainwright in England and later went to the Kodak Research Laboratories in Rochester, New York, to start the Wratten filter department.

Cappy had not been long in the new research laboratory at Rochester before he began experimental work in several fields of photography. By 1914 he was working on processes

Home Movies

Glenn E. Matthews, F.P.S.A.

of color photography, and a two-color portrait process was worked out by him and exhibited at the World's Fair in San Francisco in 1915. This process was called the Kodachrome Process, however, it was related in name only to the present Kodachrome process and materials currently in use. Soon after this, experiments were started to adapt the process to motion picture photography, two-color separation negative images being printed in register from a master positive onto opposite sides of double-coated film by means of an optical printer, these being transformed into dye images by a process related to that on which Cappy had worked many years before for the production of carbon prints from bromides.

Reversal succeeds

In 1914 Cappy conceived the idea of applying a reversal process to the production of amateur motion pictures. Work on this progressed rapidly and in a letter which he wrote on April 17, 1917, he laid down the conditions which he believed necessary for the development of a practicable process or system of home motion picture photography. Work had already been done in this field by others, and much had been done from the standpoint of the design of apparatus, but what was necessary to make the whole thing a success was a simple and inexpensive method of producing the finished pictures, and this was supplied by Cappy's invention of a practical reversal process.

The process eventually used was based on a method previously proposed by Namais in 1909, in which the film exposed in the camera was developed to a negative, the developed image was next bleached with acid permanganate, the bleached image was then exposed to white light, finally the residual silver halide was redeveloped to a positive and after fixing, washing and drying, was ready for projection.

The difficulty with that process was its great sensitivity to the exact thickness of the emulsion coating. If the emulsion coating is too dense, there is too much silver halide for the second image. If it is too thin, there is too little. Its use required the adoption of a very thin emulsion having little latitude and necessitated very even coating, any streaks produced serious difficulty. The pictures were dependent upon the original exposure given; there was no means of correcting for errors in exposure.

Secret of success

These difficulies were overcome by Cappy by the use of a controlled second exposure, the exposure given after the bleaching of the original image being determined by the density of the silver halide remaining. Thus the lack of silver halide was compensated for, to some degree, by an increased second exposure, and, similarly, an excess of silver halide resulting from heavy coating or underexposure was compensated for by decreasing re-exposure.

John George Capstaff, Hon. FPSA

The results obtained by this improved reversal process were amazing compared to those which could be made without the control of the second exposure, and it was principally this factor which made the process a success. With this as a basis, Cappy worked on the design of the film itself, the camera loading method, the camera, the projector, and the processing equipment. A great deal of work on the subject, however, was done by his associates under Cappy's supervision.

The process was first announced and demonstrated publicly in January 1923 in lectures at Rochester and at the Franklin Institute in Philadelphia. Pictures were taken at the beginning of the lecture, processed in the building while the lecture was in progress, and shown at the conclusion.

The film, the camera and the projector were introduced in June 1923, and in addition to the apparatus made by the Kodak Company itself, other manufacturers also introduced equipment—cameras and projectors—before the close of the year.

Many improvements in the equipment used for exposing, processing, and projecting the film were later devised by Cappy. For example, the claw pull-down and curved gate used in the Model B Cine-Kodak represented useful refinements which improved the steadiness and uniformity of the picture. A daylight loading film magazine was designed. Much basic optical work was done on the projector and a friction-type panoramic tripod head was resigned which has displaced the gear type in professional as well as amateur tripods.

Several continuous types of 16mm film developing machines were designed and built, incorporating his inventions. One of the improvements used in these machines was the portable-type rack, permitting sections of the machine to be removed easily for threading, changes, and inspection.

Extensive investigations were conducted to improve the

quality of duplicate prints from 16mm positives. Cappy's suggestions resulted in a steady improvement until it was possible to make duplicates that were almost indistinguishable from the original. Printing equipment used for this work was designed in part by him. Improvements in the film emulsion used for duplicating purposes were also effected at his suggestion.

A new industry is usually the result of the integrated ideas of a large number of individuals, and this is also true in the case of the 16mm film system. However, it can be stated fairly that Cappy contributed the major portion of the fundamental elements.

During the past 25 years, many other cameras and projectors have been marketed. As a general rule, the cameras are driven by spring motors which are wound up between exposures. Such cameras for amateur use are made much more compact than the earlier ones. Projectors for 16mm sound films were introduced in 1932 and cameras in 1935.

8mm and color

The "Cine-8" film and apparatus were introduced in 1932, the pictures being one-quarter of the area of the 16mm picture. Much work was done by Cappy on several aspects of the 8mm picture program and in fact, during the early years of the 16mm process, Cappy made 8mm pictures. Motion pictures on film of this size remained one of his goals and improvements made in the speed and graininess of photographic emulsions in the late twenties made possible 8mm pictures of satisfactory quality. The Cine-8 program further reduced the cost of motion pictures for the amateur and increased greatly the popularity of home movies.

In 1925, the Eastman Kodak Company secured rights under a three-color additive process of color photography which had been developed in principle by French inventors. In this process, a black-and-white film is used. There are combined blue, green and red filters in front of both the camera and the projector lenses. The film is embossed with cylindrical lenticules that form images of these filters on the film during the taking in the camera. Cappy worked on the practical development of this process for use in the home movie field. By 1928, his work had progressed to the point that the process was ready for the market. In July of that year, George Eastman invited Thomas Edison, General John J. Pershing, Adolph Ochs and other noted persons to Rochester to witness the showing of the first amateur motion-picture films for color photography.

Research work on a 35mm lenticular process was carried on under Cappy's direction for several years. A number of improvements in the process resulted in pictures of high quality, a demonstration of which was given before the Society of Motion Picture Engineers in 1936.

Important discovery

While working on his two-color Kodachrome process, 1918 to 1925, Cappy found that the addition of a yellow dye to each emulsion of the double-coated film used in making the duplicate negatives represented a useful method of controlling the depth of the exposure and therefore preventing penetration of the light through the film. The addition of the dye also had the effect of increasing the resolving power of the emulsion by reducing irradiation or scattering, greatly extending the latitude and lowering the maximum contrast. The dye was water soluble and could be washed out during the developing process. Cappy realized that the use of a yellow dye would improve the films employed for the making of duplicate negatives and carried out much experimental work, which resulted in the introduction of special films for this purpose. In consequence, motion picture producers

established the present practice of duplicating their original negatives, a notable improvement in motion picture technique.

In 1927, Cappy established the formula of a developer especially suitable for the production of fine-grained images on negative film. This formula (D-76) met with ready acceptance and is used very widely by amateur and professional photographers for all classes of work.

It is generally acknowledged in the motion picture industry that the so-called "three-strip" method is one of the most important methods for taking professional color motion pictures. An objection to this method is that it requires the use of a special camera fitted with a beam-splitter prism.

Since 1940, Cappy has done considerable work on the development of a single multilayer negative film which can be used in any standard motion picture camera. After exposure and before development, the two upper layers are wet-stripped separately by means of a stripping machine into special transfer supports. After the three resulting films are developed to give three color separation negatives, they can be printed by any one of several processes including the embossed film type. This unique film and stripping machine were described by Cappy in an article published in the Journal of the Society of Motion Picture Engineers in April 1950.

Cappy's honors

Besides the Honorary Fellowship of the Photographic Society of America (1950), Cappy's work has been recognized by the Royal Photographic Society with the award of their highest honors, Honorary Fellowship (1944) and the Progress Medal (1946). For his key invention (controlled second exposure) which formed a basis of amateur movies, he received in 1940 a Modern Pioneers Award of the National Association of Manufacturers. His design of a processing machine incorporating several new principles drew him an honorable mention from the Academy of Motion Picture Arts and Sciences in 1943. The Society of Motion Picture and Television Engineers awarded him their Progress Medal in 1944.

Cappy is essentially an experimenter and loves to carry out his work with his own hands, but no account of that work would be complete without some mention of the training which he has given through the years to his associates and assistants. Many men in the organization of the Eastman Kodak Company are proud to acknowledge with gratitude their obligation to him. This feeling is shared also by many motion picture engineers throughout the industry, many of whom have been helped by his wide knowledge and ready invention.

This statement of his work and discussion of his principal inventions show that motion picture technique owes very much to Cappy. In the whole field of cinematography he has been a pioneer, and his work has always been distinguished by its accuracy and completeness.

Truillo Sponsors Cornerstone Membership

Dr. Rafael L. Trujillo Molina, President of the Dominican Republic, is sponsoring a Cornerstone Membership as first prize in the First International Salon of the Dominican Republic, according to word received from Juan Carcia, Secretary of our International Portfolios and a resident of Ciudad Trujillo.

This is the first time that a head of state has recognized the PSA as a factor in international friendship and the honors for bringing this about fall to Juan Garcia, PSA and Honorary President of the Dominican-American Photographic Society.

Judges take one off the wall for closer inspection in this different kind of judging.

REVOLT!

By George L. Kinkade, A.P.S.A.

Almost everyone talks about and condemns the weather; almost all photographers at one time or another damn the salons. It's obviously impossible to tamper much with winds, rain and storms; exhibitions, like all human institutions, can be altered if we wish!

We at the Northwest Salon of Photography, held each year at the Western Washington Fair at Puyallup, have been smelling rats for some time in conventional judging methods. Last year we took the bull by the horns in a do-or-dic experiment that we think all those who patronize the exhibitions should hear about. And should a Salon executive or two read these lines and acquire a few seeds of revolt then our labors will not have been in vain!

What we did was simply this: We hung all the pictures submitted and then on three different evenings strolled around taking down those not considered worthy of exhibition. Sounds simple. It was, but the implications were many.

Normally a salon judging goes something like this: The jury is plopped down in front of a viewing box early in the morning and a human conveyer belt starts an endless chain of pictures which will go maddeningly on until evening. Juries are usually composed of people whose judgment is sound, who know a good photograph when they see one and why. But the lads who engineered the inquisition could have learned a few things from exhibition judging on how to shatter moral, befuddle judgment and make one a saddist at heart!

We have witnessed a good many international salon judgings, and here's what we've seen too many times: The judges are in an expansive mood when the production line starts

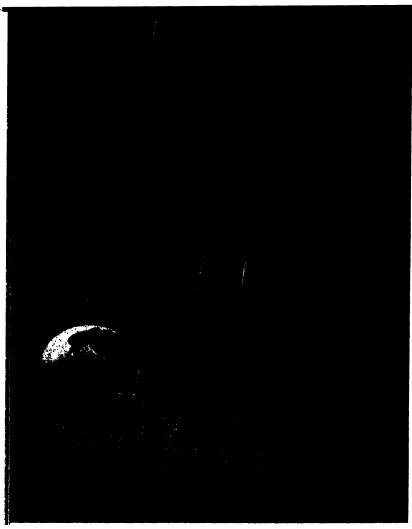

rolling and so almost everything that comes along is accepted or placed in the reconsider pile. This goes on for a while until the jury suddenly awakens to what they are doing or a salon official pokes his head from behind scenes and says: "Hey, you guys, we won't have enough room to hang all the junk you're accepting!"

So the judges get tough and out goes many a picture deserving better treatment. After an interval of toughness the judges come to again or are prompted by the fellow behind the curtain. About now it's time for lunch.

At the beginning of the afternoon session everyone's feeling good again, and this is when smart members of the salon committee try to run through their own prints, hoping to catch the judges off guard. Invariably soon after lunch the chairman of the committee suddenly discovers that there's still 500 or more prints to be run through the mill, and one of the judges has to catch the 5:15 train. From then on deterioration is marked and increases by geometric progression!

Almost always one judge gets his finger stuck on the reject button. This is either prompted by his discovering that the other two seem to be against him, or he's sick and tired of the mess and thinks this way will get it over quickly.

The great bulk of entries in any international salon are the middle-of-the-roaders. The quality of the show wouldn't be changed much whether they were hung or not. Most of them are fair pictures, certainly, but are the same old ideas, same old techniques. After waiting patiently for an outstanding picture to come along (most of them were accepted in the first round) cynicism is apt to color even the most unbiased

EGGSHELL ABSTRACTION II

JOHN F. BARNES

person's judgment. I already said the quality of the show would be affected little whether these prints hung or not; but the joker is that hidden in these ho-hum pictures is many a fine photograph that must be considered at length. They landed in the reconsider pile first time around because the judges thought they saw something and wanted another squint. But they won't have a chance in the afternoon because of conflicting emotions that have rendered the judges impotent.

After witnessing several judgings, both as judge and member of the committee, we have often observed that all that happened was the worst pictures were eliminated. It was our conviction that a salon committee which had worked together on a few international salons could do just as good a job, with less fanfare. The judgment of the jurors was not questioned; they were merely up against an unbeatable system!

Dr. R. C. Morse, superintendent of the Northwest Salon, with whom I have had the pleasure of working since 1946, had considered these iniquities of existing judging systems, and we spent many evenings together attempting to find a way out.

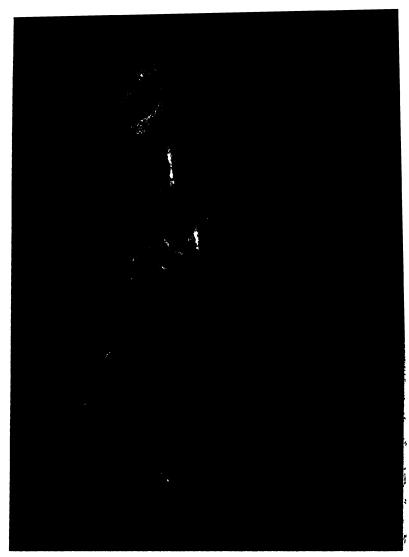

The underlying evil seemed to be in trying to jam through a thousand prints in one day. We were convinced that no human could look at that many pictures in eight hours with justice and fairness. Besides it was inhumane! The answer to that question was obvious: Do the job in evenings and use as many as necessary.

We believed greater justice could be done the submitted prints if examined in another way than the conventional viewing box. The public would see them on the gallery walls . . . so, what better place to judge them? This dovetailed with an unanswered problem to the first question: If we performed the job in installments, where could that be done? The place must be of ample size, and where the pictures could be left for an interval of a week or more. The Fair Association informed us the lights would be on in the exhibition gallery, that the doors could be locked and watchmen were on hand at all times.

At the time the entry blanks were sent out, six months before the exhibition, some of the problems were still to be threshed out, so we merely mentioned that a committee from the Washington Council of Camera Clubs would assist in selecting prints to be hung. We did a little sweating previous to the salon, apprehensive over whether our experiments would lead to disaster. The exhibitors seemed satisfied, however, for entries topped the previous year, with 1038 entered.

Northwest's capable secretary, Mrs. D. E. Hartung, unwraps and records prints as they are received, so two days

Uttarpass [albrid lin Library

after entries closed she had the entire lot, with exception of foreign pictures, on the gallery walls.

Mr. James R. Stanford, APSA, of Olympia, and Hale Van Scoy of Seattle, both with extensive judging experience, willingly consented to be accessories after the crime. This writer made a threesome, with Dr. Morse pointing a finger now and then.

The first evening we found it was no task at all to wander through the galleries and take down the R-ls, pictures that obviously were not up to salon calibre. Three days later we spent another evening. This time we got about half way around again and then sat down and reviewed foreign prints. Two days later another session saw us the rest of the way around the galleries, with time left for a final look at the foreigners and selection of prize prints and honorable mentions.

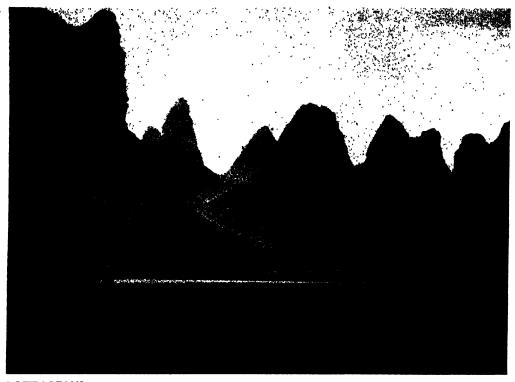

Total time elapsed for three evenings was about 10½ hours. We reached the interesting conclusion that not much more time was devoted than for a normal salon judging, but what a tremendous difference! Completely fresh on three occasions, our appetites for pictures were at no time jaded, and mental fatigue was completely lacking. Plenty of coffee, doughnuts and cookies, with sitting down spells to look at unmounted foreign pictures, obliterated any possibility of physical tiredness. In fact, we were all so enthusiastic over

the novel procedure, that time to leave always came as a shock and the doors were locked with a guilty feeling.

As the second and third sessions came, we became conscious of strange goings-on. Pictures with great initial impact, that under normal judging systems would be accepted first time around, began to pale on us. We saw them in their true light, not as works of art, but as photographic tricks calculated to win snap judgment. Copycat ideas began to irritate us.

On the other side of the ledger, quiet pictures, and those with deeper meanings, received every consideration, and many were discussed at length. Several pictures which we felt would have received no consideration in conventional judgings were left up because we felt that although they exhibited little artistic, they did contribute a sense of humor and drama the public would enjoy.

It often happens that along comes, say a picture of a whiskered gent. It isn't too bad and the judges accept it. By-and-by another whisker job pops up, and soon another and another. By this time just one small whisker on a fine portrait is assurance that that picture will be thrown out. So what happens? The first few whiskers accepted may be, and usually are, inferior to those rejected later, but that's the way it stands. (one reason we hear so many people say that they could pick another show from the rejects!) With

LOFTY PEAKS WING CHEUNG WONG

our system this is obviously impossible. If there are a great many pictures of one type entered, comparison on the walls soon establishes which show the greatest imagination, freshness of viewpoint and inspiration. There are no firsts, for it only takes a few seconds to refer to all others entered!

Voting of course was by voice only, and no picture was taken down unless by unanimous agreement. Several impassioned speeches were made when a juror went to bat for what he believed right.

In conventional systems there always seem to be a considerable number of pictures accepted whose quality is not quite up to the average. Even the jurors, on seeing the show hung, admit they would like to recover some prints from the reject pile, exchange them for a few on the walls. There always seems to be an air of frustration, of unfinished business.

Not so with our "Puyallup" system! On the third evening we all came to the simultaneous and unanimous decision that we were done. Nowhere could we spot a single picture that seemed inadequate. The feeling was akin to putting the finishing touches on a single composition, one master picture. We did not assume infallibility, but did feel we had created something to the best of our collective abilities!

Selection of honor prints, rather than automatically including prints unanimously accepted in the first round, was a labor of love. Many pictures had indelibly impressed themselves on our consciousness as we strolled about the galleries. It was a pleasure to make the round once more and point these out.

It is obvious that the adoption of the Puyallup system will play havoc with some old-established customs of salon judging. First is the selection of judges. The importation over great distances of "big names" would have to be discontinued if selection of pictures is extended over a week's time. This might be a hardship in some of the smaller isolated cities, but surely most metropolitan centers have their own talent close at hand.

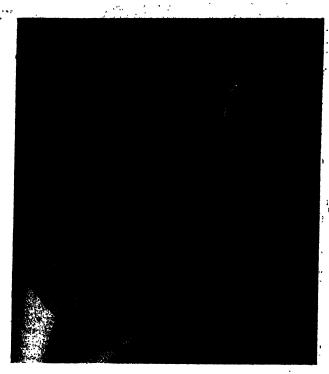

Another quaint custom that would have to be foregone is that of making a festival of judging. It must be apparent to all that an audience would be completely out of the question. We must reconcile ourselves to the notion that exhibition judging is a serious business and not an entertainment.

The only genuine hardship that may take a bit of doing to overcome is the selection of a spot to do the deed. We are fortunate to have large galleries used for no other purpose than the exhibition of photographs. Others, with less available room, may find it necessary to put up only a part of the entries at a time.

In summing up, it seems that our revolution has not been of great proportions, but we are firm in the belief it is a step in the right direction. It is our contention that the Puyallup system will encourage pictures with a fresh viewpoint, will unmask the tricks and dodges of hackneyed "salon type" pictures.

By breaking the judging down into several sessions, judges will retain their keen sense of proportion, free from distractions and fatigue. The informality of strolling around the galleries eliminates the mechanized sense so often experienced at conventional judgings. The exhibitor will benefit, in that greater justice is done his offerings. The public also gains in that they see a collection of pictures more nearly approaching the goal: "The world's best in contemporary photography!"

The Red Eye Effect

in flash color photography

By Oran E. Miller*

In color pictures taken by flash illumination the people photographed often exhibit what is sometimes called the "red-eye" effect. The pupils of a person's eyes may appear bright red or orange-colored, a weird and startling effect which is pictorially undesirable. By observing a few simple rules this may be avoided in practice, or at least minimized.

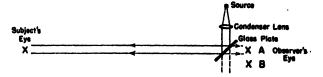

The red-eye effect occurs because light which enters the eye of the subject is reflected from the retina out through the pupils in a fairly narrow beam in much the same manner that light from automobile headlights is reflected by highway sign reflector buttons.

Nearly everyone has observed that the eyes of certain animals seem to shine in the dark. This is because the eyes of some mammals are equipped with a layer of flattened, highly reflecting cells located just behind the retina. Furthermore, the ocular pigmentation is much less in this area and hence, most of the incident light is reflected. In the human eye, however, almost the only reflecting substance in the retina is the mass of blood vessels associated with the retina. Light transmitted by the retina is mostly absorbed in the black pigment of the choroid. For this reason the reflection from the human eye is not as bright and is reddish in color. Such reflections from human eyes are seldom seen except under very special conditions. It is sometimes observed in children when a distant bright source such as a window is imaged on the retina but the face is shaded from nearer room lights.

One may well wonder why this reflection is not recorded in ordinary color photography, but only in flash pictures. The answer is not that the reflection is absent under ordinary circumstances, but that it is either not bright enough to photograph in comparison with the brightnesses of the other *Color Control Division, Eastman Kodak Company elements of the scene, or that the geometry of the lighting is such that the camera lens is not in a position to receive the reflected light, which is confined to a narrow beam in the immediate neighborhood of the principal light source. The brightness will be directly proportional to the amount of light entering the eye, which, in turn, is proportional to the square of the diameter of the pupil.

The effect is not often noticeable in black-and-white flash photography since red light does not contribute a major part of the exposure and hence the effect will, in general, be too faint to register. Only in the case of pictures made through a red filter would the effect become really serious. Figure 1 shows a portrait of a dark-adapted subject taken by flash through a Wratten #29 red filter on Eastman Super-XX negative panchromatic film. The first picture was made with the flash reflector touching the lens, and the second with the reflector displaced according to the rule given below.

In order to visualize more readily the optical phenomena involved, consider briefly a few simple schematic ray dis-

grams, the first of which (Figure 2) shows a very simple way of observing the red-eye effect. A sheet of glass is held between the eye of the subject and the eye of an observer at A. A collimated beam of light is partially reflected by the glass plate directly along the observer's line of sight

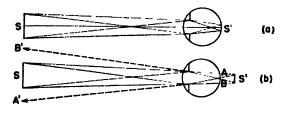

and into the eye of the subject. Since the observer looks directly along the incident beam of light, he is in position to see the reddish reflection from the pupil. However, when he moves his eye to position B, the reflection is lost and the pupil appears black.

Figure 3 illustrates a typical situation for flash photography. Light from the source, S, in a reflector of linear dimensions AB, is imaged by the eye lens of the subject on the retina at A'B'. At the same time, the camera lens L, is also imaged at L'. If the eye of the subject is perfectly accommodated for the distance of the camera and light source, the retinal images are sharp. The reddish illuminated spot on the retina becomes a new source from which red light passes out through the eye lens and is focused in exact coincidence with the original source. This is due to the wellknown principle of the reversibility of the path of light in optical systems. Likewise, the dark opening in the camera lens which is imaged on the retina at L' will be re-imaged back upon itself, and therefore, the pupil will photograph black. In this case no red-eye effect would be recorded in the picture.

Effect of Sharpness

In the foregoing illustration we have assumed perfect distance accommodation and have neglected the refractive errors of the eye. This need not greatly concern us in the present discussion since the chief effect will be to add slightly to the unsharpness of the image formed on the retina due to incorrect distance accommodation. Since the subject does not ordinarily look at the source, the eyes usually are accommodated for some other distance and the image of the source on the retina is not sharp. The eye lens projects this blurred image over an area larger than the source, which results in a small zone immediately around the source from which the observer may see the illuminated

pupils. Figure 4 shows two conditions of accommodation. In Figure 4a accommodation is exact and the image of the source, S, at S' is sharp. Figure 4b shows what happens when the subject's eye is accommodated for a greater distance. The image of the source falls behind the retina at S' and results in an unsharp circle of light on the retina at AB. This is projected by the eye lens to a larger diameter than the source, the boundaries of which are shown at A'B'. Anywhere within the circle A'B' the pupil will appear luminous. Its relative luminance will vary from point to point due to the penumbra effect of an unsharp image, being of least brightness at the extreme outer edge. If the subject is dark-adapted, a camera lens placed anywhere outside of S but inside the limits of A'B' will photograph the red-eye effect. A similar effect will be observed when the accommodation is for an object nearer than the source.

The red-eye effect is observed whether the subject is looking at the camera or to one side, although the brightness and color of the reflected light will vary somewhat due to the variations in color and reflectance of the different areas of the retina upon which the image of the light source falls. Reflections from the optic nerve may be nearly white, and from the macula the reflection usually has a characteristic amber color. The color and brightness also depend on the retinal pigmentation of the person. This is related to the iris color, people with blue eyes usually having less pigment in the retinal area also, and dark-eyed people having more. The effect is usually more pronounced for subjects with blue eyes. Also, since the ocular pigmentation increases with the age of the subject and the accommodation decreases, the red-eye effect will, in general, be more pronounced for very young children and correspondingly less for people in the older age groups.

Avoid "Red-eye" Effect in Flash

There are two general procedures whereby the "red-eye" effect may be avoided in flash color photography. One is to reduce the reflected pupil illumination to a low enough intensity so that it will not record photographically. This is accomplished by keeping the subject light-adapted as in ordinary photography. The other method is to maintain a sufficient separation between the flash lamp and the camera lens so that the reflected pupil illumination cannot enter the camera lens.

The first of these methods makes use of the familiar nerve reflex which regulates the size of the pupils of the eyes according to the prevailing level of illumination. If the subject is kept in relatively bright surroundings and the exposure is made by means of a synchronized flash, the diameter of the pupils will, in general, not be larger than normal, about 3mm. The red-eye effect usually will not be bright enough to record photographically with the pupils contracted to 3mm or less. On the other hand, if flash synchronization is not available and pictures must be made by the "open flash" technique in a darkened room, the pupils will dilate in many instances to 7 or 8mm in diameter. Since the brightness varies as the square of the diameter, the pupil may be 6 to 8 times as bright as when the subject is light-adapted. The red-eye effect then will be recorded if the camera lens is sufficiently close to the light source.

Even when synchronized flash is used, pictures sometimes may have to be exposed in a relatively dark environment. In such cases, it helps if the subject can look at a reasonably large area of relatively higher brightness. A luminance of five or ten foot lamberts is probably enough to keep the pupils from dilating appreciably.

Open Flash Technique

If the open flash technique must be used, or if pictures must be exposed under dimly lighted conditions in which dilation of the pupils cannot be avoided, then it is necessary to resort to the second method of avoiding the red-eye effect. By this method a minimum angle is maintained between the camera's line of sight and the direction of the illumination so that the reflected light from the pupil will not enter the camera lens. A simple calculation will show what this minimum angle should be. The normal range of visual accommodation in everyday experience requires a change in lens power sufficient to bring objects into sharp focus at any distance between ten inches and infinity. Since the equivalent focal length of the average normal eye is about 17mm, it can be calculated that when an object at 10 inches' distance is seen distinctly, the image of a distant object point is focused at a distance of about 1.15mm in front of the

Chapter IV Continued

9. Nature Photography Activity.

Nature subjects seem to have an almost universal appeal, and landscapes, flowers, clouds, etc., appear frequently in club competitions. In recognition of this interest, a special activity in nature photography can be organized.

The leader should have some knowledge of nature but need not be a naturalist. If he knows the names of common flowers, rock formations, etc., this may be sufficient. Or the leadership may be rotated if it is desired to have more qualified leaders in each field of natural science.

Since the subject is almost endless, the activity can continue through the year. Several sessions or trips may be devoted to flowers alone (wild and cultivated, indoor and outdoor). One meeting or trip might cover insects: where to find them: how to photograph them; etc. Similarly, other subjects may be covered.

The activity is especially gratifying to participants because two kinds of knowledge are obtained at the same time: photography and nature.

The group effort may produce a number of program features for club meetings, such as color slide stories of life cycles. or seasonal changes.

Of interest in connection with such a project is the fact that there is an exhibition field restricted to nature photography in which contributors may obtain the same sort of recognition as in the "pictorial" exhibitions.

10. Print Clinic Activity.

In effect, print clinics comprise instruction courses in photography for members. Hekl separately from regular meetings and directed by competent photographers capable of analyzing defects and shortcomings, and particularly of suggesting corrective measures, the Print Clinic Activity is particularly effective as a diplomatic method of improving the club's mass photographic ability. Print clinic sessions give each member personal attention, and a chance to correct personal shortcomings without public embarrassment.

For greater effectiveness, each participant in the activity should produce a corrected print at the session subsequent to that at which the original print was criticised. This becomes possible if made a fundamental requirement of participation, and if the regulation is religiously enforced.

Each participant should receive equal attention, and along the lines of obvious personal needs. Small groups being preferable to large, with 10 members the maximum, several clinics may be organized by larger clubs. If the spirit of team competition is introduced the activity becomes more interesting and the progress more rapid.

First session of the clinic may open with a discussion of the good and bad points of favorite negatives. East participant then is instructed to make a trial print for display and discussion at the next session. Study of the trial prints should reveal certain defects which may be corrected. A new print is made for a subsequent session.

Print clinic activities are excellent means of helping the more timid club members who dislike to ask questions or

to display faulty prints at open meetings of the club. Within

the security of the smaller group, there is less feeling of embarrassment, and greater personal encouragement to participate in discussions.

11. Judge-Training Group.

This is especially valuable to the larger clubs with members who have demonstrated their photographic ability but who have had no experience in judging. The purpose is to train them so that they may judge rationally (without prejudice or bias) and explain their selections concisely.

An experienced judge who has the respect of the members is required. He may be from within the club or may be an outsider. He will select the prints or slides to be used in the program so that they will illustrate the points to be made at each meeting of the group.

The size of the group must be restricted so that each member may receive personal attention. Perhaps ten should be the maximum. (Form additional groups if necessary.)

At the first meeting, ten slides would be projected, or ten prints passed thru the viewing box. Each member would decide for himself, silently, which he would consider the best of the ten pictures and indicate his choice on a slip of paper.

Each member then would be required to explain his selection. In the course of that explanation, the leader would note the weaknesses which would need attention, prejudices which would need control, etc.

About ten sessions should be scheduled. One should cover mechanics of judging (various methods of elmination such as voice vote, electrical voters, written scoring of each entry, etc.) Another should be devoted to methods for evaluating print or color quality. One should cover consideration of composition, with emphasis on avoiding decisions based on dogmatic composition. Two or three sessions might be required for considering subject material because this is where prejudices are most evident, and most in need of control.

Some place in the course should be a session on provincialism in judging, the feeling of some photographers that they can learn nothing from painters, etchers, etc.

At completion of the course, the club will have a number of judges who after trial assignments might go on to bring real credit to the club.

12. Community Projects.

Few projects are so profitable to a club as those in which it serves not only itself but also its community. Members profit photographically, the club gains publicity, and the community obtains the photographs (prints, slides, or movies) necded for its program.

The most common such project is the home town "documentation" of historical spots and buildings. Historical museums are much interested in these and appreciative of additions to their photographic files.

A variation of the same theme is the "pictorial" approach to home town subjects. See No. 2. The resulting pictures might be used by the local Chamber of Commerce in connection with vacation publicity.

Non-profit institutions such as hospitals occasionally need photographic help for major undertakings (for example, a campaign to obtain volunteer nurses.)

Community-fund drives, centennial celebrations, etc., are other events in which a camera club can be of great help. Some projects, such as documentation, can be initiated by

This Camera Club Manual is a tevision of the original manual prepared in 1945 by Victor H. Scales. It will be reprinted when publication is co distributed to member clubs.

the club and continue over a number of years. A standing committee might handle selection of subjects, preparation of albums or files, and contact with museums or other interested organizations.

Special committees would handle other projects.

Credit to the club is greater when it offers its cooperation rather than waiting to be asked, and once a year a club well might include in its business agenda the question: Where can we be of help to our community in the coming year?

13. Color Slide, or Stereo Slide Activity.

Many clubs are organized exclusively for planar color slides or for stereo slides, and most clubs which started as black-and-white clubs have added sections for slides.

However, in clubs in which the chief interest still is in monochrome it might be profitable to have a sub-division to organize contests or present programs in color, for those members whose interests might be shifting from monochrome.

Color camera clubs might have similar provisions for stereo.

14. Dark Room Activity.

Whether the club provides dark rooms for its members, and however well members may be equipped with private darkrooms, the organization of a regular or occasional Darkroom Activity can be helpful.

The fact that darkroom facilities usually are limited requires that the number of participants in the activity be small or that the activity be divided into groups which can make use of darkroom facilities at established times. Small groups may meet in home darkrooms.

Objective of the activity is to inform members as to darkroom design and construction, layout, equipment, use, and methods. A darkroom activity may become an interested group which builds and equips the club darkroom and controls its use, an obvious aid to club management. Darkroom demonstrations may provide club meeting program features.

Special Events

Many camera club undertakings, being temporary in nature, scope, and interest, lend themselves more to promotion as special events than as organized activities. Having aspects of novelty and entertainment, they are held only occasionally. Out of some of them, provided members indicate a sustained interest, can develop organized activities. Among such undertakings which clubs have found interesting are:

A. Scavenger Hunt. There are a number of variations of this, but the different versions basically are similar. Club members meet at an announced place and time, and either individually or in teams, draw folded slips of paper on which are typed photographic projects to be completed within a given time.

Every effort must be made to assure as fair an operating basis as possible so that no members or teams may have good reason to protest injustice, partiality, or discrimination.

Subjects can be simple or difficult, suggested plainly or in the form of riddles. Usually the scavenger hunt ends when prints are completed and exhibited for the award of prizes by competent judges.

This feature obviously must occupy considerable time. Sometimes it is called a "Dawn-to-Dusk" hunt. Winners may be either member or teammates first completing the assignment, or presenting the best picture or series of pictures.

The event tends to develop the ability of club members to find pictures, to take them, and to make satisfactory finished prints within a given time. Comparison of prints at the end of the hunt is educational. If the hunt occupies an entire day, a club picnic, luncheon, or evening party may be held in connection.

- B. Portrait-Matching. This event creates active interest in "informal" portraiture. Members of the club are divided into "odds" and "evens". Duplicate numbers then are mailed on postcards to pairs of members. For instance, one "odd" and one "even" each receives a card bearing the number 7. When the club meets, with each member instructed to bring equipment for informal portraits, the "odds" and the "evens" having similar numbers are paired, and each takes the other's portrait. This event is particularly helpful in completing a set of informal portraits of club members.
- C. Art Tours. Club members form a group which, through its leader, makes special arrangements with the director of the local art museum. At an appointed time, the group visits the museum, inspects the pictures, discusses with the director art features applicable to photography. Such tours are educational in composition, lighting, subject matter, and other features.
- D. Make-an-Ad-Contest. Slips identifying products to be advertised are drawn from a hat by participating members. Each participant then makes a photograph he regards as suitable, prepares a layout of the complete advertisement with picture and words. He photographs the layout, and exhibits the print at a stated meeting.
- E. Negative Exchange. Each member brings a good negative to a meeting. The negatives are put in blank envelopes, are taken up in a box, and then drawn by members. Those who draw their own negatives may trade. Each member drawing a negative then makes for exhibition at the next meeting, a print which embodies his own ideas of how the negative should be printed. This event develops the picture possibilities of negatives, since any method or control process may be used.
- F. Auction. An auction of members' surplus photographic equipment and supplies is a service to all members, a "variety" program for one meeting, and help to the club treasury (by a ten percent commission on sales, if it is wished).

Appoint a committee to establish rules and conditions of the auction (whether owners can bid, whether fixed starting bids can be set, etc.), to contact members so as to obtain a sufficient "stock" of material, and to select an auctioneer. The auctioneer not only should be able to move the items for sale, but also his methods and patter should contribute to the "entertainment" part of the program.

G. Exchange Set Night. Most clubs have found it profitable to include in their programs each season one or more print or slide sets prepared by other clubs. Not only do such sets enable members to see what other clubs are doing, but also through discussion of the pictures they learn more about photography.

Sets can be obtained by exchange with other clubs through contacts established directly or by listing in one of the P. S A. directories of clubs with sets for exchange.

Another method is to enter one of the club circuits sponsored by the P. S. A. Color Division (slides) or Pictorial Division (prints). Each club enters several slides or prints and in exchange receives the complete set composed of pictures from all of the participating clubs.

H. Prints-from-Slides Assignment. Sooner or later most slide makers want or need black-and-white prints from their slides. Thus a color club can serve its members by teaching them how to make prints by direct-positive papers or by intermediate black-and-white negatives.

A group leader might schedule several meetings for small groups in the homes of members who have darkrooms. The resulting prints may be exhibited and discussed at a subsequent club meeting.

To be Continued.

Joing Away

Give a thought to the beginners in your family...and your own

Personal Cameras

Your wife . . . your Girl Scout daughter . . . your boy starting off to summer camp-each should have his own camera. Picture taking is a family affairall the more enjoyable and rewarding when each member contributes his share.

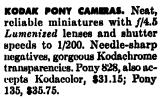

Here are four excellent choices.

BROWNIE HAWKEYE CAMERA, FLASH MODEL. Smart, compact, streamlined, and thrifty-12 pictures, 21/4 x 21/4, to a 620 film roll. Simple to operate, no adjustments—and a big, crystalclear view finder that helps the beginner get good results. \$7.20. Flasholder, \$3.39.

KODAK DUAFLEX II CAMERAS. Popular, inexpensive, twin-lens reflex types—12 pictures, 2¼ x 2¼ to a 620 roll. Kodar f/8 Model, with simplified lens settings for hazy, bright, and brilliant conditions, \$22.30. Basic Kodet Model, \$14.50. Duaflex Flasholder, \$3.50.

Hic

Safety First. Bumps will occur ... and a sturdy Kodak camera case protects your camera. Handsome, too. Field-type cases flip open in a jiffy; neckstrap makes carrying easy, keeps camera ready for action. There's a Kodak case for every Kodak camera.

You want to be in some of the group pictures. Clip a Kodak Auto-Release to the cable release to your camera . . . let it snap the shutter for you. Handy, too, when you must be near a subject, holding a reflector, back-ground, or extension flash. \$3.86.

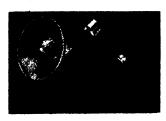

Set Clase. The vacation story demands close-ups for completeness

. . whether the subjects are nature specimens or commemorative inscriptions and historical plaques. Take along a complete phaques. Take along a complete set of Kodak Portra Lenses—the 1+, 2+, and 3+—and you're ready for subjects as small as 5 x 7 inches. These slip-on lenses fit Kodak Combination Lens Attachments . . . are priced from

Tuck this wallet-size encyclopedia into your pocket
... you'll refer to it a hundred
times during your vacation. The
Kodak Master Photoguide includes fast action computers... contrast-viewing filters . . . data on flash, close-ups, filters, and every other basic need. \$1.75.

Bettled Sunshine. Take flash equipment along—you're ready for action anytime, anywhere, indoors and out. Superb Kodak Ektalux Flasholders-reliable, professional-quality battery-condenser units—are priced from \$29.75, depending on the camera bracket included. Standard Kodak Flasholder, with Flash-guard, \$12.35. Kodalite Flash-holder, for Brownie Hawkeye, \$3.39. Duaflex Flasholder, \$3.50.

Light Control. Take a Kodak K2 Filter, for all-around blackand-white use . . . an A, for dra-

matic dark skies . . . a Kodak Skylight Filter, for use with color film (it subdues the bluish haze in distant scenics, gives a warmer cast to shots in open shade and on overcast days) . . . a Kodak Lens Hood, for flare protection. Kodak G and X1 Filters, and a Kodak Pola-Screen, are also use ful aids. Protect them all and keep them ready-at-hand in a Kodak Combination Filter Case.

Junior Lab. Let your boy or girl have the fun of processing his own pictures with his own equipment. Kodacraft Outfits supply the basic needs, at reasonable cost. Three levels: the Kodacraft cost. Three levels: the Kodacraft Printing Kit, for print-making only, \$4.30; the Kodacraft Photo-Lab Outfit, including film tank and print frame, \$7.45; the Kodacraft Advanced Photo-Lab, with film tank and metal contact printer pictured \$12.10 printer, pictured, \$12.10.

Prices include Federal Tax where applicable and are subject to change without notice.

Kodak

Experts' Choices For Fine Prints

M. PHOTOG., PPSA

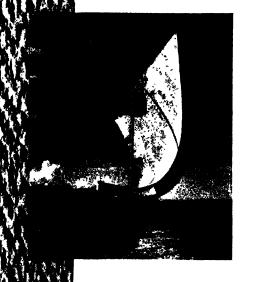

No. 5 of an informative series...how leading exhibitors choose papers to fit their salon aims

CARL MANSFIELD'S "Minnow Catching" is a much-traveled print—it has hung in eighty-eight salons, spanning the alphabet from Albany, N. Y., to Zaragoza, Spain. Like all his other exhibition prints (except glossies), it is on Kodak Opal Paper.

Mansfield writes: "In making prints for exhibition purposes, I like to retain as much of the original negative quality as possible, and still make a good snappy print that will stand out in competitions. It is also desirable to have a paper that will tone a color suitable to the mood of the picture. Kodak Opal Paper possesses both of these

qualifications, and also is available in a number of surfaces which can be suited to the type of picture. In Kodak Gold Toner T-21, it tones nicely to a rich brown, which is the tone I prefer for most of my salon prints; or it can be toned blue in gold thiocarbamide or Kodak Blue Toner, for marine and snow pictures. I use the G surface for most of my work, since it retains the fine detail that I like to see in pictures, yet its surface permits further manipulation and retouching on the print, which is sometimes necessary."

For more Opal Paper data, see below.

In variety of tint-and-surface combinations, Kodak Opal Paper excels all other Kodak enlarging papers. Where extra speed is needed in an Opal-type paper, Kodak Ektalure Paper G is a growing choice. And for high speed plus excellent "tonability" plus flexibility of contrast control plus a choice of several contrast grades all matched in speed -Kodak Medalist Paper. Bernard Silberstein's "Full Sail" (presented early in this series on Kodak Illustrators' Special) is here reproduced from a print on white, high-lustre Kodak Medalist Paper J.

Medalist's great flexibility and ease of control make it an especially good choice for anyone who desires to gain experience quickly and to refine his printing skill.

KNOW YOUR KODAK PAPERS, FOR KNOWLEDGE SPELLS SUCCESS

These are the papers for fine exhibition enlargements, gift prints, home decoration, and specialized applications—in a range of types to fit your every need:

For fast printing, fine warm-black tones, and great flexibility in manipulation—Kodak Medalist Paper.

For rich neutral blacks in a top-speed paper—Koda-bromide, five evenly spaced grades and four surfaces.

For rich warm blacks in a moderate-speed paper— Kedak Platine Paper. Two surface choices; three printing grades.

For widest choice of tint and surface in a low-speed paper of utmost tonal quality and adaptability to toning—brown-black Kodak Opal Paper. One printing grade.

---brown-black Kodak Upal Paper. One printing grade.

For Opal quality with twice the speed of Opal—

Kodah Ektalure Paper G.

For Opal quality in a special fine-grained surface suited equally to exhibition and reproduction—Kedak Illustrators' Special.

For photomurals-Kodak Mural R.

For transilluminated prints-Kodak Opalure Print Film and Kodak Translite Paper.

For extra-fast printing and processing—Kodak Resisto Rapid N. It's as fast as Kodabromide; and its special base allows washing and drying in ten minutes.

And for contact prints—Kodak Azo, Velex, Resisto N, and others. Each Kodak enlarging paper has a contact-paper counterpart, equivalent in type and quality.

For full details on these fine Kodak papers—tints, surfaces, weights, processing—consult the Data Book on Kodak Papers, and your Kodak dealer.

The Final Choice—First prize winner was made by judging club member, H. Ivan Bryden. Judges commend his work.

INTERNATIONAL CLUB PRINT COMPETITION

ROBERT J. LAUER, Associate Editor
California clubs still in top positions

With results of only one competition to report this season, two California Camera Clubs, Oakland in Class A, and the Mission Pictorialists in Class B, retain their long established first place lead. An unusual situation developed in this competition, held at Owego, N. Y., in that there was a three-way tie for the first place club trophy in Class A between the Photo Guild of Detroit, the Science Museum Camera Club of Kenmore, N. Y., and the Lawson Camera Club of Chicago. The host club, Owego, was trophy winner in Class B.

In Class B, the Mission Pictorialists are 40 points shead of their nearest rival, Orleans Camera Club. In Class A, however, the race promises to be a close one, with the Photo Guild of Detroit, with a score of 304 points, close behind Oakland with 309. And not too far away from the leaders is Baltimore, with 300 points.

The three judges of the April competition are well known in photographic circles throughout the Finger Lake, and Southern

Kevin Brown

Buena Vista
Second Place

Tier sections of New York State. Rev. Boyd Little, of Homer, N. Y., is a high ranking salon exhibitor, having judged numerous exhibitions throughout the southern New York area, and including a previous Rochester International. A widely known lecturer and teacher of art in many forms, Professor Walter K. Long, of Auburn, N. Y., was included on the panel. Professor Long is director of the Cayuga Museum of History and Art in Auburn, and also a professor of Fine Arts at Nazareth College, Rochester, N. Y. Last but not least is Mr. James H. Thomas. APSA. ARPS, of Binghamton, N. Y.

An engineer by profession, Mr. Thomas is employed by the State of New York as an assistant district engineer. Mr. Thomas' outstanding work as a pictorialist gained him his associateships in The Photographic Society of America and the Royal Photographic Society. He is also a member of the Pictorial Photographers of America. His one man show of fifty prints was exhibited at the Smithsonian Institution and in museums throughout the country. A group of his prints circulated by PSA have appeared in camera clubs from coast to coast.

Ballots were used by the judges again this month, and were sent to the participating clubs right after the judging. Here's how it worked: The teller who passed the ballot to the judges read off the club number of the print; the man at the casel checked the number and called out the title of the print so that the judges could he sure they had the right ballot. The judge then checked his name on the ballot and checked the squares under the headings of interest, composition, and technique, whether excellent, good, or fair, and in some cases wrote comments. The scores were checked. and duplicate reports immediately sent to the participating clubs.

Individual winners were as follows:

First Place "The Old Mill" by H. Ivan Bryden, Owego Camera Club

Second Place "Buena Vista" by William Condon, Lawson Camera Club

Third Place "A Thousand Eyes Plus" by Tony Karnosh, Western Reserve Pictorialists

Third Place "Young Explorer" by Earle W. Brown, Detroit Photo Guild

The third place tie was broken by the judges in favor of "A Thousand Eyes Plus" on the basis of originality and imagination.

Next month we'll publish the complete rules for the coming 1952-53 competition, which starts in October. And following that, in the September PSA JOLENAL, the results of the final contest of the season, held at the Fort Dearborn-Chicago Camera Club in June.

Club Scores are as follows:

CLASS A

Club	Apr.	Cum.

A. LYNNE PASCHALL, Associate Editor

Vacation Time

Most clubs take a recess during the summer months. The members close up their darkrooms and get out their traveling outfits, for the belief is common that summer is the time for accumulating a stock of fine negatives from which the prize-winning prints of next winter can be made. Maybe so, but many a roll of vacation-made shots never get beyond the hang up and dry stage, while the picture of the garbage man at the back gate is the one that goes to the salon.

But let us be of good cheer. Whether you are taking your vacation in Europe this summer, at the PSA Convention in New York, or just out to old Aunt Mary's, by all means take your camera along. When really looking for pictures you will find beautiful things in the most unexpected places.

We are all prone to overlook the things that are near at hand and go gallivanting over the country in search of wonders that never quite materialize. Perhaps, after all, it is the call of the open road that lures us on, and the camera is only an excuse. But no matter, let's take some pictures, because the more we take the more we see and that's the way to enjoy a vacation.

The vacation from which the sojourner returns without pictures is quickly forgotten, not only because he has failed to keep a record, but because he has overlooked so much. There is a type of traveler we all know (but do not wish to emulate) who lives only for the pleasures of the hour and returns from a lovely and inspiring jaunt remembering only what he had for dinner at Fisherman's Lodge, and how the hoot owls kept him awake at Lonely Hollow.

This summer promises to be the biggest season in the history of photography, so let's get into the game and collect some negatives with which to spellbind our camera clubs next winter.

Camera Club Print Circuits

Interest in Print Circuits, as well as some other camera club activities, seems to lag about mid-ummer. This is hard for us to understand, for it is the very time when program committees should be making plans for next year so that the program can be ready when the season opens in the fall.

You need not wait for prints from this summer's negatives. Take the three best ones from last year.

Mr. Hutchinson says that only a few clubs have been writing comments about the prints from their own members. Go ahead, he says, comment on all the prints; other clubs like to read what you have to say. In a recent circuit one of the clubs had this to say about one of its own entries:

"We like it enough to send it along in the Circuit. The maker is now in the process of remaking it a la Hogan . . . (John R. Hogan was the commentator). If everyone remade theirs according to the comments . . . What a show we could have! We're for it."

That is the spirit that makes any commentator happy. It shows that his work is not in vain and that some print makers are following his suggestions in an effort to make better prints.

Instruction Print Sets

Another activity has been inaugurated by the Pictorial Division as a service to photographers.

The Instruction Print Sets, under the directorship of Dr. John S. Anderson, are intended to bring top flight salon work to the smaller groups in the more remote or isolated sections of the country. In the past it has been brought home to us forcibly that this large segment of serious amateurs, while producing some remarkably fine photography, have been denied the privilege of viewing salon exhibits or attending the judging of salon submissions.

With this in mind the Pictorial Division has assembled sets of top flight 'one man shows,' and is making these sets available to PSA camera clubs throughout the coun-

try. Many of these sets are accompanied by comments by recognized experts so that the camera clubs may have not only the prints themselves but a running commentary as well to explain the finer points of the photographic arts.

Other sets are made up of prints which actually won recognition in nationwide print contests. Through the combination of these sets the small groups in isolated areas are given the opportunity to sit where the judges sat and hear what the judges had to say, and in that way to evaluate their own efforts. A test run on this activity during the past few months has proven that many of the folks who thought they were mediocre actually were doing salon work.

Recently reorganized, this activity now has distribution points in the North, South, East and West, and the sets themselves will be rotated so that all sections of the United States will derive the greatest service in the least time.

Watch this column for the announcement of Instruction Print Sets available to camera clubs in YOUR area.

PORTFOLIAN CLUBS

Sten Anderson reports that he has received several letters from prospective Portfolians in which it is evident that there are some mistaken ideas about the scope of the Portfolian activity, so he has written the following to clear these up.

Shortly after the start of the American Portfolios in 1945, it was noticed that a great number of PSA members enrolled in more than one Portfolio. These members, benefiting by participation in their first Portfolio, were eager for greater participation and thus enrolled in more Portfolios.

Sensing this desire led to the formation of the Portfolian activity, grouping PSAcrs in a city or community so they could collectively examine and comment on each other's Portfolios. To further coordinate the work and at the same time provide counsel, advice and criticism on member efforts, a Sponsor is assigned to each group.

The organized Portfolian Club has regular monthly meetings and may call extra or special meetings when necessary to accommodate the arrival of member Portfolios. If no Portfolios are on hand, the regular meetings are given over to demonstrations or other matters relative to Portfolio work or Salon presentation.

Due to the fact that the majority of the meetings may be held in the homes of the members, it has been found best to limit membership in any one group to 15 active members and declare the club closed when it has reached this quota. To supply replacement members, Associate members are permitted on a probationary period of 6 months.

Through the year the members may make prints on assigned subjects and after club criticism, these prints are sent to the Sponsor for individual criticism and evaluation. After return of prints from the Sponsor, they are worked over, resubmitted, and then may be sent to recognized Exhibitions.

During the year as the various Portfolios are evaluated by the group, certain prints may be selected by the Portfolian group as

meritorious and the Secretary instructed to make note of these so they may be borrowed at a later date for local showing.

With 10 members in a Portfolian Club, it is possible to view at least 20 Portfolios during the year, and with each containing on the average 30 prints, the group may evaluate and profit by the examination of some 600 prints.

At the conclusion of the Club year, the Annual Portfolian Club Salon is held. The purpose of this Salon is to give visible credit to the work of the members and at the same time publicize the local Portfolian Club. The showing comprises before and after prints, selected prints from the Portfolios viewed during the year and courtesy prints by the Sponsor. Thus a show of from 60 to 80 prints is made possible. The value of such a Salon to the community lies in the opportunity it gives to study and appraise individual characteristics of the members with established records, and at the same time develop their techniques and skills to meet the high standards set up by present day pictorial photography.

The Portfolian Club activity lends itself to many variations suitable to the particular locality and desire of its members. It provides a tried method for serious study and improvement in pictorial photography, as evidenced by the 15 Portfolian Clubnow operating from coast to coast.

To all interested groups or individuals we extend an invitation to inquire into the many advantages and benefits of this unique type of photographic club. Inquiries should be addressed to Sten T. Anderson, APSA, Director, whose address is in the masthead.

PORTRAIT PORTFOLIOS

Introducing A New Director

It is with deep regret that we announce the resignation of Paul J. Wolfe, APSA, as Director of the Portrait Portfolios, Increasing work in his own studio has made it impossible for Paul to continue to carry the heavy burden as Director of this activity. Our very best wishes go with you, Paul. May your studio continue to grow and prosper!

Replacing Paul at the head of this activity is Frederic Calvert of Chester, Pennsylvania. Many of you met Fred at the Baltimore and Detroit conventions. And probably many more of you will meet him next month at the New York Convention.

Fred writes us that he first became interested in photography in the early thirties, but didn't do too much with it as a hobby until late in that decade. Although he tried to get into photographic work in the Army during the war, he ended up in the Medics. After his return to civilian life, he was introduced to the benefits of PSA membership in 1947.

He first joined a Pictorial Portfolio, but since his bread-and-butter job is Real Estate, he can't get out on nice days as often as he would like to shoot pictures. Nice days, he writes us, he feels guilty if he goes out looking for pictures instead of trying to sell someone's house. And since

he can set up lights and take portraits regardless of the weather, his interest turned to this form of photographic expression.

He joined Portfolio #1 of the Portrait group. One time it was very late, so he wrote to ask where it was. Paul talked him into acting as secretary for that group. Later he also served as secretary for Portrait Portfolio #11.

Fred writes that he has been doing quite a little high key figure work, and has had prints accepted in several of the exhibitions both last year and this year. He was President of the Nether Providence Camera Club last year, and as news of his abilities spreads, he has been giving lectures and demonstrations on high key figure lighting.

The Portrait Portfolios enjoyed fine growth and expansion under the direction of Paul Wolfe—and we know that with someone as interested and enthusiastic as Fred Calvert at their head, they will progress to even greater heights of achievement and participation.

MISS EVELYN ROBBINS, Associate Editor

Chirps From The Robbins

This month you will find a deviation in the "Comments by Commentators" Section, which was written by *Dr. Carleton J. Marinus*, *APSA*, from the usual formalized copy that you are in the habit of reading.

reading.

"Doe" wrote giving me permission to take out what he called the "personal paragraphs", but I have purposely left them in. It is such a perfect example of the feeling of all Commentators toward their own personal "gang" they are to them their "children", their family,

Every single Commentator that I have talked with has impressed me with his feeling of responsibility and that special "fatherly" attitude not to mention, of course, their pride when they say, "MY Portfolio Gang". You know, too, that they are sincere; they have a proud lift to their heads and a smile that can mean only one thing—pride of accomplishment.

Yes, we are all very very proud of our Commentators, too. It is truly a wonderfully warm feeling to know that they feel this way about us. I'd like to take this opportunity to say—and I know that I speak for each and every one of you that belong to Portfolios—many many thanks to you, our Commentators, for your unceasing and untiring efforts in our behalf. May we prove worthy of your pride!

Remember, next month is the big PSA doin's in New York. Why not plan now to attend?

You will have an opportunity to meet in person many of your fellow Portfolio members, and your Commentator. It is the chance of a lifetime to become better acquainted. There is no thrill quite equal to that first meeting in person with someone that you have previously known only through correspondence. From that time on they become more than just a printed, or written, name on a page-they are "real folks" and your friends. Most of these meetings have resulted in lifelong friendships.

From my own personal experiences, I can fully guarantee that if this were ALL you got out of a PSA Convention, it would be well worth the time and expenditure for the trip. Of course, you know, as well as I, that that is not all you will get out of a PSA Convention attendance. So, you see, the trip is doubly worth while all the way rcund.

Plan now to attend, Will YOU be there?

Comments By Commentators

By Carleton J. Marinus, MD, APSA Commentator Portfolio #52

Dear Children:

The new grand-on is really a husky and doing fine. I have no snapshots as I do not use flash and floods are too much for a five month old baby.

Jack: Your picture along with that of Jim and the boss are in the notebook, at the end of my October '51 notes. Jack's snapshot of me is better than mine of him, although the idea is the same. He has used the light more expertly and my print is too light. I think I had a better model than he did, but didn't do as well by it.

Did you notice the poignant expression in Marion Perry's snapshot contest winner in the notebook? That's really getting it. And to think Mr. Eastman got that negative for five bucks. There's no justice.

In comparing the prints in the portfolio, I notice two things.

- 1) The very very gratifying improvement in the pictures of the great majority of the portfolio members.
- 2) Experiments in new techniques by some of the members that did not come up to their past performances with normal technique. Don't let that bother you, There was a time when they were making as bad or worse mistakes in handling normal techniques.

These observations point up one of the real values of the portfolio program. The beginner has trouble with the variables in normal technique. He puts in a print that is bad. He knows that it is bad, but does not know why or what to do about it.

Old '52 goes around. Everybody puts in his two cents worth. When it comes around again, the maker has fourteen comments, some about one fault, some about another. Each one offers his suggestion about an error-how to avoid it- how to correct it.

That is the meat of the portfolio. To say to a beginner that his print is not sharp, without telling him why it is un-sharp, is no help at all— as an example.

The same thing applies to the unsuccessful attempts of the advanced worker with a new technique. He knows that the print is not right; but he doesn't know why or

what to do about it. All the contributors, new or old in photography, make their comments. Out of fourteen opinions the maker will find a great deal of help in solving the problems.

I want to point out that you do not have to be an expert photographer yourself, to have a valid opinion about a print. The really good picture has to appeal to the great majority of all who see it. Joe Doakes has just as much weight as Ansel Adams or Steichen.

Maybe the newer photographer's suggestion as to improvement, does not help. So what? If you have fourteen suggestions, all different, some of them will be in the right direction, just by the law of averages. If you get four or five saying the same thingthey are right and you are wrong, so help

As an example--several in the last round. suggested cutting off most of the base of my print-eliminating the little girl's legs. I knew they were wrong and I was right; so I made another print to prove they were wrong. What happened? The new print was much better. Did I come down off my high horse?

To really get the most out of the portfolio, we must make it a point to re-make the print as suggested by the commentators. I did, and learned a real lesson. How many of you do? I know it is an effort. You worked with the first print and now you're tired of it. You don't want to ever see it again. But do it over, even if you think the portfolio is wrong. You will learn most about photography by trying to correct your mistakes.

Now about this business of experimenting. I would suggest that you stay with normal techniques until you have them licked, then go into the experimenting, one thing at a time until you have that licked.

We're all so happy that Marion's Charlie is on the mend. It will be slow. Marion, so don't get discouraged. Give our love to Judy. What a job you must have with that house-full of glorious humanity,

That word "humanity" suggests my final paragraph. Let's continue to express the warm, friendly feeling we have for each other. Unless we write it down, no one will know about it. The notebook is the place.

Let's all get to the convention in New

AN INVITATION

This is an invitation to every PSA member to participate in the PSA American Portfolios.

Enrollments are now being received in the following specialized groups:

PSA Pictorial Portfolios

PSA Portrait Portfolios
PSA Miniature Portfolios
PSA Control Process Portfolios

PSA Star Exhibitor Portfolios (For PSA Award of Merit Winners) PSA Nature Portfolios

PSA Photo-Journalism Portfolios

For information concerning any of the foregoing activities and for enrollment blanks, write to the Director of the PSA American Portfolios. Eldridge R. Christhilf, Hon. PSA, APSA, Suite 406, 800 Davis Street, Evanston, Illinois.

York this August. I'll be here. Look me up; I want to know you better.

... "Doc" MARINUS

"Star Dust"

A monthly column devoted to the "Fit and Wisdom" of the Stars as taken from the Notebooks in the Star Exhibitor Portfolios.

By ROY E. LINDAHL, General Secretary Star Exhibitor Portfolios

We had the privilege of browsing through Star Number Three the other day and found that it contained some very good examples of Pictorial Photography, also that in the relatively short time it has been traveling the members have made a place for their group among the "top" Portfolios.

It has been our experience generally that in those Portfolios with which we have come in contact, the ones which have an active Note Book are the ones which maintain the most consistent membership as well as provide the greatest continuing interest. This is again confirmed by the contents of the Note Book in Star Three which contains some timely comments and suggestions that we will try and pass along to you.

Early entries by several members are directed at stimulating interest in the Note Book and might well serve as a pattern for some of the less successful Portfolio groups.

Ray Tallinger, Pleasant Hill, Ohio writes as follows:

"To be perfectly frank, this Portfolio isn't all that I expected. If a person desires to make better pictures I think the Portfolio should contain his current work rather than represent his pictures of one or two years

"So far as the commenting is concerned, for the most part I think it is fair and well founded, and if the maker is really serious in wanting criticism, it should be very helpful."

Frank Heller, Bartlesville, Oklahoma, makes a bid for increased activity in the Note Book with the following comments:

"I think that the members of this group need to let their hair down. We are all too formal. Let's argue and make profound statements. I am in two Anglo-American Portfolios and we have several interesting arguments going on and it is very interesting as borne out by the fact that one seldom sees less than a three page notebook entry. Contrast that with the "duty-bound" short entries found here. If we do not start having fun the portfolio will surely fold."

H. J. Ensenberger, Bloomington, Illinois,

"It is my firm belief that pictures are made in the darkroom. Not being scientists or research experts we must rely on our spare time to appease this diversion. That seems to be the status of the great majority of amateurs and (according to the notebook) of most all the members of this portfolio. My darkroom work is confined principally to Fall and Winter at which time I work on the negatives that were exposed through the Spring and Summer.

"It would seem to me that prints which have all ready proven themselves in the Exhibitions are "excess baggage" in this kind of portfolio. However, the opinions from other exhibitors, on prints that did not "click" or on new ones of which we are in doubt, are surely most welcome and of real value.

"Making prints that we ourselves like, or prints that salons like (in most instances) are two different things. Our prints are something like our children. We see only the good points in them. But the "trial-by-jury" of fourteen other "parents" who are interested and experienced in raising pictorial "kids" of their own, can hand down a decision that will reassure the original parent and perhaps influence his approach in the right direction."

The Salons, always a timely topic among exhibitors, come in for a little evaluation by two of the members with the following comments:

Alfred Hyman, Rochester, New York:
"I dislike the expression 'Salon Print'. Let's make pictures for the pleasure of creating. Like the word 'Pictorial' let us aim for pictures with interesting subject matter, pleasing lines and good tone and mass arrangements. We have all had honor prints in one salon rejected in the next,

so why worry?"

Axel Bahnsen, Yellow Springs, Ohio:

"Salon exhibiting is a means by which I evaluate my ideas, I have no illusions about salons being art, or that hanging a number of prints every year will make one an artist, Heaven forbid, but it will make one a good craftsman."

STANLEY D. SOHL, Associate Editor

An International Vacation

Is it vacation time again at your house? Well at least it is that time of the year when all hearts, minds and pocket books start straining their eyes to look over the various fields of vacation pleasure. Where shall we go, how shall we get there and how much money shall we spend, are the big questions for this month. If you're really interested in a camera-shooting vacation, and who of us isn't, let me recommend a man who knows all about a place superb, a place just made for your requirements, Ed Palmer of Sioux City, lowa can give you all the inside dope on the best vacation land with the Americans-Mexico.

Photogenic Mexico

Members of the Mexican-U. S. International Portfolio are well aware of the photogenic attractions of Mexico. The thousands of tourists who cross the border every year are equally aware of her photographic charms and the infinite number of opportunities to use a camera. For those readers who haven't yet succumbed to the lute of Mexico the following suggestions are offered.

I don't know any convenient place where so much that is different, pleasant and beautiful can be found for such a modest expenditure of time and money. There is plenty of travel literature on Mexico and every tourist will accumulate a stock of it. I particularly recommend the tour book of the American Automobile Assn. entitled "Mexico By Motor." It is invaluable to motorists and extremely useful to those going by plane or train. It contains a wealth of information about climate, clothing, health and customs requirements as well as information about hotels, routes and points of interest. Another very helpful publication is the book "Photographing Mexico" by Cecil B. Atwater, FPSA, FRPS, published by The Camera, Baltimore, Md. It covers the photographic considerations, tells where to go and how to get back from your equipment. It is really a photographic guide-book.

As to what to take, it depends on the individual but I would suggest that gadgets be kept to a minimum. Take a tripod if you can, a K-2 or similar filter, sunshade, light-meter, and a sky-light filter for color. A changing bag is a must if you use cut film and may prove convenient if you have mechanical difficulties. Take a good supply of film with you, though fresh supplies are available in all the larger towns at prices equivalent to those in the States. You will be surprised how much you will want to shoot and you will be an exception if you don't underestimate your needs.

Mexico is colorful and color slides afford a most satisfactory personal record of your trip. By all means take a miniature camera for color and use it freely. Your slide collection will be a priceless souvenir. Moviemakers will find plenty of company and can use mileage rather than footage to measure their productions. The serious black-and-white worker will go mad over the numberless salon subjects he finds everywhere.

There is considerable controversy about the high actinic quality of the light in Mexico. A good deal of the average visitors travel will be at altitudes of 5000 feet or more. The air is clear, the sun is bright, and I believe you will be better off if you use about 1/2 stop smaller aperture than the meter indicates. One of the main problems is contrasty lighting with black shadows. This is particularly true at midday when the sun is directly overhead. Try to concentrate your shooting in the hours before 10 or after 2.

If you must shoot a contrasty subject then overexpose by one or two stops and cut development time to 1/2 or 2/3. I find that my own most common fault with my Mexican shots is over-development. If you find an occasional negative that needs more development it's easier to intensify them than it is to reduce the ones that are too contrasty. Local processors are about the same everywhere and developing your own B & W films is much to be preferred. However as you will be operating under new conditions it might be worthwhile to have a few samples finished to see how you are doing. Cloud effects are often spectacular in Mexico but heavy filters are rarely called for. If you are one of those who likes dramatic sky effects perhaps you will want a darker filter but for most workers

a K-2 will be ample. For ordinary scenes the lighting is usually so contrasty that no filter is needed. By the same token a good sunshade is essential as reflected light can cause plenty of trouble.

Club Activities In Mexico

The Club Fotografico de Mexico, centrally located at Ave. San Juan Letran No. 80 in Mexico City is an amazing lavout and well worth a call. The facilities of this super camera club are outstanding. The members make frequent field trips and if you are lucky you may be able to join one. It sponsors the Mexican end of the Mexican-U. S. International Portfolio. You are always invited to visit their setup and even use their facilities if you wish.

Beware

As to non-photographic suggestions: the biggest bane to the tourist is dysentery. You can avoid it by extreme care in what and where you eat and drink. Mexican beer is alright but if you don't like beer, tea is safe as it is made from boiled water. Bottled water is almost always available. Be suspicious of all tap water. Avoid uncooked vegetables and fruits except those you peel yourself. Pass up milk, butter, cheese and other dairy products. Avoid lettuce as you would the smallpox. I have made many trips to Mexico and have never had what is locally known as the "turista disease." It can be done if you will use these simple precautions.

If you go by car by all means carry a basket of picnic supplies with a few caus of food from the States and a supply of cheese, peanut butter, sardines, etc. so you can have lunch where you want. Delicious, fresh hard rolls can be bought at any village bakery panaderia, if you want to know what to look for--and bananas, oranges, tangerines, papayas and pineapples are sold for next to nothing in the public markets. Carry a thermos bottle of water and a gallon jug too. If you don't need it perhaps the radiator will.

The people are pleasant, courteous and helpful. They have been educated that the tourist dollar is a great natural resource and will do all they can to go more than halfway with you. You'll be amazed at how genuinely helpful they will be. Frequently a proffered tip will be refused but don't be afraid to offer it, and expect to pay a small fee if you ask people to pose for you.

Try to find places off the beaten path if you have time. Many of them are singularly rewarding. Every tourist has his favorites and experienced travellers will be glad to tell you of ones they know. My own dreamland is Hacienda San Miguel Regla, located about 80 miles NE of Mexico City. Reservations can be made through Wells Fargo. It is one place where you don't have to worry about food or water, and it is photogenic to the nth degree.

A knowledge of Spanish is helpful but far from essential. English is spoken in shops and hotels, and in its absence the sign language is a good substitute. Again the courtesy of the people is wonderful. They'll do much more than most of us would to help an ignorant foreigner.

Few visitors to Mexico fail to return

again and again. For the photographer it's a dream come true. Don't put it off but take the first chance to visit Mexico. You'll wonder why you waited so long. And remember it's delightful at any time of year. Good luck and good shooting!

Well, I highly recommend a try at Mexico this year but if you can't, for some reason or the other, start making plans for next year. As Ed said all you have to do is write and you'll get all the folders and information you'll want for such plans.

Have a good profitable camera shooting vacation and we will see you in New York come August and our convention.

George Green, Associate Editor

Summer Musings

When the bees start beeing and the day beckens to the wanderer, the doer, and the lethargic ones, that is the time when the pictorialists pick their ways through fields, streams, and byways to capture upon film the wonders of this living world.

It is the lethargic ones, though, of whom I m thinking. They are the ones, lucky souls, who have a faculty for achieving the ultimate because they are too lazy to do anything the "hard way". They are "lucky souls" because by a minimum of effort they find time to observe the beauty that surrounds us constantly. With leisurely eye they survey this kingdom of hurrying humans and drink in all which the quick is so prone to miss.

Not by any means does your humble Associate Editor cast a blemish upon those who are nimble of mind, fleet of foot and/or derisive of slowpokes. It's just that right now I'm beginning to see that a slower pace permits a greater enjoyment of life. If something has to be done within a certain time the one with the growing ulcers will take over the chore from the lethargic one. This impatient individual cannote stand by and wait for the slow-moving person to do the job. Because impatience is fed by impatience the flame burns so that the eyes are obscured.

AND THAT IS WHERE I COME TO THE MEAT OF THIS COLUMN.

Whether you are a Sunday Snapper or a Picky Pictorialist this applies to you. When your camera is loaded with film and you're out to get good pictures you must keep your eyes open and your wits keen so that you can see and recognize good picture material.

It is immaterial what your subject matter may be. It is of no consequence that the picture was taken with a Super Snazzeroo f2 lens in Palatable Shutter. It doesn't mean a hoot to the persons looking at your finished product how, with what, and when you made the shot. It's the results that count. Unfortunately, as in every walk of life, many aspire but few succeed whether it be greatness in art, business, or photography.

What is the measure of success? How does one know whether they have the stuff that leads to this goading task-master? And, most of all, how does one recognize it?

You all can undoubtedly answer these questions because we all aspire. Because we yearn, dream and want — we know what its measure is. But that is as far as it goes, Very few know what it takes to achieve and very, very few can recognize it in themselves.

All this beautiful white space taken up with many inked words to lead to one point! But then, what would you have done IF I had merely written: Do you want to be a success? I know how you can!! You would have immediately skipped to something more interesting and there I'd have been — without anyone to read the fruits of my love.

The majority of us mortals are darn lazy. We like nothing better than to have someone take over the work we are supposed to do. We're always willing to have someone make our lot a little easier. And, then . . we don't do a darn thing about it. So, if you're not too tuckered-out from reading this far and want to know what is wrong with you not hitting the bulls-eye with your photographic efforts just send an enlargement and contact print of your prize (to you but not others) print to J. Elwood Armstrong, Director of the Print Analysis Service, Tell him how you took the shot, why? and whatever other data you can recall. Send it to him by first class mail and enclose sufficient postage for first class mail return to you. You will find the address on the masthead.

And, before you hustle off to the print collection, may I close with this thought: Photography is what you make it -- not what it makes you. Keep shooting!

VIEWS AND REVIEWS

BY THE DICEST EDITOR

New Pictorial Division Officers

The 1952 Pictorial Division Nominating Committee consisting of Grant Duggins, FPSA, Sacramento, California; Mrs. Anne Pilger Dewey, Hon. PSA, APSA, Chicago, Illinois; Warlaw M. Hammond, Philadelphia, Penna.; and John R. Hogan, Hon. PSA, FPSA, Chairman; presented the following slate of officers for the 1952-54 term:

Chairman, Ray Miess, APSA, Milwau-kee

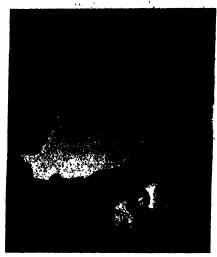

Vice-Chairman, Loren M. Root, APSA, Chicago

Secretary, Miss Stella Jenks, Columbus Treasurer, Robert J. Lauer, Wauwatosa

No further nominations having been received before the deadline, the Secretary was instructed to cast a unanimous ballot for the nominated officers, and they were declared elected.

These officers will assume their official duties at the time of the New York Convention.

STELLA JENKS, P.D. Secretary

Lines For Someone Who Hasn't Quite Decided

You've read all the articles put out by New York Convention Committee extelling the glories of attending the convention. You've carefully looked over the program in the JOURNAL, and you agree that there are some mighty interesting speakers listed, speakers you'd like to hear. But still you are a little doubtful. You haven't participated in many of the PSA activities and you only know the names of the people you read about in these pages from month to month.

You are just an ordinary guy. You've never been to a PSA convention before, and you are just a bit dubious. What can YOU expect from your attendance at a PSA convention?

If you are anti-social, and don't want to talk to a soul, you can still get a lot from attendance at the convention. There are at least seven really good programs that the Pictorial Division has had a hand in planning for your instruction and information. You can attend these programs and find the solution for many of your problems.

The Exhibition held in connection with the convention will be at the Hotel New Yorker. If you want to study the pictures which are being accepted in the best of the photographic exhibitions, these pictures will be available to you for study and inspiration during the convention.

But if you are interested in making friends (and who isn't), you will find among those attending the convention at least fifty who can and will be better friends of yours after the convention's four days have ended.

There will be outstanding foreign personalities at the convention. Francis Wu is coming from far-off Hong Kong to be with us at convention time (and to make a Lecture Tour afterward). Manuel Ampudia will be up from Mexico, and there will be the usual large group from Canada.

And people who love photography from all over the United States will be there. California and Texas, Florida and Alabama, Missouri and Illinois, as well as Massachusetts and New York. Most of the Directors of the activities will be there, and they are all such friendly folk—all you have to do is to shake their hand and tell them your

name. It's as easy as that.

Many of our outstanding PD personalities will be on the program. And they are not the untouchable kind of folks. They are the friendly, neighborly people who will help you with your problems if they can.

You're still not sold, you say. Well—there is still one more type of photographic hound you will meet at the convention. He's the ordinary guy like yourself who isn't quite sure whether he is good enough to be in any of the activities, and he came to convention from somewhere in the Mid-West just to see what it is all about. You'll sit next to him at the programs, and you may share a table with him when everyone tries to get lunch at the same time in the corner drugstore or beanery. He'll be a little lonely too, and you will find that you have much in common. Together you may get up enough courage to see that I'm telling the truth when I tell you that the activity directors and the speakers and the other photographic personalities who will be there are just as friendly as the ordinary guy you sit next to at a program (and he may even turn out to be one of the speakers trying to pick up something new).

So you're still a bit dubious — but you think maybe you'll try it. Fine! Make your reservations, for sure, right now! Tell your boss you've just got to have your vacation from August 12th to 16th. And say "hello" to me when you get there. I'll be seeing

PSA Recorded Lecture Program

The Recorded Lecture Program of the Pictorial Division offers the inlowing programs for your club.

No. 1 An Analysis of Recognized Salon Prints by Ragnar Hedenvall, APSA.

No. 2. Commentary on Recognized Salon Prints by Morris Gurrie No. 3. Outdoor Photography by D.

Ward Pease, FPSA
No. 4. Still Life by Ann Pilger

Dewey, APSA, Hon. PSA.

No. 5. New Prints for Old by Barbara Green, FPSA.

SPECIAL Photography of the Nude by P. H. Oelman, FPSA

A deposit of \$25.00 should accompany an order. A service charge is made for each Lecture. The SPECIAL costs \$10.00 and should be ordered directly from Mr. Oelman. For clubs which are members of PSA but are not affiliated with the PD the charge is \$6.50. Clubs which are affiliated with the PD will be charged \$5.00. The service charge is deducted from your deposit when lecture is returned. Clubs or groups not members of PSA will be quoted prices on request to the Director.

For Nos. 1 to 5 order from Philip B. Maples, Director, Recorded Lecture Program, 29 Spring Street, Brockport, New York. For the SPECIAL please contact:

For the SPECIAL please contact: P. H. Oelman, FPSA, 2505 Moorman Avenue, Cincinnati 6, Ohio.

PSA COLOR DIVISION

George F. Johnson, APSA

Forestry Building, State College, Penna.

To Our New Members

It is most gratifying to note that approximately 225 new members joined the Color Division during the first quarter of 1952, making more than 1,000 new members during the past year. Most of these individuals and clubs have probably never been members of PSA and the Color Division before. The officers of your division are, therefore, especially anxious to have you take full advantage of all services provided by the Division and report your reaction and suggestions from time to time. If for any reason which you feel is within our control, you decide not to continue your membership beyond your first year, you will do us a great favor by reporting the reason to us.

You have received our welcome letter and our Service Folder. Keep the Service Folder handy and refer to it frequently. Within its four pages, you have the details of 14 special projects and 15 related services, all planned around the desires and needs of our individual and club memberships.

Bi-monthly, you receive the Color Division Bulletin. Read it carefully, and keep the issues on file. You will find many occasions to refer back to helpful suggestions and important facts published therein. You are invited to contribute material for this publication.

. We, the officers of the Division, are anxious that you enroll not later than next fall 'n at least one of the Color Division special projects. Many of the leading color slide exhibitors today, are "graduates" of these circuits, slide study groups, and bi-

Coming Salons Agreeing to Follow PSA Recommendations

Note: M-monochrome prints, C-color prints, T-color transparencies, SS-stereo slides, V-monochrome slides, A-architectural prints, S-scientific or nature prints. Entry fee is \$1.00 in each class unless otherwise specified. Recognition: The monoch.vme portions of salona listed have initial Pictorial Division approval. Check salon list of appropriate division for recognition of other sections.

monthly competition, in which active participation has been taken for the past five or more years. Remember all projects are free to Division members. You have paid for these services, why not take advantage of them!

G. F. J.

Et Tu, Judges?

The millenium is almost upon us. Three out of four Judges, heard recently, have preambled their comments with a serious plea for slide makers to "stop trying to make pictures to please Judges".

Not so long ago a cry was raised against Judges with personal prejudices and preferences. These Judges are beginning to take such criticisms to heart. And they now have presented a pretty good defense.

They realize what we should all consider, that human nature is bound by prejudice and preference. That it is practically impossible not to let it creep into "Judging".

So—they have faced facts and have decided that smart slide makers should be able to evaluate their own slides as to Composition and Technique and that if the maker likes the subject matter and if the slide completely satisfies him, that is all that is necessary.

Whether or not it is accepted by one Judge and perhaps rejected by another should not discourage the maker.

It then behooves the maker to be quite certain the slide is completely satisfactory to him in every detail before presenting it for Judging.

When this is accomplished, the slide's record of acceptances will undoubtedly outnumber its rejections. V. 1., F.

Chicago (M) Closes Sept. 27. Entry fee \$2.00. Exhibited Oct. 18 to Nov. 16 at Museum of Science and Industry. Data: Miss Mabel Young, 231 S. La-Salle St. Room 1382, Chicago 4, Ill.

Zaragoza (M) Closes Sept. 15. Exhibited Oct. 5-28.

Mexican (M) Closes Oct. 15. Exhibited Nov. 15 to
Dec. 15. Data: Ray Miess, 1800 N. Farwell Av.,

Milwaukee 2, Wis. or Club Fotografico de Mexico,
San Juan de Letran 80, Mexico 1, D.F., Mexico.

Coming Color Exhibitions

PSA (New York), August 13-17, deadline July 10. Four slides, any sise, \$1, or four color prints (any process), \$2. For. ". Amy Walker, 25 Monroe Pl., Brooklyn 2, N. Y.

SACRAMENTO, Aug. 28-5 rot. 7, deadline Aug. 7.
Four slides, \$1. Forms: Grant Duggins, PO Box 2036, Sacramento 9, Calif.

PITTSBURGH ALL COLOR, Oct. 5-13, deadline Sept. 23. Four slides, \$1. Four prints, \$1 p.'s postage. Forms: James Dixon, 219 Seventeenth Av., Homestead, Pa.

TULSA, Oct. 13-14, deadline Sept. 30. Four alides, \$1. Forms: Ruth Canaday, 1779 S. Victor, Tulsa, Okla. CHICAGO, Nov. 3-16, deadline Oct. 18. Four alides (all sizes), \$1. Forms: Arthur Papke, 4106 Gilbert Av., Western Springs, Ill.

MISSISSIPPI VALLEY, Nov. S-8, dendline Oct. 22.
Four slides, \$1. Forms: E. A. Tucker, 3625 Carter
Av., St. Louis 7, Me.

Leaders and Trailers for 35mm Color Film

Each roll of 35mm film contains a leader and a trailer. Between the two is an area intended for pictures, and this is of ample length for 20 (or 36) correctly positioned 24 x 36mm frames. The lengths of leader and trailer are not determined arbitrarily by the manufacturer, but by definite standards established by the American Standards Association.

On such specification is Z38-1.49-1948, and it is titled American Standard Dimensions for 35mm Magazine Film (For Miniature Cameras). According to this specification, the leader is defined as the part of the film that precedes the first picture. It is used for threading the camera and protecting the picture area from accidental exposure. The trailer is defined as the part of the film that extends beyond the last picture. It is used for fastening the film to the magazine core, and extends from the spool core to the picture aperature.

According to the specification, the leader, including the tapered tongue, is the first 8½ inches of leader include the equivalent of three 24 x 36mm frames ahead of the first exposure. It is in this area that we frequently get into trouble when we attempt to obtain an additional transparency or two beyond the indicated capacity of the roll. In terms of sprocket holes, the normal position for the first exposure is 44 perforations from the leading end of the film.

In the case of K135 film, 4 inches of leader, including the tapered tongue, is removed before processing. Of the remaining leader, % inch is used for splicing one roll to another, preparatory to continuous processing. Just inside this splice, the identification number for that roll is perforated.

A minimum length of 5 inches of leader is necessary for the cut-off, splice, and identification number, and the remaining 3 inches is provided to guard against accidental fogging of the usable film during loading and subsequent handling. While the length of leader may appear to allow for one or two additional exposures, there is no guarantee that the corresponding transparencies will be returned undamaged, since some tolerance is required for the film used.

Consequently, if exposures are made on the leader, it is entirely possible that these exposures may be perforated, fogged, or lost. Perhaps many of us have experienced these situations and we should guard against them accordingly.

Because cameras vary, we should follow the respective loading instructions for the camera involved, and should not deliberately attempt to use leader with the idea of obtaining an extra frame or two, since we will have no cause to complain if perforated or fogged transparencies are returned as a result.

With stereo cameras it is necessary to follow the loading instructions to the letter, and to use extreme care to prevent fogging the leader. Otherwise the first frame will be lost

With these thoughts in mind, and with some real Summer weather in the offing, load your cameras carefully, and go out and have fun.

W. K. RAXWORTHY.

Color at the Convention

Three days beginning Wednesday evening, August 13, will be filled with features of special interest to Color Photographers attending the PSA Convention in New York. Opening with the projection of the accepted slides in the PSA International Exhibition on Wednesday evening, the program contains an outstanding array of travelogues, slide clinics, field trips, luncheons and lectures on subjects of interest to both the beginner and the advanced worker in Color.

Paul J. Wolf, APSA, is serving as local Color Chairman, ably assisted by Mrs. Amy Mintel Walker for the Color Slide exhibition; Robert and Edna Goldman for the Color Division Luncheon; Al C. Klein for the Color Slide Clinic, and a host of enthusiastic and efficient local cooperators.

Look elsewhere in this issue of the PSA JOURNAL, as well as in the May and June issues, for complete details of the 1952 Convention.

Easy Road to Good Composition

What is Good Composition?

Are you convinced that "Good Composition" is an elusive quality that either just happens to the lucky photographer whose slide is rated high? Or, that it is a dreary, mechanical device dreamed up by art instructors to add to your list of worries when making a picture?

You can stop worrying about composition if you know how to use your camera and all its accessories. You, too, can learn good composition in one easy lesson.

What makes Good Composition?

If you were to read a dozen books about it or listen to a hundred instructors or judges talk about composition, you would discover that each had a set of dogmatic rules, which when applied are supposed to give you fool-proof composition.

Your brain would be filled with the terms, Hogarth Curve, Dynamic Symmetry, Linear Perspective, etc., etc., etc. You've been told time and again you must never place your object of interest in the center of your picture, that horizons must be either one-third up or one-third down—never in the middle, that the main object of interest should be placed thus and so, and a hundred other dogmas.

True, these rules were made by the famous artists and instructors of yester-year. They have been taught to students of the arts ever since. But if you will study the old masters, you will discover that not one of them actually followed these rules in all of his own most famous paintings.

What, then, makes their pictures continue to grow in both popularity and in value?

It is because their pictures are pleasing to the eye.

None of us who love good art ever notice whether the rules of composition have been followed. We instantly like a picture—or—we don't.

If we like it, we linger to look at it because it is pleasing to our senses. It is pleasing because no single part is out of harmony with the rest of the picture.

If we do not like it, some part, eitherlarge or infinitesimal, is in discord with the whole. It offends our senses.

Therefore, it follows that Good Composition is merely a Pleasing Arrangement of component parts, making a harmonious whole

In color we have two types of composition, both equally necessary to a pleasing picture—(1) A Pleasing arrangement of objects, and—(2) A pleasing arrangement of harmonious colors.

If we would take time to study each picture before we shoot it—check each detail, being sure it is in harmony with all others and that the whole is pleasingly arranged in our view-finder, we cannot help but have Good Composition.—VELLA L. FINNE.

What Size Masks?

It's time we unmask the mask question, says a leading exhibitor.

Upon additional questioning, we found that this exhibitor had his local printer make two different sizes of "telescoping" masks so that he could secure almost any size and shape of transparency he desired. Were they going in the exhibitions? Sure. We have some of the masks to try.

A few months ago, another exhibitor and experienced judge favored us with a special collection of his masks of three or four different sizes other than the standard 35mm mask. And to complete the supply we had purchased a collection of masks (ovals, round, square, etc.) from a commercial source several years ago. The result is: We have for the first time, a complete set of masks so that we can easily accomplish any variation from the standard 35 mm size we desire.

Does this special masking effort justify itself? Time will answer this more completely, but here is the record of the present writer so far: out of 56 pictorial and nature exhibition accepted slides, 36 are the full size standard mask, and the remaining 20 were masked smaller in one of several shapes.

Special points should be kept in mind when masking slides for exhibitions or public lectures. It is possible to get the pictures so small that size alone becomes an important factor in its loss of interest value or impact when projected along with slides of full 35 mm or bantam size.

Also, the masking should be accomplished in a neat, skillful manner with all corners of the transparency alike. Two round and two square corners are evidence of careless masking. Having all sides of the picture not properly "squared" is another disturbing element. By use of regularly prepared masks, many of the common objections to masking can be avoided.

Look over your collection of slides with the idea of judicious masking. Perhaps, you have some exhibition pictures via the masking route. One of our better exhibition slides, remained in the file for almost two years before we hit upon the right shape and size of mask to "bring out" its maximum pictorial quality. Perhaps, you have some of these unhonored slides, also.

G. F. J.

PSA NATURE DIVISION

HARRY R. REICH, APSA 286 Schenck St., No. Tonawanda, New York

The Trend Is Towards Nature Photography

The time was when the Nature Photographer wended his way to some secluded back woods lot being very careful that none took note of his entry with camera and tripod. He spent a glorious day photographing his favorite subjects and then, after tedious hours in his dark-room emerged with a handful of pocket sized prints pocket sized so that they might be carried about without attracting attention) to be displayed only to a select few similarly afflicted souls and then, only in some secluded corner where no one would be likely to peck over a shoulder and get a glimpse of this contraband.

This condition persisted until some stuffy old museum had the temerity to sponsor a nature exhibition which prompted some of the bolder of the clan to submit prints with a certain degree of uncertainty as to how they would be received. The success of this first exhibition coupled with the knowledge that there were others with a leaning towards nature work bolstered his courage to the point that he actually placed his name on his best efforts and braved the storm of derision which he was certain would follow.

Things have a habit of changing, however, and in the past fifteen years nature photography has taken its place in the sun as is evident by the number of Nature Camera Clubs now in existence, the number of Camera Clubs that have organized nature sections, the organization of the Nature Division of PSA which now has an enrollment of well over six hundred members, and the increase in the number of recognized nature exhibitions, which brings us to the topic of this article.

We have been hinting at developments in the way of additional nature exhibitions and feel that probably this is the time to let you in on these developments. In a previous column we mentioned a possible nature exhibition in Bangalore, India. At this writing we feel that this exhibition is probably a reality as the Nature Division was asked to draw up minimum requirements for this show and the master mailing list of the division was requested, and has been furnished for the mailing of entry forms.

The Channel City Camera Club of Santa Barbara, California through its president Al Stewart has advised that it is prepared to form a Salon Committee for the purpose of conducting a Nature Exhibition in possibly October or November and has asked for advice and assistance and a mailing list all of which have been made available to them for the purpose.

The writer has been negotiating for some time with the Photographers Exhibit Society of Cleveland for the inclusion of a nature section in the Cleveland Photographic Exhibition and in a recent note from the secretary of that society was advised that the 1953 exhibit would include a nature section.

This all mounts up to the fact that we may look forward to at least three new nature shows in 1953. Two of them probably becoming realities during 1952. Yes, the trend is towards Nature Photography.

April Nature Color Slide Contest

The judging of the Nature Division Color Slide Contest was held at the home of the Co-chairman of the Nature Division on April 19. Forty nine contestants submitted 193 slides to this contest. The judges were: Mr. Jack Remde, President of Green Briar Camera Club; Al Suter, Chicago Color and Chicago Nature camera clubs; and Dr. Frank E. Rice, APSA, Chicago Color, Chicago Nature, Chicago Stereo and Fort Dearborn camera clubs. The awards were as follows:

MEDAL AWARDS

Irma Louise Carter, Manhattan Beach, Cal. "Begonia Blossoms". W. T. Davidson, Warren, Pa. "Chippy".

W. T. Davidson, Warren, Pa. "Chippy". Clifford Matte-on. William-ville, N. Y. "Mating Call".

HONORABLE MENTIONS

W. L. Coleman, San Bernardino, Cal., "Red Spines".

Irene M. Heffner, Albany, N. Y., "Vacation Land".

Edward A. Hill, Flectwood, Pa., "Fan Tail".

Norman E. Rocker, Balboa Heights, Canal Zone, "Oriole Hangout".

W. H. Savary, Plainfield, N. J., "Male Cardinal".

John H. Stanley, Columbus, Ohio. "Waiting for Lunch".

Rev. Joseph R. Swain, Middletown, Conn., "Red Winged Blackbird".

Hubert J. Thelen, Brooklyn, N. Y., "Mother's Darlings".

It is very apparent that the contestants appreciate the criticism service that these contests offer, since all but three of the forty nine contestants requested criticism of their slides.

May Nature Print Contest

The second 1952 Nature Print Contest was judged as a feature program of the Kodak Camera Club at Kodak Park in Rochester, New York on May 20th. There were 52 prints submitted, most of them being 11 x 14 on 16 x 20 mounts. The quality of the prints was above average. All but five entries called for criticism. There were entries from two non-members of the division who submitted prints.

The Judges were:

H. Lou Gibson, Kodak Office, E. K. Co. Dr. Grant Haist, Research, E. K. Co. Ralph Bacon, Bausch & Lomb Optical Co. Kodak Camera Club employs a system of scoring allowing a possible 27 points to a print. The scores and criticisms are taped to the back of the prints when they are returned.

MEDAL WINNERS

Points

- 27 Wan Tho Loke, Singapore, "White-Bellied Sea Eagle".
- 27 Clifford Matterson, Williamsville, N. Y., "Dragon Flies".
- 27 W. Arthur Young, Webster. N. Y., "Full Moon".

HONORABLE MENTIONS

- 23 Eugenia Buxton, Memphis, Tenn., "Sunbath for Skinky".
- 23 Albert H. Clarke, Syracuse, N. Y., "Alert".
- 25 Robert C. Hermes, Buffalo, N. Y., "Mischief Moot".
- 18 Jacques Legare, Quebec, Canada, "Paconia Mlokosievitchii".
- 22 Otto Litzel, New York, N. Y., "The Rock".
- 26 Wan Tho Loke, Singapore, "White-Bellied Sea Eagle".
- 26 Clifford Matteson, Williamsville, N. Y., "Grasshopper".
- 22 George Munz, Bergenfield, N. J., "American Prince".

Meet The Figworts

For the amateur botanist or the Nature Photographer who is intrigued by the study of flower families and their distinguishing characteristics, the FIGWORT FAMILY has much to claim his interest. The wide variety of form and color exhibited by its various members would provide a fertile field for a series of pictorial flower studies.

It would be difficult to make many generalizations in regard to this family because of the diversity of the characteristics of its various members. For example, Speedwell has a creeping stem, the dainty Blue Eyed Mary grows four to six inches high, the spike of Giant Mullein towers six to eight feet, and Paulownia is a full sized tree. The leaves vary in form, size and arrangement. In Toadflax and Gerardia they are linear, in Mullein ovate, in Pentstemon lance shaped, and in Wood Betony and Fern Leaved False Foxglove pinnate. In Pantstemon and Monkey Flower they are opposite, in Wood Betony and Mullein alternate, and in Culvers Root in whorls of three to nine. The only feature in which all the leaves agree is in not having stipules. The flowers are mostly in terminal clusters of some form or other.

The one feature which is a distinguishing family trait is the irregular corolla. This is characteristically two-lipped, and in some respects resembles the "labiate" corolla which is the trade mark of its near neighbor the Mint family. Probably the commonest example of this trait is the cultivated Snapdragon. Some of these corollas seem to have been designed to admit only the species of insect which will properly pollinate the flower. For example, in the Snap-dragon and Turtle Head, the lower lip serves as a landing place for the bee, and as she pries her way within the stamens dust her with pollen in just the proper place to fertilize the flower she visits next. Most species have four fertile stamens in two unequal pairs, and the fifth either sterile or abortive. In the genus of Pentstemen

or Beard Tongue, this fifth stamen, althosterile, is densely bearded and very conspicuous, thus giving the genus its name.

The forms assumed by the corolla of the various Figworts are many and varied. Monkey Flower presents the face of a grinning ape, and Turtle Head a good imitation of that reptile. Butter and Eggs features a cornucopia shaped flower having the colors of these two edibles, and Foxgloves are fairy finger cots or "folksgloves". Scarlet Painted Cup or Indian Paint Brush almost conceals its little yellow flowers in a tuft of flaming scarlet floral bracts. The true Figwort, which gives the family its name, grows tall and rank, four to six feet high, with inconspicuous flowers in a loose terminal panicle. The flowers themselves, about a quarter of an inch long, are shaped like a tiny sugar scoop, and colored with lurid hues of purple and green. Blue Eyed Mary, a rare and delicate inhabitant of the open woods, might be mistaken for a violet at first sight, but a closer look reveals that half of the corolla is white and the other half blue. In the dense dome-like cluster of Lousewort or Wood Betony, the upper lip of each corolla is strongly curved into an overhanging hook. Its near relative, the Elephant Flower of the Rockies, has a corolla shaped like the head and trunk of a tiny pink elephant. The little white flowers of Culvers Root are arranged in tall steeple-like terminal spikes.

Some of the Figworts are bitter, some are narcotic, and some, such as Digitalis, have definite medical properties. The botanical name of the family, "Scrophulariaceae" refers to the reputed property of Figwort to cure scrophula.

So, as you search the woods and fields this summer for flower oddities, whether to photograph or merely to make their acquaintance, you will find much of interest among the Figworts, and you will have to agree that they are a family well worth knowing.

W. H. FARR

TECHNICAL DIVISION

Nominations

The Nominating Committee was appointed by the Chairman at the executive committee meeting held in Rochester, New York on February 23, 1952. After consultation by telephone and by letter, the committee has reported the following slate of nomination-for elective offices of the Technical Division for the term starting with the Annual Meeting, August 15, 1952.

Chairman: Dr. E. P. Wightman
Vice-Chairman: Mr. W. H. Fritz
Secretary: Mr. H. A. MacDonough

In accordance with the By-Laws, the above candidates were consulted by the Nominating Committee and they have agreed to serve in these offices if elected. Also, in accordance with the By-Laws of the Division, this report is being published

in the PSA Journal at least 30 days before the election.

No nominations by petition, signed by ten or more members of the Division, have been received by the Nominating Committee between the date of the February 23rd meeting and the date of this report, May 1. 1952.

H. H. DUERR, Chairman, Nominating Committee PSA Technical Division

New York Section

One of the outstanding features of the 2nd Annual Banquet of the N. Y. Section,

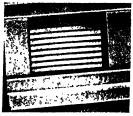

Technical Division was the presentation of the PSA Service Medal to Jane H. Waters of Pavelle Laboratories and Secretary of the Section. The presentation was made by David Eisendrath Jr., in the absence of Pres. Harkness.

The citation reads:

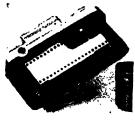

"For outstanding service to photographers, for service to the New York and Binghamton Sections, Technical Division, and for efforts benefiting the Photographic Society of America, The Biological Photographic Association and other organizations. the Photographic Society of America presents its Service Award to Jane H. Waters."

Dr. H. Clyde Carlton APSA, was Toastmaster and speakers included Victor Keppler, Irving Desfors and Weegee.

Good reasons for choosing CONTAX

1. Durable and climate-proof all-metal vertical focal-plane shutter with speeds to 1/1250 sec.. T and B.

2. Rewinding film after exposure unnecessary (by using two cassettes). No danger of scratching film.

3. Bayonet mount permits its Zeiss lenses to be interchanged in rapid succession and assures accurate seating.

4. Long base, swivel type range-finder of prismatic construction for more accurate focus and ruggedness.

5. Range-finder and view-finder combined in a single window. Middle finger focuses lens: index finger releases shutter.

6. Removable camera back permits accurate film loading — avoids film jamming. Easy accessibility for cleaning.

See the superb new Contax II-A and III-A (made in the American Zone of Germany) at your dealer's, and learn of the many other significant features that make Contax today's most desired camera,

• Write for new Contax booklet.

CARL ZEISS, INC.

485 Fifth Avenue, New York 17, N. Y.

PSA STEREO DIVISION

DON BENNETT .

28 Leonard St., Stamford, Conn.

At first we thought the column wouldn't be very long this month, what with the column conductor filling the larger shoes of Editor of the whole blooming Journal. Then along came Frank Rice with some essays on stereo subjects that are as apt as anything we've seen, and lo, the column is filled without much effort on our part.

If you SD members will stop reading for just half a mo', I'd like to address words of wisdom to non-members of the Stereo Division.

Frank Rice is really making this Division roll. The members have already received Stereo Bulletins that are packed with information. If you are even slightly interested in stereo you should join the Division and get this added info and help that is not available to non-members. Just send a dollar to Frank at 228 N. LaSalle St., Chicago 1, Ill., or to Headquarters, with your name and address and say: "Enroll me in the Stereo Division."

• •

Because it is the hottest news there is, here is the line-up for stereo activities at the PSA Convention:

Two travel shows by Paul J. Wolfe, APSA, one on "Mexico", the other "The Colorful West".

Two showings of the PSA International Stereo Salon, two, so everyone can get a chance to see it.

At least two clinics, one on "Stereo Materials and Equipment" and one on "Mounting Stereo Slides for Projection." Both clinics staffed by real experts.

The top feature, if there can be only one, looks like the demonstration by Douglas Winnek of Trivision, Inc. Mr. Winnek will make a grid stereo, one that can be seen without wearing glasses. You will see the actual making and assembly of the stereo.

Next to top, and only because they are not solely ours, are the joint demonstrations with the Motion Picture Division, one by veteran stereoist Floyd Ramsdell of Worcester Film Co., on the making and showing of stereo movies; the other a clinic and demonstration of equipment and movies made with amateur stereo movie equipment.

Last but not least . . . the salon postmortem, a showing and discussion of rejected slides, with the judges giving their reasons, and perhaps other judges standing by to check up.

So, if you're anywhere near New York in mid-August, the Hotel New Yorker is the place to be.

Now for the results of the Stereo Slide Individual Competition for May:

Seventeen stereo enthusiasts submitted 68 slides to the final competition of the season. Selecting the award winners were Robert L. McIntyre, camera editor of the Chicago Tribune, Dr. Frank E. Rice, APSA, Chairman of the Stereo Division; and George W.

Rlaha, APSA, Chairman of the Lighthouse Exhibition of Stereo Photography.

The winners are as follows:

1st (Medal Award)—North Branch Chicago River —Fred T. Wiggins, Jr., Park Ridge, Ill.

2nd—Ghost Town R. Howard, Bloomfield, New Jersey

3rd-Filling the Mold-Victor Pagel, Milwaukee, Wis.

4th-Third Alarm-James R. Young, Lansing, Mich.

Honorable Mentions

Sunrise in Yosemite-A. C. Sunde, Glendale, Calif.

The Thundering Pacific—A. C. Sunde, Glendale, Calif.

Flowers at St. Marys--Julius Wolf, Chicago, III.

Sky Bridge--W. J. Rosenheimer, Milwaukee, Wis.

Pouring Forth Light—Earl Krause, Chicago, Ill.

The Weaver Henry C. Crowell, Winnetka, III.

George W. Blaha, APSA, who has had charge of the competition and the writing of criticisms of the slides this past year, wrote to each person who entered slides as follows: "The comments on your photographs — though brief — are intended to help improve your technique, composition, and enjoyment of stereo photography. If you are interested in entering the various competitions and exhibitions, it is hoped that the comments have given you an insight to the type of material which might have a chance of being accepted."

The competitions will be resumed in the fall. Write to the Stereo Division Chairman for entry forms. Dr. Frank E. Rice, 228 N. LaSalle Street, Chicago 1, Illinois.

Camera Motion

The use of a tripod in stereo photography whenever possible makes composition of a scene much easier and assures razor sharpness of subject matter. A "fuzzy" stereo slide is practically worthless and many pictures taken in hard-to-reach places with a hand-held camera may be found to be blurred. The heart breaking part of it is that the combination of circumstances that made the shot may never occur again.

A stereo composition should be seen stereoscopically, that is with both eyes. The viewing aperture will give you a miniature scene and it is difficult to see the faults that must be cut out of the picture. This aperture should be used only to define the limits of the scene while actual composing is done with both eyes. After everything is set, it is also easier to watch for motion of trees, etc. and wait for an opportune moment to snap the shutter.

CONRAD HODNIK

How to Get Out That Last Slide

Stereo Group News of the Jackson Park CC, Chicago, includes the following under the head of "projection hints":

"Have you ever struggled trying to get the last slide out of the carrier of the TDC machine? Make a 'slide pusher' out of heavy cardboard and keep it beside the projector. Dimensions should be 1\%" x 7\%". It can be inserted in either the stereo or 2" slide channel of the carrier and is long enough to grab hold of as it pokes out the left side.

"Have you ever accidentally pushed slides out onto the table or floor? Prevent glass breakage by putting a cardboard box under the OUT end of the carrier and upholstering it with a hankie.

"If you are projecting mixed mounts other than the new projection mounts better make it a two-man operation. One man to handle the slides and one to handle the controls and focusing. Beware of too much adjusting of the screen images—the man who handles this should practice his art thoroughly the ends of his fingers are on the cychalls and brains of everyone in the audience."

Good Stereo Doesn't Change

The present day stereo fan can learn a lot about taking stereo pictures by studying the old cardboard mounted stereograms of our grandparents' day. Get a couple of dozen of these old time cards of varied subjects and view them through an old Holmes type viewer. Separate those having the most outstanding stereo depth from those having the least. Then try to discern why the first group shows the best depth.

Views looking through foliage usually brings ah's of admiration from the beholder. The picture that has "something in the way" shows the best sterco. The gorgeous spread of Yosemite Valley may have grandeur but it might as well be a single picture as far as stereo is concerned unless there is a tree, rock or person in the near foreground to give depth to the scene.

Many of the early stereo photographers did not realize this and went on making thousands of "stereo" pictures of distant scenes like the White Mountains and Niagara Falls without any perceptible depth at all. Don't waste precious color film taking shots like these for stereo effect unless you include some object in the foreground for relief. Even a few leaves hanging into the top of the picture make the difference. Any succession of objects that gives a tunnel effect makes an excellent stereo picture.

There were a few of the 1870 school of photographers who knew and took advantage of this effect. They made scenes looking endwise through rallway cuts, down into gorges and chasms, along roads arched over with tree branches or Spanish moss and shots under long grape arbors. These often make you feel like climbing right into the picture. So study the old time prints carefully and they will show you what to avoid and what to take to get the best stereo effect in your pictures.

REMARKS

If I had the money I would buy some stock in the Scotch Tape Company, I betcha, the stuff seems to be as habit forming as photography, so it must be a good investment! Every month I tell you we can't mount your point winning prints in the Exhibition Books when there are labels stuck on the back, and we can't remove the labels stuck on the back, and we can't remove the labels and tape without damaging the prints, but what's the use, nobody seems to pay any attention to me. Folks, if you would read the Rules, and follow them, you would get your prints back a day or two sooner each month and make it easier for everybody. How about it, huh?

retina. If the diameter of the pupil is 8mm, the blur circle on the retina from the distant object point is approximately 0.54mm in diameter. Within this blur circle, light is reflected by the retina and the reflected light emerges from the observer's eye as a circular cone of light with a spread of about 1.8 degrees. At a distance of 15 feet the diameter of this circular cone is about 6 inches. Thus, in the extreme case, there is a zone about 3 inches wide around the photo-flash reflector within which the camera lens might intercept reflected light from the eyes of the subject. In other words, to avoid photographing the effect, the nearest edge of the reflector must not be less than 3 inches from the nearest part of the lens aperture, at a camera distance of 15 feet.

However, the blurred image on the retina may be somewhat larger than we have calculated due to the spherical and chromatic aberrations of the normal eye, and additional refractive defects which are found in the eyes of many subjects. It seems wise, therefore, to allow a minimum safety factor of two. According to this, the reflector should not be placed closer than 6 inches to the camera lens at a subject distance of 15 feet. For other camera distances, the minimum safe angle is the same and may be expressed as the ratio of the two distances. Thus, the lateral separation of light source and camera lens should be not less than 1/30 of the distance from camera to subject.

It must be borne in mind that the value 1/30 is arrived at somewhat arbitrarily, although in the author's experience it seems to work quite well. Exceptional subjects may be encountered that give the red-eye effect even with the 1/30 separation. Therefore, an extra margin of safety might be desirable whenever a greater separation of the camera and

flash unit is feasible.

The rules for avoiding the red-eye effect may be summarized briefly as follows:

1. If possible, use flash synchronization with the subject adapted to a luminance level of at least ten footlamberts. If the whole environment cannot be lighted, at least provide a fairly large bright area for the subject to look at.

2. If pictures must be made under dimly lighted conditions or by the open flash technique, see that the lateral separation of the flash source and the camera lens is at least 1/30 of the camera-subject distance. Provide an even greater separation if possible.

3. If the environment is not totally dark but is poorly lighted, have the subject accommodate on some object at the same distance as the source. This alone will not eliminate the effect but will often greatly reduce its intensity.

Humor (from p. 416)

model in the latter picture is a member of our own camera

Speaking of models; it is very important that the one you select for your picture actually fits in every way, the plot of your story. In each of the illustrations shown, I conceived the idea for the picture and obtained the props before I found the right model. Jot down your ideas and keep a list of them with your props in your camera case. Then, during a club shooting session or wherever you may be, when you find the person or persons you are looking for, you will be all ready to shoot.

The old fellow in "Young In Heart" lives on a farm near our town and is a Sunday School teacher. He was obtained for a club shooting session. The boy, I found for "Turbulence" was buying groceries for his mother in the neighborhood grocery. Although he had never before had his picture taken, he proved to be a very capable model. Most children don't have affectations and usually enjoy posing for you.

I am still trying to find the right person to fit an idea I have been carrying around for the past for years. I feel that just the right model is so necessary in this case that I think the long wait will have been justified when the final picture materializes.

Think your ideas out very thoroughly; select the necessary props; find the best model possible for your story; light and compose carefully and you will, I am sure, create something that will not only be a great pleasure to yourself, but to all who see it.

Hypo Splashes

About 20 minutes after putting one of those "Don't forget your camera" cartoons into the dummy, your Editor dashed off to New York by train, sans camera. Twenty minutes after the train left Stamford, the electric locomotive caught fire and blazed merrily, tying up the main line for two hours. News photogs didn't arrive for nearly an hour. No pix. Red-faced Editor.

While the train was stalled we picked up a copy of Collier's and thumbed through it. Found a nice color story about camera clubs, or one club in particular, the Village Camera Club of New York's Greenwich Village. Meeting five nights a week, with open house on Sundays for the camera widows, this club has 120 members, features noted speakers at meetings, fosters individual expression among its members. In the Collier's story, our own Jack Deschin is shown giving a lecture.

Did you know there is a limit on Cornerstone Membership, and that the limit has nearly been reached? It's a fact! There can be only 200 of them and Joe Perry has been sparking a drive to get those last 24. Better get yours in while there is still a chance.

Maybe you'll like...

In this department you will find some reading suggestions from the current photographic magazines. Not a complete listing of each magazine, nor are all the August, 1952 mags represented. The list will grow...

PHOTOGRAPHY Dan Weiner's pictures of Nova Scotia, sea and people . . . 20 ways to pose your glamour girl by Peter Howland . . . "Synchro-Sun", all you need to know about flash fill-in outdoors . . . "Lens Stops and Shutter Speeds" a down-to earth explanation of exposure and depth of field . . . Statement of Policy The PSA Journal

The Board of Directors and the Publications Committee have ordered the publication of the following Statement of Policy:

"The PSA Journal is an official publication of The Photographic Society of America. It is intended to report the business and the accomplishments of the Society and to serve the membership and photography through the publication of authoritative articles of lasting value and the reproduction of outstanding photographs. The Journal is issued to PSA members as part of their membership, It is also obtainable through the Society by subscription to schools, libraries and technical organizations.

All articles submitted for publication, including those concerning commercial products, are subject to the approval of the Publications Committee. While the Journal cannot be responsible for the statements and opinions of authors, the Publication- Committee will pass upon the accuracy and fairness of all statements pertaining to the industry or commercial products.

The business policy of the Journal shall be determined by the Publications Committee, with approval of the Board of Directors, and administered through the appointed committeeman. The advertising shall be under the supervision of the Publications Committee or its approved representatives, who shall accept or reject advertising copy within broad policies laid down by the Publications Committee.

Material for the Society's technical publication, "Photographic Science and Technique." shall be under the control of the Editor of that publication and in accordance with the general policy established by the Board of Directors and the Publications Committee."

PSA TRADING POST

Open to individual members, free of charge. Limit 25 words each. Copy closes the twentieth of the second preceding month before publication.

Rolleidoscope, stereo rollfilm camera; metched Tessars 1/4.5 in Compound shutter, speeds 1 to 1/300, T&B. Camera is reflex type, uses 120 roll, gives 5 stereo pairs and a single. Also leather case and matched optical glass filters. All in good condition, like new. Write Milton Reich, PSA, 741 Sackman St., Brooklyn 12, N.Y.

THERMOSTATIC (POWERS) WATER MIXER

Quickly pays back its cost

Set a Powers water mixer for any temperature desired and forget it. Temperature of water remains constant regardless of fluctuations of pressure or temperature in supply lines. Failure of cold water supply instantly shuts off delivery.

Because it gives the most precise control obtainable it is recommended by leading film manufacturers. It is a necessity in all photo-graphic dark rooms, a must for color work and matrices. Used by thousands of photographers, lithographers, engravers, and in X-Ray film developing. Order a Powers 60° to 125° F. Thermostatic Water Mixer from your photo supply firm, or write new for Bulletin 358PD.

Camera \$99.50 Flash \$10.00 Case \$7.50

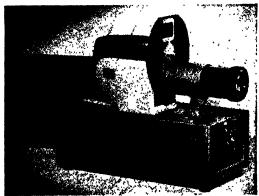

America's most distinguished 35mm camera argus c-four

No other camera combines such amazing ease of operation with this exclusive array of precision features!

Ultra-fast f:2.8 Cintar coated lens—a truly great lens—to give you beautifully defined pictures in color and black-and-white—even in failing light!

Combined rangefinder and viewfinder—to give you an in-focus "picture-window" view—even if you wear glasses!

Superaccurate shutter...1/10 to 1/200 second—perfect complement to the critically sharp lens. Built-in flash synchronizer. See the versatile Argus C4 at your dealer's!

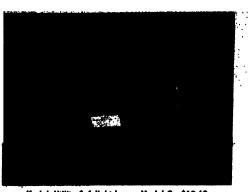

(b) 1952 Argus Cameral, Inc., Ann Arbor, Mich. All prices include Federal Excise Tax where applicable, and are subject to change without notice.

America's Fevorite way to look at color slides—Argus 200 Watt blower-cooled projector. See your highly-prized color slides in true, brilliant color. The "right-side-up" rotary slide carrier prevents upside-down pictures. Silent power blower protects valuable slides. It's the perfect companion for any 35 mm camera! An unmatched value at \$49.50.

This camera gives you

YOUR PICNIC PICTURES...ALL FINISHED...IN 60 SECONDS

All of summer's good times are better times when there's a camera handy to snap the high spots. But the most fun of all is showing the pictures right away! Only one camera in the world will give you that thrill . . . the Polaroid® Land Camera. It delivers a finished black-and-white print just one minute after you snap the shutter.

And what a camera for your vacation trip! Your travel record grows as you go ... every picture ready to enjoy, to pass around among admiring friends ... to mail home the very day (or minute!) you take it. What a convenience to jot down those easily forgotten names, dates and places ... to be sure that a difficult,

once-in-a-lifetime picture comes out exactly right—because you see results immediately and can shoot again if you're not satisfied.

The Polaroid Camera is so simple to operate that even a beginner is soon making beautiful pictures. Easy "drop-in" loading; easy to focus; easy to set the single dial controlling lens opening and shutter speed; easy to remove the brilliant $3\frac{1}{4}$ " x $4\frac{1}{4}$ " finished print. Extra prints are quick and inexpensive... and enlargements, too!

To understand the real thrill of 60-second photography, you have to try it. Your photo dealer will gladly demonstrate. Why not see him today?

YOU'LL WONDER WHY YOU EVER WAITED !

PUBLICATION OFFICE: ORANGE, CONN.

Address All Communications (see footnote below) To: PSA HEADQUARTERS: 2005 Walnut St., Philadelphia 3, Pa. Randolph Wright, Jr., Headquarters Manager

Correspondence releting to editorial matters should be sent to the Editorial Office or to your Division Editor. Change of address hotices should be sent to Headquarters, giving both old and new addresses. PSA JOURNAL is sent to all member clubs and affiliated organizations. It is for the use of the entire club and not solely for the individual in whose care it is bent.

News frems about Division activities should be sent to the Division Editor whose name appears above, or at the head of the Division news section. Manuscripts of Articles of a divisional nature should be submitted through the Division Editor concerned and manuscripts of a general nature should be exhaulted through the Division Editor.

NAL does not pay for articles or pictures; all func-tions of the Society are based on voluntary activity. Manuscript paper for the JOURNAL will be sup-plied free on request. Glossy photographs are pre-ferred but good reproductions can be made from any picture of suitable contrast. Submission of an outline of a proposed article will result in a

an outline of a proposed armere was a prompt editorial opinion of its suitabilit Copyright 1962 by the Photographic America, Inc. Reproduction or use of terial contained herein without permissi Editor is forbidden. Views expressed in the PSA JOURNAL, are those of the authors and do not secretarily represent the views of the Seciety.

The President Reports . . .

It's a grand and glorious feeling. The Convention with all its details seems to be running along just about perfectly and the program looks like one of the best PSA has ever staged. Several problems that have puzzled and bothered me are working themselves out, and there are several most promising volunteers for "any job in which I can help". But the highspot of the day is the simple fact that, for the first time in far too long, there is not one unanswered letter on my desk! It's a grand and glorious feeling!

Going back to the Convention for a moment, this issue of your Journal will reach most of you before you start for New York, and when you get to the New-Yorker, you'll find another copy waiting for you. May I ask that you read carefully the piece on the plans for what PSA should do in the future: and then think about it enough to be ready to perfect those plans and suggest improvements or ways in which they can be put into immediate effect. Or maybe you will come up with entirely new ideas much better than those already suggested. I hope so.

When you read those two pages, remember that the suggestions and ideas are not mine: they are the result of so many long discussions with so many PSA'ers that by now their parentage would be most difficult to establish. Bits of each one have been added by dozens of the members and parts of several different ideas have been grafted onto each other to produce something new and better.

Be ready, please, to add your bit at the Membership Meeting where all this will be discussed by everyone interested enough to take part. But, in order to make sure that nothing is missed, will you put the outline of your idea or suggestion on paper and let me have it either at that meeting or earlier in the Convention?

PSA has a wonderful future of vastly improved and increased service to its members and to photography, but that full future can be realized only if all of us give our best possible thought and then put our energies into carrying out the plans we have developed together.

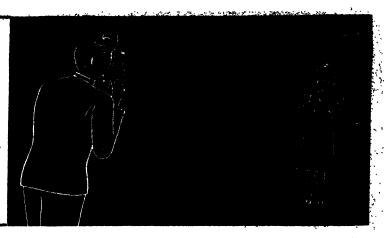

Without changing the subject at all, there is one thing that demands immediate attention—the fact that PSA asks far too much of too few. We overload a comparatively small number of workers to the point where they finally begin to wonder where the fun of photography has gone.

It comes about perfectly naturally. The officer who must appoint someone to a job or the Nominating Committee who must produce a working and workable list knows that Mr. A will do the job assigned to him. They also know that the job in question is important and must be done. Without any chance of being equally sure of some other members ability and/or willingness, the appointment is made, and soon the handful are doing all the work.

Some member of PSA will come up with the solution to this problem—at the 1952 Convention and at the Membership Meeting, I hope. Will it be you, or will you add the touch of perfection to some other member's suggestion? I hope so. See you there.

NORRIS HARKNESS

Q = What is the fastest way to get sharp focus with an AUTOMATIC ROLLEIFLEX in dim light or total darkness?

A-ADD A KALART RANGEFINDER-FOCUSPOT

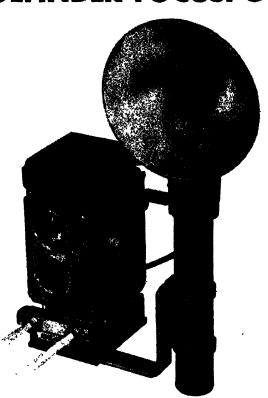

To all the wonderful features built into the Automatic Rolleiflex, Kalart now adds another—the new Range-finder-Focuspot. With this simple-to-use attachment, precision focusing in dim light or total darkness becomes as fast and certain as daylight focusing.

What is the Kalart Rangefinder-Focuspot? A rangefinder mechanism similar to the famous Kalart Rangefinder used on press cameras—a miniature lamp and 3 batteries—all mounted in a metal case that attaches to the tripod socket at bottom of camera.

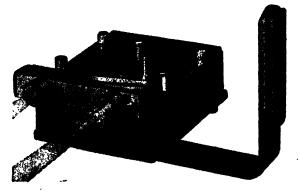

How do you use it? Press lamp switch, which causes twin circles of light to be projected from the two Focuspot lenses. Turn: focusing knob of camera until the twin circles merge into a single circle... and you're in focus. Indicates accurate focus as close as 3 feet. Beams can be projected over 30 feet.

A Kalart Rangefinder-Focuspot makes it easy to use the eye-level finder in dim light. You can focus and frame your picture at the same time. A wonderful way to get "steal" shots. Another valuable use is as a "watch-the-birdie" gadget in photographing children and animals. The light attracts their attention and helps you get a natural, interested expression.

Twin circles of light are projected from the two Focuspot lenses. Flash unit illustrated is famous Kalart Master.

\$29.95 complete with 3 batteries and bracket for attaching flash unit

Single large screw fastens Focuspot firmly to bottom of camera. No holes to drill. No wires to connect. Case finished in satin chrome and black crinkle.

NEW AIDS FOR BETTER PICTURE-MAKING

BY JACOB DESCHIN, APSA

News about three major new products have hit this desk since last month's column. One will interest the twin-lens reflex fan; another the 8mm moviemaker, and the third, anybody who has been thinking about climbing aboard the speedlight band wagon.

New French Reflex

The first item is the Rex Reflex, a French twin-lens reflex sporting interchangeable lens boards, the first camera of this type to reach the market. The importer is Biber Foto Corp., 153 West 23rd Street, New York; the designer, Andre Grange, president of Photorex, St. Etienne, France, the makers.

Unveiled at a reception by the commercial attache at the French Embassy in New York, the 2½x2½ camera, costs \$298.50 for the camera and two interchangeable lens pairs with taking lenses of 75mm and 150mm focal length. Accessories, such as ever ready case, filters, proxar lenses, etc., are extra.

Each lens pair, together with Prontor V-S synchronized shutter (set and release) is mounted on a metal lens board which is fixed rigidly in place on the camera front by four machined bronze studs and by locking with two small levers. Unfortunately, the film is exposed, therefore fogged, when the lens boards are interchanged. Undoubtedly, this fault will be corrected in the near future. The closest working distance with the 75mm lens is 4 feet, with the 150mm, 9 feet. For closer work, proxars are available for the 150mm lens for near views of 3 and 4½ feet.

The lenses are the Berthiot or Angenieux 75mm f/3.5 with 70mm f/2.9 viewing lens, and the Berthiot 150mm f/5.5 taking and 100mm f/3.5 viewing lens. Coincidence of the upper and lower lens fields is provided by coupling the lenses to move at different rates. Focusing is by turning knurled rings on the lens barrels.

The 120 film roll the camera takes for twelve 2½x2½ pictures is wound automatically by lever after the first exposure has been brought into position by sighting through a red window. The film winding mechanism also operates an exposure counter and controls shutter cocking to avoid or permit double exposures as desired.

Novel features of the camera are a new type of film pressure-plate that assures parallelism with the lens board, and a camera back locking ring that springs back if it has not been fully engaged.

Synchro-Tape

The second big news item is Revere's new Synchro-Tape, which makes it possible for any 8mm or 16mm moviemaker to get synchronized sound as easily as making a home recording. He uses any ordinary movie projector and a tape recorder, adds Synchro-Tape, follows instructions, and he's in.

The tape costs only \$7.85 for a 600-foot roll, which covers a half hour's running time.

There is no other expense. If you don't already own a tape recorder and don't know where you can borrow one baving the required tape speed of 3% inches per second—it may interest you to know that tape recorders may be purchased for anywhere from \$100 to \$200.

The sound is added to the tape as the film is projected, then played back on the recorder in full synchronization with the running film. To make the recording, a tape recorder threaded with Synchro-Tape is positioned in front of and slightly below the lens of the projector. A small reflector is clamped on the lens barrel and adjusted to permit some of the projected light to spill onto the reflector and bounce toward the moving ribbon of tape. When the movement of the tape and the film have become synchronized, the tape appears to be standing still. Recording is then started by speaking, playing or sounding off into a microphone. Tape and film are marked at the start just to make sure both will move in synchronization. Synchro-Tape works on the strobo-scopic principle by intermittent revelation of a moving body. The tape is imprinted on the back with a repetitive pattern of narrow vertical, alternately light and dark stripes which move at exactly the same speed as the lights and darks being flashed on the screen.

Battery Speedlight

Our third star this month is the Sun-Lite Portable Speed Flash, the first portable unit to employ the "powerhouse" dry-battery pack based on the new high-efficiency "supercircuit" introduced some months ago by National Carbon Co. The new speedlight unit, which weighs 4½ pounds, delivers 1,000 flashes from one battery, 10,000 from one bulb, and costs \$79.50, is made by Hershey Manufacturing Co., of Chicago. When the battery is used up, \$7.95 will get you another. A Sun-Lite AC Adaptor, a smallish unit. costs \$16.50.

The effective flash duration is about 1/1,000th second, color temperature 6500 Kelvin, alchemized reflector and Kemlite Sunflash Jamp. Oscillating ready light shows the condition of the battery.

B-C Flash

In the B-C flash field, announcements have come in from Jen Products Sales Company, 419 West 42nd Street, New York 36, and from Kalart Company, Inc., Plainville, Conn. The first describes the Jen Rollei B-C Pocket Flash, which is attached to Rolleiflex and Rolleicord cameras by means of a new-type vertical anti-twist bracket. It costs \$15.65. The new gun may also be used on other cameras with built-in flash by changing the mounting bracket or adding a Jen shoe and changing the cable. The Rollei bracket, which may be purchased separately at \$1.95, weighs only one ounce. The gun is placed high above and to the side of the lens. The

You'll get more sparkle in all your summertime picture with Du Pont VARIGAM

The print at the left is on a regular No. 2 contrast grade of paper. It lacks snap. Clouds are chalky . . . there's little detail and the "burning up" effect of intense sunlight makes it a truly disappointing picture.

Study the sparkling print at the right made on Du Pont "Varigam" variable contrast projection paper. You can see the difference immediately. It's typical of results you can-get every time from difficult negatives with this versatile paper.

The contrast of "Varigam" is easily varied with filters that slip over the lens of your enlarger. Each of ten filters produces a separate contrast and you can print more than one contrast in a single print. For example, in the picture above (right), the clouds were softened and detailed by printing through a No. 3 filter. A short exposure through the No. 8 filter added contrast without loss of detail in the water and shadow side of the boat. That gave two different contrasts in one paper. So whether your negative is soft, normal or hard..."Varigam" gives you the exact grade of contrast you need for a perfect print every time.

Try "Varigam." It's the one paper that meets every contrast need... saves bother and fuss, time and money. Ask your dealer for Du Pont "Varigam" today. E. I. du Pont de Nemours & Co. (Inc.), Photo Products Dept., Wilmington 98, Delaware. In Canada: consult your photographic dealer or Canadian Industries, Ltd., Montreal.

ILE OOD AMARINARAMEN

complete unit, weighing eight ounces, folds into a compact case that fits in a pocket.

Kalart has B-C flash units for the Argus C3 and C4 35mm cameras. The C3 unit is supplied with a rubber-cushioned bracket for placing the gun on either side of the camera. The gun for the C4 has on its base an "electric" shoe which makes an electrical connection as the unit slips into the camera's flash slide. The guns are \$14.30 each.

Magnetic 16mm

Eastman Kodak has announced a magnetic sound track striping service, Kodak Sonotrack Coating, for single-perforated processed Kodak 16mm film, Kodachrome or black-andwhite. The charge is 3½ cents per foot, minimum order charge \$10. Double-perforated film must be duplicated on single-perforated film to use the service. The new coating can be applied to film taken at either sound or silent camera speeds.

New Cine Raptars

Wollensak Optical Company, Rochester, N. Y., announce two extras for free along with news about some new lenses. The free items are: a new lens mount design to take a drop-in filter that fits in back of the lens hood without a retaining ring; and a haze filter, now supplied with each lens at no charge.

The lenses are seven new additions to the Wollensak Cine Raptar line. The two 8mm lenses are the 6.5mm f/2.5 wide-angle in fixed-focus mount, at \$44.24; and the 38mm f/1.5 telephoto in focusing mount, at \$67.50.

The five 16mm lenses, all in focusing mount, are the ½-inch f/1.5 wide-angle at \$99.68; the 3-inch f/2.8 telephoto at \$68.50; 2-inch f/2.5 telephoto at \$69.50; 2½-inch f/2.5 telephoto at \$77.50; and 17mm f/2.5 wide-angle at \$75.60.

New Kinax Models

New French cameras are the Kinax folding jobs, of which the Ardennes and Normandy models take interchangeably, with the aid of masks, three different picture sizes on 620 rollfilm; $2\frac{1}{2}x3\frac{1}{4}$, $2\frac{1}{4}x2\frac{1}{4}$ and $1\frac{1}{2}x2\frac{1}{4}$ inches. The Normandy (\$76), has a coated Bellor f/3.5 lens, built-in flash, self-timer and shutter speeds to 1/350th. Other Kinax models, at \$22.50 to \$76, are the Riviera, Provence, Alsace and Baby.

Miscellany

Harvey Photochemicals, Inc., Newton, N.J., makers of 777 Panthermic Finegrain Developer, have placed new sizes of this popular developer on the market. In dry form, it may now be purchased in 3½-gallon, 25-gallon and 48-gallon sizes; liquid developer in 1-gallon sizes as well as paints and quarts.

New filter kits have been placed on the market by EdnaLite Optical Co., Inc., of Peekskill, N.Y., as follows:

For the Argus C3 camera, a complete filter kit, for black-and-white and color photography, at \$9.95; for moviemakers, a variety of kits each costing \$8.25. The latter includes Series 1 lens hood and adapter, retaining ring, three Kodschrome filters, haze filter and two color conversion filters.

Enteco filter kits in Series V and VI ames now come in compartment cases with a leather loop for carrying on the camera shoulder strap, according to Enteco Industries, Inc., 610 Kosciusko Street, Brooklyn 21. N.Y.

A line of metal cable releases in sizes from 6 to 120 inches long to fit all popular types of domestic and imported shutters, is being marketed by Benard Sales Co., 150 Nassau St., New York City. Prices range from 85 cents to \$9. A feature is smooth, positive action. The lower plunger of the longer lengths has a swivel tip for easy attaching.

Alphabet Soup

An item in Maurice Louis' "Portrait Pointers" leads us to wonder how good you are at photography's own brand of alphabet soup. By now you are familiar with Washington's MSA, CCC, NATO, JCS, WSB and the rest of the hundred.

But did you realize we photographers are as guilty of shorthand? Every member knows he is entitled to use PSA after his name to denote his membership, and APSA if he is an Associate, or FPSA if he is a Fellow. Then we have the awards to those who have served the PSA and photography, the Hon. PSA and Hon. FPSA.

But outside our own circle, do you recognize P.A.A., SMPTE, NAPM, MPDFA, ASC, FACL, M. Photog., and N.P.P.A.?

P.A.A. stands for the Photographers Association of America, the professionals group to which many of our own PSA'ers belong. They award the M.Photog. or Master Photographer degree to members who earn it by dint of hard work, service to the profession and the respect of other members who are familiar with their work and their ethical conduct. According to Maurice, only 167 degrees have been awarded since 1937!

SMPTE stands for the Society of Motion Picture and Television Engineers, founded in 1916 and whose members are responsible for many of the technical gains the movies have made in the intervening years.

NAPM is the National Association of Photographic Manufacturers, formed to promote photography and provide coordination within the industry.

MPDFA is the Master Photo Dealer's and Finisher's Association, formed by the consolidation of the MPFA and the National Photo Dealer's Association. Your local dealer is probably a member and may attend the annual trade shows at which new products are unveiled.

ASC is the American Society of Cinematographers, the guild of the Hollywood Directors of Photography, every one an acc cameraman and entitled to put ASC after his name. To get that right he must have at least five pictures released on which he was responsible for the photography.

FACL is the amateur equivalent, meaning Fellow of the Amateur Cinema League, a degree which also must be earned.

N.P.P.A. is the National Press Photographers Association as all members of our P-J Division well know since their membership in P-J carries with it a subscription to the National Press Photographer.

CANADIANA

News and Views from the Canadian Zone

REX FROST

37 Bloor St. West, Toronto 5, Ont.

P.S.A. Reorganisation in Canada

Following a visit of President Norris Harkness to Toronto, Ontario, recently, an extension and broadening of P.S.A. services in Canada will go into effect this year. This reorganization will mean that Canadian P.S.A.'ers and Member Camera Clubs will enjoy all the privileges and services now available in the United States, and any extension thereof.

Canada, as a recognised, fully-fledged zone will regulate its own affairs as an autonomous unit, within the overall policies and procedure of the P.S.A. as a whole.

For the time being Canada will have one director on the American Board of P.S.A. Nominated for the Canadian zone directorship is Rex Frost of Toronto, subject to confirmation by acclamation, or if other nominations are received, by ballot of the members.

Each Province of Canada will have one representative on the Canadian Board.

Oliver W. R. Smith of Toronto has volunteered to become Supervisor of all P.S.A. Services in Canada, with the objective of setting up an organisation capable of assuring adequate distribution of the Society's services the Country wide.

Ted Tozer of Oshawa has assumed the role of Canadian General Secretary of the International Portfolios, and charged with the responsibility of extending these services.

Frank Pogue of Toronto has assumed the post for Canada in securing and distributing recorded programs to Camera Clubs, in furtherance of P.S.A.'s educational and entertainment policies.

Dorothy Burgess of Toronto will act as Canadian Treasurer. A sum of money sufficient to finance P.S.A. services in Canada will be transferred to a bank in this country.

Dr. Allan Chantler of New Toronto will undertake direction of P.S.A.'s Colour Slide Clinic activities, Canada-wide.

Canada is to have its own Honours Committee, to act as an advisory medium to the main P.S.A. Honors Committee.

The institution of a new service of all-Canadian exchange portfolios between Clubs and individual members is now under consideration.

There is every probability that the P.S.A. will hold an Eastern Regional Convention in Canada during the fall of 1953, likely in Toronto. By bringing some 500-600 Canadian and American members together, it is hoped the interests of photography in general and P.S.A. in particular will be greatly stimulated in Canada. Organization is now under way to set up a Convention Committee comprised of Camera Club executives in Southern Ontario, to put the project into opera-

For the expansion and reorganization of P.S.A. services in Canada it will be noted that executive direction is being concentrated in the Toronto zone. This is a temporary set-up to enable a more rapid extension of the Society's activities. An ultimate aim will be to broaden the scope of official responsibility to embrace adequate representation on working committees from coast to coast.

Promotion of Salon Circuits

By 1953 it is hoped to organize two International Salon Circuits in Canada. One to comprehend Salons in Eastern Canada. The other, to include western Canadian Salons. The eventual objective of such a scheme is to make possible coverage of every Salon in Canada, in succession, by one set of prints or slides. These will circulate automatically from city to city across the country, according to the sequence of Salon dates. By this means, it is hoped to encourage larger entries, particularly from the United States. P.S.A. er Jim McVie (Victoria B.C. Ca-

P.S.A. er Jim McVie (Victoria B.C. Camera Club) is a prime mover in this idea. Already he has organised a Pacific North West circuit comprehending Puyallup, Victoria and Vancouver Internationals.

To enable smoother running of Salon circuits, certain modification of present, somewhat onerous Canadian customs regulations are considered necessary. To this purpose Walter (Wally) Wood. President of Montreal Camera Club, in cooperation with Salon Secretaries across the Country, has been making active representations to the powers-that-be in Ottawa. With, we hear, some success.

Novel Communication

Norris Harkness has received from Ezra Parsons a tupe recording which resulted from a meeting of seven of Nova Scotia's eleven P.S.A. members. Norris replied, also by tape recording, suggesting that they form the first of the Regional organizations.

The Feminine Influence

Miss Evelyn Andrus has become President of Toronto Camera Club, first member of the fair sex ever to assume the gavel at Canada's oldest (65 years) and largest (300 members) Camera Club. At one time T.C.C. was exclusively a men's organisation.

In The Public Eye

In addition to running a full scale International Salon, Victoria, B. C. Camera Club put up an exhibit at the B. C. Products Fair. The "Little Salon" was viewed by over 14,000 visitors. Nice publicity!

Date In New York August 12 to 16

How to Get Lost in New York

Getting lost in New York is not difficult in the least, according to the annual report of the Society for Locating, Recrienting and Guiding Lost Convention Goers, just issued.

The average convention goer does it by "just taking a short walk from the hotel." A few camera stores or dress shops later he discovers the street signs have been changed while he was looking in the windows.

Changing street signs is a hobby of New York administrations. Fourth Avenue was too easy to find so they renamed it Park Avenue starting at 32nd Street. On one side of 32nd it is Fourth, walk across the street

and you're on Park!

Now after Fourth comes Fifth (that's the street you can't tell your wife how to find . . . it's the one they have the dress shops on) and after Fifth comes Sixth. That's what you think! Between Fifth and Seventh there is a street called "Avenue of the Americas". Fiorella La Guardia stuck us with that one. If you ask a New Yorker where it is he'll say, "Oh, you want Sixth Avenue". Be careful, they may change the signs back to Sixth while you're here, but don't say we didn't warn you.

While we're on the subject of avenues, let's bring up Madison and Lexington. They are very nice streets. They have camera stores on them, several stores. Madison sneaked in between Fifth and Park and Lexington is like 3½ Ave., it's between Third and Park. Confused yet? Stick around

awhile.

Cross streets are numbered, too. The hotel is at 34th and Eighth. That means 34th Street and Eighth Avenue. Keep your wife off 34th, too. It leads right towards Macy and Cimbels. Let her get lost. Go by way of 32nd St. That is Camera Row, or take her that way so there'll be no money left for Messrs. M&G.

There are a lot of camera stores around Grand Central, too, but not so close together. You'll find another group downtown in the Wall Street district. You take the subway to get there. (You take it, we'll walk.)

If you want to spend a pleasant and confusing week, try the Shuttle from Grand Central to Times Square. It has red and green lights on the ceiling. The green lights do not lead to a police station. New Yorkers get lost too, and all a guy has to remember is which color he follows morning and night. Everybody who lives on the East Side works on the West Side and vice versa. They have the Shuttle to get them transposed properly. East Siders follow the green light to work and the red light back home. And vice versa.

Contrary to popular belief, a passport is not necessary if you want to get to Brooklyn. Used to be you could get there for a nickel. Now it costs a dime on the subway. (Make more sense if you went there for a nickel, it's worth a dime to get back.)

New York taxis play a constant game with pedestrians. If you look like a permanent pedestrian, they'll beat you to a light change every time. That clears the aldewalks for potential taxi passengers. If you don't want a cab, 23 will hail you in the first half block. If you need one they all

have their families out for a ride. Rainy days they take the neighbors, too. Taxis are cheep. The first ten steps are a quarter. After that it is a nickel for each fifth, of a mile, that is. You can ride from the tip of Brooklyn to Yonkers for a dime on the subway but don't try it by cab. Ten bucks, voof!

If you're not lost and want to prove it, ask a New Yorker. He don't know either. The police all carry little books that tell them where they are and how to figure out the way to where you want to go. You'll find cops in the middle of each intersection with eight-way traffic buzzing by. Walk non-chalantly through the trucks and taxis and start a conference. Don't pay any attention to the traffic lights. Nobody does. The city maintains them in the spirit of perpetual Christmas. They're leaving it to Santa Claus to solve the traffic problem.

Another way to get lost is to ask any member of the Reception Committee. They wear badges. Some of them were never in New York before. Find one of those and he will know. But never, never ask a New Yorker.

Maybe you understand now why buses will take you on the Coney Island trip.

VSP Program Expands; Help Need in Mid-West

The Volunteer Service Photographers, an organization which teaches photography in veteran and civilian hospitals is starting two new chapters in the Middle West, financed by a donation from the Master Photo Dealers and Finishers Association.

The program is now carried in 29 hospitals and the extension of this service to the Mid-West will contribute greatly to the rehabilitation of servicemen and the satisfaction of the volunteer civilian instructors who contribute their time to the effort.

PSAers attending the New York convention will have a chance to sign up at that time, the stay-at-homes can use the coupon at the very back of the book to contribute their services.

Chicago Is Prepared

Around Convention time each year there is considerable jockeying by groups who want future conventions for their cities. Chicago wants the 1954 Convention and is going ahead on the assumption that their desires will win out.

An impressive roster of names, representing practically every photographic activity in the Chicago area gathered in June 2 to form a Convention Committee. In quick order they formed a steering committee and elected officers consisting of Loren Root, APSA, Chairman; Dwight M. Chambers, Treasurer and Adah M. Barton, Secretary. Good luck, Chicago.

Travel Tips

The Union Pacific Railroad has prepared 12-page folder of camera tips for the area serviced by its lines. In addition, they offer to answer questions about still or movie photography in their area if you address Photographic Department, Union Pacific Railroad, 1416 Dodge St., Omaha 2, Neb.

Chicago Chapter PSA Installs Officers

Harry K. Shigeta Installed the r.ew officers of the Chicago Chapter at the May 21 meeting. Seated: Harry K. Shigeta, Hon. FPSA; James Riddick, Chairman, Adah Barton, Secretary. Standing: (L to R) Glen Dahlby, Bd. Dir; Walter Parker, Bd. Dir; Dwight Chambers, Treasurer; Evylin Chambers, Bd. Dir; Miriam Davey, Publicity Director; Clarence E. Homan, Bd. Dir; Margaret Barrey, Bd. Dir; Art Edwards, guest speaker and Charles Albee Howe, Vice-Chairman.

PD Convention Program Features; Famous Names Top Speaker List

The convention program of the PSA Pictorial Division reads like a list of Who's Who in photography. Francis Wu, Boris Dobro, Spee Wright, The Mawhinneys, Larry Hiller, "Pops" Whitesell and Adolf Fassbender head the list.

PI) has scheduled something for every day of the Convention and the subjects covered run the gamut of pictorial photography.

Doris Weber's "Trial By Jury" kicks off the program at 1:15 on Wednesday afternoon. On Thursday, Spee Wright referees the judging problem with audience participation by judges and exhibitors. Famous child portraitist Joe (officially Josef A.) Schneider tells how to outsmart baby.

On Friday morning portfolio members get together for a pow-wow and Francis Wu speaks on "Pictorial Photography from a Chinese Viewpoint". After lunch on Friday Boris Dobro covers the techniques of creative photography, the Mawhinneys go to the dogs for their subject matter and Lejaren á Hiller will tickle you with "Life Ain't A Bed of Roses".

On Saturday there is a commentator's conference in the morning, followed by a talk on "Photography, a Graphic Art" by Jake Endres. Saturday afternoon "Pops" Whitesell talks on Bromoil and Adolf Fass-bender speaks on "Pictorialism Through the Years".

Practically every PSA Division is offering an interesting program and many meetings are running simultaneously so there is always something going on that will interest you.

Evening programs will help fill the time for those who don't care to attend Broadway shows or radio and TV programs, and there is always that best part of any convention . . . meeting folks.

See you in New York?

Convention Shorts

The services and facilities of the entire membership of the Miniature Camera Club of New York, a P.S.A. member club, have been set aside for Saturday, August 16th, the last day of the Convention, to lead several field trips in the New York area for Convention visitors. Although all Clubs affiliated with the Metropolitan Camera Club Council in the New York areas will be called upon to act as hosts, Miniature is first to come forward with a specific date, project and the services of its entire membership.

Since the Club numbers among its members some outstanding amateurs in B & W and Color, this offer should be interesting to field trip minded Convention Visitors. P.S.A. congratulates Miniature for this fine gesture and says "Thanks". We hear that this Club has also placed 1st in the 1952 Annual Color Competition of the Metropolitan C. C. Council for the New York area. Quite an achievement, when you consider that there were over 50 Clubs competing for an entire year.

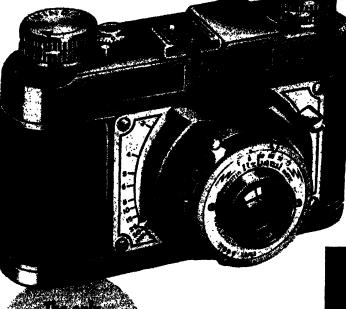

For those P. S. A. members and their families who fly to the Convention via Eastern, retention of their ticket stub will entitle them to a photographic sight seeing trip over the New York area. The actual time and date will be announced at the Convention. This trip will not be available, even for a fee, to others because says Eastern. "we do not have the planes and manpower".

So, if you are flying to the New York Convention via Eastern, be sure to retain your ticket stub and watch for the announcement of this aerial Field Trip.

The Empire State Tower, the world's tallest man made structure and a "high" spot with all visitors to New York, announces a substantial price reduction to

gets shots like this!

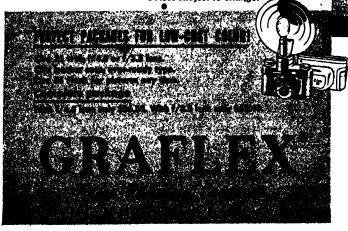

"Candidly" Why Pay More?

Ciro 35 R, as shown, f/4.5 lens \$44.15 Ciro 35 S, with f/3.5 lens....\$49.05 Ciro 35 T, with f/2.8 lens....\$89.50

• When you examine and handle the CIRO 35, at your Graflex dealer's . . . you'll be amazed that "so much camera" can be sold at so modest a price. For the CIRO 35 can match features with the most expensive "thirty-fives" in America! All models have coupled range finder to help prevent out-of-focus shots; built-in flash synchronization; coated lens; film counter; and scale focusing for sharp results every time! Compare the price and the features with any other camera of its type . . . and you'll see just why the CIRO 35 is today's most outstanding buy on the candid camera market!

Prices subject to change.

P.S.A. members attending the New York
Vacation-Time Convention.

The reduction in admittance price will be made upon presentation of your Convention Badge or P.S.A. membership card. You are urged, therefore, to bring your P.S.A. membership card with you to the Convention.

Metropolitan Camera Club Council has arranged with the Empire State Building to hang a print exhibit in the Tower Lounge for the whole month of August. Show will consist of prints from member clubs.

Jack Goldsack of the Convention Publicity Committee did that story on the Coney Island Trip and then we cheated him out of his by-line. Never should have happened.

So many things on the program that we wonder when the visiting is going to get done. That's a big part of a Convention, visiting around, making new friends, seeing old ones. Journal Staff plans a get-together sometime during the week . . . looking at the schedule maybe it will be a pre-breakfast meeting.

STEREO

DON BENNETT

This month we take a step backwards that is really a step ahead! Frank Rice has taken over the back-of-the-book stereo column with news of the Stereo Division. We revert to the original column idea with ramblings for the benefit of our nine readers. (Guess it's about time we dropped that gag. Too many letters from friendly stereo shooters who insist they be counted in. Thanks, fellows.)

This is one column that won't be written just because the calendar says closing date is on us. It's going to be a when-there-is-something-to-say-assay, so if you don't find it next month, you'll know it's only because we were speechless, and not because the column conductor was fired by the Editor.

Bob Smith of TDC, the company that makes stereo projectors (TDC means Three Dimension Company), with whom we have been having a friendly scrap since we made a crack about the cost of projectors (we lost that battle), has written us a nice letter about the letters of Jack Norling and Fred Wiggins in the June column. Bob mentions one factor about birefringence that he and I discussed at the St. Louis Trade Show.

You'll recall Jack's explanation about the effect of plastics on a beam of polarized light. Molded plastics, and some forms of sheet plastic will partially depolarize the beam. In the simple test we suggested, the effect is that of pastel colors spotted over the image.

When the polarizing filters of the projector are placed between light and slide, the problem of birefringence can become serious. If the filters are placed in front of the slide the problem does not exist. However, other problems then enter the picture. Bob points this out in his letter. The filter serves two functions when placed as TDC now has it, between light and slide. It not only polarizes the beam so we can see stereo, it also plays

an important function as a heat absorbing filter. Bob says in his letter:

"If it were not for the heat filtering function of the polarizing material which supplements the regular heat filters, it would be necessary to use heavier heat filters and thus reduce the amount of illumination on the screen."

There is also an economic factor . . . every additional part added to a piece of equipment costs money and must be reflected in the selling price to the user. Adding a pair of heat filters ups the cost and reduces the light. Well, you can't have everything.

Bob also mentions the advantages of rear projection through a ground-glass screen. It is one way to step up the illumination; you get more brilliance at the eye with the same wattage in the projector.

A column or so back we mentioned the mounting jig of the Stereo Guild. In the July issue of *U. S. Camera*, Herb McKay gives complete directions for making and using it. The order of accuracy required suggests it is easier to buy one than make it. A few dealers stock it. If yours does not, you can order from the Stereo Guild, Box 849, Eustis, Florida.

Stereo Division has a big schedule for the Convention, and the Division isn't a year old yet! Norman Rothschild has been working on this and has lined up some interesting clinics and speakers.

When Junior graduated from high school last month, we naturally shot the event in stereo. Held outdoors in the early evening, the ceremonies fill the football stadium. A waning sun and color film were not conducive of over-exposure. We finally packed the meter away when readings got too low and shot anyway. Surprisingly, we got 16 shots good enough to mount for the viewer. Now the Mrs. wants prints to send around the family. Looks like a job for Diaversal and if this heat wave ever breaks, it's into the dungeon for us . . . and prints.

Watch this column for news of stereo equipment. Jack Deschin does a swell job in his new products column, but we can't expect him to specialize in all the things that interest every Division. So we've made a deal with Frank Rice that we'll watch for the new equipment and run it here, to supplement Jack's notations.

We hope you stereo fans read the article on "Red Eye" in the July issue. This problem has been a major one for lots of stereo fans, or so we judge from conversations overheard at several photography shows last winter. One reader writes in to suggest the use of the Kalart flash unit for the Stereo Realist. It does minimize the chances because the long, tubular battery case raises the bulb to a point normally outside the critical angle. There are other ways to avoid it also, if you'll go back and read the article.

Stereo movies will be a feature at the Convention with Floyd Ramsdell, a pioneer in this, definitely scheduled to give a demonstration, and a very good possibility that we will see the Bolex stereo demonstration.

PerSonAlities

By ROBERT J. GOLDMAN
43 Plymouth Rd., Great Neck, L. I., N. Y.

Louise Agnew (Chicago) has added radio to her many talents. She recently was heard over station WLS in a discussion of pictorial photography with Ragnar Hedenvall, APSA . . . Frank Proctor (Phoenix, Ariz.) is to be congratulated on the use of one of his pictures as the book jacket for "The Desert Year" by Joseph Wood Krutch . . . Sorry to hear that Mildred Blaha (Chicago) was recently hospitalized while in process of losing one appendix . . . Angel de Moya (Havana, Cuba) has been lecturing in and around the clubs in the Chicago area. With a great big sigh of relief, Harold C. Edwards (Los Angeles) recently celebrated his 25th anniversary as a staff member of the Los Angeles Museum; Harold says he now feels that his job may be permanent.

Louise Haz (Skokie, Ill.) attended the June 6 meeting of the New York Color Slide Club . . . The city and county of San Francisco recently honored Karl Baumgaertel, APSA, by erecting a plaque in front of the house in which Karl was born; while some may think the plaque incomplete (it reads "No Parking"), it is at least a plaque . . . Fifty years behind a camera and still keenly interested in photography is Alfred Renfro (Bellevue, Washington); Al brings a humorous side to the Alaskan gold rush in the May issue of "Men", a magazine of adventures and thrills. By photos taken by him in 1901, he tells an interesting and true story of how he created the first color comics ever printed in Alaska, and of the resulting pandemonium caused by some of his characters who came to life far too realistically . . . Barbara Green (Brooklyn, N. Y.) says she is now eligible for membership in the Color Division; she recently recovered from a case of German measles . . . Congratulations to James Ganucheau (New Orleans), whose "Balloon Man" was the winner in the Class B (children and adults) group in the fifth week of the photographic contest sponsored by the New Orleans Times-Picayune . . .

Charles B. (Brad) McKee, (Sacramento, Cal.) had better get rid of that cactus garden; why bother photographing cactus plants and thorns when three roses in a damily provide material that is much more photogenic? Congratulations, Brad, on the arrival of another baby girl! . . . Seen in New Orleans-Pop Whitesell (76 years young) proudly showing his home-made sports-finder, and giving a demonstration of open-field running in his studio to prove its adequacy . . . June 6 was Paul Wolf (Hawthorne, N. Y.) night at the New York Color Slide Club; he was presented with a key for long and faithful service to the club of which he is a past president; Paul is locating in the west . . . The Rev. Herman Bielenberg (Oil City, Pa.) gave his color

Take it easy

WITH STEREO-REALIST

Realist Owners Bat 1.000 In The Photographic League

IT'S easy to take the most exciting pictures you've ever seen with the Stereo-REALIST Camera . . . with fewer picture failures, too. Even people who never before handled a camera find it amazingly simple to take good pictures with a REALIST on their very first roll of film.

In addition to being a precision instrument in every sense of the word, the REALIST is the one fine, American-made camera which exactly reproduces what you see with your eyes. Thus, if the original scene is pleasing, it will be equally as pleasing when viewed in a REALIST Viewer.

REALIST pictures are a thrilling experience in lifelike three dimensions and full, natural color. They're so real they almost live and breathe! But seeing is believing. If you haven't discovered the excitement of REALIST pictures, ask your camera dealer to show you some. Then see for yourself how you, too, can "take it easy" with Stereo-REALIST. RAPTAR LENS in RAPAX SHUTTER

for the new, deluxe PATHFINDER CAMERA

After extensive tests Polaroid Corporation selected the Wolfensak Raptor lens in Rapax shutter for its new, deluxe camera, the Pathfinder. The Pathfinder, the finest "pictures-in-a-minute" camera, required the finest lens and shutter (the heart of every camera). Polaroid found, as have so many other leading camera manufacturers, that there is no finer lens and shutter than Raptar lens and Rapax shutter. For a new thrill in photography try the new Pathfinder camera by Polaroid with the Raptar lens in Rapax shutter by Wollensak.

slide lecture at the New York Color Slide Club on the night of its final meeting of the season . . .

Dorothy Harkness (New York City) won an award from Freedom Foundation for photographic activity... Jane Waters (New York City) listened to the reading of her citation at the New York Technical Section banquet and couldn't understand why they were making an award to her boss, Lloyd Varden, when he was in Rochester that night giving the Brehm lecture; the services for which the award was given paralleled Lloyd's; then when her name was read at the end of the citation, Jane couldn't believe it or find words to accept it ...

Ralph E. Gray (San Antonio, Texas) and Mrs. Leona Lyon, also of San Antonio, were married May 12 in the chapel of the First Presbyterian Church of Oklahoma City; the wedding was the culmination of a romance that began years ago when Mr. Gray was critically ill in a hospital in San Antonio. Mrs. Gray at that time was a nurse at the hospital and by her expert care brought him back to health . . . William Price (New York City) was the winner of the William D. Fuguet Trophy in the New York Color Slide Club; it was awarded to the member who had the greatest number of acceptances in eight international color slide exhibitions.

Irma Louise Carter (Manhattan Beach, Cal.), who is in the Orient, writes that when she set up her tripod for night shots in China, the police had to be called to disperse a mob that gathered . . . News comes from Les Mahoney (Phoenix, Ariz.) that Jack Cannon (San Francisco) was a visitor in Phoenix after the judging in El Camino and took off with him for Monument Valley, after which Jack returned to San Francisco after visiting Tucson, Tombstone, Arches National Monument, etc. . . . Edna and Bob Goldman (Great Neck, N. Y.) returned late in June from a flying visit to New Orleans and nearby points where they attended their son's marriage at the Air Force Base at Biloxi.

Once again, we remind PSA folks that this column is aimed at helping them know who is doing what in PSA throughout the country. Please send personal news items such as appear here to Robert J. Goldman, 43 Plymouth Road, Great Neck, New York.

Correction

In the article on "The Father of Home Movies" in the July issue, we inadvertently made Cappy younger than his years, older than his facile brain. He was born in 1879, not 1897 as we had it. Proofreader's error. Those 18 years we robbed him of have been some of his most productive, may the next 18 be equally so.

Lewis Dates Open

Booking dates for the NLP Tour of Maurice Louis, APSA, have been set for the period from September to January, according to an announcement by Mrs. Barbara Green. Director of the National Lecture Program.

Leaving New York about Labor Day, Mr. Louis will drive west in his new Jaguar carrying his special demonstration kit. The outbound portion of his tour will end around Christmas in Los Angeles.

Returning by the southern route, his present itinerary is open after the talk at the Port Arthur, Texas, CC. There is still time for clubs in the southeastern states to book lectures in January and February by writing Mrs. Barbara Green, Dir. NLP, 30 Willow St., Brooklyn 2, N. Y.

Taracter

If you want to put more meaning in your pictures...tell a truer, more revealing photographic story, you want a Leica camera.

Leica lenses, made to the highest existing standards of optical precision, give you definition crisp and clear as you can get ... exceptional color fidelity, too. Their superb lightgathering qualities make possible amazing results by "existing" light indoors or out.

The Leica's almost automatic ease of operation...its compact design and ready maneuverability make it easier to "pick-off" hard-to-get action shots or catch the "mood" of any picture.

And the Leica is a camera that you never will outgrow. For its ever-increasing family of over 200 important accessories provides for outstanding pictures in any field of photography. Get the full story from your photo expert Leica Dealer.

Where Do We Go?

The following is presented for the widest possible discussion at the Convention and throughout the membership. It was put together by one who is enthusiastic about PSA and what it can accomplish—one who is thoroughly sold on what we can do if we all think and work together—but it is not any one man's opinion. It is the result of endless discussion and argument—arrived at after many members contributed to it. It is the expression of the opinions of many sincerely interested PSA'ers.

These suggestions are intended as a spur to all PSA'ers to express their ideas; they are not final plans but rather preliminary thoughts that will, I hope, persuade many members to make suggestions for new PSA work and to add their bit to plans already being considered.

Will you, as one interested in our Society, think over these suggestions and then let me have your ideas for other services, expansion of some of these, or implementation suggestions for any of the things PSA ought to be doing for PSA'ers and for photography?

Will you volunteer for an active part in one or more of the areas of PSA activity?

Let me hear from you.-N.H.

PSA is potentially the greatest force for the advancement of photography. Our job in the next year or two is to build so well on the present foundation that we can remove the word "potentially" from that sentence and put the strength of the Society to work for photography and our members.

We must appreciate the foundation we have and realize all the work and thought which have gone into building it. The leadership and effort of Mulder, Phelps, Rowan, Liuni, and the hundreds of other officers and members who have given so much of themselves for PSA have laid stone on solid stone to perfect the base for all the Society can do hereafter. Without their inspired efforts and the splendid success they achieved, we could accomplish nothing: we can only use what they have handed down to us.

But we have that firm base and we have both the pattern they developed and the inspiration they gave us to carry on toward their goal and ours—a strong, resourceful Society representing and advancing and promoting the arts and sciences of photography. We need only keep on planning and working.

There have been two great weaknesses in PSA in recent years. One has been the annual loss of too many members. The various Membership Committees have done a splendid job of enlisting new PSA'ers, but too many have dropped out after a year or two and without ever really experiencing what

PSA means. The other has been the weak financial position of the Society which has forbidden many worth-while projects, curtailed others and hand-cuffed the Headquarters operation.

Much of the annual membership loss has been caused by the combination of a lack of enough useful and interesting services for the members and—particularly—by our failure to explain and promote them through the columns of The Journal. There are and have been for several years many valuable services, but they have not been properly sold to PSA'ers just as too many members have not been shown that their greatest gain from the Society can only result from making use of these services and participating in the committee and other organization work.

The goal, then, is obvious. We must strengthen every part of the Society's activity through improving the financial position to the point where we can provide every reasonable service to PSA members and to photography, thus making PSA membership so valuable and so attractive that no one will ever voluntarily drop out of an ever-increasing and ever more enthusiastic membership.

A companion goal—and one interwoven with the first since it is vital to it—is to establish Headquarters and its staff on a basis which will enable future Nominating Committees to name the man they prefer for an office rather than take one from a "sucker list" of those who may be able to afford the time and perhaps the secretarial assistance necessary to the jobs. PSA has asked too much of the elected officers, the heads of the more active committees and the comparative few who carry the major load. An adequately staffed Head-quarters should handle all routine business and correspondence and leave those in executive positions free to do the more important constructive things.

Thanks to the fine work done in preceding years, PSA has a flying start toward reaching all these goals.

First Things First

Much of the financial weakness of these recent years has been caused by the cost of publishing THE JOURNAL, whose deficit has amounted to almost one-third of the entire income from dues. The efforts to date have been to reduce this budget item by organized, professional advertising sales and a complete survey of the entire Journal operation. Changes now effected will reduce the annual deficit in this fiscal year to perhaps a quarter of last year's figure and still provide a fine Journal with increased general interest and value in each issue. It is anticipated that THE JOURNAL will be operating on a "breakeven" basis within the next twelve months, and we expect to publish a gradually increasing number of pages.

At the same time, plans are being perfected for a new handling of the applications of new members and renewals of membership as well as a new method of billing for dues. New printed material for the Membership Committee is now being prepared, and we hope to have Headquarters handling the publishing details for regular Divisional publications within the next few months.

Specific Areas of Action

Existing members' services will be publicized through THE JOURNAL and in every way available, but expanding the list, the job of the Membership Services Committee, is one of the most important elements before us. Determining the most beneficial new activities for the greatest possible number of members is vital to our future growth, and every PSA'er is invited to suggest such activities. Some may be too limited in their usefulness, some may not be feasible, and some may have to be postponed. but having a long list of what PSA'ers feel should be offered by their Society will be most helpful.

Another direction that deserves full exploration and great expansion is the Recorded Lectures Program, a PD Committee. As perhaps the most valuable contribution we can make to clubs and groups, these lectures ought to be available from every Division and ready for any type of audience.

Existing services like the Recorded Lectures, the National Lecture Program, the "Tops in Photography" and the various Divisional programs must be increased—some perhaps by being made inter-Divisional in their operation—and new services for groups and individuals must be put into wide action.

Regional Activity

One of the most desirable directions in which we can move (and one which will inevitably lead to easier and greater expansion of the above) is to work out means by which there may be Society activity of real community importance in every center of photographic population throughout the country. To a degree, this is an expansion of the present nebulous Chapter system, but it far transcends the current setup in its potential and should eliminate the difficulties encountered in Chapters as they have been. Today our Chapters are too limited in scope and are neither guided nor assisted by PSA. Their so-called charters are only permission to use the PSA name and fail entirely to establish a framework within which they should operate. Chapters are valuable but not adequate to our needs.

As a springhoard for discussion, I propose a series of regional organizations to which every PSA member in the area—and only PSA members—is eligible. The area, a natural trading area rather than rigid geographical boundaries, should be larger than that "covered" by a camera club, and its programs and activities must be of greater importance to the entire photographic and non-camera-minded community than any club is likely to undertake.

The planning and conduct of these programs would be blue-printed by the national organization, and substantial aid would be given in setting up the program, its promotion, the program material, speakers, and all the other details of staging programs of real interest to all skill levels of amateur and professional photographers. The District Representatives and the local representatives of the various committees would have a hand in the operation which should eventually be under the direction of a new Vice-President in charge of Regional Activity. The overlap between this program and existing committee areas can easily be resolved.

The programs should include events like "Tops," the National Lecture Program (with these important speakers

properly financed and given fitting traveling accommodations), one-day regional meetings, one-day shooting sessions for the entire community with prizes for the contest arising from that day (Montgomery, Alabama, and the dealers' re-action to the "Tops" show there indicate no difficulty in arranging such events), and other "doings" aimed at attracting all camera users. In addition, there should be organized community activities for community benefit - regular work like aiding the Volunteer Service Photographers, counseling the Scouts (both kinds) and other youth groups, and generally serving the community through photography.

With all PSA members in the area as an organized nucleus and with adequate assistance from Headquarters, all this is well within the realm of possibility—and in the immediate future. Events like the "Tops" (nine shows this winter throughout the South and Southwest) and the "PSA Town Meeting" in Santa Barbara staged by Boris Dobro and planned in other parts of California are proof that the "grass roots" R. A. idea has been growing from both ends at once. It needs only planning and leadership; the cash cost will be insignificant.

Cooperation with Other Organizations

Since PSA represents all kinds of photographers and numbers many of all professional groups among its members, it follows that PSA if it is to be the Photographic Society of America--must he in a position to offer services to the more specialized societies which, in turn, offer their own members professional henefits which are beyond PSA's ability or scope. PSA's value to these associations and their members lies along promotional lines, and I suggest that we follow through on the plan of making nation-wide display of their work in all possible exhibition places and in shows containing panels telling of their organizations and their place in the American way of life.

A survey of the potential exhibition places is now under way on a small scale which will be expanded as the "bugs" are worked out. Then we shall be ready to invite the various organizations to supply print shows of various sizes with the ultimate aim of being able to furnish any size or kind of show the exhibitor may wish. Another service—currently being offered in the 1952 Convention as a starter—is the symposium on their particular subject and the sounding board of PSA's publicity department in jointly operated and con-

ducted meetings. Expansion of PSAT to include all technical papers will also benefit many of the companion organizations.

Let it be clearly understood that, as I see it, PSA's purpose must be to promote photography by aiding and cooperating with other organizations and with no thought of absorbing them or interfering with their operations. It may well be that our efforts will make members of other groups wish to join PSA in addition to their other affiliation.

A Color Program

Ones of the country's largest groups of potential photographers (and PSA members) is the enormous number of members of garden clubs of all types. I propose that our more skilled color photographers work under the general direction of the garden experts to make slide shows on as many of their special subjects as is possible. These shows and the printed commentary of the expert will be circulated to garden groups who will aid us in promoting them. Each show will include slides showing how the different types of pictures were made.

Certain garden groups have been approached and show real interest and enthusiasm for the plan, and the financing of this major project has been tentatively worked out. It remains to select the personnel and complete the detailed working plans—and to get the plan out of the planning stage.

Other Areas

The Portfolios — international and those confined to Canada or the U.S.A. —should be developed widely, and a suggestion coming from a recent meeting in Toronto should be put to work. It involves small groups of less advanced members working under the guidance of a more experienced PSA'er in a revolving instructional program. The details will soon be announced.

District Representatives will have a large part in these general plans, and there will have to be a number of new committees both in the various Divisions and inter-Divisional. There will be more jobs for more PSA members—important jobs—as the services for members and the general work of the Society—including RA—expand.

Your ideas for more and more valuable services and your volunteering for work on the committees are urged. Please let me hear from you.

NORRIS HARKNESS

(Written in the period from March 15 to June 15, 1952.)

See coupon on page 505 . . . then use it.

Welcome to New York

We are glad to have you come to New York, the Convention City, for this first of all vacation-time PSA Conventions. The Committee has been working long and hard to make it a memorable event. You will find a nice balance of fun, talks and demonstrations, field trips and plenty of time to renew old friendships, start new ones.

No matter what your interest in photography, there is something on the program for you. It may be outside your own Division, so study every part of the program and don't miss a single event that will help

your photography.

The PSA Salon is under the same roof with the meetings so you'll have ample opportunity to browse around and see the best as displayed there. Having it so convenient means you can go back as many times as you want.

Here's a suggestion . . . get a copy of the Official Program as soon as you arrive and mark the things you don't want to miss,

We're glad you came and we want your visit to be everything you hoped for.

Cordially,

PAUL W. GIBBS. General Chairman

Note from the Editors . . .

Many of you will have this issue of the JOURNAL before you leave home for the Convention. Still, as we put the issue together, the Convention is a month away. Therefore you will find no program in these pages. The preliminary program has run in previous issues, you have been advised of changes, and the Division news sections have been full of detailed information. When you arrive in New York you will be handed the Official Program for your week.

In this issue we have tried to give you Convention-goers some useful background which will also be interesting reading for the stay-at-homes.

On the preceding pages you will find a provocative article, edited by our President, but combining the ideas of many PSAers. Read it carefully, think of a place where you fit in, then turn to the coupon on page 505, check over the jobs listed, or write in your own idea. Bring it to the Convention with you...filled out... and hand it to Norris Harkness.

Starting on the facing page is a helpful insert furnished the JOURNAL by our friends at *Photography*, a photographers map of New York with picture suggestions galore. Keep it handy, as a source of ideas, and to find your way around.

Following those eight pages you'll find an announcement of the contest for photo coverage of the Convention.

Then there is the special show the Museum of the City of New York has put on in honor of our Convention. You may want to run up there and see these old pictures, documentaries of a by-gone day.

Read Max Beard's story on High Speed Photography for basic information that will help you in understanding Wednesday's Symposium on Photography in Engineering and Science.

Francis Wu will be one of our most noted speakers. You will find a profile on him, written by Jack Wright, on page 475.

One last word about the Convention—HAVE FUN.

Here's your guide to the Convention City

PHOTOGENIC NEW YORK

Reprinted from the July 1952 issue of PHOTOGRAPHY Magazine

NACATION CAMERA

A PHOTOGRAPHER'S GUIDE TO GOOD SHOOTING

ISITING New York this summer? Then be sure to bring your camera when you join the millions of vacationers who come each year to the fabulous metropolis on the Hudson. Whether you own a Box Brownie or a Hasselblad, whether your tastes run to candid shots or architectural views, you'll discover that New York is just about the most stimulating and photogenic city in the country. To help you get the most pleasure, camera-wise, from a New York vacation, we have prepared a lens'-eye view of Manhattan—an amateur photographer's guide to adventures in good shooting. Turn to the illustrated maps on the four following pages, pick the subjects and places that interest you, then see the accompanying paragraphs for concise information on how to get there and what you'll find. (Directions and approximate traveling times are given from Grand Central Station.) Of course we've included only a few highlights; a comprehensive guide to the city would fill a tome-the size of a Manhattan telephone book. But herein you should find enough suggestions to keep your shutter clicking for a long time and provide you with a personal photographic record of the world's most exciting city. Good luck and good pictures!

DOWNTOWN MANHATTAN

From 14th St. to the tip of Manhattan is the oldest—and in many ways the most fascinating—part of New York. You'll find Wall St. with its towers and canyons . . . the world's longest sea voyage for a nickel . . . graceful old Trinity Church . . . teeming pushcart markets . . . Greenwich Village . . . Chinatown.

1 STATEN ISLAND FERRY

For a sea-farer's view of lower Manhattan skyline and close-ups of harbor traffic, take the Staten Island Ferry which leaves from east side of Battery Park. Round-trip ride lasts about an hour, costs only a nickel per passenger each way.

IRT Lexington Ave. subway (downtown express) to Bowling Green. 20 minutes.

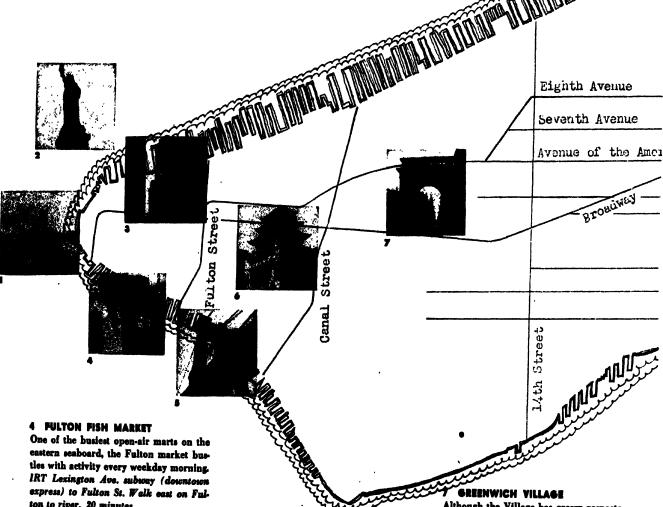

2 STATUE OF LIBERTY

Ferry for Bedloe's Island and America's goddess of freedom leaves from west side of Battery Park every hour on the hour. Tour, including visit to statue, costs 75 cents for adults and 35 cents for children: takes about an hour and 45 minutes.

IRT Lexington Ave. subway (downtown express) to Bowling Green. 20 minutes.

3 WALL STREET AND TRINITY CHURCH

Symbol of American financial power is this crevesse running from Broadway to the East River between dixty skyscrapers. On west side of Broadway opposite Wall-On west size of black spire 1500. IRT Lexington Ave. whoop concerns to Wall Sec. 18 hander.

ton to river, 20 minutes.

5 BROOKLYN BRIDGE

Legendary Brooklyn Bridge is closed temporarily to foot traffic pending repairs on the old structure. But it and neighboring Manhattan Bridge make a dramatic pair of subjects for your camera. View from South St. above Manhattan Bridge is particularly impressive.

IRT Lexington Ave. subway (downtown express) to Brooklyn Bridge. 10 minutes,

6 CHINATOWN

One of the most colorful foreign-language settlements in New York, Chinatown preserves many sights, sounds, and smells of the ancient Orient. Area is bounded approximately by Canal and Baxter Sts., Park Row, and St. James Place.

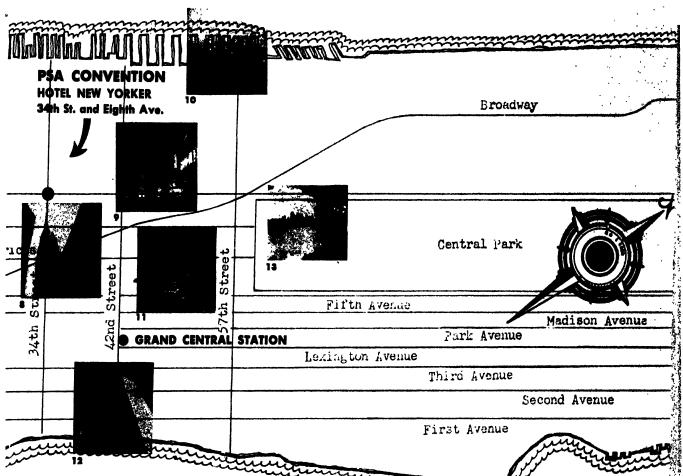

IRT Lexington Ave. subway (downtown local) to Worth St. Welk three blocks out on Worth to Chatham Sq. 20 minutes,

Although the Village has grown respectable since its gaudy heyday, it's still a fascinating place to explore. Best to do it on foot. Going west from Washington Square you'll find chaste old houses, narrow alleys, window-box greenery, intriguing shops, and even—if you look hard—a few Bohemian-type inhabitants.

IRT Lexington Ave. subway (downtown local) to Astor Place. Walk west on 8th St. to Fifth Ave. and south one block to Washington Square, 17 minutes,

MIDTOWN MANHATTAN

Between 14th St. and Central Park is the fast-beating heart of the metropolis. Turn your camers on a mountain range of skyscrapers topped by the Empire State Building... world-famous Times Square... gay Fifth Avenue... Rockefeller Center, a city-within-the-city... all within minutes of Grand Central Station.

8 THE EMPIRE STATE BUILDING

For a spectacular aerial view of New York, mount to the 102nd-floor observatory of the world's highest skyscraper Adults, \$1.20; children under 12, 30 cents. •

IRT Lexington Ave. subway (downtown local) to 34th St. Walk west to Fifth Ave. Or take Fifth Ave. bus (southbound) at 42nd St., ride to 34th. 10 minutes.

11 ROCKEFELLER CENTER

This mammoth city-within-the-city includes the RCA Building (fine shooting on a clear day from 70th-floor observation deck), open air restaurants and statue of Prometheus in the Plaza, fountains and flowers in the Promenade, Fronts on Fifth Aven between 48th and 51st Sts.

Walk west on 42nd St. to Fifth Ave., north on Fifth to Rockejeller Center. 25 minutes.

7 TIMES SQUARE

An enormous madhouse by day, a galaxy of neon after dark, Times Square is tops on everybody's list of places to see in New York. Walk north on Broadway from 42nd St. and try candid shooting by daylight, time exposures in color of the blazing signs at night.

Shuttle to Times Square. Five minutes.

12 UNITED NATIONS HEADQUARTERS

The glass-and-marble Secretariat Building and the sleek, new General Assembly Building make exciting architectural subjects when shot from almost any angle. United Nations headquarters covers land from First Ave. to Franklin D. Roosevelt Drive between 42nd and 48th Sts.

Walk east on 42nd St. to First Ave., then north to main entrance. 20 minutes.

ANDSON RIVER PIERS

On the west side of Manhattan from the tip north to 70th St. you'll see piers and docks for every kind of craft from garbage scows to luxury liners. Check New York Times for arrivals and departures.

Take 42nd St. crosstown bus (westbound) to Hudson River. Walk north to 50th St. for Cunard pier (No. 90).

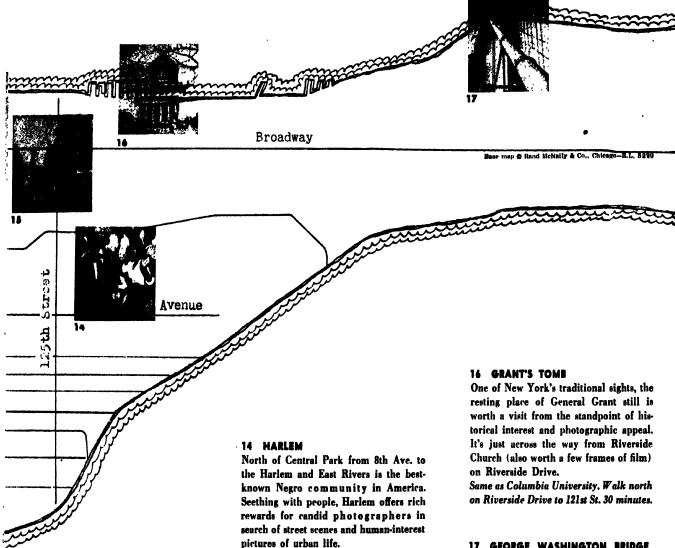

13 CENTRAL PARK

In the city's heart it's surprising to find such a huge expanse of country as Central Park (59th to 110th Sts. between Fifth Ave. and Central Park West). Turn your easure on hansom cabs, heafing ponds, and a wonderful zee for children.

Walk west on 42nd St. to Fifth Ave., take No. 2, 3, or 4 bus (northbound) to any Fifth Ave. park entrance. 15-25 minutes.

UPTOWN MANHATTAN

North of 59th St. lies a photographer's paradise . . . yelling crowds at the Polo Grounds , . . 14th century stained glass at the Cloisters . . . rowboats mirrored in the pond at Central Park . . . Grant's Tomb . . . Columbia University and Morningside Heights . . . noisy straet scenes in Harlem.

15 COLUMBIA UNIVERSITY

express) to 125th St. 10 minutes.

New York's contribution to the Ivy League covers an area bounded by 114th and 121st Sts., Riverside and Morningside Drives. Associated-and world famousinstitutions are Barnard college for women, the Union Theological Seminary, and the Julliard School of Music. Shuttle to Times Square. IRT Broadway-Seventh Ave, subway (Van Cortlandt Park express) to 110th St. 25 minutes.

IRT Lexington Ave. subway (uptown

17 GEORGE WASHINGTON BRIDGE

The only bridge in the city over the broad Hudson, this engineering marvel offers sleek lines and sweeping curves for photographers. At 178th St. and Riverside Drive, connecting to New Jersey.

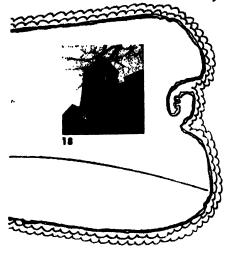

Walk west on 42nd St. to Fifth Ave., catch a nirthbound No. 4 bus and ride to 178th St. stop at bridge. One hour.

18 THE CLOISTERS

Looking for a superb view of the Hudson, an out-of-the-ordinary background for family portraits, or interested in Gobelin tapestries? Your answer is the Cloisters, a fascinating medieval museum in Fort Tryon Park. Off Riverside Drive 11/4 miles north of George Washington Bridge. Same as for G. W. Bridge but ride bus to end of line. One hour and 20 minutes.

BEYOND MANHATTAN

Explore the surrounding territories as time and desire dictate. You'll find much of interest . . . the perennial carnival of Coney Island . . . elephants and emus of the barless Bronx Zoo . . . the color and bustle of busy airports . . . sun, sand, waves—and pretty girls—at Jones Beach.

19 YANKEE STADIUM

For American League fans, 'nough said. Yankee's home field is in the Bronx at 161st St. near the Harlem River. National League rooters will head for the Polo Grounds just across the river in Manhat tan, or Ebbets Field in Brooklyn.

Yunkee Stadium: IRT Lexington Ave, subway (Jerome Ave, express) and get off at 161st St. 20 minutes. Polo Grounds: walk west to 6th Ave, and take uptown D train on IND Sixth Ave, subway to 155th St. (During rush hours change to local at 145th St.) 30 minutes. Ebbets Field: IRT Lexington Ave, subway (downtown express) to Nevins St. in Brooklyn, change to any local, ride to Franklin Ave., walk four blocks south. 35 minutes.

20 LA GUARDIA FIELD

New York's busiest akyport has an observation deck from which you can shoot interesting pictures of planes, passengers, and personnel. In Queens, Long Island, off Grand Central Parkway. Perhaps even more colorful is New York International Airport (Idlewild) also on Long Island off Southern Parkway.

Limousine service is available from Airlines Terminal (42nd St. across from Grand Central) to both LaGuardia and Idlewild. Buses leave frequently; fare is \$1.25 one way. To LaGuardia, 30 minutes; to Idlewild, 45 minutes.

21 BRONX ZOO AND BOTANICAL GARDENS

Many barless pits give the photographer a break at this super zoo. Come prepared to spend a full afternoon and lots of shoe leather; it takes a while to see the place. Flower fanciers will enjoy shooting in color the spectacular displays in the nearby Botanical Gardens.

Shuttle to Times Square. IRT Broadway-Seventh Ave. subway (Bronz Park express) to 180th St. 45 minutes.

22 CONEY ISLAND

Coney in the summer is every carnival you ever saw rolled into one. It's a bit overwhelming for out-of-towners, but you hardly can miss getting good pictures here by day or night. If you can't see the beach for the people, try some of the rides (topped by a parachute jump) or sample a hotdog (originated at Coney, they say). Shuttle to Times Square. BMT subflay (either Brighton, Sea Beach, or West End express) to Stillwell Ave. One hour.

23 JONES BEACH

Open to the public, Jones Beach offers the facilities and advantages of the swankiest private beach club. Pretty girls, miles of sand dunes, and the Atlantic Ocean combine to make your visit a pleasant one. Easier to reach by car than by public transportation. For scenic ride, take East River (F.D.R.) Drive to Brooklyn-Battery Tunnel, follow 27A on Long Island to Southern State Parkway, follow this until turn-off for Jones Beach. 2 hours.

"MING YOUR CAMERAS—HERE'S AN OPPORTUNITY TO WIN YOUR EXPENSES

PHOTOGRAPHY magazine Offers \$500 in Awards for Photo-Journalistic Coverage of the 1952 PSA Convention

Plus certificates of honorable mention. In the event of a tie duplicate prizes will be awarded.

RULES

- 1. Open to all registrants at the PSA Convention in New York. Competition opens August 12, 1952 and closes Sept. 10, 1952.
- 2. Subject: The annual convention of the PSA as told in a SERIES of pictures and captions.
- 3. Prints to be no larger than 8×10 .
- 4. Entries to be unmounted or in portfolios, all prints with captions attached and bearing the name and address of the maker.
- 5. Entries to be judged for reportorial value with major emphasis on the use of the minimum number of prints to tell the story.
- **6.** Entries to be addressed to PHOTOGRAPHY magazine Convention Awards, PSA Headquarters, 2005 Walnut St., Philadelphia 3, Pa.
- 7. Closing date—all entries must be postmarked not later than September 10, 1952.
- 8. Award winners to be announced in the November issue of the PSA Journal.
- 9. Judges: Bruce Downes, Editor of PHOTOGRAPHY magazine; David Eisendrath, Chairman PJ Division, and David J. Marshall, Professor of Journalism at Fordham University.
- 10. PHOTOGRAPHY magazine and the PSA Journal reserve reproduction rights on all prize-winning entries.

AND

... The Photo Journalism Division offers more cash awards for the best SINGLE prints of the activities at the convention.

PHOTOGRAPHY magazine's competition is for SETS of prints—the P-J Awards are for SINGLE prints.

The single-print awards:	1st	\$50
	2nd	25
	3rd	15
	4th	10
	Five 5th	. 5

Plus certificates of honorable mention.
In the event of a tie duplicate prizes will be awarded.

 Same dates, same judges, same rules, but SINGLE prints. Entries must be separate for each contest and in separate containers.

Address SINGLE-PRINT entries to The P-J Convention Contest, PSA Headquarters, 2005 Walnut St., Philadelphia 3, Pa.

Dr. Francis Wu

FPSA, FRPS

By Jack Wright

Dr. Frencis Wa

When Dr. Francis Wu, of Hong Kong, China, was nine years old he came across a book called "While You Wait Photography." The little volume purported to give complete instructions for making pictures and young Francis was mightily intrigued.

With \$6 saved from his allowance he purchased a folding vest pocket Kodak and inserted a roll of film. After taking pictures of his brothers and sisters he opened up the camera immediately and looked at the film, expecting to see the photographs all finished on a "while you wait" basis. He still laughs about the incident.

Dr. Wu was born in Canton and educated in Honolulu. In Hawaii he met Nicholas Haz, FPSA, the noted photographic teacher, and Haz encouraged him to continue and expand his photographic activities. Under Haz's encouragement Dr. Wu established an international reputation in the photographic salons, where he still exhibits with great success.

In 1931 Dr. Wu returned to China to study in the Lingnan University. Later he settled in Hong Kong. The Photographic Society of Hong Kong was originally organized by six Europeans. Wu was the first Chinese to be admitted, although the number of Chinese has now increased to 40. Under the sponsorship of the Society three All-China exhibitions were held. Then, under Dr. Wu's leader-hip, the First Hong Kong International Salon of Photography was announced.

The exhibition was well publicized and entries poured in from all parts of the world. After the judging had taken place, but before the salon opened, the war broke out and

Dr. Wu's studio is a photographic center for hundreds in that part of China who are interested in photography. He malatains large illuminated showcases in which pictorial prints are always on display, being on 16 by 20 mounts and changed every other week.

within a short time Hong Kong was occupied by the Japanese. Dr. Wu. who by that time had become a professional photographer, immediately changed his profession to "broker," dealing in what he describes as "various odds and ends." He was afraid that any connection with photography would get him into trouble with the Japanese. The European members of the Photographic Society of Hong Kong were marched away to prison camps. Dr. Wu was not imprisoned. In secrecy and by steakh, he was able to smuggle 90 per cent of the salon's accepted prints out of the club's dark rooms. He hid them at various points in Hong Kong. The remainder of the pictures, including those which had been rejected, were captured by the Japanese and destroyed or sent to Japan.

Immediately after the war Dr. Wu reorganized the Hong. Kong salon and it was successfully held. Another salon will be held in Hong Kong this year and it is planned to make the exhibition an annual event.

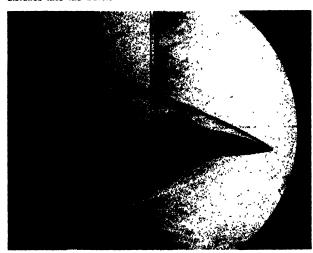

Dr. Wu's photographic ability is matched by his business acumen and today he is the head of a large photographic establishment in the heart of Hong Kong, with a staff of 20 employees who do all types of photographic work, including portraits, commercial pictures, industrial, aerial, color, press, etc.

Dr. Wu's studios are furnished with the most modern photographic devices including ten speedlight outfits. He reports that photographic supplies are fairly easy to obtain in Hong Kong but that amateur photography in most of China is greatly hampered by scarce and outdated materials and lack of efficient equipment.

In regard to the characteristics of the photographs produced by the Chinese, Dr. Wu said: "My impression of photography as practiced by the Chinese is that their pictures conform to a considerable extent to the Chinese character. Their photographs are soft, delicate and highly artistic. Very few would dare to produce a picture that was bold, abstract and strong in character. Take our great Shanghai exhibitor, Chin San Long, APSA, FRPS, as an example. His soft tones and beautiful style of composition resemble the old Chinese masters."

While kept busy by the demands of his flourishing business. Dr. Wu maintains as one of his top ambitions the spreading of amateur photography among the Chinese. He has made a number of trips to various parts of China with this aim in view. He says he is hopeful that the next few years will witness a great awakening of interest in photography among his countrymen.

High speed flash photograph of an experimental model shot into water at an oblique angle. The light source was a single flash, lighting the model from the front. The duration of the flash was approximately 3 microseconds. This was an open flash shot; the electronic flash was discharged by the initial firing of the gun, with a predetermined time delay for the missile to reach the desired distance into the water.

Schlieren high speed photograph of a model in a wind tunnel with the air rushing by the stationary object, simulating the motion of the object going through air at the rate of three times the speed of sound. Note the head shock wave, wing shock and shock waves emanating from the wing-fuselage junction. The cloth-like appearance of the background are "Mach lines" recorded by the Schlieren photographic process. The Mach lines are useful in determining the "Mach Number". (The Mach number is the speed of the air, counted in multiples of the sound velocity under the local flow conditions (2,010 ft./sec.)).

The Cover Picture

Open spark shadowgraph of a missile traveling at approximately Mach Number 3. The Mach number can be determined from the head shock wave. Directly belfind, and following the missile, is the wake and an inner shock wave cause by the wake. Note the lack of Mach lines such as were shown by the Schlieren process in picture above. A shadowgraph usually employs a single-point source of light, whereas parallel light is used in Schlieren photography. High speed spark is usually used in bellistic shadowgraph photography.

High Speed in Science and

By Max Beard

High-speed photography is a means of stopping or slowing motion down to the point where the human eye can see what is happening during an extremely short period of time. This invaluable tool of science and industry permits accurate timemotion studies within those periods of time.

Of prime importance to any photographer is intelligible presentation of any object or process, regardless of the time element. Time-motion factors combine when it is essential to present an action of the object or process in intervals of time. Time-motion thus becomes the major factor for investigational purposes, even to the extent of ignoring all "pictorialism", and utilizing only a characteristic of the motion that will permit a graphic presentation. This latter fact is most noticeable in the super-high-speed cameras of Dr. Brian O'Brien of the University of Rochester and Mr. Morton Sultanoff of the Aberdeen Proving Grounds, or the less rapid cameras of the detonation-streak type which have writing speeds of about one to two millimeters per microsecond.

In order to establish some criterion for discussion of highspeed photography, let us consider it as any still photography or less than one one-thousandth of a second exposure time, motion picture photography at over 250 frames per second, or the employment of any photographic recording device that permits the analysis of action too rapid for resolution at slower speed than either of the above limitations.

No attempt will be made to describe the various type of high-speed cameras herein, other than to state that there are many types—streak, ribbon-frame, image dissection, strobe light, rotating lenses, rotating mirror, multi-slit, Kerr cell, oscilloscope, and the more generally used rotating prism cameras, such as the Fastax and Eastman Type III. There are, in addition to the use of various types of high speed cameras, other methods of high-speed photography that do not require any special camera equipment, such as use of high-speed sparks for shadowgraphs, high-speed flash or strobe lights with regular view cameras, and high-speed schlieren photography.

The industrial high-speed photographer usually does not have these various types of cameras on hand, nor the call to perform very many of these highly specialized scientific types of photography. Most of his work is with rotating prism motion picture cameras, and high-speed flash units. Some examples of photographs taken with a few of the different high-speed cameras are shown herein.

In the Photographic Division at the Naval Ordnance Laboratory, White Oak, Maryland, rotating prism cameras are nearly as much in demand as are other motion picture cameras. Once the photographer becomes acquainted with their characteristics, he is able to devise procedures for recording data of innumerable types. NOL has used up to ten high-speed cameras on one job. Timing marks can be placed simultaneously on the film in six cameras for synchronizing action with the cameras spaced about one-thousand feet apart.

Rotating prism cameras can be as valuable to industrial organizations as to research activities. There is little to dis-

476 PSA JOURNAL

tinguish between the uses in industry and in research. The practical applications in industry are more apt to be of interest to the layman than are the photographic results of applications in research; however, motion pictures made for scientific investigation are frequently fascinating to the non-scientist, regardless of the content of scientific data. An example of application in industry is where mechanical defects can only be located by high-speed photography. Whether the requirements are for scientific investigation or for intelligibility to the layman, the photographer must frequently employ ingenuity and resort to unorthodox photographic methods in producing satisfactory pictures.

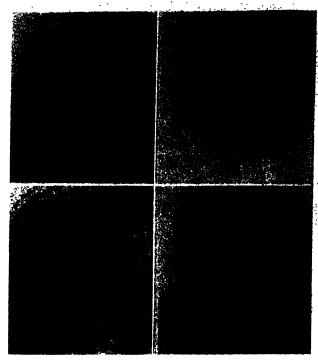

One of the more important factors in photographing action is the determination of what you want to see and determining frame speeds accordingly. Lower frame speeds may not show the action, and too high speeds may mean hours wasted by unnecessary analysis or observation. Characteristics of the action, desired to be investigated, may also be lost by incorrect choice of frame speeds.

The photographer can get different effects in a good many cases by using a wide variation of speeds. I would like to adapt the adage about scientists to high-speed photography: "As the frame speed increases, you can see more and more about less and less, until you reach the point where you can see everything about nothing." This remark, within certain limits, is applicable to high-speed photography. Take the case of photographing a television screen. In order to get frame by frame pictures of the screen, the camera would have to synchronize with the scanning of all 525 lines, which requires one-thirtieth of a second. We will assume the motion picture camera is not synchronized.

Where the camera speed (in this case, a function of frame speed and shutter opening) is greater or less than one-thirtieth scanning time, either white or dark bands will appear across the image. An entirely different effect occurs when we reach 1000 frames per second. In this case we will see only six lines scanned in each frame as they progress down the screen. When the speed of the camera is increased to slightly less than 3,000 frames per second, only two white lines will show in each frame. (These two lines are separated by a dark unscanned line, since alternate lines are scanned each time.)

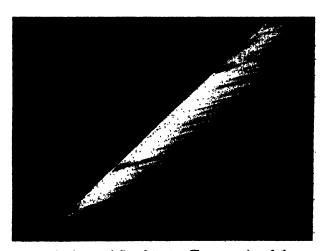

In order to photograph one line per frame, the shutter speed would have to be in the neighborhood of one-sixteen thousandth of a second, or roughly 3500 frames per second with the Eastman Type IH Camera. As we decrease the relative camera exposure time and, assuming that we have a theoretical high speed camera and film combination that photographs the progression of the transient spot of light, then, in order to photograph one inch of line, we would have to have a shutter speed of around one two-hundred-thousandth of a second. Again, if we wanted to stop the spot of light within the resolving power of the camera, our picture would have to be taken in approximately one two-hundred fifty millionth of a second.

(Continued on p. 488)

(Top pair) Photographs of explosions taken with a multi-slit camera, designed by Morton Sultanoff of the Aberdeen Proving Ground, Maryland. This camera has produced pictures of the shock wave from explosive charges at the rate of 100 million a second. In addition to the multi-slit grid, a rotating mirror is employed to obtain extreme speeds. It is mechanically possible to get pictures at a rate of 10 billion per second with this camera. Figure 5 (L) is of a spherical charge; Figure 6 (R) is of a stick charge. These pictures are the complete exposures (a "scramble of all frames"), and are viewed through a multi-slit grid in order to segregate the various frames.

(Lower pair) Photographs of a single frame of Figures 5 and 6, as viewed through the multi-slit grid. The concentric rings of Figure 7 (spherical charge) and the diagonal lines of Figure 8 (stick charge) indicate multiple exposures. Each picture shows one of 100 independent positions of the grid. There are five independent exposures shown by each position of the grid, or a total of 500 exposures taken of one explosion.

Photograph of an exploding detonator. The progression of the explosive force is shown along the length of the detonator. Time increases to the right. Total time of the detonation is about .00005 sec. The streak camera used for this photograph employs a rotating mirror, with the film in a fixed position.

Necktie workshop in a Division Street tenement about 1889. Jacob A. Rils exposed sweatshop labor conditions with his camera and newspaper articles. This print is from the original negative on file at the Museum of the City of New York.

Museum of the Honors PSA

A special photographic exhibition entitled "Cross Section" opened on Tuesday, July 15, at the Museum of the City of New York, Fifth Avenue at 103rd to 104th Streets. The exhibition, in honor of the Photographic Society of America which is holding its first New York Convention August 12-16, includes about 75 photographs from the Museum's files, showing New York scenes taken over a century ago, when photography was in its infancy, and ending with present day views. The exhibition will continue through Labor Day, September 1. Admission is free.

Two fine daguerrotypes of the city taken in the 1840's start the pageant; next, a view of the Battery in 1853 recorded by Victor Prevost, who used oiled or waxed paper negatives, among the very earliest produced in America, shows some of the "made land" which broadened New York's southern tip; an early stereoscopic view published by E. Anthony prior to 1863 shows shipping in the harbor while two anonymous examples of that popular form depict the frame exterior of Marsh's drugstore at Third Avenue and 125th Street with an interior double shot of a card game in progress in that neighborhood club.

A quiet garden party at the Grimes Hill Staten Island home of Mr. and Mrs. George R. Satterlee in the summer of 1863 contrasts with a fine photograph of ladies of the Women's Central Association of Relief serving the U. S. Sanitary Commission, precursor of the American Red Cross, organized to alleviate the misery of the Civil War soldier.

An omnibus of the 1860's with mirror-like patina stands before the East 27th archway of the John Stephenson factory, from whose early assembly line it issued, in one of the Museum's set of 600 photographs of vehicles and rolling stock designed and built by that firm. A Broadway traffic jam of the same period has been printed from a negative by one of photography's immortals, Matthew B. Brady.

In an exquisite genre shot an unidentified photographer has captured two young women of 1867, one seated somewhat anachronistically before a spinning wheel and the other facing an easel in the Staten Island art gallery of John C. Henderson, while a brooding Napoleon looks down from a massive frame on the overcrowded wall.

In 1867 came J. H. Beal's great panorama, made from 5

A documentary of 1861. Today it is the Red Cross, but then it was the Wemen's Central Association of Relief. This office was in the Ceoper-Union (building still standing). At first we thought those bestelf were esh cans, making it a true documentary, but they are shipping cases.

City of New York Convention

William Henry Jackson, Hon. FPSA, is best known for his exploration photography, and maybe that includes this picture of the Harient River which he took about 1890. We've seen better quality in some of his 1874 pictures, the original negatives printed on modern paper.

glass negatives, of the East River waterfront from land's end to Pike Street with the New York Tower on the partially constructed Brooklyn Bridge looming large. A fashionable carte-de-visite of the artist Robert Swain Gifford by Sarony, who achieved equally lasting fame as one of America's masters of lithography, shows him smiling at Mora's captivating shots of costumed beautics at the Famous Vanderbilt Ball of 1883.

Next is a selection printed from the Museum's 400 4x5 glass negatives by the first of the great crusading photographer-journalists, Jacob A. Riis. Examples of the work of Percy C. Byron, who donated over 5,000 of his matchless Solio prints, the greater part of the labor of a lifetime, to the Museum in 1943, include the "Reposing Room in a Turkish Bath for Women," "William M. Chase's Art School", a winter day on Sixth Avenue, and a sun-flecked summer scene on Madison Square, all in the '90's. Also in this period are J. S. Johnston's well known shot of the Bowery and two of G. C. Cox's great portrait studies from his Museum-owned galaxy of celebrities in artistic and literary circles. Two of New York's first electric taxi cabs are caught in front of the Metropolitan Opera House by Van der Weyde, whose collection of negatives is in the Museum's files. The Harlem River pastorale of W. H. Jackson, Hon. FPSA, the great photographer of the West, matches the grandeur of his frontier rec-

The era's end is marked by an 1899 night scene, showing fireworks in honor of the hero of Manila Bay with Dewey's name in letters big and bright on Brooklyn Bridge.

The early years of this century bring Marceau's often reproduced shot of a touring car with its sedate but adventurous owners, and one of Lewis W. Hine's Ellis Island classics. In 1910 is Theodore Roosevelt's welcome home from his African Safari, and William F. Warnecke's "scoop" of the shooting of Mayor Caynor. Arthur D. Chapman's brilliantly composed "Diagonals," winner of many awards, shows Greenwich Village at the time of World War I.

More recent is a fine example of Berenice Abbott's superb documentary work, drawn from her Federal Art Project, "Changing New York," the master prints and negatives of which are in the Museum's files. Architectural photographers, such as Samuel H. Gottscho and Richard Wurts, are represented in the exhibition, while Todd Webb is at his best in "The Old Clothes Market, Suffolk Street." The team of Diane and Ray Witlin has contributed a dramatic moment in their day-by-day account of the passing of the old Fulton Market.

Alexander Alland, Paul J. Woolf and Godfrey Frankel, among other contemporaries, complete the roster, with John Harvey Heffren, the Museum's staff photographer, giving an individualistic glimpse of the Woolworth Building as it is seldom seen.

William M. Chase's Art Class, about 1897, from the Percy C. Byron collection in the Museum. Nudes, no less! But as far as we can discover, the model was covered when that man with the camere came in to take the picture. Who says times change? Only costumes and heir-dos change.

Caraanta del Diablo

Cataracts of the Iguassu

By Irma Louise Carter

Twenty pages wouldn't be enough to tell you all the beauties of the Iguassu and the camera problems encountered. One end of the falls lies in Brazil, the other in Argentina. The best pictures are made from the Argentine end.

Garganta represents one part of a U-shaped group which falls 210 feet into a narrow chasm. The bottom is obscured by mist. This picture represents only about one-third of the falls. Exposure was 1/200th at f/5.6.

Bossetti (top left) is part of a group. I tried a shutter speed of 1/200th to try and stop the water to get a little crispness in it.

San Martin, the first view of the expanses of falls to be seen in the Iguassu. One comes through the jungle-like growth to this vantage point. Made about eleven in the morning, 1/200th at f/4, it might have been better in the afternoon with more light at the bottom.

The Bossetti and Adam and Eve . . . just one more view of a fascinating subject. A

strand of barbed wire below the bottom edge would have spoiled a more distant viewpoint which would have included more foliage to frame the scene. Exposed at 1/50th and f/5.6 to get depth from near trees to distant falls.

If one has time to linger and wait for just the right light it is possible to get even more out of pictures like these, but when traveling, plane schedules are inflexible, reservations sometimes don't work out, as here where I had to come in through Brazil.

Bossetti and Adam and Eve

"NIGHTMARE"

By ROY A. KOCH

(Print of the Year, 1949, Jackson Park Camera Club, Chicago)

Strong Points of Stereo

By Earl E. Krause, P.S.A., F.S.G.

Non-stereo photographs with violent space composition such as the one above may be seen without distortion if placed at the proper viewing distance. This is found by multiplying the focal length of the camera lens by the magnification.

Measure the distance in inches between the outside edges of the horizontal sides of the film hanger in the picture—divide this by % inches which was the distance between these points on the film, to determine magnification. Multiply magnification by 3½ (focal length of the lens of the camera used.) View the picture from this distance for minimum distortion.

If you have two good eyes, you know stereo gives you depth. But along with it, you are given a host of other special qualities.

Before analyzing these "extras", let's see what advantages lie in the depth perception due to two-eyed vision. Right away the mergers Nick Haz finds so frequently in flat pictures are eliminated. No longer do trees grow out of the top of Aunt Emma's head; if a tree was behind her when the shutters clicked, it's definitely behind her also when the slide is seen in the viewer. In other words the various planes of the scene are separated in spite of what would be line or tone mergers in a flat print. This means you have space; and the objects in the space have solidity, roundness and

relief . . . an ideal medium for the glamour hound.

True perspective is reproduced when the slide is viewed with lenses equal in focal length to the camera lenses (orthostereo). In projection also true perspective may be seen, but only near the ideal viewing point, usually midway between the projector and screen.

An orthostereo slide cannot show distortion! Violent composition in space, yes, but since the slide is only a vehicle to reproduce the same stimuli that the eyes receive by direct vision of any scene, how is distortion possible? (See illustration)

Of course, when hand viewers are used that do not match the camera, or when a large spread-out audience views stereo on the screen, we no longer have orthostereo conditions and some elongation, compression, or twisting of shapes may be evident, especially on close-up scenes or views of geometric objects like tables, square tiling, etc.

When you look into a stereo viewer, your relationship to the objects pictured in space is fixed by optical laws—in fact, the spectator's optical position and visual function are so essential that it gives one the impression of being a part of the pictured situation. Teachers have found this fact valuable and point out that it is more like direct, first-hand experience than are the semi-symbolic and less realistic images of flat pictures. The students feel a degree of personal participation in each space-picture and, as a result, learn more quickly and retain the information longer.

Another quality of the orthostereo slide which makes it valuable as an exacting scientific tool and "legally honest" recording medium is its inherent way of showing everything full life-size. The mental synthesis of the two tiny squares of film results in space-pictures having no relationship to the size of the film images, but rather, the objects always assume their original exact size, scale and perspective.

Depth Is Not All

Although stereo photography is most valuable in giving us depth perception, this medium of two-eyed vision throws in some extra qualities which may be worth more than the depth effect with many subjects.

Textures and surface sheens are shown so much more perfectly in stereo that its employment in the textile and fashion world is inevitable. Catchlights and reflections are seen a little differently by each eye, especially in closeups. Imagine the sparkling highlights in a closeup of juicy orange segments or the fuzzy texture of a fresh peach. In a snow shot, for instance, the bright reflections from individual crystals may be quite different in the two views and that difference is what gives it sparkle. (It's like men and women, "Vive la difference.")

Realism is boosted also with the use of modern color films with practically grainless images and high resolving power. Since there are two films, they complement or reinforce each other, improving the detail and minimizing any flaws or graininess in the images which might show up objectionably in a single film. Being transparencies, the films are capable of presenting a great range of tones and colors—much closer to the range of tones found in nature than is possible by viewing any print by reflected light.

Eye Convergence

Scientific studies have been made of eye movements of persons looking at various types of flat pictures. Conclusions were drawn about what elements in the pictures were most attractive, the function of leading lines, compositional structure, etc. If these had been stereo pictures it is safe to assume that different conclusions would have been drawn. For one thing, instead of the lines of sight of the two eyes converging at the surface of the print, there would be

a continually changing degree of convergence as the eyes concentrated first on something close, then on an object farther back.

As an example, picture an interior view with a child sitting at a rain-splashed window looking out across a lawn. In stereo you might look first at the child's face, then at the rain on the window, and finally, look through the glass at the scene outside. At each of these three stages only the one plane concentrated upon would appear sharp.

Contrast this with a non-stereo view in which sharp detail at all distances from the camera is compressed onto one flat print surface. Near planes may merge into the far planes, and you are not able to completely localize your vision on one plane to the exclusion of others.

In real life and in stereo the eyes converge at the distance of the original object and attention is localized there. You can concentrate on the rain-splashed window and the view beyond will assume the same degree of unsharpness in stereo as in real life.

Stereo Hard on Judges

You know how fast salon judges run through non-stereo prints and slides. Their judgment is speeded by their ability to see the complete picture at a glance, including near and far objects. This speed will never be reached by stereo judges who are unable to see the complete scene at a glance but must change convergence several times to examine the various planes of the scene.

This means an increase in the attention span, another feature which makes for effective teaching and sales presentations.

Because stereo presents a space-picture radically different from any other art medium, it has an exchetic field of its own. Principles of composition effective on flat surfaces do not always apply. The art is relatively free of hide-bound tradition and stifling rules. Imagination, not darkroom trickery and drudgery, is the main ingredient for exciting visual conceptions.

Stereo Applications

The strong points of stereo which have been described assure the medium a solid, expanding future. It will be applied to many fields including forestry, nature study, geology, geography, industrial X-rays, microscopy, architecture, engineering, machinist's work, minerology, and experimental psychology. Stereo television is also possible.

To mention one more field of application where stereo has a tremendous potential, consider medical photography. With slides, any doctor in the world could study close-up the fine detail and exact appearance of rare operations, unusual pathological specimans, clinical tests, and even stereo X-rays. As a tool for this type of record-making and instruction stereo is unsurpassed, not so much because of the visible depth but because of the whole list of special qualities including depth, roundness, solidity, separation of planes, fixed viewpoint eliminating distortion and reproducing the original perspective and size, sparkling realism, surface sheens, textures, accurate colors, reinforced details because of two views, and psychological appeal.

More of these qualities should be exploited . . . depth isn't all.

Earl E. Krause is an engineering graduate, knows the physics and optics of stereography. Besides that he is an experienced photographer, critic and judge, that is of the artistic espects of photography. Krause is a Fellow of the Stereo Guild. He now heads the Jackson Park (Chicago) Camera Club's Stereo Group, In 1946 he prepared a thesis at the University of Chicago on "Three-Dimensional Adds to Teaching". Frank Rice, Chairman of the Stereo Division, says: "I think he is the best all around stereo photographer in Chicago."

Camera Club Manual

by H. J. Johnson, FPSA

CHAPTER V

CAMERA CLUB CONTESTS

Club competitions are important for two reasons. First, their presentation and judging are instructive program features for the club (and to older members who have heard innumerable lectures, they may be of more interest than lectures.) Second, they are the "tests" which enable the members individually to gage their progress.

Making pictures requires the homework or practice which is so important to the learning process, and without which lectures alone are insufficient. The competitions stimulate members to additional practice in order to score higher in the "tests".

Newer clubs with comparatively inexperienced members may encounter more difficulties in connection with competitions than do established clubs whose members have become inured to the disappointments which necessarily arise when few pictures are honored out of many submitted.

Unlike contests in which results can be measured with precision, there are only empirical standards for judging pictures. Results must be based largely upon opinions, and since these may tend to be deflating they may cause resentment or discouragement.

It is well to remind members at the beginning of each season that in order to derive maximum benefit and pleasure from contests, everyone should accept the results in a spirit of sportsmanship and good nature. Even with the best of judging, results are not conclusive: losing pictures are not necessarily inferior; winners are seldom masterpieces.

There are very few clubs which do not have print, slide, movie, or stereo contests (and because of multiple interests of members, many clubs have contests in more than one field.)

Because egos are involved and because members will not participate in contests when they believe the rules are not fair, it is very necessary that all phases of contemplated contests be carefully considered, and all members consulted before final rules are established. Any rules tailored to fit the ideas of a minority of members may ultimately lead to discontent. A ballot approval of proposed rules will minimize this possibility. It also will reduce the temptation of some members to propose revisions of the rules to make them more "equitable" or "fairer", the rarely are these proposals such that they will work a hardship on the proposers.

Competition Classes

One of the first problems in setting up rules for a competition is whether or not to separate members into classes according to their abilities.

Some clubs have a firm policy that only top pictures will win prizes in their clubs, and that no other pictures will be allowed to win merely because protected from higher calibre competition. These clubs have no separation into classes. In general, these clubs will hold the more serious workers who

This Camera Club Manual is a revision of the original manual prepared in 1945 by Victor H. Scales. It will be reprinted when publication is complete and discribed to member clubs.

have real respect only for the top prizes.

However, most members wilt in competition unless they feel they can occasionally win something. Therefore most clubs separate members into two groups, the better workers being included in one group and all others in the second group. A new club may find it difficult to make this separation, lacking accurate information about relative abilities of its members. The separation then may be postponed for one season, or the members may select their own class, or a separation may be established on the basis of years of experience.

After the first season, separation is not difficult, and various methods used are: (a) top half, or third, in total points scored go into the top class; (b) major prize winners go into the top class; (c) members who have had acceptances in major exhibitions, or won prizes in major competitions go into the top class.

The greater the number of classes, the more members who will win prizes. Therefore some clubs, under pressure by some members, end up with 3. 4, or even 5 competition classes. The more classes, the less the significance of prizes won in each, the greater the cost, and the more complicated the book-keeping and judging. Two classifications are usually considered sufficient.

Various euphonious names for the classes have been used to minimize the inference that some are sub-standard, but perhaps the most satisfactory names are simply "A", "B", "C".

Open Competition or Assigned Subjects?

The new club has no problem as to whether contest subjects should be assigned; during the first year all contests should be unrestricted as to subject or age of pictures.

Older clubs must decide whether or not to assign subjects and restrict age in order to stimulate continued improvement by members. Some members object to restrictions which prevent them turning in pictures as they please (not wanting to try new fields nor to be prevented from using accumulations of old negatives or slides,)

However, most members prefer some restrictions because these tend to make competitions fairer. Assigned subjects place members on more equal footings because usually the conditions for obtaining the pictures are more nearly equal.

Age limits prod members into continuing productivity (building the club's reputation upon the imagination and ability of its members currently, not on what members were able to do in some distant past); equalizes opportunities for winning (both new and old members are on equal bases with current pictures because those from old accumulations are ineligible); and makes the showing or judging of pictures more entertaining and instructive to the membership as a whole because the pictures are more timely.

A practical solution is a combination of general and assigned subjects. This is accomplished either by specifying that a certain number of contests shall be general (unrestricted as to subjects) or that general and assigned contests shall be held concurrently, winners in the latter receiving a higher number of points than winners in the former. Between the two methods, the first is least cumbersome.

In selecting subjects for assigned contests, it is necessary to avoid those which are so limited or difficult that few entries would result. Subjects must be practical and equally available to all members. The following are good examples:

School days Abstract Genre Sequence Action Class Shadows Autumn Hands Silhouettes Architecture Humor Smoke Boats Ice Sports Box Calaera Industry Still life, metal Interior Cartoon Still life, ceramics Landscape Children Still life, misc. Christmas Cards Nature Snow Clouds Night Sunrise or sunset Commercial Nude Street scene Pattern Curves Table top Design Pets Portrait, Self Texture Documentary Transportation Portrait, men Eves Portrait, women Trick photography Farm Vacation Portrait, group Fishing Flowers Rain Winter Reflections Zoo Fruit

It is important that contest subjects be published well in advance (at least six months) to give members an opportunity to prepare. Unless this is done, the purpose of assignments is defeated because new field, new pictures, require more time than something selected from stock.

Another necessary precaution is to define the subjects well enough to minimize the temptation of some members to enter pictures which do not quite fit the subject but may have better chances of winning. For example, "Flowers" can be defined as "Wild flowers only; no formal arrangements; must comprise at least half of picture area." (That last clause would prevent a landscape being submitted as a flower picture because it contained flowers!) the judges should be given the same definitions so that they may reject pictures outside the subject, or the contest director should be instructed to challenge questionable pictures at the time they are submitted.

Judges

The quality of judging is important in the results expected to be obtained by contests. Judges must be the best available, and if at all possible, should be outsiders. The latter point is especially important to prevent a club becoming ingrown and to avoid personalities entering into the judging.

Three judges are preferable, but when it is difficult to obtain that many, it is generally better to have one good outsider than to have members judge their own pictures.

The more open minded that members are to viewpoints other than their own, the easier it is to find outside judges, even in small communities. Artists are good prospects and many progressive clubs make it a practice to include an artist among the judges for their major contests. Art teachers are good prospects. So are commercial photographers, portrait photographers, magazine editors. Where other camera clubs are near, judges may be obtained from the advanced members of those clubs. And finally, the P. S. A. judging service may be used, the pictures being sent to the specified judges and returned with the winners indicated and a general estimate of the quality of the pictures.

If it is absolutely necessary for a club to judge its own contests, the method which is more generally acceptable is for balloting by all members, using slips of paper numbered to correspond to the prints or slides and scoring each according to a scale of points.

If a panel of own judges is used instead, they should not be permitted to vote on their own pictures (the average scores given by the other judges being substituted). There is less possibility of criticism if the judges have none of their own pictures in the contest.

Mechanics of Judging

The mechanics of judging have chiefly to do with standards for lighting and methods for indicating votes.

There are several ways to handle prints. One way is to arrange them around the wall so that judges may pass before them and decide by agreement whether each print should remain on the wall for final decisions. Or if a scoring method is used, each judge records his score on a corresponding slip of paper. Lighting must be approximately even over the wall for this method.

Another method is the use of an easel, upon which each print is placed in turn for the judges' consideration. The recommended lighting for this arrangement is as follows: Adjust the room lights so that the illumination level at the print surface is 10 foot-candles, with no distracting glare or reflection near the print. Then set up copying type lighting so that a total print illumination level of 35 foot-candles is achieved. As a rough guide, the following setup will deliver approximatey 25 foot-candles: two 100 watt bulbs in Kodaflectors (matte side) at 6 ft. distance, with the light incident on the print at 35 degrees.

A third, and popular method, is the use of a "viewing box" in which the lighting is standardized by the wattage and placement of the bulbs. Actually there are two open-top boxes, 30" x 12" x 17½", with the open sides facing each other and the two joined together on the back side by a panel the width of the boxes and separating them by a distance of 24". Fastened to the panel is a ledge upon which the prints are placed for judging. In each box are two 40w bulbs, each 6¾" from its side of the box and 12" from the back. The viewing box is placed upon a table and the judges sit at a convenient distance in front while the prints are removed and replaced.

Slides may be judged over an illuminated panel, but practically all judging of slides is by projection. The standard illumination for projection is 10 foot-candles upon a headed screen.

Movies also must be judged by projection and screen illumination is approximately the same for a beaded screen, or 13-14 foot-candles upon a matte screen.

The simplest voting method is for the judges to discuss among themselves each print or slide as it is presented and then to call out their combined decision as "in" or "out" until all pictures have been submitted. The process is repeated until the desired number of winners have been selected.

When it is feared that one judge may dominate others, the voting may be individually, each judge indicating his own decision as to "in" or "out". The pictures are then separated into stacks according to the number of "in" votes they received. The final winners are selected similarly from the pictures having the highest preliminary votes. (With three judges, there would be four stacks after the preliminary judging round: one containing pictures which received 3 "in" votes; a second for 2 "in" votes; a third for 1 vote; and the last stack for pictures receiving no favorable votes.

A variation of the "in-out" method is to also include a "hold" classification. Thus a picture can be definitely "in" or definitely "out", or questionable and rated "hold" for another examination later to see whether it is to end up as "in" or "out."

To simplify judging, electrical voting machines may be used. The most common of these is a box containing three sets of red and green lights, each judge controlling a pair of lights by means of a push button and extension cord. Adaptations include lights for five judges, amber "hold" lights, provision for not registering lights until all votes have been cast, etc.

Finer gradations of decisions can be made when numerical scoring is used, each judge grading each picture with a scale of 1 to 10 points. (This is the most commonly used scale the each club can decide for itself what values to use.) The best pictures will receive 9 or 10 points, the poorest receive 1 or 2 points, and the others score intermediately. When this method is used, it is helpful to let the judges see in advance all of the pictures entered in the contest (project them rapidly or pass them across the easel rapidly.) Most frequently, paper slips keyed to the pictures are used, and the slips then totalled for the score of each picture. The prize winners are automatically indicated (top scoring picture receiving first place, etc.) unless there are ties, in which case the judges must make the separation.

Another advantage of using numerical scores is that a season cumulative actual total can be obtained, including all pictures entered even tho not among the winners.

When the "in-out" method is used and it is desired to obtain numerical scores for cumulation toward season prizes, numerical values are assigned to the prize winners. For example, 5 points for first places, 4 for 2nd, 3 for 3rd, and 2 points for honorable mentions. Each club must decide its own scale of values.

Prizes

More and more clubs are discontinuing the "1st, 2nd, 3rd place" basis for prizes and instead use "awards" without distinction as to place. Thus the winners in a contest might be three "Awards", each rated equally, and three Honorable Mentions, also each ranked equally. The reasoning is that unless a contest is very small, the arbitrary separation of top pictures is not of real significance because too often the separation is made on the basis of personal preference by the judges. For example, with three equally good pictures but of different subjects, the selections will vary in accordance with judges' preferences. Another advantage of the "awards" plan is that it simplifies judging.

If the number of prizes is too large, they lose significance; if too low, the encouragement factor is low. A recommended range is 10-20% (the lower percentage favored.) The 10% might work out as 1st, 2nd, and 3rd prizes plus Honorable Mentions to equal 10% of the total number of entries. Or, awards and honorable mentions to equal 10%, with half being awards and half honorable mentions.

Prizes should be tangible, but except for major contests, need not be valuable. Ribbons are sufficient for monthly contest. Medals and trophies are generally used for major or annual contests, or for prizes for season cumulative scores.

Altho some clubs use practical prizes such as photographic equipment, most prefer (in accordance with the general desires of individual members) to award medals or trophies.

It is not good policy to solicit merchandise prizes from dealers.

Instructions to the Judges

Explain to judges any classifications used, what judging method is to be used, and how many prizes are to be selected.

If the judges are selected for their acknowledged ability, it will be superfluous to attempt to tell them how to judge. (Sometimes a club will attempt to tell a judge just what factors he is to look for, just how much or how little credit he is to assign for each factor, etc. The more of this "predetermination" by the club, the less need for judges!)

General

A contest director, or committee, is necessary to handle details of the club contests, such as obtaining judges, book-keeping the scores, etc.

If rules are patterned as much as possible upon those of major exhibitions it will be easier for members to go into outside competition later. These rules require prints to be entirely the work of the entrant, slides to have been exposed by the entrant, etc. Obtain entry forms from several of the major exhibitions and study them.

Members should be encouraged as much as possible to enter outside competitions. One method is to give point credits in club totals for outside prizes or acceptances. Success of members outside the club helps obtain favorable publicity for the club. In addition, outside competition gives a better evaluation of the significance of prizes won in the club, since it is possible to be a constant prize winner within the club and yet not to win prizes elsewhere.

Clubs should not expect every member to be represented in its contests. Some members have a neurotic fear of failure and will rationalize in various ways their non-participation. Small, private "study" groups will help such members finally get started.

Sample Set of Contest Rules

Each club must tailor, from the material in this chapter, a set of rules to fit its own desires and requirements. However, the following is a sample of how a completed routine may look.

-CLUB CONTESTS

General Policy: (a) Assigned, dated subjects shall comprise the major portion of competitions in this club; (b) Outside judges shall be used to the utmost extent possible; (c) There shall be no separation into classes, i. e. Advanced and Beginners, A and B, etc.; (d) There shall be no change in these instructions without approval of membership at a business meeting.

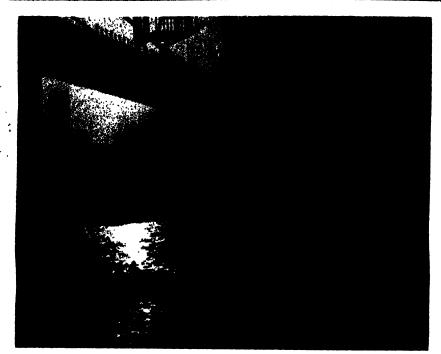

- No. of entries: 4 prints or 4 slides. No Awards or Honorable Mentions can ever be entered again.
- Identification: Entries must be identified and titled. The contest director shall return, without entry, any print or slide not complying.
- 3. Selection of subjects: The contest director shall prepare
 a list in the Spring for next season's competitions.
 These shall be presented, discussed, and revised at
 one or more business meetings so that in June, plans
 will be completed for the following season. Subjects
 may include half repeats from previous seasons, and
 half new or unassigned. "Open" contests or repeat
 subjects will have no time restrictions, but entries
 in repeat subjects can not be more than a year old.
- 4. Definitions: Each subject shall be defined (by negative or positive statements) sufficiently that there will be a minimum of entries which do not fit the subject. Definitions given to the judges must be the same. The contest director may challenge entry at time received and refer to a committee of 4 selected immediately for immediate judgment. Or an entry may be challenged from the audience, and decided by a hand
- 5. Judges: (a) There shall be three judges and one of these shall be the lecturer (unless there is a definite refusal) who shall be notified at time he accepts lecture engagement; (b) the other two shall be qualified visitors if possible; (c) finally, members may be used provided they have no entries. In case of (c), the drafting should be spread as evenly as possible, and so far as possible from the top qualified half of the membership.

In order to reduce (c) as much as possible, the contest director may invite a judge, who must be provided transportation and dinner.

 Judging: Voice vote of "in" or "out" after minimum discussion by judges. All pictures to be seen in advance by the judges.

(To be continued)

The Judges for May

Class 1-2-3 Selected by the Chicago Chapter of PSA.

J. Phil Wahlman, APSA Chicago, Ill.

Anne Pilger Dewey, Hon. PSA, APSA

Otho B. Turbyfill, APSA Theodore L. Bronson Maurice H. Louis, APSA

s 8 Anne Pilger Dewey, Hon. PSA, APSA Chicago, Ill.

Remarks

Several of the books with the mounted point winning prints will be on exhibition in the Portfolio Room at the Convention. I hope you will examine them and be inspired to get into the Picture of the Month yourselves. There is still plenty of time for you and your Portfolio to finish at or near the top, and you can see from the scores that the beginners and new members have just as much chance as the old timers. These books, one for each month, will old timers. These Doors, one for eson month, was be loaned by the PSA Library to any organization affiliated with PSA that would like to show them to their members, so we hope the quality will improve from month to mouth. This is a challenge to the best photographers in PSA to try to better the prints already shown, if they can do it!

How come California is way down in fourth place?

it doesn't look natural!

Joun R. Hosan, Chairman.

Simultaneous Color Contrast

By James H. Archibald.

Call it what you may, the effect of one color upon another is viewed by the average newcomer to Color as pretty much of a mystery, one that only the expert can understand—and exploit. Technical language in abundance has been used to explain the whys and the wherefores of 'simultaneous color contrast', yet the old Chinese proverb that 'one picture is worth ten thousand words' still remains true, else why Photography?

As a colorist who has spent a lifetime working with color, observing what some may call its idiosyncrasies, it is with sympathetic appreciation that the writer notes the travail manifest in the ranks of those recently introduced to Color. Alas, it is unfortunate that we live in an age of speed, with the accent upon education in 'five easy lessons'. In Color, what is needed is less concern for rules, and more respect for principles.

We have attended lectures where the speaker enthused eloquently about Color in ultra-technical language; seemed to glory in conglomerations of obtuse detail; showed color transparencies of exceeding merit, and—left his audience in a verbal fog of generalizations. Now what the color tyro wants, it seems to me, is information about color that he can understand, and use. There are times, however, when it is difficult to explain an idea unless the student has a fair knowledge of the subject. A simple problem in mathematics looks terrifying to the student who has never learned that two and two

make four. For this reason, then, we shall employ no wordy elaboration concerning the phenomena of 'simultaneous color contrast', but will rely upon the wisdom of the Chinese proverb previously mentioned.

Something we see usually leaves a deeper impression on our minds than something we read about. This is especially true when attempting to explain how one color affects another. Therefore, we suggest the color student procure pieces of colored paper in the following bright hues: Purple-blue, red, yellow, green, and light greenish blue. From these cut two inch squares of the first three colors, three one-inch squares of the green, and the same of green-blue.

Place a sheet of black paper on a table, and on top of this arrange the larger squares as follows—left to right: Purple-blue, red, and yellow, half an inch apart. Now, in the center of these squares place the three smaller green squares. From a distance of about eighteen inches, and with the eyes SLIGHTLY closed, compare the appearance of the separate squares of green. The one on the left will seem quite a bit yellower than the middle one, while the green on the yellow will appear deeper and bluer than the other two.

"Why is this so?" Well, the question could be answered in scientific language complex enough to induce a state of confusion in the mind of the tyro, and prolific enough to cover many pages. Suffice it then, that the experiment discloses an important fact connected with Color. which is: THAT THE 'AFTER IMAGE' INDUCED BY ONE COLOR TENDS TO AFFECT THE APPEARANCE OF ADJACENT COLORS. In this instance, the yellow 'after image' of purple-blue yellowed the green; the blue-green 'after image' of red blued the green still more; and the blue 'after image' of yellow made this green the bluest of all three. To find the 'after image' of any primary hue, simply look at a small area of it for thirty or so seconds, and then transfer the vision to a dot on a piece of white paper.

Now continue the experiment, and replace the green squares with the greenish-blue ones. Again it will be noted that the smaller square on the left is apparently the greenest in tone, while the one on the right is the bluest of the three. Here again the 'after image' formula is the same. Still another test can be made by placing a small square of red on light green, yellow, and orange. In this instance the red will appear progressively greyer from left to right.

Numerous fascinating experiments can be made with assorted pieces of colored paper, and nothing is more conducive to a better understanding of 'simultaneous color contrast' than VISUAL investigation along such lines.

High Speed Photography (from p. 477)

The subject of photographing a television screen is not to be construed as a subject carefully investigated by the writer, but is used merely to illustrate the effects of variations in camera speed. The photographing of the scanning spot of light on a television screen, if this were to be the particular subject of study, illustrates why special equipment must sometimes be devised to observe an obscure phenomenon.

Special purpose cameras represent only a small portion of the equipment utilized in high-speed photography, with rotating prism cameras being the "work-horses" in high-speed cinematography. Their utilization represents a broad field of endeavor, and usable by nearly any photographer who understands what he is after.

To Come Back With Better Pictures

Useful Advice

Every vacation picture worth taking raises some question on taking or tech-

nique. With a Kodak Master Photoguide in your pocket, the answer is easy . . . and positive. Take the question of filters. Just pull out the Master Photoguide, flip to the contrast viewing filters, look at your subject through each in turn, and pick the best. That's only one way the Master Photoguide comes in handy. It's a photo library of flood, flash, and special situation data, along with exposure and close-up tips, plus plenty of other "on the spot" information. \$1.75.

Nowadays, you'll find Kodacolor film in many a professional's personal camera . . . it's that good. The chances are that your camera will take Kodacolor too, so you're sure to want the new booklet "Let's Take Koda-

color Pictures." It tells you, in detail, how to use Kodacolor under varying light conditions; gives tips on outdoor pictures including shadow and action shots. Flash, flood, and other data are included. Only 35c.

Your interest in the many phases of still color work will lead you to the Kodak Color Handbook. It gives you ad-

vanced and complete information on both outdoor and studio photography, with full data on Kodak color films and processes. Its 250 pages include more than 100 full-color illustrations. Mult-O-Ring bound for easy addition of supplementary publications. Price, \$4. Registered owners of the Handbook also receive "Kodak Color Notes," issued periodically and containing valuable new information for color enthusiasts.

Every summer-camping youngster should have a copy of "Pioture Taking in Camp," to help him bring back a happy record of summer activities. Sets up picture projects which cover picture making

in camp... from taking, to developing and printing under camp conditions. Illustrated with actual camp pictures. 25c.

Some good informative photographic reading for relaxing vacation moments is "How to Make Good Pictures." Tells the best way to

find and place subjects, what elements make the best pictures, how to make pictures anywhere, anytime . . . in color or black-andwhite. It contains hundreds of black-andwhite pictures as well as 32 pages in full color. All-new edition, 224 pages, only \$1.00.

Maybe you will be lucky enough to take a plane to reach your vacation destination, or take a seaplane ride at a resort. If so, you'll want the booklet "Pictures from the Air with Your Camera." It tells you how to

get good aerial photographs with ordinary cameras, suggests possibilities, explains special problems. 16 pages. Illustrated. 25c.

Handy Accessories

Now is a good time, too, to take stock of those little photographic items that can add so much. The Kodak Pola-Screen gives you positive control of blue sky in your color pictures. Useful in con-trolling non-metallic reflections.

tions, too. Series IV, \$6.75; Series V, \$7.80; Series VI, \$8.80. Kodak Pola-Screen Viewer, \$6.75. At your Kodak dealer's.

On vacation, you want to get in the pictures, too. That calls for a Kodak Auto-Release. It delays the shutter action about ten seconds; gives you time to join the group in front of the camera. Works with any camera that accepts a cable release. \$3.86,

Speaking of cable releases, maybe yours needs replacing. Kodak No. 5 Metal Cable Release won't stretch or kink—the spring core is protected by an outer casing of braided stainless-steel wire. Comes in 7- and 12-inch sizes, \$1.05 and \$1.30.

If you own a Kodak Tourist I or II Camera f/4.5, or Tourist I f/6.3, and really want to add versatility, get a Kodak Tourist Adapter Kit.

Makes possible pictures in four sizes, including 28 x 40mm. (with Kodachrome 828 Film). Other sizes are half 620 (1½ x 2¼ inches), square 620 (2¼ x 2¼ inches), and the full 620 (2¼ x 3¼ inches). Price, complete with carrying pouch, \$13.25.

Kodak Wratten Filters help you add life, sparkle, emphasis to your pictures . . . with black-and-white and color film. The safest, most convenient way to carry them is, of course,

in the handsome, two-compartment, feltlined, leather Kodak Combination Filter Case. Price of case alone for Series V filters, \$4.25; for Series VI filters, \$4.95.

Prices include Federal Tax where applicable and are subject to change without notice.

EASTMAN KODAK COMPANY Rochester 4, N. Y.

Pictorial DIGEST Division

Devoted to News of the Pictorial Division of the Photographic Society of America

First Convention of the Photographic Societies of New Zealand, held at Queenstown April 26.
Convention committee (seated front row, beginning fourth from left) consisted of Albert
Marker, Roy Truscott, Fred Bowron, Leonard Casbolt and Ron Sparrow. (Photo by V. C. Browne)

A Report On The New Zealand Convention

"There is a brotherhood in photography" were the words of E. R. Bartlett of Dunedin when he was addressing the Convention of Photographic Societies of New Zealand on April 26th. The following five days only served to confirm and strengthen this sentiment, for at the Convention, held at Queenstown, New Zealand, numerous friend-ships were cemented among people who previously had been no more than mere names on prints. The password was "photography" and the sign was one or more cameras hanging from the neck.

This Convention, probably the first of its kind to be held in the British Commonwealth outside England, started back eighteen months before when Fred Bowron of the Christchurch Photographic Society visited the United States on business. But while he was here, he was determined to make the acquaintance of as many well-known photographers as possible.

As many of you know, Fred attended the PSA Convention in Baltimore. And upon his return to New Zoaland, he was so enthusiastic about his contacts made at the fine get-together here in the United States that he and his old friend Leonard Casbolt, President of the Christchurch Photographic Society, started to spread the gospel of conventions through South Island. The other clubs liked the idea and pledged their support. A convention committee was formed composed of F. Leonard Casbolt, APSA, President, Fred L. Bowron, Secretary, Ron L. Sparrow, Salon Secretary, Albert H. Marker, Entertainment Chairman, and Roy H. Truscott, Tressurer.

The convention was held at Queenstown in the heart of the southern lakes and moun-

tains at the peak of autumn color from the 24th to the 30th of April. The opening ceremonies were held on Thursday evening with remarks from the Convention Secretary, Fred Bowron, and the President, Leonard Casbolt, followed by greetings from the Mayor of Queenstown. Following this, the group heard recorded greetings from Norris Harkness, PSA President, Gene Chase and Ray Miess, officers of the Pictorial Division, and Phil Maples, Director of the Recorded Lecture Program. The whole group was thrilled with the personal greetings from PSA. Also present were Keast Burke, APSA, and several others from Australia.

Another first at this fine convention was the First National Salon, composed of 55 prints selected by Harold Larsen, Leonard Casbolt, and Fred Bowron. These prints were displayed on the wall of the "House of Friendship" where they remained during all of the meetings. The prints were reproduced on slides and comments by the judges were recorded for future circulation among the participating clubs.

On Friday, through the cooperation of the Pictorial Division's Recorded Lecture Program, the first showing of the PSA Permanent Print Collection with recorded commentary on the prints by J. Elwood Armstrong, FPSA, was held. For those with limited experience in International Exhibition work, this was truly an education. Not only did those present get to see examples of some of the finest photographic work in the world, but the expert commentary helped point out the factors which contributed to the success of these outstanding pictures.

On Sunday night, the group heard the Recorded Lecture by Barbara Green, FPSA, on "New Prints for Old", also made available to this group through the Recorded Lecture Program. Thus through the medium of the tape recorder we can share our knowledge with all parts of the world and truly make better friends through photography.

This convention seemed to be noted for the numerous field trips which were planned for the group attending. New Zealand was its full autumn foliage, and the beauty of nature helped further the cause of photography.

liford, Ltd. of London presented the four honor print winners with silver medallions. And at the final session, plans were made for a similar convention to be held next year with the Waikato Club acting as hosts.

And so the joys of photography and the fellowship developed by attendance at one of our PSA Convention has been carried to this spot nearly half way around the world from us.

—Stella Jenks, from notes by Norman Hadler

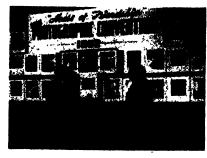

MISS EVELYN ROBBINS, Associate Editor

Chirps From The Robbins

This month the column has been devoted almost entirely to the quotation of a portion of a letter written by Dr. John S. Anderson, of Grand Island, Nebraska, and inserted in the Notebook of Portfolio #45. Due to the alertness of the secretary of this Portfolio, Miss Florence McGee, it is being passed along to you. We've found it to be something that is well worthy of consideration, and hope you will feel the same way about it. (Hope you don't mind, John!)

it. (Hope you don't mind, John!)

There is also another "thought" which
was passed on to his fellow Portfolio members by Dr. Anderson in a later notebook

Jadges Harold Larsen, APSA, Leonard Casbolt, APSA and Fred Bowron discuss the New Zeeland Salon. (Browne photo)

ş

entry. It was just too good to overlook, because of the evidence of such sincere think-

ing and deep feeling.

All I ask, and all that John asks I'm sure, is that you read the following and then sit down and give it some very serious thought, consideration and an honest try. It isn't always easy to follow this pattern—but it is easy to let the excuse, "I just haven't the time!" alip smoothly across our tongues. At any rate I hope you will make this your "thought for the day";

"A group of friends were over at my home the other evening, and during the evening asked to see some of my prints (note: asked, not were forced). After seeing many and discussing all, one person asked me where I found the time to do all this work, and with a grin and shrug of the shoulders

the remark was passed by.

"Later as I was getting ready for bed I got to thinking about his remark and came up with a thought or two I deemed worth remembering. The good Lord gave us 24 hours a day and each day is followed by a new one. It seems that because of this, the finding of time is the easiest job of all for it is ever present. Time never begins and never ends, for it is eternity itself. The big job is not to find time but rather to take time. In this art of ours, in which we all strive for proficiency, there are many exacting processes. To learn them the way we wish requires practice and more practice. You must make up your mind to take the time to do them not once but scores of times.

"We Americans are loaded down with organizations, clubs, golf, bridge, dancing, hunting, fishing, scads of hobbies, etc., etc., etc. But in our hobby of pictorial photography, if you do not plan on taking enough tune from each day to do the things you want to do in it you'll never learn it. There are only 24 hours in a day, and if you wish to do all the things there are to do, you'll never learn to do any of them well. So the only other thing you can do is cut out some of it."

Do you enjoy reading about your fellow Portfolioists, about their ideas, suggestions and experiences? OK! Portfolio Secretaries -then, it is up to YOU! Will you please review the Notebooks very carefully each time they return to you for rerouting? Anything at all that you feel might be of interest to other Portfolio Members, for one reason or another, should be copied (a rough drast will do) and sent along to me: Evelyn M. Robbins, 2417 South 11th Street, Springfield, Illinois.

Remember this is YOUR column! I'd like to put into it the sort of things that will be of interest to all Portfolioists. Any ideas or suggestions that you have will be very much appreciated—send them along!

Convention Time

Here it is at long last! Time for the big PSA Convention. I hope you'll be there! It sounds like the New York gang have some big plans in the making for lots of fun, as well as some very very good programs.

From personal experience, let me assure you that attendance at a PSA Convention is very much worth the trouble of saving your nickels and dimes for a long time in order to got You'll find friendships there that will be beyond value to you for the rest of your life, I KNOW! I wouldn't trude life itself for the friendships I've found at a PSA Convention!

You will never most a stranger there-Even introductions aren't necessary, nor are they expected. You'll find that people will walk up to you, look at your hadge, and within five minutes you are old friends—yes, and don't forget! You'll be doing exactly the same thing before the sun sets on the first day of the Convention!

Just imagine walking into the Portfolio Room and being greeted warmly and whole heartedly by someone you've never seen before! Yes, I've seen it happen. Usually the photograph that you put into the Portfolio Notebook suffices, and, even though the members of the circle have never actually met in person, there is no doubt in their minds as to the other person's identity. And do you know, it's just like picking up a conversation where you left off (seems like only a few days ago). If someone were to remind you that five minutes ago you had never met this wonderful friend, you'd swear they were off their rocker.

The spontaneity and true friendliness is amazing! Believe me! Or-don't believe me come and see for yourself! I'll just make you a little bet; that there will be just one disappointment! And that disappointment? Simply this: You'll be sure to say, "WHY didn't someone tell me about this long ago!"

How about it? Will YOU be there?

Comments By Commentators

What Pictorialism Means To Me

By Dr. JOHN S. ANDERSON Portfolio #45, Pictorial

I have been very irked by articles appearing in many of the periodicals the last few months ridiculing pictorialism. I have always felt that this hobby of ours is so huge that everyone with all their varied likes could find an interesting niche somewhere within it. To me PICTORIALISM is that niche. But I absolutely refuse to have someone else cram their likes down my throat. Consequently, I'd like to write a few paragraphs about why I like to take Pictorial pictures. Mind you now, I didn't say that you should take such pictures! I merely want to show you why I want to.

To me there exists two types of pictures. One is the documentary, realism, be-as-it-is types of picture, and the other is the pictorial print. The documentary print I define as one depicting things as they are. On the other hand, the pictorial print depicts things AS YOU WISH THEY WERE. It seems to me that our old world is so full of the sordid, the decayed, the nauscating realism and it is thrown at us by the news, radio, movies and others so much that we should strive to get away from it as much as possible. Such can be accomplished by the pictorial print, for it can be made to depict things the way you wish they really were.

Photography is trying to go the way of Literature, Art, and Music. A book is written now with no thought of its ever being read in the future. When a new book appears it is first hoped that it will be banned in Boston. Next the Book of the Month

Chair gets it and it hits a one and a half meldion obscure is born. Finally it appears in the twenty-five cent book rack and then—OBLIVION!

A ploture is painted only with the shocking power to startle the onlooker into looking at it and then to have him turn wishing he hadn't looked. There's no hope born with the picture that it will be seen by scores for centuries to come. The main idea in its birth is to startle and thus be called Modern.

A song is written not with the thought that hundreds shall play it for years to come and that budding musicians be called upon to add it to their repertoire; but only with the prayer that a leading singer or band will plug it and make it sell. Soon it hits three million copies. Thousands of records are sold, a movie uses it for a title song, it hits the Hit Parade, and then OBLIVION! Not only popular music follows this theme. How many times in the last six months have you heard the Sabre Dance? Yet it was played incessantly at first.

Yes, I'm afraid photography wants to follow the lead of its elder sisters. I for one

will do all I can to stop it!

The realist condemns us for our manipulations and control processes. The argument is that the camera as it now exists with its fine lenses is capable of producing needle sharp reproductions and should be used only as such. How silly! I presume if Shakespeare were to come back to Earth and be given our finest typewriter and placed in our finest air-conditioned study that he would be ridicaled for producing Hamlet and not something equivalent to Forever Amber. I suppose if Gainsborough were to return and be given our finest oils and sable brushes and placed in our modern studios that he would be chastised for producing a Blue Boy instead of a Dali nightmare!

The camera and all its accessories is a mere tool and I shall use it as my hand and heart desire and someday, perhaps, I may create something that will be viewed with joy by many for years to come.

I believe a pictorial picture should fulfill the following requirements. I know you've all heard this thousands of times but it still comes first. It's got to have a center

AN INVITATION

This is an invitation to every PSA member to participate in the PSA American Portfolios.

Enrollments are now being received in the following specialized groups:

PSA Pictorial Portfolice
PSA Pottrait Portfolice
PSA Ministure Portfolice
PSA Control Process Portfolice
PSA Star Exhibitor Portfolice
PSA Star Exhibitor Portfolice
(For PSA Award of Mork Winners)
PSA Nature Portfolice
PSA Photo-Journalism Portfolice

For information concerning any of the forgoing activities and for enrollment blanks, write to the Director of the PSA American Portfolios, Ridridge R. Christhilf, Hon. PSA, APSA, Saite 406, 800 Davis Street, Evension, Illinois. of interest. Pattern, Nature, or what have you—if it is pictorial it has a center of interest is the first thing that attracts the looker. Secondly this center of interest must be in a pleasing area of the picture. After the looker's attention is brought to focus it must be restful to him or he will cease to look.

Thirdly, he must have something to see when his attention is pleasingly called to the picture. The center of interest, in its pleasing spot, with other secondary centers, must say something to the looker, if it doesn't do this it must make him feel an emotion, or bring back a memory, or feel a certain mood. Fourth and the most important of all to me, the picture must have some of the maker in it. It must have style and quality and these must be the maker's own. The old masters were remembered for their blending of colors, brush strokes, and groupings of ideas. Pictorial pictures must do likewise.

A documentarian can take a picture and this picture can be duplicated exactly by anyone using the same camera, lens, film, lighting conditions, and paper. It is all a set formula from which he cannot vary and contains absolutely no individualism. On the other hand I can take a picture and through my own effort can so manipulate that picture to express my own ideas as to how I wish that picture to be. This can never be duplicated for it is the product of heart, mind, and hand, and does not come into being simply by mathematical rule. This then is the big factor in pictorialism. The first three are important to the picture, but the last is what gives it a soul.

I hope I haven't made anyone angry. This is only to explain why I wish to make pictorial prints. I'll be the first to admit that the pictorialists have not been true to their calling. Too many mimics and copyists have swamped the salons with their work. It would be nice if an artist were to be one of the judges with two photographic judges to balance. The latter are needed because the perplexities of the photographic process must be understood. The artist is needed. however, to help pick the true pictorial print, the one picture with a soul. Occasionally in a salon a small star appears. It's a new star and is welcomed with open arms. The judges sigh with relief because of its freshness, and it is nurtured as if it were a fragile plant.

I now suggest that our die-hard friends go to their nearest physician and have their blood pressures taken. A good rest and you'll be as good as new.

Highlights from the PORTRAIT PORTFOLIOS

FREDERIC CALVERT, Associate Editor

Good Portraiture Is A Challenge

Good portraiture is a challenge. A good portrait reveals the personality of the subject. It brings out many facets of the person. It is more than just a map of facial features.

Many folks can go out in the field, take a picture of a pretty scene and come up with a pleasant pictorial print without too many mistakes, and it will pass the Judge's cagie eyes and be accepted for a salon.

But in portraiture, you work with a live model that is movable (especially movable at the wrong time). The lights are completely controlled by the photographer to produce the effect he wishes.

To have a portrait accepted in a Salon, it must be practically perfect in every detail. To learn how to do this a Portrait Portfolio is your answer. Even if you are not interested in Salons, you will learn how to make good studies of your loved ones, friends and acquaintances.

Of course, if you have reached a high degree of proficiency in your portrait work, you may not need the help of the others in the Portfolio quite so much. But you can always learn new tricks in portrait making and your comments will help others who have not yet become as adopt as you are.

And do we need to tell you about the marvelous friends you'll make? You will be in a group of 15 persons like yourself, all working toward making better portrait studies.

Why don't you join a Portrait Portfolio today? Write the Director—his address is in the masthead.

A. LYNNE PASCHALL, Associate Editor

August is the month when many camera clubs hold field trips. How much is accomplished for the good of photography by such activities may be open to debate, but most people have a good time on these outings, and if a club needs new members, or the old members need reviving, then there is nothing equal to a field trip. The indoor "shooting session" can not compare with it. An amateur photographer needs lots of room; he needs blue sky and fleecy clouds, and distant hills.

I went on a field trip last summer, down into a state park that had everything: towering hills and stately forests, a mirror lake and a rippling brook. There were winding trails and cozy nooks. And, in order that there might be something to photograph, the committee bought out some city girls to act as models. And, how do you suppose they were dressed? Yep, you guessed it! Not in rustic garb but in ballet costumes, some of them in bathing suits.

One of the would-be pictorialists, after trying to fit a sophisticated model into the forest primeval, gave up in despair, and he was seen later, sitting off by himself, busily writing.

He came up with this:--

SHADES OF JOYCE KILMER!

I think that I shall never see

A model lovely as a tree! A tree by Nature clad in green,

A form that blends with any scene.

Its graceful limbs demurely dressed In leaves and verdure, surshine friessed. No styles or fashions rule its day, Yet beauty never shone so gay.

We're wasting words, my gentle friend, I cannot hope to block a trend: Go pose your model, but for me-I'll use my film to take a TREE.

A. L. P.

PORTFOLIAN CLUBS

Sten Anderson reports that a new club has been formed at Shreveport, Louisiana. H. O. Wiseman is the president and H. G. Friedman the secretary. This club, to be known as the Shreveport Portfolian Club. was organized on May 5 with an active membership of thirteen and one associate mem-

The Lincoln Portfolian Club joined with four other photographic clubs in Lincoln to bring one of the PSA National Lecture Programs to that city. They had Barbara Green, F.P.S.A. with her lecture on child photography: "Don't Watch the Birdie," A large crowd was present including twentyfive photo fans from Fremont, fifteen from Seward, and four from York, Nebraska. Kappa Alpha Mu, (PSA) photographic fraternity from the Department of Journalism. University of Nebraska, was one of the sponsors.

American Exhibits

One of the ways that we make progress in photography is by studying the work of people who are better at it than we are.

By all means get in as many prints by your own club members as possible, but it would be a good plan to schedule at least one of the American Exhibits for the coming season. Write to Fred Fix, Jr. and tell him all about your club, as well as the open dates. We are sure that he will have something for you.

Among the more recent additions are shows from the Photographic Guild of Detroit, the Fort Dearborn Camera Club of Chicago, and the Southern California Collection.

If your club goes in for fads and outof-the-ordinary work, perhaps you would be interested in prints by Anne Dewey or Y. Ishimotto. Or maybe the nudes of Buck Hoy.

Then there are always the lovely seascapes of John R. Hogan, the human interest shots by Carl Mansfield, the landscapes and portraits by Edward Crossett and Louis David-

Camera Club Print Circuits

The one activity that is always open for a PSA club is the Print Circuit. Write to William Hutchinson for an application blank, now, but do not send it in until you are all ready to go. Yeu will need three prints from your club, get them in your own hands before sending in the final application, because things happen fast sometimes. and it is discourteous to keep the other seven clubs waiting.

Be sure to tell the open dates that your club has. It is not always possible to sched-ule for an exact day but Bill will do his best for you.

(You will find the addresses of the directors of all these activities in the masthead on the second page of the Digest.)

INTERNATIONAL CLUB PRINT COMPETITION

For many of us summer vacations are over. Pretty soon we'll be dusting out the corners of the "ole club room" getting ready for another year of photographic fun and progress. Some clubs already have programs set up for fall, while others are hurriedly making preparations. In any case most emphasis is likely to be placed on the fact that "the print's the thing" and plans arranged accordingly. A lot of possibilities are offered to program chairmen by PSA -tape recorded lectures, personal lectures by well known photographers, print shows, and of course to add a friendly challenge: The International Club Print Com-

Now starting its second year under the direction of the Pictorial Division, this stimulating camera club activity promises to be a big drawing card because it offers so much. Limited to PSA Camera Clubs only, it provides a challenge to photographers to see how their club, no, to see how your club compares with others, not just in this country, but throughout the world. Exhibition photography is a personal thing, reflecting the merits of one person. The International Club Print Competition calls for team spirit, and co-operation from all the club members. Although individuals are rewarded for their good work, the chances of any one person doing it all are remote, and the big rewards at the end of the year go to the top camera clubs.

If you're in New York for the PSA Convention you'll see the trophies which will be presented to the winning clubs next year. If not, you'll want to urge your club to participate -- to get into the race which begins very soon. The rules are listed right here, but remember, write to the Director for your club's entry form—and do it now, before it slips your mind. And good luck to that camera club of yours, too.

INTERNATIONAL CLUB PRINT COMPETITION RULES

1. Any PSA Camera Club is eligible. Entry fee is \$5.00 for the season's com-

petition.

2. Clubs may choose the group in which they wish to compete, Class A or Class B. Class A clubs are composed of the larger and more advanced groups. Class B is for the newly entered clubs and those working for advancement to Class A. At the end of the series of contests at least 20% of the highest scoring clubs in Class B (and not more than 25%) will be advanced to Class

3. Contests are held in October, December, February, April, and June. Prints are judged in a different location each month as indicated on the entry form for each contest.

5. Print onces are to be used for past and cent propaid. Prints will be turned by parcel post. 6. Prints must be undented. Overcea.

trice may be unmounted but, wit postal regulations and free of costons

charges. 7. Each club may enter 4 prints for each contest. No more than two prints may be entered from any individual member. Prints once entered onniet be entered again; and prints which had been accepted in National Exhibitions mora than 18 months prior to the deadline date are incligible.

8. Prints must be solely the work of the entrant and must be identified with name, address, and club or maker. Prints must be titled for identification purposes.

9. Judging will be on a point basis, each of the three judges scoring each print from 1 to 10 points. Report and score sheets, including judges' ballots will be sent to each club participating.

10. Individual winners will receive silver medals each month, and a gold medal will be swarded to the maker of the "Best Print of the Year." Honorable mention winners will receive stickers.

11. Trophics will be awarded to the highest scoring clubs in each of the two classes at the end of the contest season.

A Word About Judging

Any PSA Camera Club, with suitable facilities, is eligible to apply to handle one of the five judgings. Such club need not be participating in the competitions. Three judges are required, who are qualified to judge photographic exhibitions. A chair-man, in whose hands responsibility rests, has complete charge. Arrangements must be made to judge the prints according to established standards, with scoring sheets prepared by the judging committee. Clubs will be selected based upon availability of judges and suitable help, with location being a factor, to distribute judging points throughout the country. For further information, write to Robert J. Lauer, Director, Int'l Club Print Competition, 807 South 14th Street, Milwankee 4, Wisconsin.

GEORGE GREEN, Associate Editor

Thru The Camera Eye

The Camera's Eye is a most wonderful thing. This piece of man-made optics is abused no end with dirt, dust, finger-prints and vigorous rubbing. But despite it all it does its job of capturing the scene your

bying haw and transmitting it to the sen-

without material.

We himm beings also have a camera eye. Two to be specific. And, like the camera lone, they are abused by their owners. Not only by neglect but by permitting them to stacken in their duties. Of course, we know, our eyes are us. We tell shem what to look upon and WHAT TO SEE. The first part is reflex action. It is performed automatically. The second part is training and requires a great deal of practice.

The preface to this was inspired by a letter just received from my good friend Roy Green (no relation) of Modern Photography, My eyes looked at "Special offer to P.S.A. Members" and then I decided to read further and find out why Modern Photography wanted to make this special offer to me because I was a member of P.S.A.

What did I see? I'll bet it was different than what you saw. I saw that they were giving me the opportunity to obtain experience by seeing. Experience which is priceless because I would be looking at subject matter through the eyes of those who have attained a niche in the photographic field. And after I looked, what then? I would either say to myself. "TER-RIFIC" or "e-e-h-h!" Why either? Why one in CAPS and the other in agate type? Because having trained my mind to see what my eyes looked upon I can evaluate MY REACTION in a glance.

PSA Recorded Lecture Program

The Recorded Lecture Program of the Pictorial Division offers the following programs for your club.

No. 1 An Analysis of Recognized Salon Prints by Ragnar Hedenvall, APSA.

No. 2. Commentary on Recognized Salon Prints by Morris Gurrie No. 3. Outdoor Photography by D.

Ward Pease, FPSA
No. 4. Still Life by Ann Pilger
Dewey, APSA, Hon. PSA.

No. 5. New Prints for Old by Barbara Green, FPSA.

SPECIAL Photography of the Nude by P. H. Oelman, FPSA

A deposit of \$25.00 should accompany an order. A service charge is made for each Lecture. The SPECIAL costs \$10.00 and should be ordered directly from Mr. Oelman. For clubs which are members of PSA but are not affiliated with the PD the charge is \$6.50. Clubs which are affiliated with the PD will be charged \$5.00. The service charge is deducted from your deposit when lecture is returned. Clubs or groups not negabers of PSA will be quoted prices on request to the Director.

For Nos. 1 to 5 order from Philip B. Maples, Director, Recorded Lecture Program, 29 Spring Street, Breckport, New York.

For the SPECIAL please contact: P. H. Osiman, FPSA, 2505 Moorman Avenue, Cincinnati 6, Ohio, And that's the lead-in to the conclusion of the column.

It's your reactions at a glance that either makes you a film-spendthrift or a pictorialist. It's what your mind sees in that first look that urges you to raise the camera and press the shutter release or to leave the camera as is. And your reflexes are tuned by previous experience.

That's why Modern Photography's letter set me to seeing things: Pictures at Dawn with grey overtones, breaking surf and peek-a-boo sun, and Ivan Dmitri's name takes me back to 1936 and I'm in his studio overlooking Park Ave., marvelahing his most wonderful work. Yes, my mind's eye saw plenty because it has experienced what makes living important . . . an understanding of values—the ability to accept the good and reject the bad—the perspectivity of picture-impact.

And, believe me, if I can do it so can you. Don't be a film spendthrift. It's more fun to be a scene-saver. Good shooting.

C. "JERRY" DERBES, Director

The Salon Workshop— A New Service

(The idea of providing "The Salon Workshop" as an activity for Pictorial Division members came originally from a similar circuit started in his own Portfolio by John Hogan. Several trial circuits have been formed, and this new activity is now ready to be launched officially.—Ed.)

Are you interested in making a Salon Print? Have you sometimes wished that you had the knowledge and experience of the "Masters", the well-known Salon Exhibitors, who seem to hang prints with the greatest of ease?

The Salon Workshop is a plan offered to Pictorial Division members by which you may try your hand at making a Salon Print. It is an opportunity for you not only to see first hand what a negative capable of producing a salon print looks like, but also to learn something about making prints of salon quality from such a negative.

The Salon Workshop will operate as follows: Groups of 15 members each will be formed. Each member in a group will be sent a negative and a contact print of it made by a well-known Salon Exhibitor. This negative will be one from which it is possible to produce a print that has or will hang in an International Salon. The same negative will be sent to all 15 members in each particular group.

From this negative each member will be required to make an I1 x 14 print to the best of his ability and experience. He may crop the print the way he thinks the Master would. He may tone it using any toner he thinks best or not tone it at all. He may use any manipulation or photographic process he thinks will improve the print.

The print is mailed immediately to the Director in charge of this activity. The negative is to be sent to the next member in his group. Ten days will be allotted each member for making his print.

each member for making his print.

At the conclusion of the first circuit, all 15 prints will be sent by the Director to the Master who made the original negative. He will judge the prints and comment on them. To the person making the best print in the group, as selected by the Master, we will award an actual Salon print made by the Master.

The 15 prints plus the one of like size made by the Master will then begin its second and final circuit of the group. Everyone will then have an opportunity to inspect and compare their print with the others and see how the Master made his print. Five days will be allotted each member for his inspection, after which he will again mail the package to the next member, leaving his print in the group.

In order to classify everyone according to ability and experience, there will be three different levels of participation:

Class "A"—those who have never had a print accepted in an International Salon.

Class "B"—those who have had not more than 2 different prints accepted in an International Salon.

Class "C"—those who have had from 3 but not more than 6 different prints accepted in an International Salon.

Each group will be composed of workers using the same negative size, and each member will be expected to handle the negative of the Master as he would a valuable negative of his own. There will be a service charge of \$1.00 for each group in which PD members participate.

For further information and an application blank, write the Director of this new activity, C. "Jerry" Derhes, 136 Rosslyn Street, Jackson 9, Mississippi.

STANLEY D. SOHL, Associate Editor

Honors To Our Comrade

Word has just been received that Prof. Abelardo Bonilla, one of our fellow International members, has been elected to the high office of President of the National Assembly of Costa Rica.

A letter to Burton D. Holley, Hon. PSA,

APSA, General Secretary for the United States of the Caribbean-American Fortfolios, from Dr. Esteban Antonio de Varona, APSA; General Secretary for Costa Rica, said that Prof. Abelardo Bonilla has been elected the new President for this term. In Costa Rica the legislature is of the single chamber type composed of 45 Deputies.

Professor Abelardo Bonilla is very much liked in his country. He is an outstanding man, a learned scholar, loved, admired, and respected by everyone. As a photographer he is a very hard and serious worker, and is now Vice President of the Club Foto-

grafico de Costa Rica.

The members of the First Caribbean-American Portfolio of which he is a part, know him and know his work, but for those of us that have not had the pleasure of meeting him, we can feel highly honored that one of our members has reached such a high office in his specific country. Congratulations are in order for him.

Australia Meets South Africa

Leo Lyons

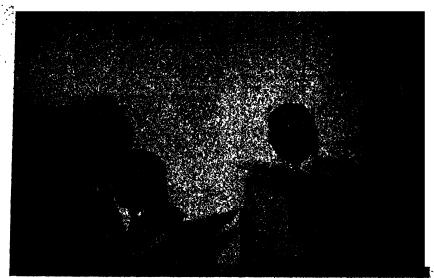

Dr. A. D. Bensusan, FPSA

It seems that once a PSA member and a member of some international portfolio, you have the makings of a friendship with many people and even people from some foreign land. So it was when Leo Lyons of Port Kembla, Australia and Dr. A. D. Bensusan, FPSA met in Johannesburg, South Africa on Leo's recent trip to Africa.

In this case Ray Miess, APSA of Milwaukee, Wis. knowing both men and fore-seeing a possible meeting, took care of the necessary details to bring about such a fine experience. Leo Lyons is a member of the First Australian-New Zealand-American Portfolio while Dr. Bensusan is Circle Secretary of one of the South African-American International Portfolios. Dr. Bensusan is also editor and publisher of the South-Africa Photogems Annual.

A Change Of Leaders

Oliver W. R. Smith, Canadian General Secretary, has resigned with Edward G. (Ted) Tozer, taking over from very able hands. Oliver Smith has done an extra swell job for the past three years but he has found, along with his other duties, the load was getting pretty heavy. Besides the portfolio duties, Oliver has done a great deal in promoting the Canadian division of the PSA. With Oliver's help, the Canadian-American portfolios now have five sircles in operation, one being a 16 x 20 salon portfolio.

Alfredo Senior, Juan Ulises Garcia, William J. McCarthy of New York City, and Mr. Cites Tripp, Economic Adviser of the United States Embassy, discussing pictures of the Caribbean-American Portfolios.

Ted Tozer, the new General Secretary, is an enthusiastic worker who says he is pleased to be able to do what he can for PSA and photography in general, but most of all, he enjoys the friendships he makes and the experiences gained in working on various jobs for the Society.

A General Secretary Speaks

Juan Ulises Garcia of Trujillo City, Dominican Republic tells what the International Portfolio activities mean to him.

The Caribbean-American Portfolios have the singular privilege of sheltering, like an amphora of friendship and love, many notable pictorial works of six of the countries of this part of the world, which the immortal Roosevelt called the Continent of Hope. They are: The United States of America, Cuba, Dominican Republic, Costa Rica, Nicaragua and Mexico. In these Portfolios are expressed, with eloquent language and notable adornment of the reality itself, an appraisement, plain and fundamental, of the interesting pictorial motives palpitating in the unbounded and flowery scenery of the Americas. The plausible enthusiasm with which, in tight row, their members have maintained in circulation this valuable messenger of a sincere comprehension and friendship, incontrovertfbly shows that "Art is a fecundation of the spirit in the sublime and tender field of human love." In all these manifestations, the Art in them contained also becomes a realistic expression, promising and fruitful, of a common ideal which makes all kind of effort to introduce in our world a supreme common good.

Our world simply could be, for those engaged in the cultivation of Art, a simple surface of luminous values, if our emotions had not, as they really have, the necessary potential strength to fecundate in our souls a fervid and noble passion which, caressing the beauty contained in the matter and in the forms surrounding us, organized and enlivens it to transform its attributes in something spiritual and human in character. These luminous values, rigorously interpreted sometimes, ideally, considered in other occasions, but always shining in the

scenery, discover through the seathetical pleasures they swake, the strong, vigorous, fecund and noble soul of The Americas.

Pictorialism feeds itself with emotions which, being extremely contagious, create a mutually recognized current of under-standing and sympathy linking the nations to one another and to a common ideal. Every emotion is an idea, and every idea is a force, a decisive and strong spiritual force. When emotions vibrate with such a tenderness that make themselves loved, they can penetrate, formally, deeply and intimately, into our sentiments. It is then when, at a point of saturation, our ideals will overflow, externalizing themselves. So they will carry, from without to within, through the common land on which we stand, the bundle, complicated but definite. of our aesthetic and ethnic roots.

This is why we must consider the deep influence which our Portfolios, in general. are affording to a mutual understanding among all the nations of the world, and specially among the countries, of a dualistic origin, spread over the American Continent. All artists have a very elevated mission to fulfill, and they are doing their best through our International Portfolios: they are to reveal the anxieties, conceptions and ideals which historically integrate the soul, virgin and luminous, of our nations. These artists, painters, poets, sculptors, photographers, all those who philosophize and exalt the matter and its forms, by an instinctive impulse almost supernatural, have the role of classifying, embellishing and reconstructing the conceptions and principles on which our present life stands. They must also discover the ideal of truth, the ideal of justice, and the ideal of beauty that wander in the almost forgotten shadows of the history of mankind, to form a new and most propitious spiritual atmosphere, in which the soul of our menaced civilingtion might breathe without interférence or fear.

If you are not now a member of an International Portfolio why not write for information. When one person feels as strongly about this activity as does Mr. Garcia, it is worth joining—I think so!

PSA COLOR DIVISION

GEORGE F. JOHNSON, APSA Forestry Building, State College, Penna.

Two Groups In Slide Contests

Due to growth of interest, the International Color Slide Competition for Individuals has been divided into two groups for the 1952-1953 season, according to Charles B. McKee, 5030 Del Rio Drive, Sacramento 18, California. This will be advantageous to beginners.

All entrants who had two or more slide acceptances in recognized exhibitions previous to July 1952, should enter Class A, while those who did not have two acceptances should enter Class B.

The first two of the 1952-53 contests will close September 20. Class A entrants will send their slides to Robert J. Goldman, 43 Plymouth Road, Great Neck, N. Y., while the Class B group will mail theirs to James Perdue, 321 E. Street, Davis, Cali-

The general entry form can be secured from Mr. McKee. No entry fee is required of Color Division members; non-members pay \$1.00 for the series of five contests scheduled to close on 20th of September. November, January, March and May an-

The May, 1952 contest was conducted by the Tulsa Camera Club at Tulsa, Oklahoma with 90 entries totalling 357 slides. The award winners were: Mrs. David Page, Topeka, Kansas; George Steck, Oil City, Penna.; Alfred Renfro, Bellevue, Washington; Adolf Vignale, New Toronto, Canada; Pearl E. Schwartz, Chicago, Ill.

Postal Regulations

Akhough most people believe that postal laws and regulations prohibit anything in handwriting in parcel post or fourth class matter actually a great deal of information either handwritten or otherwise can be placed in or on fourth class matter. For purposes of reference check article 14 page 82. U. S. Postal Guide Part 1, dated July 1951. This reads as follows "There may be placed on fourth class matter, or on the wrapper or cover, tag or label, any marks, numbers, names or letters for purposes of description"-

As far as photographs are concerned, either color slides or prints, this means that they can show the name and address of the maker and a title or the location or subject matter of the picture. If part of a set or series they can be numbered and carry a lot number.

We are bringing this to your attention as a number of contributors have been needlessly paying first class postage on slides for the Hospital Project bearing the identification which makes these slides so much more valuable and so much more interesting to the patients in the U.S. and U. N., Army, Navy and Veterans Hospitals in Japan, Kores and in the country. Such slides our be sent by percel post at a considerable saving.

Incidentally slides have been slow in coming in. We have been able to take care of the hospitals in this country that are receiving service but there has been a real shortage of the slides bearing identification that are needed by Army and Navy hospitals in Japan and Korea. To service properly the hospitals now on our list and to allow us to service hospitals in Japan and Korea not now receiving slides, we need at least 4000 slides a month. Prior to May we were able to send about 2500 a month. This figure is falling fast. Please go through your slides and send anything you can. Send them to Karl A. Baumgaertel, 353 31st Avenue, San Francisco, California.

"The Trouble With Us"

The trouble with a lot of us is we try to get too much in the picture. We need to learn to reduce, to concentrate, to simplify our picture area-to pick out some outstanding feature or phase of the scene and then build our picture around it, and eliminate everything else possible. It's the difference between scattered ineffective attention and concentrated effective attention.

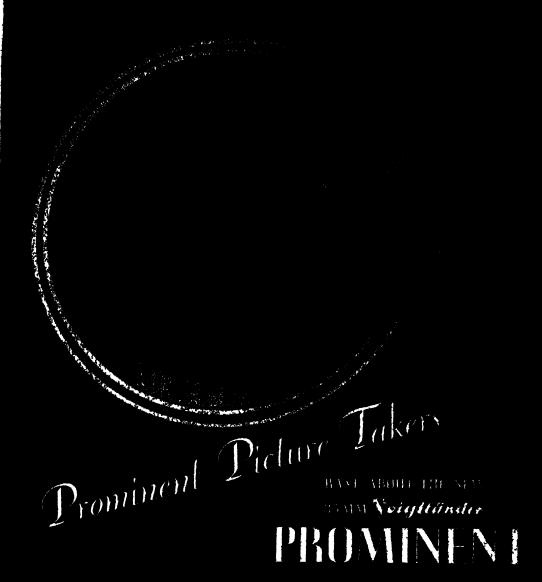

A whole corn field may make a picture of sorts. A single hill of corn may make a better picture. A single ear of corn may make the best picture of all. Simplified. Concentrated. Effective. A whole building may make a better picture—if you can crowd it in. A gable of the building may make a better one, or a single window or door, or even the window latch or the door knob, or the hinge on the door, may make the best of all. Why? Because it's concentrated, simplified, effective. It's the difference between scattered ineffective attention and concentrated effective attention, between DIVIDED INTEREST and interest that CAN'T BE DIVIDED because it has only one dominant factor or chief interest point to be fixed upon.

Move in on your pictures, else use a longer focal length lens so you CAN'T take in all creation when you make a shot. This admonition is general, of course. I have two wide angle lenses myself and use 'em on occasion-perhaps once in 100 shotsand have gotten acceptances with them. But in general I don't even carry a wide angle lens. When it comes to composing your picture, if you can't eliminate irrelevant material at time of shooting, consciously compose the view so you can easily crop it later, or perhaps reverse it, in order to gain the very best in composition possible.

PSA NATURE DIVISION

HARRY R. REICH, APSA

286 Schenck St., No. Tonawanda, New York

The Nature Division in New York

Naturally at this time all roads lead to New York and the 1952 PSA convention. We are certain that the Nature Division in force will be represented in the pilgrimage wending it's way to the Big City for the big doings of the year.

This writer is happy to be able to assure the members of the Nature Division that a treat is in store for them when they reach their destination in the Big City, a treat in the way of a well rounded program of activities of intense interest to all of them. A program that will carry on to the big climax Saturday night, the honors banquet. To give you an idea of what to expect let me outline the menu for you.

On Thursday, August 14th, from 9:15 to 10:30 A.M. in Parlor A&B, Dr. B. J. Kaston will present "Photography of Spiders". From 10:45 to 12 noon in the North Ball Room, Helen Manzer, APSA will hold forth with "Ins and Outs of the Color Show". This is a program which the Nature Division is co-sponsoring with the Color Division. From 9 to 10:30 P.M. in the Grand Ball Room, Mr. Jay T. Fox, APSA will present "Natures Highlights".

will present "Natures Highlights".
On Friday, August 15th from 9:15 to 10:30 A.M. in Parlor A&B, Bruce Force will present "Photography of Minerals". From 10:45 to 12 noon in Parlor A&B, Dr. Romen Vishniac will give us a talk on our favorite subject "Nature Photography". From 1:15 to 3:15 P.M. in Parlor F&G, C. B. Schaughneoy will present "New Jersey Birds".

On Seturday, August 16th from 9:00 to 10:30 A.M. in the Grand Ball Room there will be a showing of the Color Slide Exhibit of the PSA Salon. To insure against the possibility of the Nature slides running over the time limit and the showing of these having to be curtailed, they will be shown in the Gold Room as a separate showing. From 3:30 to 5:00 P.M. in the Gold Room there will be a program "Photography of Flowers and Botanical Specimens".

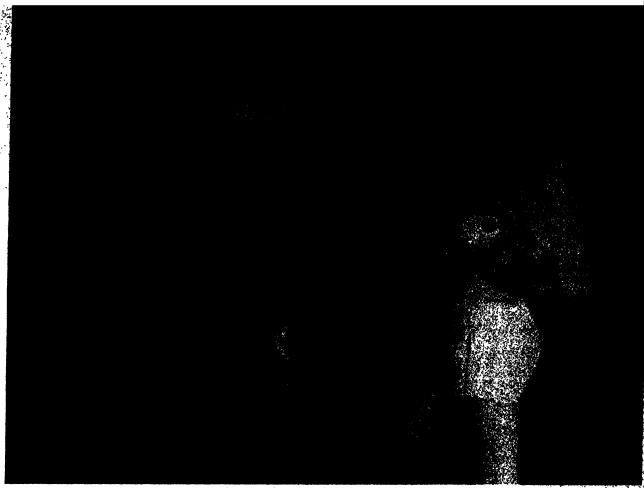

There has been an added attraction scheduled for Saturday from 1:15 to 2:45 in the Gold Room. Ruth Sage, the Division Secretary will hold forth in a most interesting How-To-Do-It nature program. The element of surprise in this program would be spoiled if too much were said of it here. She will be assisted by Chet Wheeler. The writer had the pleasure of seeing a preview of this program when it was rehearsed in a western New York camera club and the best I can say for it is Don't Miss It.

Last but not least there will be a Nature Division luncheon in the hotel at noon Saturday. Tickets may be procured at the time of registration. Let's make it a big get together for the division. Last year at Detroit there were 125 members of the division present at the luncheon. How about beating that record in New York?

The Who's Who Listing

In this issue of the journal we publish the Who's Who In Nature Photography listing. The preparation of this list presents quite an involved problem. Naturally it is compiled from the catalogues of the various recognized nature exhibitions. Often que to misspelled names or transposed names there is the possibility of an error

198

Basic exposure is measured by G-E Mascot meter; then G-E Photoflush puts extra light enberait's needed?

Idea for Better Pictures!

Use G-E Photoflash in sunlight to control lighting balance

Next time you go picture-taking outdoors, take along your flash gun and some General Electric Photoflash bulbs.

For that handy punch of light from G-E Flash bulbs can make a good picture better! You control the lighting when the sun is high overhead. You can capture both sparkle and detail with the sun at any angle—especially in color. (Skies can be rich blue even when foreground subjects are backlighted by the sun).

You'll be delighted at the results—in black and white or color. And you'll see why G-E flash adds so much to daylight pictires. It's the mark of the expert! Try it!

Remember, there's a G-E lamp for every photographic purpose

ELECTRIC

recention is taken in the preparation of this list there have been some errors in the past. It is just possible that there might

be some error in this one.

If in reading this listing you should discover that we have made any error in our compilation please address a note to either the secretary of the division, Ruth Sage or to the writer and an acknowledgement, and correction will appear in this column in the next issue of the Journal after it is brought to our attention.

First M.P.S. International Salon of Natural History

In a recent issue of the Journal we announced that it was the intention of the Mysore Photographic Society of Bangalore, India, to include a nature section in their salon. On March 22 the Nature Division supplied the Mysore Society with information covering the minimum requirements, and standards of conduct in order that their show might be sanctioned by the PSA Nature Division. At the time the master mailing list of the division was also mailed to them in order that entry forms might be sent to all of the current nature workers.

Last week I received an air mail communication from Dr. G. Thomas of the Mysore Society advising that the master mailing list had not reached them until May 19th, too late for them to use it for the 1952 exhibition and Dr. Thomas advised that they had taken the listing of nature workers from the 1948 American Annual as a mailing list. The good doctor advised that he knew that this list was outdated and asked that we do what we could

to publicize the show.

While the writer realizes that the release date of this issue of the Journal will allow only a month at most for prints to reach Bangalore by the deadline of their show. which is September 5th, maybe those of you who did not receive entry forms will give it the big try to be represented. We need more nature exhibitions and the success of their 1952 show will insure its being repeated in 1953. The salon is for prints only. If you have no entry form the prints may be mailed to

MPS International Salon of PHOTOGRAPHY c/o Mr. K. Girimaji 26, Sri Rama Mandir Road, Bangalore 4. India

the calendar is as follows: Last Date for Entry5th September, 1952 Judging7th September, 1952 Notification of Results 10th September, 1952 Total Rejects Returned

22nd September, 1952 The entry fee is \$1.00, payable to K. Girlmejl.

Why Be Hard On The Nature Exhibitions?

A short time ago the writer received a communication from the sponsors of one of our nature exhibitious containing a gripe best the way prints and slides are shipped the artibilities. The complaint was that they were shipped in trunks and caskets in order to protect the constants without consideration of the cost of establish same by the exhibition. The writer had nover board this complaint before which is probably because postage rates had never been quite so high before.

It happened that the writer was called on to serve as Salon Chairman of the 14th International Exhibition of Nature Photography of Buffalo this year and this gave him an opportunity to sympathize with the griping sponsor. I realized just what was meant by trunks and caskets. I realize that we all would like our prints and slides well protected while in transit but there is such a thing as going too far in order to do so. The writer carefully noted the manner of packing the slides and prints submitted to the 14th International this year and also noted the postage required to return them and the findings were simply amazing.

While none of our exhibitions have ever expected to make any money on their shows most of them are sponsored by camera clubs and in such cases it is hoped that the exhibition would not cut too deeply into the club treasury, as is the case with the International of Buffalo which is sponsored by the Science Museum Photographic Club. Some of the exhibitions have tried to maintain the \$1.00 entry fee as has our club the complaining sponsor. With our experience this year, which I presume was similar to the experience of the exhibit which did the complaining, I can assure you that the \$1.00 entry fee is most certain to be a thing of the past. The return postage amounted to more than 50% of the entire receipts. While generally the postage on the return of the slides is nominal and helps to carry the load for the return of the prints our experience this year shows that the slide makers are following the pattern of the print makers and are increasing the size and weight of the slide packages so that the above is no longer the case.

Let me cite some instances of what I am referring to. We received one package of prints from our own state and within a radius of 200 miles of Buffalo, which was packed in a plywood box made up of quarter inch stock and which required 98¢ postage to return. The maker certainly knew this because he had to pay the postage to send it in. He also knew that he sent a \$1.00 entry fee and expected to receive a notification card of his acceptances and he also knew that he expected to receive a catalogue of the show, so he was sure that the exhibit was going to lose considcrable from his entry, so why ship his prints in a trunk? We also received slide entries that cost as much as 37¢ to return.

I am just as particular of my slides and prints as most people are and I also pack them in a way that I expect they will be perfectly safe in transit, and let me say that I have never had a slide broken, or a print damaged in shipping, and I can give you proof that this can be accomplished with but a nominal cost to yourself and to the exhibition to which they are submitted. The last show that I entered which was as recent as three months ago, returned my four prints for 37¢ and my four for 6¢. My prints were shipped in a container that I make myself, consisting of a piece of corrugated cardboard that is 17 and % incluse wide by 48 inches long the to folded and tacked onto two light such of pine wood of 14 inch scook, 16 inch wid and twenty inches long. My slides were shipped in a regular box in which Kodak used to return slides after processing (the narrow size) with a light sheet of corrugated board on the bottom, then two slides, then another sheet of the board then the other two slides and then another sheet of the board. This is wrapped in ordinary brown paper and scaled with tape, the whole weighing just two ounces. How about giving the exhibitions a chance to come near breaking even on their venture. Stop shipping your prints and slides in trunks and caskets.

Who's Who in Nature Photography — 1952

Prepared by Ruth F. Sage, Secretary, PSA Nature Division

During the photographic exhibition year, 1952, there were aix nature exhibitions conforming to the standards of the Nature Division. These were PSA, Louisrille, Chicago Nature, Rochester, Columbus, and Buf-

The requirements for inclusion in this listing were acceptances in two or more of the exhibitions listed. which is an in-This year's exhibitors number 277, crease of 37 over last year. In addition there were 402 persons who had acceptances in one show, which is an increase of 20 over last year.

Interest in the Nature Exhibitions is steadily growing as indicated by the increase of 134 persons submitting to these approved exhibitions over the 1950 records. This is a gain of approximately one third in two years.

asterisk appearing before a name indicates that the person served as a judge in one or more of these exhibitions. The code for the abbreviations is E-Exhibitions, S-Slides accepted, and P-Prints

Who's Who Awards

Dr. Grant Haist, Rochester, N. Y., and Lou Quitt, Buffalo, N. Y., are tied in first place for having the most prints accepted. Each received a medal award. Dr. Haist exhibited 20 prints in five exhibitions a perfect record. Lou Quitt exhibited 16 prints in four exhibitions and served as a judge for the fifth. This gave him a perfect score also, due to the credit for four prints in the show which he judged.

The winner of the medal for the most accepted

slides for the year was Edward A. Hill, Fleetwood, Pa., who exhibited 24 slides in six exhibitions — a perfect score.

The award for the highest combined total of prints and slides went to Lou Quitt who had a point score of 22 in slides and 20 in prints, giving him a total point score of 42 for slides and prints.

These awards, in the form of silver medals, will be

continued next year.

PHOTO-JOURNALISM

WILLIAM A. PRICE

78 Elbert St., Ramsey, N. J.

The Photo-Journalism Division has prepared an outstanding program for the convention this year. Even the non-members of the P-J Division will find each presentation to be interesting.

There will be sufficient coverage of the many phases of photo-journalism to give any serious amateur a liberal education in this field. All presentations will be entertaining as well as instructive and educational and there will not be any super-technical information "over the head" of the average photographer.

This is a down-to-earth program for all amateur photographers. There will be question and answer periods. Some of the world's best photographers are participating. It will not cost anything extra. Nobody should miss this opportunity to see and hear the experts in their particular fields.

On Wednesday, Aug. 13, there will be a conducted tour through the Life magazine darkroom, the most modern in the country. This special feature is limited to the first 100 P-J members who register for this tour at the P-J desk. There will also be a talk and exhibit on "The Versatile Small Town Newspaper Photographer", the man who must do a number of different jobs and still meet the deadline. Then there will be

a round table discussion where questions will be anisvered by experts.

On Thursday, Aug. 14, the day and evening will be filled with programs. The FBI will give a presentation on "Photography in Crime Detection". Don Mohler of General Electric will give his famous and entertaining demonstration, "Light is not Artificial, it's how you handle it". There will be illustrated talks by famous photographers on their work with industrial publications and, if you have wondered how a prize winning school or college annual can be made, there will be such a presentation by the man who got together the prize winning annual in 1950.

On Friday, Aug. 15, will be a presentation that will interest everyone who would like to get back some of his photographic expense, a show called, "Where is the Cash in Photography?". Another subject, "Personal Photography" will deal with your negatives and prints and what to do with them. Then there will be a famous magazine photograph editor who will tell how it is done before publication. "Photo-Journalism in Television" will also be presented as a special feature.

On Saturday, Aug. 16, world famous photographers will present the ins and outs of photojournalistic work in these special features, "The Rights and Privileges of Photographers," "Picture Agencies, How they Work", "A Life Photographer at Work," and "Searching for Features."

Come to the convention, see all that you can, but don't miss any of the Photo-Journalism Division programs and you will not be sorry.

PSA STEREO DIVISION

FRANK E. RICE, APSA ..

228 N. LaSalle St., Chicago 1

Organized Groups

Almost every week we hear about a new stereo group being organized, either as a special stereo camera club, or as a group within an established club.

The Stereo Camera Club of the East Bay is one of the newest. Mrs. Leon S. Young, 260 Yale Ave., Berkeley, Calif. is Editor of their informative bulletin called "The Stereo View".

The Light and Shadow CC of San Jose, California, now has an active Stereo Division. Dr. Gustave Fassin, an experienced stereo photographer is leader of the group. Secretary of the Club is Ruth Penberthy, Rt. 1, Box 336, Cupertino, Calif.

The Natural Color Camera Club of Pittsburgh has a group that is running its special stereo programs. Robert W. Sharon is its leader, 125 Delano Dr., Pittsburgh is his address.

Color Camera Club of Waterloo, Iowa, is just getting under way. It starts right off with a Stereo Division, a Still Slide Division and a Movie Division. President is A. E. Phillips, 251 Bakimore St., Waterloo. They projected a stereo show recently to 130 people—no eye atrain, due to very careful mounting and projection, and to a specially built screen. (We hope to have an article for publication on the details of this screen.)

The organization of Flint Stereo Guild was announced not too long ago. Dr. J. Vincent Murphy is the President—11511 S. Saginaw Rd., Grand Blanc, Michigan.

Saginaw Rd., Grand Blanc, Michigan.
Shorewood Camera Club of Milwaukee has long had an active Stereo Group. They had a "Stereo Roundup" recently and invited the public; 241 people ahowed up. Stereo contact man—Arthur J. O'Connor, P. O. Box 1906, Milwaukee.

If you are in the vicinity of any of these organizations you will find it of interest to get in touch.

We shall be happy to have reports of other clubs and groups that are forming. Perhaps some time we can publish a list. Let us know also about the kind of programs you are having. That information will be of interest to other clubs.

The assignment of keeping in touch with club activities has been accepted by Earl E. Krauee, 5706 S. Happer, Chicago. Put both of us on your mailing list, please.

New Competition Director

The Individual Stereo Slide Competitions will be resumed in the fall—first deadline November 15. Frederick T. Wiggins, Jr., 438 Meacham Avc., Park Ridge, Ill. has accepted the directorship.

Members of the Stereo Division will shortly receive the instruction and registration form. The service is free to SD members. Others write Fred for information. A medal for first, and ribbons for honorable mention, will be awarded. Comments and criticisms on each slide will be returned to the makers.

Wanted—Contributions

There are lots of experienced stereo photographers who read this column. And there are many who are eager to learn. Will you in class No. 1 give of your experience to class No. 2. Send us shorts such as would fit into this column—some helpful hints, some "dos" and "don'ts". And, send us a roal man-size article with illustrations which can be run in the main body of the Journal. You really never know a thing until you try to tell it to others!

There are many good subjects, Much interest has been expressed in obtaining information on making stereograms of closeups, and once they are made how to mount the tricky things for projection. A good article re this subject would be accepted instantly.

Some Stereo History

Steroe received its greatest boost from a woman. Back in 1851 a great fair was held in London. Photography was very young

then end unity a handful of men know the thing about it Mr. Few Talket who frivented the aspetter to positive printing process exhibited pints of his work at the fair. Included were since stone dispurretypes and a Browner viewer.

types and a Brewster viewer.

One day Queen Victoria paid a vigit to the fair and was very much facebased by the lifelike, three-dimensional views. She was so captivated by those, the first she had ever even, she immediately commanded that the entire royal family should have their portraits taken in stereo.

Up to this time stereo had been only a curiosity seen by the small number of visitors to the workshops of the few who were dabbling in the new science of light pictures. But the moment her majesty put her stamp of approval on stereogcopy, the public literally fell over each other trying to get stereo pictures made for themselves The London Stereoscopic Society was formed and had great difficulty supplying the demand. Optical houses were swamped trying to make viewers fast enough and the great march of stereo was on, lasting until the beginning of our own century when a flood of cheap half-tone prints in stereo killed the boom which has now been reawakened by color film and better optical equipment. —JULIAN H. WARNER

OWEN K. TAYLOR

Owen K. Taylor, founder and president of the Stereo Society of America, a founder member of the Stereo Division and Chairman of the SD Membership Committee, died in New York on July 5 of a heart stack.

Mr. Taylor was interested in every phase of stereo hotography and was instrumental in working up the proposed standards for 35mm stereo equipment. At the time of his death he was working on proposed judging standards for stereo competitions.

He was also a Cornerstone Member of PSA.

New Flat Stereo Screen

Commercial Picture Equipment, Inc., SD Founder Member Robert D. Hall. President, is marketing a new screen which solves some of the problems of stereo projection. The screen is made of an elastic base material without seams, coated with a flexible metallic coating. When mounted on the frame it is stretched 4-ways-no wrinkles. Packaged, it is rolled and carried in a unique tubular carrying case. screen frame allows tilt-control so that maximum illumination from the screen can be utilized. David White Sales Co. will distribute the new screen under the trade name Stereo Realist SILVRSCREEN. Two sizes to be produced immediately 40x40 List—\$39.50, 54x59 List—\$79.50. For further information write Bob Hall, 1567 W. Homer St., Chicago 22, or the David White Sales Company, Milwaukee, Wisconsin.

True colors go hand-in-hand with precise exposure control. That's why the Master II is so widely preferred for critical color work. It provides complete control of color exposure, in quick, simple form. Glance at the A and C positions on the exclusive WESTON exposure dial. Within these positions you have the safe working range of color film. Thus by simply keeping the colors you want within this safe range, you can be sure of truthful color reproduction, every time. And for monochrome, too, this exclusive dial gives you the same exacting exposure control for every shot. With the color season right ahead, why not visit your dealer and ask to see the Weston MASTER II, today. WESTON Electrical Instrument Corporation, 617 Frelinghuysen Avenue, Newark 5, New Jersey.

PHOTOGRAPHIC SOCIETY
OF AMERICA

OFFICIAL PUBLICATION

VOLUME TA A NUMBER 9 • SEPTEMBER.

NEW...The Polaroid Pathfinder brings you the magic of 60-second photography...in a camera that puts at your command a fine fast lens...a shutter famous for its range and reliability...a coupled, fast-action rangefinder. In the Pathfinder you have all you have been asking for in a Polaroid Camera. Be sure to see the Polaroid Pathfinder now at your photo dealer. Because of the sensational advance orders, it will pay you to see him promptly.

The Pathfinder Shutter is the Wollensak Rapax II, choice of top news and military photographers. Nine speeds from 1 to 1/400 second, plus Time and Bulb. Iris diaphragm controls apertures from f/4.5 to f/32. Here's flexibility.

The Pathfinder Flash Synchronizer, built into the Rapax shutter, gives you a choice of all shutter speeds, with either flashbulbs or electronic units. Two-position switch for easy, confusion-proof selection. Synchronizer is cocked automatically when you cock the shutter...you can't forget.

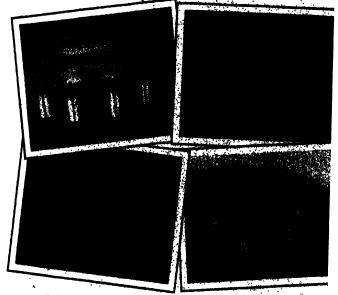

ACTION SHOTS ... PRESS

- The Pathfinder Rangefinder, super-imposed image type, is Kalart's best, coupled to the focusing track. You focus instantly, effortlessly and accurately down to 3 feet. Focusing scale has 11 indicated distances from 3' to infinity for convenience in making flash exposure settings and hyperfocal distance settings. A convenient depth of field scale indicates at a glance depth of field for f/16 and f/32 at any distance.
- The Pathfinder Viewfinder combines the convenience of an eye-level optical finder with the more precise cropping and framing of the press-type frame finder. Parallex-correction settings for accurate centering of close-ups down to 10 inches (with close-up lens kit).
- Exposure Computer, mounted on rangefinder, quickly and easily converts readings from Polaroid-G. E. light meter to f/numbers and shutter speeds.
- The Pathfinder Camera uses the standard Polaroid Type 41 Picture Roll fast as ever (ASA 100) and greatly improved in picture quality.

SCIENTIFIC ... COMMERCIAL

FREE — New, attractively illustrated 16-page booklet tells the complete story of the Pathfinder...its new features...its versatility in both commercial and amateur use. Ask your dealer for a copy or write to Polaroid Corp., Dept. PS-12, Cambridge 38, Mass.

America, Inc. Reproduction or use of any meterial contained herein without permission of the Editor is forbidden. Views enguessed in the PSA JOURNAL me these of the suthers and do not necessarily approvent the views of the Society.

The President Reports . . .

The 1952 Convention ended yesterday, and it would be extremely difficult to find any man happier than I. It would also be hard to find anyone less able to express his deep gratitude to the men and wetner—the wonderfully loyal friends—who made the Convention the splendid success we all so enjoyed. This was the fifth convention I have attended—and to my mind by far the smoothest and most exciting.

The excitement comes from the spirit every PSA'er showed. The general membership meeting on Wednesday was heavily attended, and the enthusiasm and desire to accomplish the things PSA really means

were almost beyond belief.

That same feeling ran through the informal meeting of representatives of camera clubs—the meeting whose them? was "What can PSA do for clubs?" Most of the suggestions were for more of what is already being done, but there were others for entirely new services which will make PSA membership much more valuable to camera clubs all over North America.

The other informal meetings of the groups representing different areas of interest in the Society showed the same spirit. In all of them, the big question was "What should we be doing to make photography bigger and more important in the particular parts of camera activity that mean most to us and in the geographic areas we represent?" With that main question closely followed by "How can PSA contribute most to that objective and how can we as PSA'ers do most to attain that objective?", those meetings added much to the over-all planning that must preceed any organized activity.

Again, the newly established Regional Activity Committee under the leadership of Gene Chase began its planning. The objective for Gene and his group is to establish activities of real community importance in every center of photographic population throughout the continent. This is not a program for the camera club members only: it embraces the box camera owner and the men and women who have not yet found the fun and satisfaction that photography offers. It is PSA at work for all we believe in.

The high interest and splendid enthusiasm of all PSA'ers for what lies ahead made the Convention that fine thing it was for all who could be on hand.

But they enjoyed a fine Convention largely because of what Paul Gibbs and his committres did and the unbelievable efficiency with which they did it. Since I have no space to tell you the names of all to whom I feel so grateful, it is unfair to single out any few. In my book, they achieved the impossible and made it look easy. From the opening gun on Tuesday morning straight through the clean-up on Sunday and Monday, they have done an outstanding service for PSA—and that means for photography.

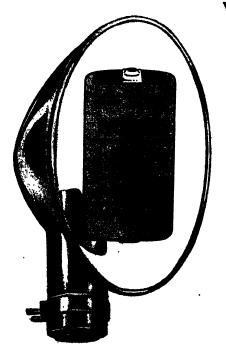

Those who could come to this 1952 Convention have my congratulations because they were privileged to share in what Paul and his committees did for us: those who could not have my sympathy and my hope that they can be at Los Angeles NORRIS HARKNESS next August.

"EVEREADY" "B" BATTERIES

Lyer felt sad about the shot that "got away"? Of course you have, if you depend on conventional flashlight batteries in your flashgun. Maybe it was the baby's cutest smile... or an on-the-spot news shot you lost. No matter what the subject, it was darned annoying — cost you something in film and working time, too.

With the Battery-Capacitor System of photoflash firing, powered by "EVEREADY" Battery No. 412 especially designed for this service, you can absolutely eliminate irregular synchronization and wasted film exposure due to battery failure. One tiny "EVEREADY" "B" BATTERY in your B-C Unit will fire up to 20,000 bulbs, within the long shelf life of the battery, and assure positive sync even with multiple-flash work. Battery replacements are reduced to once or twice a year.

Save fuss, save face and save film - with B-C Photoflash and "EVEREADY" Photoflash Batteries!

NEW AIDS FOR BETTER PICTURE-MA

BY JACOB DESCHIN, FPSA.

Speedlight, stereo and 8mm Soundstripe take the limelight this issue with an important announcement in each field.

Battery Speedlight

In the first, the long-rumored Strobo-Research portable speedlight unit with twin 225-volt dry batteries in series, will interest many. The first favorable reaction I have heard comes from a veteran press photographer who thought it furnished enough light for almost any assignment he might tackle. SR Stroboflash II is its name and it costs \$99.50 equipped with one lamp. You buy the two batteries, at \$7.50 each. Strobo Research, 4351 North 35th Street, Milwaukee 16, Wisc., in breaking the news, claimed a black-andwhite guide number of 220 for fast film, color 35 to 45. Capacitors charged directly from the dry batteries permit firing the unit every three to four seconds, said to be a new record. One set of batteries will yield 2,000 flashes before they have to be replaced. The lamp can be mounted on most available camera types without special brackets. It is so designed that it can be easily changed from straight to bounce light position by simply loosening a set screw, changing the lamp position, then tightening the screw again. Multiple flash units may be used and large area coverage may be achieved by using a photoelectric cell attachment. The unit looks handsome too, with case and lamp housing made of Royalite, the new strong plastic. For shoulder comfort, the plastic carrying strap has been made extra wide.

Kodachrome Stereo

Lead item No. 2 is Kodachrome with stereo loading and Eastman Kodak stereo mounting of same. The new package is Kodachrome Film 335, Daylight Type, for use in stereo cameras and yielding 20 pairs of 23x24mm stereo frames with standard spacing between pictures. The price of \$4.75 for the new package includes in addition to the regular processing, stereo-mounting by Kodak for viewing in standard hand viewers. Type A stereo will be available later, perhaps even by the time this gets into print. The stereo film will be processed and mounted in Rochester for the balance of this year. It is expected that next year processing laboratories will have been set up in Chicago and Hollywood as well.

The announcement adds that regular 135 and 135A Kodachrome will be similarly mounted by Kodak for an additional charge of \$1 for the 20-exposure roll, \$1.60 for the 36-exposure roll. However, this service will be available only for Kodachrome exposed in stereo cameras that yield 23x24mm stereo pairs with standard spacing. The mounting charge must be prepaid (enclosed with the film when sent in for processing). For the regular 20 roll, which lists at \$3.59 and furnishes 16 stereo pairs, the total cost is \$4.50. The new package means economy since is yields 20 stores pairs for a total cost of \$4.75.

8mm Magnetic Sound

And here's our third leader: 8mm Magna-Striping, announced by Reeves Soundcraft Corp., 10 East 52nd Street, New York. The magnetic sound developed by this company for 16mm and 35mm motion picture film, is now at the service of the 8mm masses too. The new service for bonding Magna-Stripe to 8mm silent film for "talkies" at 31/2 cents a foot, comes at the threshold of new 8mm magnetic projectors about to hit the market, the first of which was imminent at the time of this writing, and was to be introduced at the P.S.A. national convention in New York. The maker is Movie Mite Corporation, of Kansas City, Mo. A story on this trail-blazer appears in another part of this issue.

Two other speedlights have been placed on the market. They are two new Synctron electronic flash models, the first of four new designs for 1953 by the Dormitzer Electric & Manufacturing Co., Inc. Features are increased light output, reduced weight and less bulk. The new Synctrons are encased in a form-fitting shoulder-slung pack of tough plastic. The model 208 is a 100-watt-second unit, weighs 6 pounds, 6 ounces, has 250 and 40 guide numbers, for black-and-white and color, respectively, and costs \$127.50. The model 207, 75-watt seconds, guide numbers of 155 and 25 and costs \$95. Flash duration is 1/2500 second for the 208. 1/3000 for the 207.

B-C Units

Other flash items are two new B-C units, an improved Flashflex and a flash extension. A B-C type flashgun, the Bolsey B/C Flashgun No. 3, is announced by the Bolsey Corporation of America, 118 East 25th Street, New York. The \$15.50 unit, which is supplied with a flannelette bag for storing, has a safety feature to prevent premature flashing; a built-in test light, bulb ejector, and is said to fire up to six series-connected flash lamps. The compact unit is attached to the Bolsey camera without visible external wiring.

The Kalart Company, of Plainville, Conn. has a Model BOLC Kalart B-C flash unit for the Leica IIF and IIIF flash-synchronized cameras. The unit is attached to the accessory shoe on top of the camera. The \$14.30 unit includes the battery, capacitor, reflector for midget lamps, camera bracket and connecting cord with right-angle plug to fit snugly on the camera flash terminal.

An improvel Flashflex, the B-C flashgun uniquely designed for bayonet-mounting on the Rolleiflex like a filter and weighing less than 7 ounces, was recently placed on the market by the makers, Burleigh Brooks Company, 10 West 46th Street, New York. In addition to other details, the gun now has a thinner extension wire, the end of which is clipped under the reflector when

not in use. The gun is \$21.80.

Jon Products Sales Company, of New York, has introduced the Jen BC Pocket.

JOHN WAYNE AND NANCY OLSON Say:

Take it easy with STEREO-REALIST

"It's amazing how simple this camera is to operate. And it takes the most beautiful, true-to-life pictures we've ever seen."

THERE'S no doubt about it — Stereo-REALIST takes the kind of pictures you've always wanted. They're beautiful beyond description, with full, natural color and thrilling, realistic depth.

What's more, the REALIST is so easy to use that people who never before owned a camera get outstanding pictures on their very first roll of film. It's economical, too, producing 29 stereo pairs from a 36-exposure roll of 35 mm. film.

You have to see REALIST pictures to fully appreciate their exciting beauty. Ask your camera dealer to show you some. Once you do, you'll agree that the REALIST is the ideal camera for your personal pleasure . . . and to use as a sales tool in your business. DAVID WHITE COMPANY, 387 W. Court Street, Milwaukee 12, Wisconsin.

Announcing ...

PORTABLE "STEREO-REALIST SILVESCREEN" FOR PROJECTION

Now for the first time, stereo photography has its own screen specially designed and engineered for proper stereo projection—the "STRENG-REAL-EST SILVESCREEN." Picture surface is absolutely flat because it is elastic, with powdered aluminum bonded to the surface to give the widest possible reflection of light. Built-in tilt con-

trol further assures maximum reflection from the screen for more brilliant projection. Light, collapsible frame packs neatly inside attractive tubular carrying class with handle and guickclosure, permanently-affined metal end. Screensizes now available: 40" x40", 54" x39". Latter model has stand which is adjustable in height. Final Extension who unit Market onto the sulb socker and automorically locks in place? Several reflectors can be nested without acratching for portability. The unit includes the reflector, socket, adjustable rubber-covered states; claims and a 15-foot extension cord.

If you like 'em small, here's one that really should please. It is the Zett 35, a 2x2 slide projector that comes down to 4½x2-¾x5 inches, yet will throw an image on a screen 10 feet wide, if need be! The Zett is marketed by Willoughby's, 110 West 32nd Street, New York, weighs only 1¾ pounds, is equipped with a multiple condenser system and a specially designed Voigtlander &cm f/2.8 coated lens. Projection at short distances is possible in subdued light or fairly dark corners. The price is \$76.50 for this well-made, unusually portable little projector.

All processed Kodachrome movie, stereo and still film is now being returned first-class mail by Eastman Kodak. Hitherto, the film has come back by third-class unless otherwise requested and the money enclosed. To speed things up, follow Kodak's cue and use first-class mail when sending the film in for processing.

Brumberger Sales Corp., 34 Thirty-fourth Street, Brooklyn, N. Y., has two new alide cabinets, one for casual, the other for busy 2x2 alide-makers. The first is the No. 2149 (\$2.95), which holds 330 glass or metal binders, twice this many cardboard mounts. Group-partitioned, spotwelded, all-steel, in platinum gray enamel, the unit has metal handle and snap catches for easy carrying. The No. 1094 is the big job, a slide cabinet that holds 1980 glass or metal binders, twice that many cardboard mounts, and is similar in construction to the small file unit. The big one costs \$24,95.

Cameras

Two new 85mm cameras, one from Germany, the other from Italy, were added recently to the rapidly growing list of available ministures. The first is the Futurama, which has a behind-the-lens Compur Rapid instead of between the lens, according to custom, and offers a 50mm f/1.5 as lens equipment, for 2197.25. The camera is imparted by the Futurama Camera Corp. of America, 158 West 19th Street, New York,

The Futurama's shutter has speeds from I second to 1/400, plus bulb, a time exposure mechanism and automatic exposure counter. Delayed-action is built in, as well

as fiscit funtacie, coupled rangefinder (superimposet 1976) and single window for finder and Fingefinder. Foresing is by helical mounts

Lenses are interchangeable and include the 4-element 50mm Elor 1/2.8, the 4-element 45mm Schneider Kenar 1/2.8, the 5-element 50mm Evar 1/2, and the 6-element 50mm Frilon 1/1.5. Accessory lenses include the 70mm 1/1.5 Frilon, the 100mm 1/2.5 Telefutar and the wide-angle 85mm Ampligon 1/4.5. Accessories include a copying stand and extension tubes. Prices of the camera with Compur Rapid range from \$127.95.

The Italian camera is the new Condor II 35mm miniature made by Officione Galileo in Italy and imported by Biber Foto Corp., 153 West 23rd Street, New York. Equipped with the 6-element click-stop Off. Galileo Esaog (CORRECT) 50mm f/2 coated lens in collapsible mount and a bright coupled range finder, the camera is \$134.50, an everready case \$8.95. The Condor has a lever rapid-wind type film transport device, which simultaneously advances the film and cocks the shutter, rewind knob with collapsible handle, built-in X-type flash contact and automatic film counter.

The Pathfinder, an adaptation of the Polaroid Land camera for press, commercial, industrial and advanced amateur use, is now available, according to announcement by Polaroid Corp., of Cambridge, Mass. Designed primarily around the regular Land Model 95, the Pathfinder has a redesigned optical system that includes press-camera features. These are a 5-inch f/4.5 Wollensak lens; Rapax Shutter, with speeds form 1 second to 1/400; coupled rangefinder; new combination optical and wire frame finder: M and X flash synchronization. The Pathfinder uses the same film and loading method as the Model 95 and costs \$249.50.

The Linhof Guide, working manual for the Linhof Super Technika cameras, is available in a new edition at 50 cents a copy. The 75-page illustrated book may be purchased either in camera stores or from Kling Photo Supply Corp., 235 Fourth Avenue.

Miscellaneous

Carl Zeiss, Inc., 485 Fifth Avenue, New York, has imported "Ikoprox," a coupled pair of supplementary close-up lenses for use on post-war Ikoflex twin-lens reflex cameras. The joined lenses provide for parallax adjustment and are available for two distance ranges, 40 to 20 inches and 20 to 12 inches. Price, \$12.50 and \$15, respectively. Zeiss also has paired Bernotar polarizing filters in a similar mount, with the upper ring calibrated from 0 to 180 degrees. As the upper Bernotar is rotated to get a desired reflection-eliminating effect, the lower one turns exactly the same distance. The price is \$27.50.

Another type of close-up attachment, imported by Alfa Photo Corp., 308 West 42nd Street, New York, is the Proximeter, a close-up attachment for 35mm rangefinder cameras. The device is available in two models, for 38 to 20 inches, and 20 to 13. Both combined shorten the closest limit to 10 inches.

A. & S. Camera Supply Co., Inc., 1123 Broadway, New York, has imported Leit-meyr lenses for portrait, wide angle and press use. (The portrait lenses are 1/4.5, 210 to 300mm, listing at \$49.94 to \$89.95. The

wide-angle lenses are in Pronter synchronized shutters, 42 4/6,8 and varied local lengths, listing at 433,95 to \$36,95; Third is also a 50mm f/2 enlarging lone at \$22,95.

A little developer goes a long way with the Envoy Band Tanks imported by Benard Sales Company, Inc., 150 Nassau Street, New York. They are equipped with cellulose acctate aprons for winding the film instead of the conventional grooved reels and take a minimum quantity of developer, only 4 ounces for the 35mm film strips, 6½ ounces for 120 and 620 rolls. For either size, the tank costs \$5. Envoy tanks for developing sheet films four at a time are \$7 for sizes 2½x3½, 3½x4½ and 9x12cm.

Burleigh Brooks Company, 10 West 46th Street, New York, announce that Stereo and Panorama heads for use with the Rollei cameras are again available. The stereo head is for making two stereo pictures in succession at the correct spacing and costs \$13.95. The pan head, \$14.19, is for covering up to 360 degrees, all the way around the scene, in ten exposures. The prints are overlapped to produce one continuous picture.

A kit of permanently labeled darkroom storage bottles, the Applicolor Darkit, has been placed on the market by Applicolor, Inc., 1501 S. Lafin Street, Chicago. The six quart-size amber bottles in the kit have black plastic tops, four are labeled for film and paper developer, short stop and fixer, the other two with blank labels. Extra labels of white porcelain fused on the glass permit pencil-writing, later erasing. The kit is \$2.95.

Canadian Zone Starts Rolling

The time is opportune. September is the month for rejuvenation of camera club activity. The PSA is now all set to roll with new enthusiasm. And why not?

Camera clubdom has boomed in Canada during the 1951-2 season. The Commercial and Press Photographers Association has doubled its roster (250 to 550) during the past twelve months. Now has representatives in every province except P.E.I. The Color Photographic Association of Canada indicates a 50% boost (400-600) in membership over the same period. Has consolidated and enlarged branches from coast to coast. Local clubs across country report bigger meetings, growing enthusiasms.

Further plans now have been completed for the organization of the new Canadian PSA Zone. Following the earlier naming of PSA executives for Canada (See August "JOURNAL") the appointment of Provincial Representatives has now been made. These

British Columbia.....Jim McVie, Victoria Alberta. Alf Blythe, Edmonton Saskatchewan Dick Bird, Regina Quebec Ray Caron, Montreal Ontario..... Ed. G. Tozer, Oshawa Maritimes. . Ezra C. Parsons, Windsor, N.S. Manitoba Ed Matthews, Winnipeg

The Maritime's representation will be divided later into two sections, Nova Scotia and New Brunswick.

It should be explained that appointments are made for the period of one year. For, that is, the time considered necessary to complete the organization of PSA's Canadian sone as an autonomous body.

In the United States, state representatives this year are mostly being chosen by ballot of local members concerned. Some consideration was given to the adoption of similar procedure in each Canadian Province, However the conclusion was reached that several weeks time would be saved by the naming of Provincial representatives immediately, to give that much more opportunity for getting the Zone into effective operation with as little loss of time as possible. At the conclusion of the years provisional period however, the Canadian Board will receive competitive nominations and hold a ballot whereby those concerned may express their wishes.

Responsibility of Provincial Representatives

There has never been any official definition of the duties of a District or Provincial Representative. In the past the P.R. has conducted correspondence with Headquartere, and upon occasion, acted as contact man with delinquent members. He has had little elfo to do. Right now, in the reorganization of the

new Canadian zone, there's the need for aggressive action (1) to consolidate PSA's present membership (2) to expand it by a vigorous membership campaign. At the present time the Society has barely more than two hundred individual and club affiliations across Canada. As one might say, ridiculously small.

Where to go for new members? That is the question immediately to be pondered by Provincial Representatives.

The nucleus of new members lies largely in existing camera clubs, particularly in larger towns and cities. In many of these centres of population, there is usually more than one camera club. Some of these are adult clubs comprising business and professional men and women, office and plant

There are numerous young people's clubs. Educational authorities have recognized the camera hobby as a means of keeping Canada's youth profitably and culturally employed in spare time. Because of this, high schools, colleges, universities, Y.M.C.A.'s and similar organizations already have promoted groups of bright eyed youngsters, full of the vigor, the bubbling enthusiasm of youth. These are all substantial prospects for PSA affiliation.

Practically all camera clubs, senior and junior share two major, mutual problems. First, the question of securing competent speakers, lecturers, print and slide critics. Second, the need to know what, by way of photographic standards, is going on in the world outside their own organizations.

Most small, local camera clubs have a tendency to remain too self-contained. They depend too much on their own personnel for programming.

This is where PSA can be of help. One of the Society's most conspicuous services, formerly only enjoyed by American affiliates, now has been extended to Canadian clubs. A series of recorded lectures, illustrated by slides, and presented by some of America's most prominent photographers will be made available to member organizations of PSA's Canadian Zone this winter.

Would it not then seem feasible that one of the first things to be done by Provincial Representatives in their membership drives, is to organize local federations of camera clubs in the larger towns and cities, to take cooperative and collective advantage of these PSA services.

This would neither prejudice nor interfere in any way with the continuation of the individuality of existing small clubs. It would, however, enable groups of localized units, within a federation, to pool their enthusiasms to coordinate their objectives and improve their photographic standards.

To this end, joint meetings could be brought together under PSA suspices to enjoy educational lectures by highly competchi; photographem say many photographere; say once a month, for the mutual hepselt of everyone concerned.

Let's make this an immediate objective.

Nova Statile atreasty helicipate's mesonage PSA on both the ideal of spitting up 'n noir regional organization. Physicial Representatives absentues motion Countie right now should set similar whools in motio

Fresno Town Meeting Two-Day Open Affair

October 25 and 26 will be big days in Fresno, Calif., for that's when the Fresno PSA Town Meeting is scheduled. To be held at Fresno State College, it is sponsored by PSA, Fresno CC and Central California Council of Camera Clubs.

Events scheduled include a B&W clinic conducted by Harvey Brown, APSA, a Photochromers Court led by Merle Ewell, APSA. print exhibits from Brooks Institute of Photography and others, lighting demonstrations, lectures by Boris Dobro, APSA, ARPS and others, movies, color slides, field trips, models and a banquet. All facilities of the college are available and a trip to the Roma Winery is in prospect. The event is open to all who are interested in photography.

New Magazine

A new magazine "Industrial Photography" is scheduled to appear in early October. Editor will be Ben Zale, formerly on the staff of Photographic Trade News. The new publication will cover the industrial field, with everything from 2x2 alides to radiography.

Features will cover a broad range of subject matter, from both the production and application angles. David Eisendrath, Jr., Chairman of the PSA Photo-Journalism Division will be the Technical Editor.

Address of the new magazine is 1114 First Ave., New York 21, N. Y.

PSA Convention First: 8mm Magnetic Sound!

When the advent of 16mm magnetic sound shook the film world into new vistas a year ago, many home filmers raised the cry "What about Eight?" The answer was a vehement NO, even though Marvin Camras had experimented with an 8mm projector several years ago.

At the Industry Trade Show last March your Editor was allowed to hear a faint rumor that the Moviemite Corp., of Kansas City had licked most of the problems of 8mm sound. September was rumored as the possible release date.

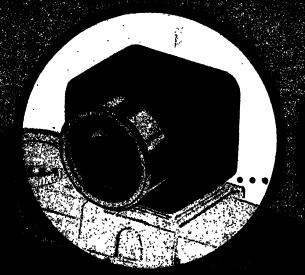

At our August Convention, the projector was demonstrated at a Motion Picture Division session. It will be on the market in September.

Quality? As good as the average and better than most home radios. Conversion? No, not practical, too many changes in the projector would be required. Cheaper to buy a new one and sell your old one or give it to the kiddies for basement showings.

Track? Reeves Soundcraft applies the sound stripe to your processed film. You put the voice and/or music on with the projector. And if you're wondering where they put it . . . it goes outside the sprucket holes.

86 Honors Awarded at Annual Banquet: Archer, Clerc, Tuttle & Wu Top List

Eighty-six individuals were honored for their contributions to photography and achievements therein at the Annual PSA Banquet during the closing hours of the 1952 Convention held at the Hotel New Yorker Aug. 12-16.

Honorary fellowships were awarded to Fred R. Archer, FPSA for his long and varied service to the photographic art, and to Louis Phillipe Clerc, noted French

editor, teacher and author.

Honorary membership in PSA was awarded Harris B. Tuttle, FPSA for his outstanding service to the Society, especially his efforts in behalf of the Motion Picture Division; and to Francis Wu, FPSA for his activity in behalf of the Society in the Far East.

Most of those receiving honors were present at the banquet as Pres. Norris Harkness called the roll. The compelte list and the individual citations follow:

Honorary Fellow

FRED R. ARCHER, APSA, FPSA for achievements during a long and varied career as exhibitor, technical photographer, illustrator, inventor, and school administrator for his unselfish services as judge, author, lecturer, and teacher.

LOUIS PHILIPPE CLERC for valuable contributions to technical and scientific photography during more than fifty years of outstanding service as author of many books, as translator and editor of photographic publications and as teacher in many fields

of photography.

Honorary Member

HARRIS B. TUTTLE, APSA, FPSA for outstanding contributions to the Society especially in inspiring, organizing, developing, and serving the Motion Picture Division and for his achievements as lecturer, author, editor, technical consultant and judge in the field of amateur motion pictures.

Francis Wu, APSA, FPSA for unselfish activity on behalf of the Society in the Far East and for extraordinary accomplishments as both professional and pictorial photographer.

Fellow

FRANK G. BACK, APSA for contributions to the technology and design of photographic optics.

EARL W. Brown, APSA for outstanding proficiency as a photographer, exhibitor, and teacher and for services to photography on a local and national scale.

H. CLYDE CARLTON, APSA for contributions to the technology of film manufacture and for enthusiastic work on behalf of the Society.

L DESCRIN, APSA for extensive contribettens to photography as author, editor, lecturer and exhibition judge.

JOHN . HANS DESSAUER, APSA for contributions to the research and development of

pliotographic products.

APSA for proficiency as a photographic exhibitor, and for service as an author, teacher and organizer of photographic mostings.

MERLE L. DUMBON, APSA for extensive contributions to the art and science of photo-

graphic emulsion manufacture,

SE T. BATOM, APSA for contributing to the field of induttrial photography by writing, teaching and for services to the Society and the Rochester Technical Section.

DOROTHY M. EIDLITZ, APSA for her devotion to amateur photography through teaching, photographic organization activities, lecturing, writing and exhibiting and personal achievement as a color photographer.

CHARLES E. IVES for research contributions to motion picture technology, particularly in the field of continuous processing of films.

ROGER P. LOVELAND, APSA for eminence in the field of photomicrography, for scientific writing and contributions on the

nature of photographic emulsions.

THOMAS H. MILLER, APSA for proficiency as author, educator, and lecturer on numerous aspects of photography and for outstanding efforts on behalf of the Society.

ALEXANDER MURRAY, APSA for authoritative work in the graphic arts and for advancing the art of color reproduction.

JOHN A. NORLING, APSA for pioneering developments in motion picture production and for exceptional service in the field of stereo photography.

Louis J. Parker, APSA for exceptional work in black-and-white and color photography and unique abilities as teacher and lecturer on photographic subjects.

ORLANDO E. ROMIC, APSA for organization, administration and promotion of camera clubs and for accomplishments as an exhibitor, lecturer and teacher.

CHARLES ROSHER, APSA for outstanding excellence as a motion picture cameraman, both professional and amateur.

RICHARD W. St. CLAIR, APSA for services to photography as organizer and officer of photographic groups, as author, teacher, and lecturer.

I. W. SCHMIDT, APSA for unusual public service to photography as author, teacher, lecturer, exhibitor and craftsman.

HOWARD SCHUMACHER, APSA for outstanding work in behalf of professional photographers, for teaching and judging in the field of photo-journalism, and for service to the photographic industry.

HENRY C. STARHLE, APSA for original contributions to the science and applications of photography and for proficiency as a

photographer.

ALLEN G. STIMSON, APSA for the original design of photographic instruments and for devoted participation through many years in Society and camera club activities. MONROE H. SWEET, APSA for outstanding

contributions to photographic consitunistry and the design of original instruments in

Done M. WERER, APSA for outstanding

schievements as exhibitor and enthusiastic apport of partfolio and other PSA

Associate

Louise F. Asnew for her lectures, teaching, and exhibiting in the field of color photo-

graphy.

MANUEL AMPUDIA for organizing and promoting photographic clubs in Mexico and for his own enthusiasms and proficiency as a photographer.

GLEN ANDERSON for contributions to photographic techniques and the popularizing of exposure measuring instruments.

DON BENNETT for achievement in photographic education, journalism and engineering design, and for service to the Society and other photographic organizations.

JACK BREED for achievement in scenic color photography and for unselfish services as a lecturer, judge and author.

JOSEPH S. BRICKER for his work in pictorial photography, in education and camera club activities.

THEODORE L. Bronson for accomplishments as a pictorial photographer and exhibitor. Our Chin for distinction as a photographic artist and teacher.

BRUCE DOWNES for services to photography as author and editor.

ROBERT F. EDGERTON for participation in camera club activities and for proficiency as pictorial photographer and exhibitor.

GEORGE EHRENFRIED for contributions to both the art and science of photography.

Louis K. Eilers for outstanding contributions to the technology of photographic film manufacutre.

J. M. Enders for encouragment and support of pictorial photography and proficiency as an exhibitor and lecturer.

GISELA A. ELLIS for inspiring beginners in photography by her example as a pictorialist and exhibitor and by teaching, coaching and camera club activities.

LYNN FAYMAN for original work in color photography and extensive lecturing.

MRS. CARYL FIRTH for promoting the Society and the art of pictorial photography.

JOHN I. FISH for unusual accomplishments as a pictorial photographer and exhibitor. REX FROST for proficiency as pictorial photographer and exhibitor.

Morris Gurrie for service to photographic education through camera club activity,

writing and lecturing.

IRMA HASELWOOD for accomplishments as a pictorial photographer and exhibitor.

IRENE M. HEFFNER for versatility and excellence in pictorial and nature photography. VENNING P. HOLLIS for teaching amateur photography, for practicing technical and scientific photography and for accomplishing pictorial photography.

R. B. HORNER for excellence as a photographer and for service to the Society and

to camera clubs.

CHARLES ALBEE Howe for achievement in competitive exhibitions and for special proficiency in travel photography.

George J. Husers for many years of successful exhibition in pictorial salons.

STELLA JENKS for advancement of photography by organizing and directing camera clube and by service as teacher and edi-

FLORENCE JOSOT for her story telling pic-tures which have been widely published

PSA JOURNAL

For "professional" results use these ANSCO sheet films!

ANSCO SUPERPAN PRESS. The most versatile film you can load in your holders! Superpan Press brings you an improved emulsion with all the speed and brilliant gradation you need for sparkling negatives of the widest variety of subject matter. Its modern panchromatic sensitivity produces excellent results with all common light sources-sunlight, incandescent or fluorescent lamps, flashlamps or electronic flash tubes. By simple variations in developing time, Superpan Press can give you negatives ranging from soft "portrait quality" to the brilliant gradation required for press and commercial work.

ANSCO TRIPLE 8 ORTHO. This ex-

treme-speed, long-scale emulsion has the type of color sensitivity often preferred for the portraiture of men. It is also extremely useful for landscapes and pictorial subjects where a full orthochromatic rendering is wanted.

ANSCO ISOPAN. The fine-grain characteristics and brilliant gradation of this high-speed panchromatic film make it "standard" with many serious advanced amateur photographers. Isopan's wide latitude and high resolving power make it easier to get clearer, more sharply defined pictures of the widest variety of subject

For best results develop your films in Anaco Prepared Developers. Available at your dealer's.

d for her inspiration and encouragement sthing photographers.

KAM F. Konner. for success as a pictorial vehibles and devotion to camera club orediretions.

RAYMOND J. LEBLANC for public service furthering the interests of amateur and pictorial photography.

THOMAS LIMBORG for proficiency as an artist and photographic exhibitor and judge. ROY E. LINDAHL for proficiency as a pictorial photographer and exhibitor.

VICTOR A. LOOKANOFF for service to the Society as a print analyst and for accomplishments as a pictorial exhibitor.

HERRERT A. MACDONOUGH for photographic accomplishments as a lecturer, author, technician and cinematographer.

ROBERT L. McIntyre for proficiency as a news photographer and photographic columnist.

JOHN A. MAURER (N.Y.) for pioneering work in the engineering aspect of 16mm motion picture production.

JOHN A. MAURER (St. Paul, Minn.) for proficiency as a medical and technical photographer and for unusual aid and encouragement of amateur photography.

LOWELL MILLER for success as an exhibitor and judge of photographic exhibitions.

PRAN NATH MEHRA for mastery of pictorial and forensic photography,

HARLAN P. NASVIK for devotion as a teacher and proficiency in many fields of photography.

JOE NOBLE for contributions to photographic science and manufacturing techniques and devotions to PSA activities.

JOSE OTTICICA for his artistic ability as an exhibitor and for his services to photography as an author and club member.

WALTER E. PARKER for enthusiastic work in behalf of photography and the PSA.

RICHARD B. POMEROY for his achievements as an exhibitor of color film slides.

Louis Quitt for outstanding interest and ability in nature photography.

ROLLAND A. RAHE for color transparency and motion picture proficiency.

W. K. RAXWORTHY for successfully combining technical accomplishments in photography with pictorial abilities and for services as author, lecturer and judge.

PEARL SCHWARTZ RICE for national and international competence as a color slide exhibitor,

DELOS W. RUPERT for contributions to the technological advancement of photography. RUTH F. SACE for unselfish and outstanding service as a lecturer and teacher and for accomplishments as a nature photographer and color specialist.

WENERL J. SCHUBERT for his activities in organizing, directing and participating in photographic groups and for his accomp-lishments as an author, lecturer and designer in the photographic field.

MILL W. SEYMOUR for research and development in photographic technology, par-ticularly in the field of the color film.

ROY E. STRYKER for demonstrating the power of the decumentary photograph as an educational force in the United States. JAMES F. THOMPSON for proficiency in the art of o for printing.

ROMAN VIENNIAC for excellence in the technique of medical and scientific photog-

tapliy, Sam J. Vogan for promoting photographic organisations and for proficiency as pho-

tographer, locturer, and exhibites, Amy Minter. Walken for proceeding of color photography by locturing, teaching, and demonstrating.

GORDON B. WHITE for outstanding accomplishments as a photographer, critic and judge of nature pictures.

HARRY YOURAN for camera club activity and support and for service in the field of photographic publications.

Boris Dobro Named First "PSA Man of the Year"

Boris Dobro, FPSA, celebrated California pictorialist, has been named "PSA Man of the Year" by unanimous vote of the Membership Committee for his leadership in PSA activities and for signing up new members as a part of a concerted drive on his part to establish the Society on a strong footing in California. The title will be awarded next year to the member who sponsors the most new members, Sewell Peaslee Wright said in making the announcement at the Convention in New York.

MP Division Awards Given to Eleven

First Annual Cinema Competition of the PSA Motion Picture Division has resulted in eleven awards for excellent film productions. The first three winners are all sound films; nine are 16mm, two are 8mm, all but one are in color and that one is sepia-toned. Two of the films have sound accompaniment on tape and four are sound-on-film.

First Award goes to Roy C. Wilcox, Meriden. Conn., for "Life Along the Waterways", a nature study. Second Award is for "Introduction to Jazz" by S. David Saxon, W. Los Angeles, Calif. Third Award goes to Dr. Harold Lincoln Thompson of Los Angeles for his "Introduction to Hawaii".

The Honorable Mention films run the gamut from comedy, through family life, hunting, travel and fantasy. Honorable Mentions were awarded: Stanley S. Yasbec for "Reversing Mitty"; Timothy and Delores Law-lor for "Isle of the Dead"; Wm. Messnor for "Maxine's Career"; Othel G. Goff for "Mountain Memories"; Edwin W. Hurd for "Karambi"; Martin B. Manovill for "Never Say Diet"; Jack E. Jacobsen for "What Happened In Our Neighborhood"; and T. Wilcox Putnam for "Legend of Indian Summer".

David White Award To Herbert C. McKay

First recipient of the David White Award, a new honor instituted at the 1952 PSA convention, is Herbert C. McKay, FRPS, PSA, of Eustis, Fla.

McKay is one of the small group who have kept the interest in stereo photography alive through the years when a stereo photographer must be a mechanic as well as a camera operator. He founded the Stereo Guild and has served as its Managing Director continuously. He has written several books and innumerable articles on all phases of stereo photography and designed the SG mounting

The David White Award is spensored by the David White Company and swarded by the Stereo Division.

Dr. L. A. Jones Wine 1952 Journal Award

Dr. Loyd A. Jones, head of the physics department of the Kodak Research Laboratories in Rochester, N. Y., is the third distinguished scientist to receive the PSA Journal Award.

Presented at the PSA convention banquet in New York City on August 16, the award cited Dr. Jones' paper on "Psychophysical Evaluation of Quality of Photo Reproductions," published in the December 1951 is-sue of the Journal. The paper deals with the evaluation of print quality and its relationship to the characteristics of the negative camera material.

Three additional papers that appeared in "Photographic Science and Technique" during 1951 received honorable mention awards, as follows:

R. B. Pontius, Kodak Research Laboratories, for his paper on "The Action of Developers as Tanning Agents", published in the September 1951 issue.

L. B. Fortmiller and T. H. James, Kodak Research Laboratories, for their paper on "Kinetics of Development of Liquid Photographic Emulsions", published in November 1951.

R. W. Henn, J. I. Crabtree, and H. D. Russell, Kodak Research Laboratories, for their paper on "An Ammonium Hypo Reducer", published in November 1951.

All of the technical and scientific papers published by the Society in 1951 were reviewed by the Journal Award Committee who have found an increasing level of quality over their period of operation since

The committee consists of the following: H. Clyde Carlton, FPSA, Chairman, Eastman Kodak Co., Rochester, N. Y., from the Technical Division. Frank E. Fenner, FPSA, The World Book Encyclopedia, Chicago, Ill.; from the Motion Picture Division. George Ehrenfried, Polaroid Corp., Cambridge, Mass.; from the Technical Division. Glenn E. Matthews, FPSA, Kodak Research Laboratories, Rochester, N. Y.; from the Technical Division. George Allen Young, APSA, Camera Craft

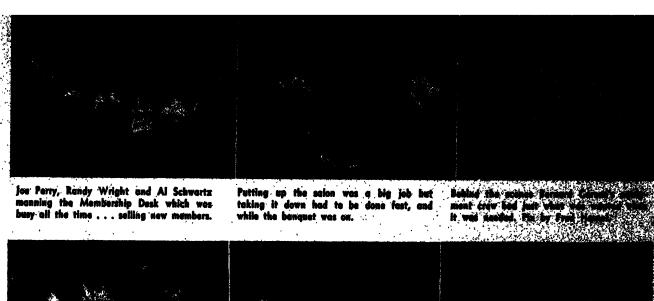

Publishing Co., San Francisco, Calif.; from the Color Division. The PSA Journal Award was inaugurated in 1950 by action of the Technical Division's

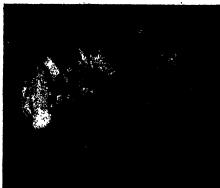

executive committee. Its purpose is to recognize "The most eignificant contributions published in the PSA Journal for the preceding year, in either the technical or scientific fields."

Peabody Award To Gene Chase of St. Louis

The Stuyesant Peabody Award of the Pictorial Division was presented to W. E. (Gene) Chase, APSA at the Convention by Boris Dobro, APSA.

Gene is completing his term as Chairman of the Pictorial Division which has made great strides under his leadership. He has en a member of PSA since 1940: Although Gene's term, as chairman runs to October, he has resigned in favor of Ray Missa, to take on the higger job of Regional Activities.

Carl L Gumpert

Informally posed, this is a strong, masculine, character-revealing portrait. Inclusion of the ship, out of focus, both complements the subject's profession and adds apparent depth to the photograph. Hersh lighting from direct sunlight has been tamed by the use of a reflector, revealing transparent shadows so desirable in outdoor portraiture.

Double trouble! Practice, patience, releasing the shutter at the split second, and sheer luck, will help you make an occasional pertrait like this. An old Army blanket, faintly illuminated, acts to set off the fair holr, while the reverse is true. Crumpled coat, stray hairs, eyes partially opened . . . that's what makes this photograph alive and real.

Maurice H Louis, APSA

Why Not Better

By Maurice H.

There are few photographers, regardless of their specialty, who do not take at least an occasional portrast. It may be only an informal outdoor picture of a member of the family, or it may be a more ambitious portrait for exhibition purposes, made by artiheial illumination.

Although a professional photographer now. I graduated from amateur ranks. Since I know, and have experienced, the problems of both, I feel I can evaluate amateur portraiture impartially.

From the hundreds of prints continually passing through my hands as Assistant Director and Commentator of PSA's Portrait Portfolios, I have come to the conclusion that the average amateur-made portrait is inferior in quality to any other type of pho tograph he makes. I decided to find the reasons for this. After considerable study, I drew the following conclusions.

Portraits take patience, practice, and planning. But in what phase of photography are not these equally necessary? There is no short cut to proficiency, and many amateurs lose heart before mastering the technique which, in reality, is easily learned. Equipment is inexpensive; models, especially children, are readily available, and what better time can one find for this type of photography than during the winter months, or at night, or in inclement weather? Practice makes perfect, so why not make more portraits?

If the beginner could only learn the true importance of simplicity, most of his consequent problems would never arise. Simplicity in equipment, simplicity in proccosing, simplicity in lighting, simplicity in composition, and simplicity in models' dress and grooming!

Were I asked to name the greatest difference between amateur and professional photographers, I would answer: If there are two ways of doing a particular job, the singteur will always also the more difficult

Make

Portraits?

Louis, APSA

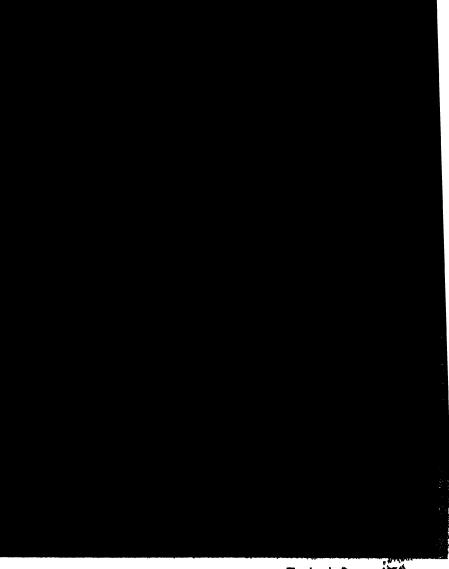

before you attempt to walk! There will be plenty of time later for you to exercise your imagination and initiative, but first ground yourself well in the fundamentals

The inexperienced look but do not see In the excitement of taking infrequent por traits, they are overly anxious to make the exposure and hustle into the darkroom to view their efforts What a rude awakening they receive when they finally study the finished print The unpracticed eye must be trained to note minute detail If jewelry 19 worn, does it draw undue emphasis? Is hair properly groomed? Do eleeves hang without objectionable creases? Are high lights and shadows properly placed and of correct intensity? Are facial weaknesses minimized by corrective posing or lighting? These and many other details must be recognized and dealt with at this stage. If you wait until mistakes appear on your negative, you are only asking for trouble, for many can not be corrected then So, look before you re lease that shutter!

A major criticism leveled at amateur photography concerns subject matter It is repetitious, it fails to clicit an emotional reaction, and it contains much extraneous material. These faults, as well as others, are just as valid in portraiture as in other forms of photography. However, they are harder to remedy, for in the making of a portrait we are concerned with the handling of fewer and larger masses, the face alone usually being of primary importance.

Remember, the larger you reproduce the face, the greater you emphasize your own technical shortcomings, as well as your subject's facial weaknesses. Expression is the keynote of a portrait, and this is transmitted by the eyes and mouth. Are they adequately lighted? Are they relaxed but still alive looking? Is background and dress in key with subject and mood? This is especially important in the making of character studies where the portrait often looks posed and unnatural.

How does one improve print quality? This is a favorite question of the amateur,

Theodore L Bronson, APSA

The judicious use of "propo" has elevated this partrait from a strictly conventional photograph into something much were appropring. The oval hat and veil accontuate the blonde hair and fair pith coloring. They also separate the subject from the background. They dark dress offers a firm "base" found so necessary in the companing of a portrait.

Cover Picture by Charles Baptie, Jr., APSA

By capturing the expression of this truly noble character and combining it with flawless photographic technique, Charles Baptie, Jr., APSA, of Fairfax Hills, Va., has created a portrait of rare, artistic excellence.

The most difficult task of obtaining depth and roundness in a low-key portrait, while using a dark background, has been achieved by careful and delicate lighting. Nowhere do you find disturbing mergers.

Here again the subject's expression is paramount. It vividly bespeaks hundling, kindliness, patience and knowledge, Through these westry but agaless eyes, the weight trials and sorrows have been viewed. Yet faith in an eternal delay radiates through the medium of this photograph.

Maurice H Louis, APSA

The use of strebe has made it simpler to catch the peak of expression and action of this baby. No harsh lighting to Sestrey delicate flesh tones. A spatlight helps separate subject from background. The body is angled to such a degree as to eliminate any distortion of the near leg. An artistic touch is the inclusion of the baby's first shoe

Expression is the dominant factor of any portrait and often overshadows trivial short-comings. The striped jersey, deep shadows and prominent ear may disturb pictorialists but who will gainsay that this portrait has caught the impish and realistic expression of the All-American Boy? No salon winner, but this photograph will stand the test of time!

and more often than not he receives a pretty inconclusive reply. To me, perfect print quality is arrived at only by doing everything correctly—no easy task. A portrait is made by a series of steps, all related to each other. Just where the maker has erred is often difficult to ascertain on viewing the finished print.

To me, the most common weakness of amateur pertraits is their flatness, washedout high lights and lack of depth. Possibly
to avoid the much-publicated dense shadows,
or to escape retouching, the maker swings
to the other extreme. To correct this fault,
one often hears the instruction to give fuller
development to the print. Not had advice
but hardly of value in this particular

The fault lies in incorrect lighting belance. The occasional portraitist arranges his lights, views the highlight and shadow areas, and often lets it go at that liturity is any consideration given to the background. Hence, there will be light against light or

dark against dark—the result being a merger, with no separation between subject and background. The portrait resembles a "cutout," lacking roundness and depth. When you check your lighting arrangement, look through your subject at your background. Then evaluate your illumination—the highlights, the shadows and the background—not by themselves, but each in relation to the other.

While there is no substitute for practice, there is plenty that has been written on the subject of potraiture which will prove helpful to amateurs. I can recommend two volumes, understandably written from a practical viewpoint. They are: "Lighting for Portraiture" by Walter Nurnburg and "Portraiture" by Fred Archer. Studying "Faces of Destiny" by Karsh will acquaint you with the technique of the most famous of modern poternitiets.

Composition has been amide to apposed a bet sport complicated that is really in H a sport to the synt to me, it is

well composed. While not written primarily for the portraitist, "Image Management" and "Emphasis in Pictures," both by Nicholas Haz, will tell you, in a simple way, all you need to know on this subject.

The ephotography of children is always fascinating and extremely satisfying. Reading "Child Photography, The Modern Way," by Josef Schneider answers many of your problems in the handling of babies and youngsters. Or you may refer to this writer's article, "Practical Pointers on Photographing Children," which appeared in the June, 1951, issue of the PSA Journal.

There is nothing particularly mysterious or difficult about portraiture. Take stock of yourself and your photographs. From what I have written, it may be possible for you to spot your weaknesses at once. But if it means retracing your stops and starting on a new tack, do so. There are many helpful hands, waiting to assist you.

Let us hope you now have the answer to: Why hot make better perturbe? the little of the later of the later of the Photographic School of the Society than the one who was honored with a position unique in photographic organisations—that of Headers of President.

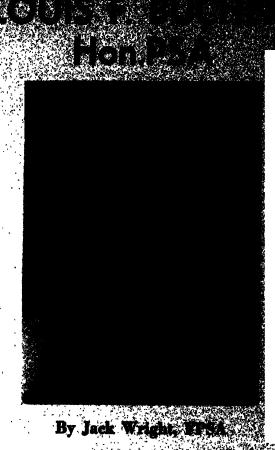

In the years prior to 1919 there was no national photographic organization in this country. This idea was merely a gleam in Louis Bucher's eye. In that year the Associated Camera Clubs of America was organized. But before telling this story it might be well to say a few words about the history of Louis F. Bucher.

Lou Bucher was born in Paterson, N. J., but moved to Newark at an early age. There he built up a successful career in insurance. From his earliest years he was an excellent salesman, and he got his first camera, a 4 by 5 plate "joh," by selling a certain number of bars of soap. From then on photography played a great part in his life. The hobby has had two manifestations. One has been the making of pictures, the other has been in helping to "spread the Gospel" of photography by working in photographic organizations.

Mr. Bucher got his first contact with organization work when a friend took him to a meeting of the Newark Camera Club. He immediately became interested in that phase of photography and during the years of his service to the club was elected to the various offices from director to secretary, vice president and president. During his connection with the Newark club he helped make it one of the outstanding organizations of its kind in the country, being one of the few clubs at that time to own its own building.

During the years prior to 1919 Bucher was a member of the Royal Photographic Society of Great Britain. It seemed

A STATE OF THE PARTY OF THE PAR

the baltimore show . . .

For a good many years now the Baltimore International Salon has been hung in the Baltimore Museum of Art. Last year it did not hang.

We understand the Museum authorities accused the Salon of having become trite, stodgy, static, and repetitious. They wanted something alive and progressive on their walls. This year the Museum people and the Baltimore Camera Club collaborated in an experiment. The Museum picked the judges . . . not photographers, but artists.

They picked good men—Benton Spruance, Guggenheim Fellowship winner in 1950 and professor of Art at Beaver College, Pa; Harry Steinberg, teacher at New York Art Student's League and a Guggenheim Fellow in 1936; and Jacob Kainen, Curator of Graphic Arts at the Smirhsonian Institute in Washington.

Each man is a practicing artist and has had his work hung in many exhibitions of art. Mark Mooney, Jr., in his editorial in the August Camera, writes: "To salons which may consider duplicating the Baltimore Experiment, we would sound this note of warning—be sure that your artist jury, when it is selected, is composed of sensitive, capable people as was the Baltimore jury."

Because this experiment was such a radical departure from the usual salon judging. Mooney took a recorder to the scene and recorded the judges' comments. CAMERA has given us permission to reproduce portions of the report as it appeared in the August issue, together with their reproductions of the winning prints and honorable mentions. We found Mooney's editorial as significant as the judges' comments. You should read them both.

The jury examined 800 prints by 180 U. S. photographers and 20 foreign entrants. Prints varied from 6 x 8 inches to 20 x 24. One of the medal winners was a 6 x 8. The jury selected 94 for hanging. No limits were placed on the jury, they selected 94 prints as suitable.

The jury knew none of the famous names of photography. Some of the famous collected four rejects. Unknowns were hung. Only two color prints were accepted. According to

reports, the feeling about the show is divided, some think it is great, some think it is terrible. In that it doesn't differ much from any salon. Let's quote Mooney again . . .

"Any print which was contrived, phony, too stilted or obviously set up, was too romantic, or proclaimed 'look—here is an S curve,' went out— but fast. And that included a lot of prints which have regularly hung in photographic exhibitions. Prints which said something, which showed that their maker had seen and captured a fragment of human experience, were those which were accepted, and likewise, many were regular exhibition prints. There are familiar names and new names in this salon catalog."

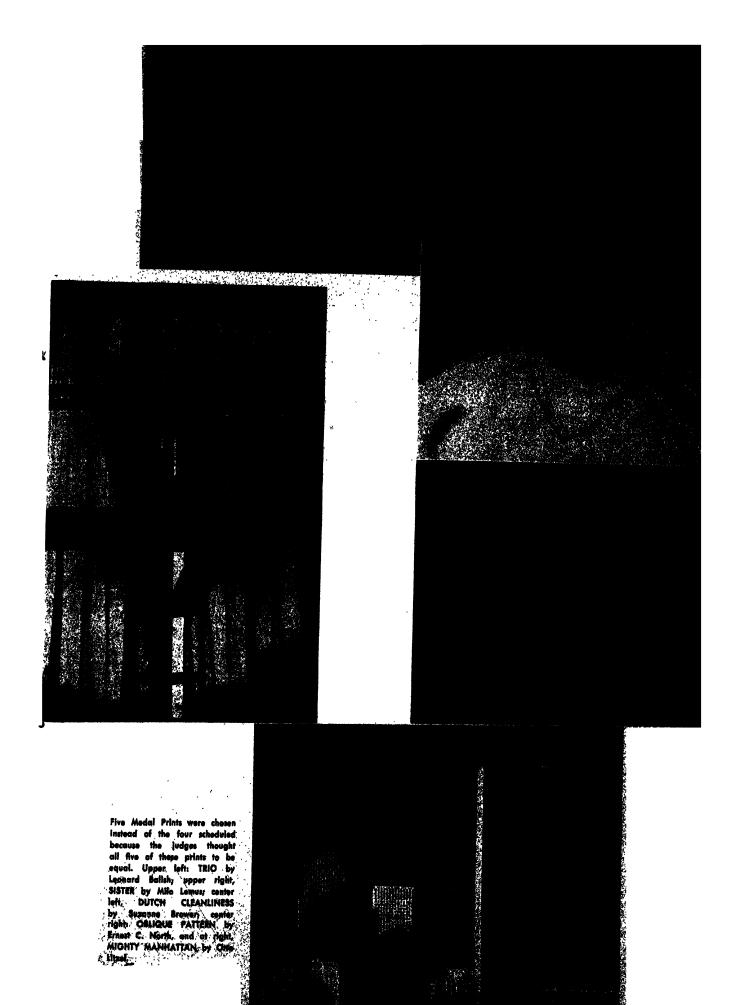

It is not possible, nor would it be fair, to take the comments of the judges out of context. Instead, your Editor would much rather report the *feeling* he gets from reading the discussion by the judges as recorded.

The judges were not too concerned with technique. They were most sensitive to *ideas* and *feeling*. They were often unanimous in their reactions to a picture. They tried to see what the creator had in mind in making a picture, not the way he exposed or printed it, or even composed it.

Whether they were right or not is a matter of opinion, an opinion that cannot safely be formed at this remote spot. We hear that those who have seen the show, like it.

One valuable outcome is the way these artist-judges thought about what they had done. CAMERA has done a distinct service to exhibition photography by reporting the verbatim proceedings of the discussion following the judging. We suggest you get a copy of CAMERA'S August issue and read for yourself... there is much food for thought in the eight pages of reading matter that forms the report.

Then, we'd like to open these pages to a discussion of what you think about it. Your Editor has some ideas, too, which he has carefully tried to keep out of this discussion but which he might divulge in company with others on these pages. So why not write us what you think of the Baltimore Experiment and what you think it means? Just one thing, let us know if you have seen the show...or just read about it.—db.

Fun For All

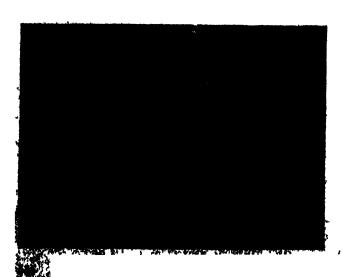

By Robert J. Goldman

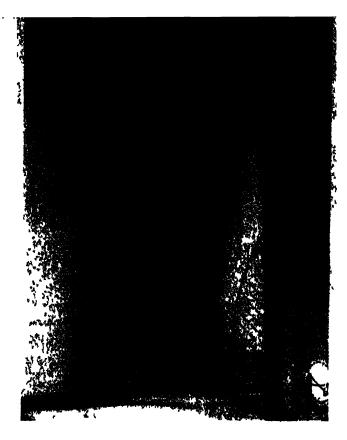

Much has been written about technique in the making of color slides. Eloquent authorities have given invaluable advice and assistance for the purpose of helping the serious worker in improving his photographic skill. Many excellent articles have been published on the Do's and Don'ts of exhibiting, but little if any on the emotional side of this phase of photography.

We who work in color as a hobby, are undoubtedly aware of the tremendous field at our disposal for expressing ourselves, and of the many opportunities afforded us for developing our creative and imaginative abilities. The response to the recently announced competitions in Modern and Creative Photography by the Metropolitan Camera Club Council in New York gives definite proof that there is no dearth of initiative or lack of imagination and originality among the ranks of the members of the camera clubs.

But let's look into the emotional side of this business called Photography, and see if some of us are not inclined to take it all a little too seriously. Let's look into ourselves and see if we would not be happier as individuals, and particularly as club members, if we could think of this hobby of ours strictly in the light of having fun, and even more important, as a means of giving fun and pleasure to others. To my way of thinking one of the nicest things about our hobby is that we whe work in color are definitely in that very postion of being able to share our hobby with others, and that by so doing we can contribute much to the well-being and happiness of others who may not be so fortunate.

R's lots of fun to compete in our camera clubs with our fellow members. But do we get angry, when we are not the winners? No! For if we do, then we are angry at those who win, and that is hardly conducive to a healthy club spirit. Remember: It's not a matter of life and death, and an Award or an Honorable Mention, as desirable as it may be, is and should be secondary to the spirit of good sportsmanship and good fellowship.

It's fun to compete in the many International Exhibitions that dot the calendar throughout the year. We all get a big kick out of the report cards when they arrive, indicating that one or more of our slides have been accepted. And again we suffer keen disappointment when we haven't done as well as we had expected, or as well as we thought we should have, or when a forbidding-looking circle appears around the "NONE".

Here again is where the emotional side enters into the picture. Whether competing in club or international exhibitions, we must learn to control our emotions and desires for success. This is particularly important for novice or beginner. The inexperienced contestant or exhibitor must learn that only through criticism and analysis of his work, can he learn to improve his technique and gain ability to create better slides.

Most judges are not only kind and considerate in their criticisms, but are extremely helpful and constructive in their remarks and suggestions. Strict attention to the remarks of a judge concerning your own slides as well as those of your competitors will contribute more to your ultimate success than anything in the world. Never take a judge's remarks as an insult or in a manner that you might consider as personally disparaging. Benefit by them! By the same token, only through failure of your slides in international exhibitions and by observation of the types of material submitted by your successful competitors, will you learn to recognize the acceptable subject matter that you may have for entering in international competition.

Try not to take it too seriously. Remember it's all for fun, it's your hobby, and the judges are only human after all. If you think your slides are good, even though you may not have been successful, the chances are that the next time you said the same ones out you'll his the jack-pot. Don't let your amostops get the best of you, because if you do you'll list the

(Cintinual in page \$54)

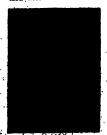

Manuer over! It's really just beginning!

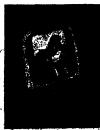

aybe summer, and the summer's sun tan, are beginning to fade. But to members of the camera fraternity, summer's pleasures are only now beginning. For now we start making use of the shots we made... now we start re-enjoying our summer... now we begin sharing it with old friends, and the new friends the summer brought us.

if you shot Kodacelor Film . . . you'll need prints for your permanent collection, prints to send to your hosts and summer friends. And enlargements of your best shots as gifts (Christmas is just around the corner) or as decorations for your home. And to take care of your color negatives, a negative album is a common-sense necessity. Your Kodak dealer will help you set things up.

if you used Kodachrome Film... you'll want to keep your slides in order in a Kodaslide File. The Kodaslide Compartment File holds 240 Kodaslides or 96 glassmounted slides, in twelve swing-out compartments. With index; price, \$3.94.

Then, having arranged your slides, there's the matter of showing them properly. For home viewing by a few, a table viewer is the answer.

The Kodaside Table Viewer, 4X, shows your pictures blown up better than four times. A neat achievement in mahogany-toned plastic, \$49.50; case, \$15.50. The Model A Kodaside Table Viewer is the aristocrat of viewers; gives you a good big, sharp, colorful image (on the order of 5 x 7 inches) and works beautifully even in a lighted room, Price, \$97.50; case, \$27.50.

Screen projectors are, understandably,

favored by many. The Kodaslide Merit Projector is the popular home-use job. It has an easy-to-use top feed for slides: 150-watt lamp, the full brilliance of which is utilized by the lumenized 5-inch f/3.5 Ektanon Projection Lens; and fills as large a screen as most homes require. For auditorium, church, or club presentation of your slides, the Kodaslide Projector, Master Model, is away out front. It will take a 1000-watt lamp if you need it, and keep cool, too. You've a choice of great lenses with which to "tailor" your projection to the actual needs. Price, governed by the lens desired, ranges from \$169.00 to \$246.00. Ask your Kodak dealer to put the Kodaslide Projectors through their paces for you.

Of course, the usefulness of your Kodaslides goes well beyond viewing or projection. You may have color prints and enlargements made from them, Good ones, too, Your dealer has the details.

Maybe your summer picturing was in B & W . . Color suthusiasts to the contrary notwithstanding, black-and-white photography will always appeal because its users can so intimately and personally control all its manifestations, from exposure through development and, most engagingly, in enlarging.

in enlarging.

Some of us, certainly, have yet to deyalon the last of summer's films. The Kodacraft Roll-Film Tank offers easily the singleest way through the development greater. There's another version of the said handles two 35mm, or Bassar collections, for 127, 620, and 615 size Moran After initial leading, you're out of the dark Either tank, \$2.53; extra aprens.

With your negatives presented, their final full realization depends on enlargement. He your own work the Kodak Familie Hallarger is the answer. Impact one, Ma a relation in fine design and effectiveness. It can be adapted to become, in addition to an enlarger, a versatile view, quality for copying, small object photography, and see

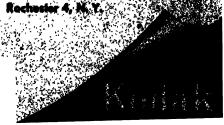

on. The enlarger, less lens BURENT The Kodak Enlarging Elstanon 4-bigs 1/45 Lens is suggested for negatives up 56 34 2 31/2. Priced at \$29.20. You'll probable white a Kodak Masking Easel, too. Practically ancessity for papers up to 11 x 14 Frida. \$9.60.

As to enlarging papers, the following two pages have a story to tell. A good story.

Any questions? Your Kodek deflet will be glad to oblige.

Experts Choices For Fine Prints

No. 6 of an informative series...how leading exhibitors choose papers to fit their salon aims

JOSEF SCHNEIDER is an illustrator whose child studies triumphantly combine psychological and photographic skill. He exhibits chiefly to advertising agency art directors, his salons are the advertising pages of national magazines. Each of his prints must be perfect for its intended use, and in selecting paper, he exercises the same careful discrimination as in choosing and lighting his small subjects

"Were I," he writes, "to make up some prints for Susan's mother's own personal use, I would use Kodak Opal G or Opal R For presentation to a client, my first choice is Kodak Illustrators' Special, the paper can take it and I really can make the print 'sing.' I use Kodak Medalist Paper. No. 3 if I need the added contrast

"Frequently I need to make up a large number of prints for display purposes I use Kodak Medalist Paper because it is fast and has terrific latitude. The tone values are superb. I do a lot of experimenting here, and really the Opal, Illustrators' and Medalist Papers do the job."

To keep children happy before the camera, Mr Schneider says—give them raisins It never fails Susan (see right) has a raisin now.

OTHER veteran photographers will promptly approve Josef Schneider's selections. More salon prints appear on Opal G than on any other paper . . . Illustrators' Special has long been the darling of topflight commercial studios . . . and Medalist, a young and sensational member of the Kodak paper family, is swiftly moving up to rank with both

Kodak Medalist is a paper specifically tailored to meet the serious worker's demand for a fast paper of exhibition quality, in a full range of contrast grades, adaptable to toning, easy to manipulate, with exposure-development latitude to permit close matching of negative and paper. Four grades, several surfaces Elmore C Adams' "Brush Burner" (to appear full-page later) is here reproduced from a print on white, high-lustre Medalist J.

FOR PRINT SUCCESS—PICK THE PAPER THAT FITS THE PURPOSE

These are the papers for fine exhibition enlargements, gift prints, home decoration, and specialized applications—in a range of types to fit your every need:

For fast printing, fine warm-black tones, and great flexibility in manipulation—Kodak Medalist Paper.

For rich neutral blacks in a top-speed paper—Kodebromide, five evenly spaced grades and nine combinations of sheen, texture, tint, and weight.

For rich warm blacks in a moderate-speed paper-Kodak Platine Paper. Three printing grades.

For widest choice of tint and surface in a low-speed paper of utmost tonal quality and adaptability to toning —brown-black Kedak Opel Paper. One printing grade.

For Opal quality with twice the speed of Opal—Rodak Ektalura Paper G.

For Opal quality in a special fine-grained surface suited equally to exhibition and reproduction—Kodak Illustrators' Special.

For photomurals-Kedah Mural R.

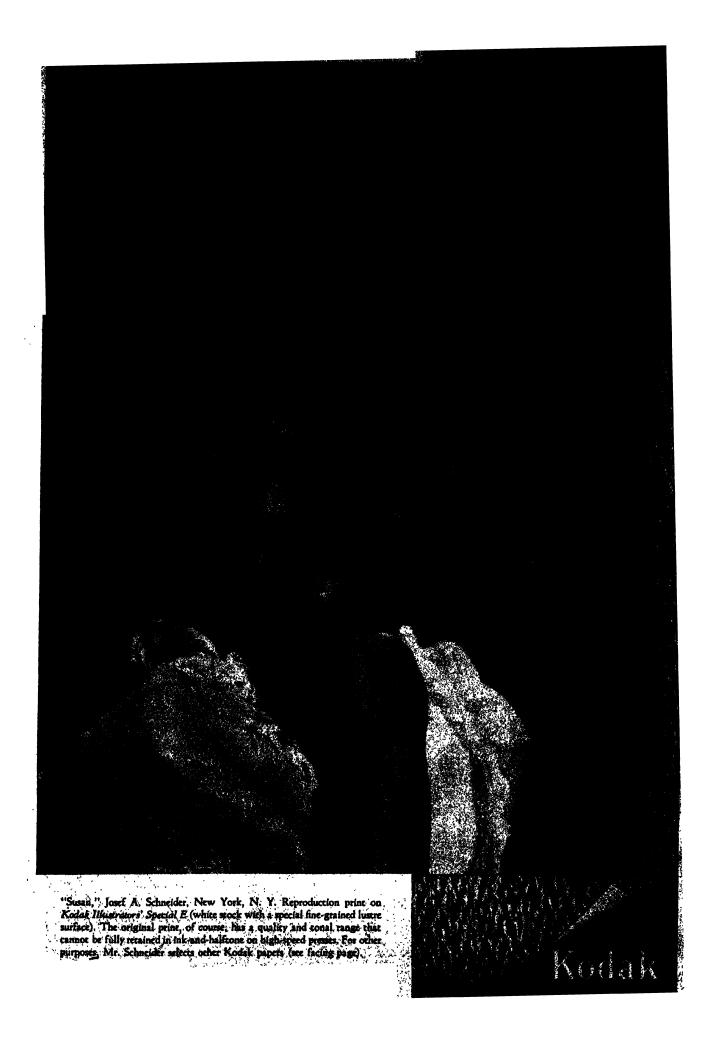

For transilluminated prints-Kedak Opalure Print Film and Kodak Translite Paper.

For extra-fast printing and processing—Kedah Resisto Rapid N. It's as fast as Kodabromide; and its special base allows washing and drying in ten minutes.

And for contact prints—Kodak Are, Velex, Resiste N, and others. Each Kodak enlarging paper has a contact-paper counterpart, equivalent in type and quality.

For full details on these fine Kodak papers—tints, surfaces, weights, processing—consult the Data Book on Kodak Papers, and your Kodak dealer.

Detroit Photo Guild—Mission Pictorialists Class A and B Final Winners

Applegate's "The Queen Arrives"—Print Of The Year

By ROBERT J. LAUER, Associate Editor

It was a fight right to the finish, with the Photo Guild of Detroit overtaking Oakland Camera Club's long established lead, and thus winning first place in Class A, winding up the 1951.52 season of the International Club Print Competition. In Class B, the Mission Pictorialists weren't able to be beinged as they took first place, a position which they firmly held since last October. The Print of the Year was selected by the jedges from among the first place winners in this monthly contests. October to June.

feditis from among the first place winners in this monthly contests, October to June. After a 50 minute discussion on the merits of the 'sarlows prints the judges' decision went to "The Queen Arrives" by John H. Applegate of the Grosse Pointe Camera Clob. This print was first place winner in the February competition. Mr. Applegate will receive a gold medal.

Judging took place the last Saturday in Jane in Chicago, under the direction of the Fost Deathorn-Chicago Camera Club. Invitations were extended to all clubs in the Chicago area as attend. Trophy winners for last, the clabs scoring the most points for the month in their respective classes were Green, Brief (Chicago) in Class II. The last panel has county in Class II. The last panel has county were of her last panel has county and having served of informations. MISS EVELYN ROBBINS, Associate Editor

Reward For Promptness
By Eldripg: R. Christhilf, Hon. PSA
Director—PSA American Portfolios

For years you folks have been telling usthat it was impossible for a Portfolio to complete its schedule on time, that the time between stops was too short, etc., etc. We, on the other hand had maintained that the schedules had been carefully worked out, and if more time were allotted between stops, the Portfolios would still come in behind schedule—inasmuch as the delays, in our opinion, were due to thoughtlessness on the part of some members, that is, unless strikes or embargoes interfered, as they sometimes do.

At Detroit, John Hogan made available two Portfolios covering darkroom controls and showing the steps from the original contact print to the finished salon print. Knowing that there would be a great demand for the two Portfolios we offered to have them travel the Portfolio Circles that completed their schedules AHEAD of time. We felt that, judging from past performances, the demand would not be too great and that we would not be beset by any problems.

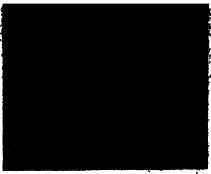

What happened? Well, it seems that Portfolios that had never travelled on time before began to come in ahead of schedule, and, as this is being written, the following Pictorial Circles have qualified to have the Hogan Portfolios travel their respective circuits: Circles 60, 59, 30, 43, 36, 44, 42, 55, 21, 15, 32, 10, 31, 19, 51, 9, 28, 60.

The Circles listed above are in the order of their going on the reservation list. Don't write and ask when your Circle will get the Hogan Portfolio, just figure it out for yourself. The best that we can do at the present is to travel six Circles a year, which means that we are now booked ahead into 1955.

Our only hope is to speed up the Portfolios a'bit in their travels, or else, perhaps Uncle John can be induced, in his spare time (?) to provide additional Portfolios. In the meantime I am looking for a good place to hide out in until all Circles have been covered.

. Chirps From The Robbins

If you will remember, several mentils ago the hope was expressed that we might be

Industrial

Bob Wilkins

3rd Place-June

able to obtain another article from Challis Gore a member of Pictorial Portfolio #47. Mr. Gore has been kind enough to comply with our wishes and sends along the following:

Photography vs. Golf

By CHALLIS GORE Pictorial Portfolio #47

Four years-plus ago I built my darkroom, joined Berkeley Camera Club, and took up photography in a serious way. It wasn't long after that that I did what many a person has wanted to do and has often threatened to do: I quit golf. I resigned from the country club and sold my clubs in order to have more time for photography—and I have never regretted the change. After 25 years of golf and four years of photography, here is how I see it:

A round of golf kills a whole day, including time consumed in getting ready, organizing a foursome, refreshing one's self at the 19th Hole, and getting a shower. And for this, what do you get? You sink maybe one long putt or two, smack one or two down the middle, make a lot of bad shots, lose your temper and \$2.00, hawl out your caddy and learn something new in the way of alibis. Your permanent possession is a bad score. Golf demands everything and gives nothing.

Photography, on the other hand, is the ideal hobby because, like golf, it gives you companionship with kindred souls, plenty of exercise, and, unlike golf, gives you something permanently worthwhile for your time and effort. Photography takes you places and trains you to see things.

True, pictures are everywhere; you need not go farther than your own backyard or town to find salon subjects. But for my part, I like to get around, and there is far more pleasure in travel when you travel with a camera and with eyes searching for pictures.

With photography, you can always improve your product; no one ever reaches the top or limit of achievement.

Every phase of photography is satisfying or rewarding. Every picture looks fine in the ground glass, no matter how badly it turns out in the print. There is pleasure in work done in total darkness: time to relax, and when the safe light goes on, what a thrill as we witness the miraele we have performed! Finally, the print—consthing permanent as a reward and as a restinger. No phase of photography ever gets old or tiresomy to me.

grandi AF Chambantanari Minin M. Unipawoon, PPSA Pintulia Portfellö #74

in injurished on and we march with it, it pictures remain to be checked and our pictures remain to be charived and had by those who succeed us. This should he the first rule to improve each and every time we expose a negative or make a print, either from an old negative or a new sac. This thought has been brought to light en observation of the portfolio now at hand. The improvement of the portfolio now under criticism is far better than the portfolios of past years and it is encouraging and much more interesting to me than the average exhibition. In the exhibits we expect to see the best at all times. Whether we do or not is sometimes a question—at times I have my doubts.

It has been my good fortune to observe many exhibits and to have been elected to judge salons and camera club competitions for the past fifteen years and truthfully, the portfolios have a place no other source can fill. They reach those who want to improve their work, talk shop with other members, and last but not least, acquire friends all over the world. Stop and think - what is better than a good friend, a photographic pal, one with whom we have the same in common-talking the same language -swapping thoughts and enjoying things together. Or would you rather he like some exhibitors who are continually peeved with themselves, or with the judges whose opinions they criticize forever and a day.

Criticism is a strong word and many photographers cannot take it-those who cannot have no place in photography or in any other hobby for that matter. It is from good constructive criticism that improvement in one's work or play will eventually show. Those of us who have gone through this trying time can well reflect back and point to the critic's hard words about our pet print at the camera club, and well we can remember how true his point of view was. And-upon making the print with the critic's suggestions, how much improved it was, or if he suggested the waste basket. how much better off we were to start over again and do something better.

How can we judge our own prints? This is not always as simple as it might seem, yet there is one method to be tried-having had a fair amount of success. Make the best print from your negative that can be made (your first print will not be the one-maybe the twelfth or the twenty-fourth will be) mount, spot and polish it-hang it in a place you can readily see at all times for a one month period. If you like it as well at the end of the month period, the picture has something. Then ask your friends for their opinion. If they like it, it is successful. Then send it out in a portfolio and see what the commentators have to suggest. Suggestions will be made. No print will be perfect, and all of us have differences of opinion, and living in a democracy we have the right to state them, and most of us do in no small

Once again much improvement has been made, and as time goes on you too will be in the exhibition field. When all is said and done, this is what you are striving for. Hest of luck, both picterially and other-

Mighlights from the

FREDERIC CALVERT, Associate Editor

Have you ever tried outdoor portraiture? Very good results can be had outside in the shade. In the shade we get nice, soft, even lighting. A white cardboard reflector can be held close to one side of the face to lighten up the shadows and give a little more roundness.

In either event, indoor or outdoor portraiture suffers greatly from loss of character. Very few amateurs as well as professionals have the knack or ability to capture the true character of the sitter. Most photographers set up the camera, lights, pose the model, then say "smile", click the shutter and there is supposed to be a picture. Many wonder why.

While getting the lights ready, the photographer should engage the model in conversation about his interests. In so doing the model relaxes and when the time comes to snap the shutter, you get a natural smile, with life and sparkle in the eyes, and in most cases the true character of the model shines forth. Even if the picture is not to be a smile picture, with sparkle in the eyes you capture a more lifelike expression. Who wants a picture of a dead pan?

For more information about how to take good portraits, join a Portrait Portfolio. We can help you to make better use of the lights, pose your model in a more pleasing manner, and do all those other little things to help you make a better portrait. Our Commentators are among the best portrait makers in the United States.

Dance Pictures On Display

One of our Commentators, Miss Gerda Peterich, had the second in a series of three exhibitions on "Modern Dance Today" on view through June in the Music Library, a branch of the New York Public Library.

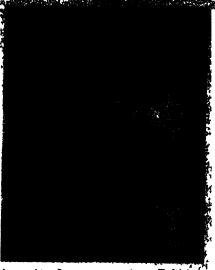

Miss Peterich uses chiefly a Speed Graphic with multiple flash synchronized to the focal plane shutter. The photographic style, she says, should reflect the personality of the dancer and the style of the dance rather than the personality of the photographer.

C. "JERRY" DERBES, Director .

Being the Director of this new activity has its rewards and compensations for the work involved.

For instance, I recently received, among others, three outstanding negatives, Groups

Approaching Storm

James T Johnson

2nd Place-June

are being formed now to receive these negotives but I would like to tell all of you shout them because I would like to see every that feels the need for improving their plus-tography participate in the Salen Workshop.

The first of these is a character study. The picture is that of a native Guatemalas in the attitude of prayer. Regarding the negative, the Master advised that he purposely overexposed it one stop and nuderdeveloped it 20%. As a result it shows

PSA Recorded Lecture Program

The Recorded Lecture Program of the Pictorial Division offers the following programs for your club.

No. 1 An Analysis of Recognized Salon Prints by Ragnar Hedenvall, APSA.

No. 2. Commentary on Recognized Salon Prints by Morris Gurrie No. 3. Outdoor Photography by D.

Ward Pease, FPSA No. 4. Still Life by Ann Pilger Dewey, APSA, Hon. PSA.

No. 5. New Prints for Old by Barbara Green, FPSA. SPECIAL Photography of the Nude

by P. H. Oelman, FPSA

A deposit of \$25.00 should secompany an order. A service charge is made for each Lecture. The SPECIAL costs \$10.00 and should be ordered directly from Mr. Oelman, For clube which are members of PSA but are not affiliated with the PD the charge is \$6.50. Clubs which are efficiented with the PD will be charged \$5.00. The service charge is deducted from your deposit, when lecture is returned. Clubs or groups not members of PSA will be quoted prices on request to

For Nos. 1 to 5 order from Philip B. Maples, Director, Recorded Leeture Program, 29 Spring Street, Brockport, New York. For the SPECIAL please contact:

the Director.

P. H. Oelman, FPSA, 2505 Moorman Avenue, Cincinnati 6, Ohio.

Milimitiful detail in both the highlight and abadem, down. He respected the negative brises, printing to improve the composition when wisting to improve the compoundated used a slight tilt forward of the head. He barned in accouple of light areas on one the shoulder, then inished car and parts of the shoulder, then finished it off by sheding all four sides slightly with raw light to hold the eye within the picture area. This particular negative could be printed by tilting the head backward with eyes looking up. It could also be printed straight without reversing the negative. Both variations would make a very satisfactory print. It has all kinds of possibilities. His Il x 14 print and his actual Salon Print which will be awarded to the winner of his group are out of this world as far as print quality is concerned.

The second of these negatives is a marine scene, a sailboat heading out to sea pulling a small dinghy. The sails are full and there are just a few small clouds which incidentally need burning in a little to bring out their full beauty. This print was made just as the Master took the picture but the burning in of the clouds and again flashing all four sides alightly with raw light improved it immensely. The print is blue toned and

very beautiful indeed.

Do you have aspirations to make an abstract that will hang in the Salons over seventy-five percent of the time? I have a negative at hand belonging to a Master who is a "master of abstracts." It has details galore and beautiful tonal quality from white to black. The center of interest is properly placed in the lower left dominant third and contains the lightest and darkest parts of the whole picture area. The Master wrote me that certain changes in composition would work equally as well as the way he printed it. This print was slightly toned in Nelson's Gold Toner. Subject matter? Oh, that's a secret.

If you haven't already gotten in on the fun of printing from one of the Master's negatives you don't know what you are missing. You will find more of the details of this new activity in the August issue of the Pictorial Digest. Write me for an ap-

plication blank.

STANLEY D. SOHL, Associate Editor

Ambassador's Position Open

Yes, your eyes are not deceiving you there is an Ambassador's job open and YOU can qualify.

First, and probably most important, is that you be whole-heartedly interested in a better world, in a free world and a world where photographere can take pictures where they want to, when they want to, and how they want to. You must have a pro-found instant in people of the families conners in which you are to walk, that it, you, more he but out about their continue. their philosophy, and their ways of Mr. You should be faterested arough to spoul a few nights every tix mentils or so to do your job in the best manner you ketow how. But, you see, the best part of this feb is that you will get in return so much or more from the people you work with as you put into your new position.

Photographers in a foreign country are much interested in exchanging not only prints for constructive criticism but also ideas on techniques, ideas on the conception of a picture and ideas on a full story

of composition.

It has been a long proven fact that if there is a problem of misunderstanding or indifference in front of you-back up and find a common ground or interest and then walk right over the situation. In other words, using photography as your common interest-work together through this subject to learn about each other and in turn you will soon understand each other.

Now I know that there will still be problems but as an Ambassador of Good Will from American Photographers, to some foreign photographers, you can do as much good as a hundred bushels of wheat, or some item of machinery to stimulate under-

standing.

Right now, today, there are some very rich positions open to YOU, if only you will accept. Any individual, or a group in the Society, that is interested in such a position, with the exchange being prints in a portfolio, should make application to Col. Charles J. Perry. There are people waiting m both Japan and Chile as well as other countries to start an exchange with YOU. Won't you take the job?

First Dominican Republic Salon

Juan Ulises Garcia, General Secretary of the Dominican-American and Caribbean-American Portfolios, has completed the organization for the First International Salon of Photography. The Salon is under the joint sponsorship of the Dominican Photographic Society and the Dominican American Institute of Culture.

The latest news of the Salon is the magnificent gesture of the Dominican Republic President, Dr. Molina, in donating \$200 as top prize to the best print of the salon. This prize is to be in the form of a Cornerstone Membership in the PSA. This gift is tangible evidence of the warm feeling existing in our International Portfolio program. This is particularly true in the Dominican-American Portfolio under the able direction of Sten Anderson, the U. S. General Secretary and Juan Garcia, the General Secretary for our southern friends. This type of gift must be most gratifying to these two men who have worked so hard and who have built up such splendid cooperation between the two nations. They are both true Ambassadors in the International parade.

New Chairman Visits Mexico

Ray Micsa, A.P.S.A., the new Chairman of the Pictorial Division and a secretary for the Second Caribbean-American Internor we second Carmbean-American Inter-national Portfolio has just distinct a trip to Maxica City. He actually west form there he a delegate to the Source Indipa-tional meetings, but he also existing as a plice place, of PSA business while there,

A. LYNNE PASCHALL, Associate Editor .

September

". . . And then the whining school-bey, with his satchel

And shining morning face, crosping like enail

Unwilling to school."

Did your brat act like that on the first day of school? If he did, you haven't trained him right. The American public school system is one of the great democratic institutions of the world, and school attendance should be held up as a reward for being born an American, not as a punishment for being under foot for five years.

We trust you got out the old camera and made a record of Junior as he started off on that great adventure, and we hope that you caught the eager look on his "shining

morning face."

In years to come, you will look upon that picture as one of your prized possessions, but guard it well from Junior. In a few short years, he will be grown up, or think he is, and he will resent your insistence

that he once looked like that.

The old verse that starts: "Thirty days hath September" is still true and they are all busy days. As far as camera clubs are concerned this is really the beginning of the year and the first week of school will scarcely be under way until we have to start scurrying around to get the winter's program started.

Print Circuits

If you plan to get in on a Camera Club Print Circuit, better not wait to see what your members did over the summer vacation, but gather up the three best prints of last year. Then write for an entry blank and get an early start.

The director is William R. Hutchinson. When filling out the blank give him second and third preference on dates if possible.

Recorded Lectures

44

If your club has some money in the treasury but still has to keep within a limited budget, there is nothing quite equal to a recorded lecture. See the list of available subjects on an adjoining page.

Several of your members will have slide projectors, and if you can find someone with a tape recorder you will be all est.

Write to Philip E. Maples for a satisfactory date.

Judging Service

At some time during the year, you will syant to have a diamer meeting economess by a big print contest in which systyle is represented, By all apages have the pri fadged and integ stitions in the cent of with history, First, Squard, Tripis, or stants/ap. you wish to avail.

in the second se

Portfolio of Portfolios

If you have a club room with malding ground the walls for the display of pictures, you should hang a Portfolio of Portfolios at some meeting during the winter. This can be done along with your negative process.

be done along with your regular program.

Perhaps the director of this activity will let you keep a show on display for a longer period. For a suitable schedule write to James T Johnson.

American Exhibits

There is no real substitute for the prints the members make, and as long as enough of them come in, the meetings will be full of life and vigor, but after a few meetings there will come a lull. Then is the time to bring in a show from the outside.

Write to Fred Fix, Jr., for his latest list. Be sure to tell him the approximate date the pictures are wanted.

Portfolian Clubs

If you live in a district where a number of PSA members belong to Pictorial Portfolios, you may take part in an enjoyable side activity by organizing a Portfolian Club. A club with as few as four members will get recognition. The director is Sten T. Anderson.

VIEWS AND REVIEWS

BY THE DIGEST EDITOR

Dissatisfaction

The July PSA JOURNAL and the August CAMERA magazine both report new methods in the judging of photographic exhibitions Both of these reports indicate further the growing dissatisfaction with present methods of judging, and photography's desire to strengthen its position as one of the aris—to come of age.

For the more we study photography and the more we study painting, the closer the two seem to come. They are both concerned with conveying feeling within a space bounded by four sides and lying on one plane.

The rules of photography and the rules of painting are the rules of graphic art. Who is to say which method of conveying feeling is better.

The rules of grammar govern both the apoken word and the written word. Can we say either is better? No, they are used by people for different purposes, and by different people for the same purpose. But the rules are guideposts for both methods of

Pitrhaju, as one of the judges of the Splainters show suggests, we who are photographics, have been too percompled with splainters, picture than sector, pictures. Perture view house heavies into completes of the subject of sempted by first and have Arthur the subject what the subject of party Pitrhals and subject of the subject of the

house, or for abatting house on comments of an evil, Painting out do this shade of a country in the hands of a good phalographs can be an instrument of truth or an instrument of truth or an instrument of truth or an instrument of distortion. It depends on the photographer.

Maybe the whole dissatisfaction about the present status of photographic exhibitions is a reflection of our own dissatisfaction with what we are producing. We are looking for the road which will lead us to greater satisfaction in our photographic work.

Maybe if we change our methods of judging our exhibitions, as suggested in the Puyallup, Washington experiment, we can get away from the impact type of picture and become more aware of the picture which grows in appreciation and importance the longer it is seen. With this system our pictures would need to convey more emotion to the viewer—they would need to arouse more emotion in the photographer who takes the picture originally.

The PSA is dissatisfied with many things in photography as it is today. And the workers in the Society are striving toward progress—they are working to make photography better—technically, esthetically, creatively.

Photography can come of age. Photography will come of age—but whether that coming of age is hastened or retarded—only the photographers of today can decide. Through dissatisfaction comes change—and through change, properly directed, comes progress—Stella Jenks

PSA COLOR DIVISION

GEORGE F. JOHNSON, APSA ______
Forestry Building, State College, Penna.

CD Officers, 1952-1954

Mrs. Blanche Kolarik, APSA, of Chicago, Illinois will be the Chairman of the Color Division for the 1952-54 term. She is widely recognized for her outstanding exhibition record, for her efficient compilation of "Who's Who in Color Slide Photography" over many years, and for her untiring efforts in behalf of color photography in the Chicago area. Mrs. Kolarik served as CD Vice-Chairman during the past two years. The Vice-Chairman will be Paul J. Wolf,

The Vice-Chairman will be Paul J. Wolf, APSA, of Hawthorne, N. Y. Mr. Wolf has ably served the Color Division as Chairman of the Honors Proposal Committee. Eastern Editorial representative, and as Secretary during the 1950-52 term. His enthusiastic efforts for the advancement of color photography as an exhibitor, judge and exhibition director, as an officer of local color clubs, and as a PSA Committee Chairman, are widely known.

Merle S. Ewell, APSA, of Los Angeles, will serve as Secretary. Mr. Ewell has been for many years one of the leaders in his widely recognized local Color Camera Club, and has performed a most creditable service to the Color Division during the past two years as supervisor of the National Club Slide Competition with 138 Clubs from 35 States and several foreign countries taking part.

The Color Division is fortunate that three such able and experienced individuals, have agreed to accept major responsibility in the Division for the next two years. Our congratulations and best wishes go out to them on the eve of assuming their new tasks.

GFI.

Tokyo Tidings

The Color Division Hospital Project has received the following note from the American Red Cross in Tokyo, Japan, which distributes the color slides we donate to U. N. Army and Navy Hospitals in Japan and Kores. We quote:

"During the past week we have received three boxes of color slides from you. We thank the wonderful members of the Photographic Society of America most heartily. They could not have come at a more opportune moment, as for the first time we had no back log of slides to fill our monthly quota of 3000 and those three boxes enabled us to fill the need on time."

The Red Cross quota of 3000 slides per month is only enough to provide slides for the hospitals now receiving service. To allow for an expansion of service we should be sending them at least 4000 slides per month. Actually, due to a slow-down in the number of slides being received we have in recent months been able to send only 2000 to 2500 slides a month. So as can be understood, slides are needed badly for this outstanding service to hospitalized service men and women; Please send whatever slides

you can, with a simple identification as to subject matter if possible, to Karl A. Baumgaertel, 353 31st Avenue, San Francisco, California.

Medal Winners in National

The fifteen medal winners—top slides of the 3468 entered in 1951-52 in the National Club Slide Competitions, has been announced by Merle S. Ewell, APSA, supervisor.

In Class AA, with 39 Clubs entered, the final winning individuals were: First: "Last Gleam" by H. N. Fulbright, Boston Camera Club: Second: "November Skies" by Mrs. F. N. Decker. Salt Lake Photochrome; Third: "R.R. Snow-Melter IV" by Harold Schwartz, Shorewood Camera Club; Fourth: "Lazy Canvas" by Helen C. Rahe, Ft. Dearborn-Chicago Camera Club; Fifth: "Breaking Surf" by Herbert Weihrich, Science Museum Photo Club.

In Class A, with 47 Clubs taking part, medals were awarded as follows: First: "Design in Glass" by David Murray, Rockefeller Center Camera Club; Second: "Secured" by Meida Hammond, Los Angeles Cinema Club: Third: "Ma's Glasses" by Art F. Shea. Tripod Camera Club; Fourth: "San Blas" by A. B. Hinkle, Diablo Camera Club: Fifth: "Dunes of Ibex Pass" by Ivan Murry, Taft Camera Club.

In the Class B contests with 52 Clubs enrolled, the awards were issued as follows: First: "Quo Vadis" by J. S. Boeckh, Toronto Camera Club; Second: "Routine Heroes" by E. G. Tozer, Toronto Camera Club; Third: "Pals" by George Merritt, Jackson Camera Club; Fourth: "Excelsior" by G. K. Smith, Equitable Life Camera Club; Fifth: "Patricia" by E. V. Mayer, Equitable Life Camera Club.

All clubs desiring to enroll in this series of five competitions in 1952-53 should contact at once Merle S. Ewell, 1422 W. 48th Street, Los Angeles 62, California. Clubs affiliated with the Color Division pay no entry fee, others pay \$4.00 or \$6.00 depending upon PSA membership.

Chantler Leads Who's Who

Dr. M. A. Chantler of New Toronto, Canada, topped "Who's Who in Color Slide Photography" for the period from July 1, 1951 to July 1, 1952, published elsewhere in this issue. Dr. Chantler was the only exhibitor to have slides accepted in every listed exhibition. He also led in total slide acceptances with an aggregate of 85. He was followed closely by Helen C. Manzer, APSA, of New York City, who had 84 acceptances in addition to judging one exhibition where judge's slides are not listed as accepted.

Other exhibitors who had more than 60 acceptances include: Karl A. Baumgaertel, APSA, San Francisco; Norman R. Brice. Clayton, Missouri; Louise Cramer, Salt Lake City, Joe M. Dixon, Roseville, Calif.;

Color by First Class Mail

Starting July 7 and until further notice all Cine Kodak films, Kodachrome film 135, 335 and 828 will be returned by the Kodak Company to the customer by first-class mail. This will apply only to processing laboratories in the United States and Hawaii. No additional charge will be made for this service which is intended to avoid the many serious delays that have occurred in the use of third-class mail. Several months will clapse before notice of this change appears in the cartons and instruction sheets but the service is now in effect.

Whoops

On page 439 of the July issue we pulled a boo-boo. In W. K. Raxworthy's excellent article on 35mm leaders and trailers, the typesetter left out a couple of lines and the whole corps of proofreaders missed it.

The third paragraph should read:

"According to the specification, the leader, including the tapered tongue, is the first 8½ (8.228) inches of film, and the trailer is the last 1.87 inches. In addition to the tapered tongue, the 8½ inches of leader include the equivalent of three 24 x 36mm frames ahead of the first exposure."

As it ran the statement didn't make too much sense but with the italicized portion put back in, it does.

Our spologies to you readers and to Mr. Raxworthy, -- D. B.

Who's Who in Color Slide Photography 1951-52

In the following listing are the names of those who have had acceptances in at least two of the recognized exhibitions during the past season. Such listing is indicative of better than average ability in color slide making.

The period covered is approximately July 1, 1951 to July 1, 1952, with some irregularities represented by exhibitions held within the period but catalogs not available in time.

30

Only the following exhibitions are inoladed ARIZONA Bergen, CHICAGO, Cin-cinnati, Cloveland, Columbus, Caba, Dixie, El Camino, HARTFORD 1951, HAWAII, Louisville, Milwaukee, Minneapolia, MIS-SISSIPPI VALLEY, Philadelphia, Pitteburgh, PSA, Rochester, Sacramento, Salt Lake City 1951, San Francisco, SOUTH-GATE (England) 1951, Southgate 1952, Southwest 1951, St. Louis, Toronto, Tulsa, Valparaiso (Chile), Victoria, Whittier, and Wilmington.

One Canadian show did not meet requirements for listing, nor did any of the foreign shows except the three listed. (Most foreign shows permit too many entries, or keep entries too long.) Altho finally included, three of the American shows were borderline in performance and future listing will depend upon improvements in those shows. On the other hand, five American and one English show (capitalized in the list) were so efficiently managed that they received "special recognition", including silver medals for their contributors.

Since nature photography exhibitions are covered by a separate "Who's Who", they are not included in this listing.

A total of 732 exhibitors are represented this year, a slight increase over the last year, tho the number of exhibitions is the same. In addition there were 971 contributors who were successful in only one exhibition, and more than 1000 who submitted entries and had none accepted.

Judges' slides are not included in the following list, but asterisks indicate how many exhibitions the individual has judged.

The "Who's Who" list is compiled annually by national committee member Blanche Kolarik, APSA, from card files (approximately 3600 individual cards) on which are recorded acceptances from the various exhibition catalogs. Catalog errors, variations in names and addresses, etc., require considerable investigation by direct inquiry, Color Division's cross reference files, and other sources developed for this purpose. Most such irregularities have been eliminated, but if there are any questions, these may be addressed directly to Mrs. Kolarik at 2824 S. Central Park Ave., Chicago 23, Illinois.

NO MORE PRINT-CURL

New effective solution for your print flattening and conditioning problems.

- MAKES PRINTS LIE FLAT
- ELIMINATES CRAZING
- IMPROVES GLOSS
- GALLON TREATS 3000 8x10's

NO MORE HYPO STAIN

BFi No. 30 frees prints and films from hypo faster, more completely, and with less water. Saves up to 80% time and water. Assures permanence of record prints. Aids successful toning.

Gallon treats 5000 8x10's. Keeps indefinitely, under normal storage conditions.

TD Executive Committee Meets

When the brass hats of the Technical Division gathered for an Executive committee meeting at Ansco Lake, near Binghamton, recently, they took time out to watch the birdie. In the usual order, those seated are: Walter Litten, Joseph Friedman, George Eaton, William Swann and H. Lou Gibson. Standing: Fritz Dersch, Frank Carlson, Earl Clark, Norris Harkness, Hubert Scheffy, Paul Arnold, R. C. Hakanson, Herbert MacDonough.

PSA NATURE DIVISION

HARRY R. REICH, APSA

286 Schenck St., No. Tonawanda, New York

More Nature Exhibitions In Process

If it appears to the readers of this column that the advent of more new nature exhibits is of sufficient interest to rate top billing in this column month after month please remember that as chairman of the Nature Division it is my business and extreme pleasure to sell Nature Photography to the PSA member-body, and to the world at large. The advent of new shows reflects an increased interest in our favorite form of photography and should furnish the necessary impetus to increase the membership in the Nature Division and also in the Society.

This past week the writer received a request to furnish the minimum requirements for Nature Division approval of a nature section to an exhibition of photography conducted by the Newcastle-upon-Tyne Photographic Society in Northumberland, England. The Newcastle show is not a new exhibit but it is their intention to conduct their spring show to conform with PSA practices in order that they might be favored with PSA sanction and approval. The Nature Section I feel certain is new to the show. The information requested has been furnished them and they have been advised that the official Nature Division mailing list is available to them if they wish it.

On this very day I am in receipt of a letter from the Secretary of The Syracuse Camera Club. I take the liberty of quoting from

this letter for your approval.

"I read with interest your article in the PSA Journal on Nature Salons. The Syracuse Camera Club is planning a salon for May of 1953. Our first consideration is to keep the cost of it down to a point where we will not go into debt. We also have a relatively small active membership who can be counted

on to do the actual work.

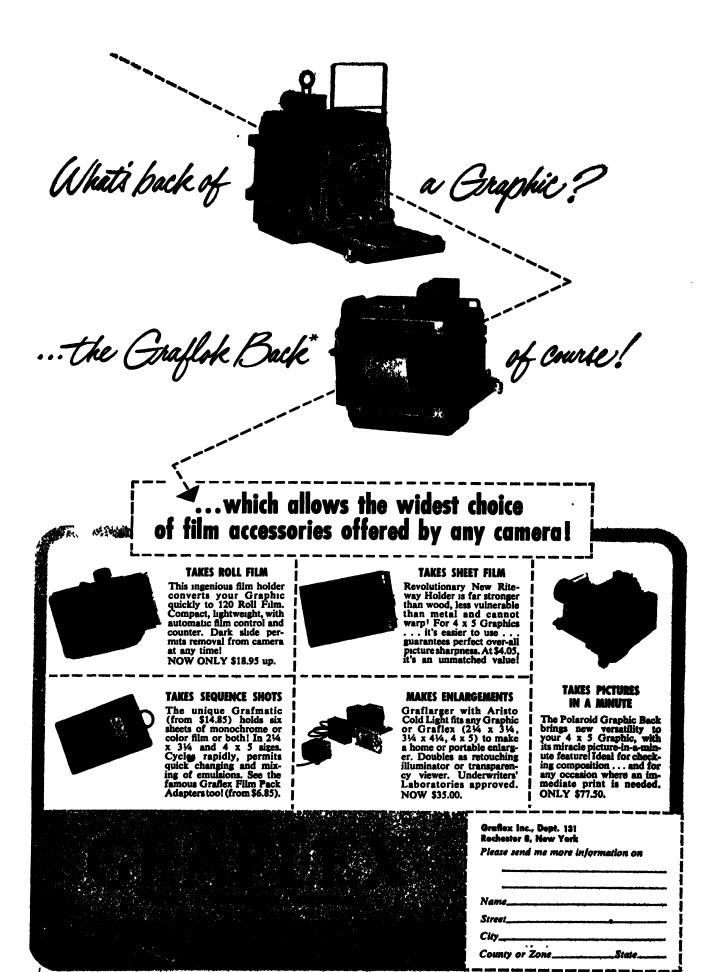

"We are considering adding a nature section in our salon. First, what are the minimum requirements to meet PSA Nature Division approval? Secondly, if we had such a section, would we get enough response to make the effort worth while? We would like to support your efforts if is is possible."

The Salon Committee of the Syracuse Camera Club is meeting with some of the Rochester Salon Committee on Wednesday night, July 30th, in Rochester. I shall make it a point to be present at that meeting and I assure you their committee will have all the necessary information for having the show recognized by the Nature Division of PSA and all the advice I can render. It will be up to you nature photographers, however, to furnish the necessary support to the show to guarantee its success. I am counting on all of you to do just that.

Permanent N.D. Print and Slide Sets

As most of you know the Nature Division has three permanent sets of nature prints and also several sets of nature slides for circulation. These sets have proven very popular as programs for camera clubs since they were first announced, numerous clubs have requested these sets and to date they have not had them. The print sets have been scheduled in defined areas in order to save as much expense in shipping charges as possible to the clubs requesting them.

Scheduling them in this manner makes it possible to send out a set of prints, say for instance, to the middle west area so that the club first on the schedule will receive the prints postpaid. They will then mail them to the second club prepaid. That club will then mail them to the next club, pay-

hig the postage when they mail them. In that way each clab has but one shipping charge to pay, and the Nature Division has hat one postage to pay per set for a given area.

Several of these sets will soon complete such schedules and will be returned for rescheduling. If your club has previously made requests for print sets and has not as yet had them please make a second request now before schedules are again completed for these sets.

Requests for print sets should be made to Dr. Stanley H. Seeman, 331 Euclid Avenue, Kenmore 17, New York. Requests for slide sets are to be made to Louise K. Broman. APSA, 6058 South Troy St., Chicago 29, Illinols.

New York State Museum Announces Second Exhibition of Nature Photography

The New York State Museum has announced its second exhibition of nature photography which consists of a series of six different exhibits occuring on alternate months beginning with the month of December 1952. For a time it was thought possible to arrange for this exhibit to meet the minimum requirements for PSA Nature Division sanction but due to the fact that it is a State sponsored exhibit certain conditions prevailed that prevented this. The writer thinks this exhibit is a very fine show and worthy of the support of all nature photographers.

Each of the six exhibits is restricted to classified subject matter. The First:-Wild Birds, on display December 1, through December 31, 1952. Closing date, November 10. The Second:-Scenery, on display February 1, through February 28, 1953. Closing date, January 10. The Third:-Wild Animals. on display April 1, through April 30, 1953. Closing date, March 10. The Fourth:--Trees, on display June 1, through June 30, 1953. Closing date, May 10. The Fifth:--Flowers, on display August 1, through August 31, 1953. Closing date, July 10. The Sixth:-Nature Photographs, (all natural history subjects not included in the other exhibits) on display October 1, through October 31, 1953. Closing date, September

First International Exhibition of Nature Photography

Some time ago in this column we mentioned the possibility of a new nature exhibit to be sponsored by the Channel City CC of Santa Barbara, Calif. this fall. This prediction has materialized and the show is scheduled for November 1 and as it will be conducted to conform with the recommended practices of the PSA, it will be included in the Nature Division's Who's Who listing for 1953.

The exhibition calendar for this show is as follows:

Closing date.....Oct. 18, 1952
Judging.....Oct. 25, 26
Notification cards sent....Oct. 27
Total rejections mailed....Oct. 30
Exhibition.....Nov. 1 to 10
All entries analled.....Nov. 20

As this is the first Santa Bethere Exhibition it means that all of your prints and slides, if they are nature material, are eligible. There is no excuse therefore for not entering. Let us all help to make this show a success.

You Can't Win If You Don't Enter

Time and again the writer has pleaded with the nature workers to refrain from hiding their lights under a bushel. Pardon the old saw, but it is so appropriate. After you have worked hard over a print to submit to the handfull of Nature Exhibitions and have had the pleasure of seeing it accepted in one after the other of the existing shows why not give it a chance to compete with the best the pictorialists, and the photo-journalists have to offer.

If you don't send them out and let them compete how can you expect to win with them. How can you expect to learn the true quality and excellence of your efforts? The recent announcement of the winners in the 1952 Graflex Contest proves the point

in question graphically. One of the manners of the nature division, a very due nature worker who however requires constant unging by the writer to submit his prints to this and that contest or competition, had the pleasure of seeing one of his prints win first prize in the action class of the Graffer contest which netted him three hundred delars and then saw the same print win first in a special news class which netted another three hundred dollars, making six hundred in all for one print. I feel certain that this particular N.D. member will need no further urging to submit.

I have in mind another member of the division who in 1950 had created a very superior print of a flight of gulls on gull island which he dutifully submitted to all of the nature exhibitions and then filed away, only to see another photographer enter the same subject in the Popular Photography Contest of 1951 and win first prize in that contest with his print. I am also satisfied that that member will need no further urging to submit.

Why not get into the swim? Enter your prints for you can't win if you don't enter.

MOTION PICTURE DIVISION NEWS

H. A. McDonouch, APSA R. D. #3, Binghamton, N. Y.

"Tops" In Movies

Elsewhere in this issue you will read of the first of the "Tope" shows for this year, to be held in San Diego on Sept. 13-14. The MP Division will play a heavy role in this opening meeting of the 1952-53 Tops season.

Among the outstanding events will be a movie clinic at which Dr. Harold Lincoln Thompsen, APSA, will preside as Chairman. "Color in Motion" will be presented by Lynn Fayman. Station KSMB-TV will demonstrate movies for use in television. Dr. Thompson will screen a color picture of his own making. Question and answer clinics will be featured and a number of live models, many with costumes, will be available for shooting.

Birds After Birds

Dick and Ada Bird have been battling the elements up in the North Atlantic. A portion of their report written to their good friend, Harris Tuttle, is printed below. This will give you an idea of the hazards under which movie makers work to bring documentary pictures to our acreens.

"For the past four days we have been working on some very small islands off the Atlantic choreline whereon, in addition to the "Western Birds" there are tens of thousands of Puffins, Murres, Kittiwakes and other sea birds.

"To get to these islands it is necessary to hire fishing boats and fishermen to assist in the landing operation—and this is just what it is because the isles are masses of rock on which it, is difficult to land. One has to trainafer from the larger boat to a deep, no easy task if the water is rough, then row

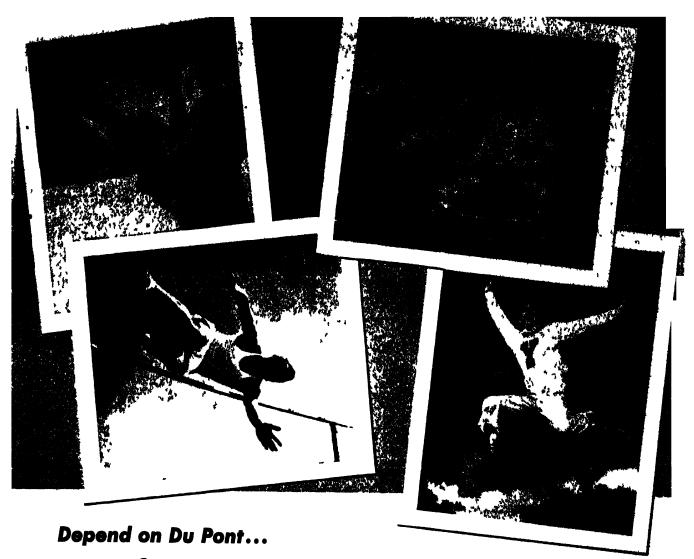

shorewards and between swells, the boatman rows the dory against the rocks and the photographer and his mate, scramble overboard onto the rocks, slipperv with wet kelp, and, if you are lucky, get a fingerhold on the boulders or rocks and bellyflop on them as the dory slips away from under into 30 feet of very chilly Atlantic, Passing ashore the equipment is just one of those things you try not to worry about until you do it, that's the time you worry and how!

"When you are ashore, perched on the barren but slippery rocks, keeping an anxious eye on the camera cases and tripods to anticipate any of them sliding back into the briny, you toss the gaze upwards to the face of a 70 to 80 foot cliff that has to be climbed by clinging to its sheer sides by fingers and toes and every hope the mind can conjure until you crawl gratefully over the ridge near the top where you tie a stout rope and haul the gear up in stages and finally your companion Atlantic Alpiner until everything and everybody is ready to go to work. We consumed an hour each day to climb this cliff, and a half hour each evening to reverse the process.

"The isle is barren of tree growth, not even a bush, considerable green grass in which the puffins dig their burrows and which makes walking an ordeal, falls are frequent with one or both feet plunging down a foot or more into a hole occupied by a nesting bird.

"Weather closes in, sun goes, rain comes and the wind breaks out from the east, white caps appear and the waves best against the cliffs below. You realize the fishermen in their small bests couldn't get to the rock let alone take you off it. You are in for the night and its cold, its sain-

September 1952

for Pictures You'll Never Forget

When the cool breath of autumn bathes the countryside in a garment of vivid color and students flock back to their studies and Saturday afternoon

sports, there are a million pictures in the making... pictures that in the years ahead beckon you to walk down Memory Lane and enjoy again happy, carefree moments. Only photographs can stop time and catch forever that pageant of memories, the tête-à-tête on a campus wall, or the exciting highlight of the big game.

So, carry your camera wherever you and don't miss a single memory. If it's a sheet-film camera, load your holders with Du Pont High Speed Pan Film, snap away, and you'll be sure you get the best pictures possible. Its high speed (ASA: 160 daylight, 125 tungsten) lets you shoot fast, or cut the aperture way down for sharpness and depth of field, without worrying about thin negatives. Even if you mist the exposure by a stop, the wide latitude of High Speed

Pan ensures you a full-bodied negative that shows every tone from deep, rich black to whitest white, with shadows and highlights packed full of detail.

If you do your own darkroom work, print your negatives on Du Pont "Varigam" variable contrast paper . . . the one paper that gives you any of ten contrasts in a single sheet through easy-to-use filters. Or, when you drop your films off at the photo shop, ask for "Varigam" prints. Either way you'll thrill at the better, livelier print quality. E. I. du Pont de Nemours & Co. (Inc.), Photo Products Dept., Wilmington 98, Delaware. In Canada: Consult your photographic dealer or Canadian Industries, Ltd., Montreal.

Du Pont Photographic Products

150 Maniagreary

ing, the wind makes it difficult to even stand upright and there is no shelter. No trees, no wood, not even a twig to build a fire for warmth, the thermos coffee is cold, the sandwiches, those that are left in the haver-sack, are soggy, the grassy spots are honey-combed with puffins burrows and its getting dark. You have a tent but no poles to erect it, you stretch it between two rocks and its roof is two feet from the ground and every moment it may blow away with the breeze, whatta breeze.

"Cold and wet hands pull up tufts of grass in an attempt to fill in the hurrows for your reclinnig body beneath the sopping canvas but the job would require hours to do for any semblance of comfort. With the wet canvas sagging onto your face every few minutes to prevent more than seconds of dozing you spend the long night.

"Up at dawn, crawling out of your soggy shelter into a dripping world and survey the prospect of leaden skies still spilling driving rain and a sullen ocean expending itself against the cliffs nearly a hundred feet below and wonder what the new and uninviting day holds for you other than anxiety and frustration.

"You hear the putter of a small engine and around the headland comes the fishermen, their tiny craft bouncing crazily with the heave and fall of the ocean, they have realized your plight and braved the high winds and waters to haul you to safety and comfort. The ordeal of getting down the cliff again is one we don't want to repeat, every foot of the incline was dripping wet and made more treacherous by the soaked bird excreta with which the rock is plastered. The descent by rope is made with many misgivings, for a slip means broken bones if not worse. The transfer of selves and equipment from rocks to dory is one of those adventures that are in the realms of the impossible until you have had to engage in it. Here a slip means drowning, for sure. The transhipping from dory to fishboat of equipment provides more nervous flutterings until finally we are bouncing and rolling towards the fishing village, a hospitable welcome a hearty and filling breakfast and much, much relief in the mind but, we've got aches and pains in various parts of our anatomies that we didn't, until now, seem to know we had, and bruises on shins, knees, thighs, buttocks, backs, arms, elbows and places where you can't see without looking in the mirror and gawd knows we look like the devil without that aid. Wanna be a wildlife cinematographer?"

PHOTO-JOURNALISM

WILLIAM A. PRICE ______ 78 Elbert St., Ramsey, N. J.

Dear Don:

I am on a field assignment away from home and can't pick up much of anything for the P-J Division column this month.

Long before this I had hoped to write a general "hello" letter to all the PSAers and to P.Jers in particular through the JOURNAL. I want to start the ball rolling towards member participation and invite correspondence from all PSA members with regard to P.J. I would like to run a sort

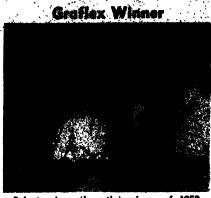

of Question and Answer box, for example.

I feel sure that most amateurs consider Photo-Journalism to be photography for profit, from their individual viewpoints at least, and I myself can think of related questions that I cannot answer without professional advice.

I think P-J can do much towards building up spirit and pride for and among amateur photographers. Suppose that an amateur has an investment of about \$200 in his equipment. If P-J, through the JOURNAL, can give him an idea or furnish information that will enable him to make just one \$5 sale, to a picture service or a neighbor, you can imagine his enthusiaam for P-J.

On the basis of economics \$5 is certainly small potatoes from a \$200 seed, but it isn't the crop that counts, its the pride in the fact that the seed did sprout! The guy will probably plant a lot more expensive seeds for small sprouts but he will love it—just like you and I love our \$5 radishes from our own garden in the Spring.

What can we do to get the questions

Bob Jennings (bow tie) winner of 1952 Graflex-INP Press Fellowship chats with Bob Dixon, Mary Collins and Ken Carson on Sheriff Bob Dixon TV show. Jennings spent a week in New Yerk working with top editors and specialists at INP under terms of the Fellowship.

rolling in for the box so we can get some seeds sprouting?

BILL PRICE

PSA STEREO DIVISION

FRANK E. RICE, APSA

228 N. LaSalle St., Chicago 1

Stereo Slide Instruction Set

L. B. (Red) Dunnigan, in charge of stereo slide circuits, together with a couple of capable assistants, James W. Stower and Rohert L. Howard, have put together a set of 45 slides selected to illustrate various good points in picture making, and otherwise.

In the series are slides showing interesting ways to shoot a subject. The commentary that accompanies the set says in this connection: "But look around you and you will see millions of simple items and scenes... photographing them in a way that will interest an audience is far greater satisfaction than recording a scene that almost photographs itself."

A portion of the series shows shooting straight up (through tree branches) and straight down. You are directed to try pointing the viewer at the same elevation as the camera was pointed. What a difference it makes! Also, in some measure it shows why such slides often look better in the viewer than on the screen.

There are also illustrations of having foreground objects too far from background, shooting with daylight and floods as against flash, and various other points that make for good and not so good pictures.

This instruction set is being circulated just now to those in the slide circuits Nos. 1 and 2. When it has completed the rounds, it will be available for clubs or individuals who wish to be "wised up" on good stereo shooting.

Circuit No. 3 Is About to Start

"Red" Dunnigan reports that he can take on more slide makers in his circuits. Fifteen people make a circuit. Each puts in slides. The set, together with note books, moves from one member to another by express. Every member adds comments about every other member's slides. The whole thing is fun, and most profitable to those who wish to improve their picture making.

Write Red.—His address is 519 S. Vermont, Royal Oak, Michigan.

Stereo Folio Program

The Stereo Club Traveling Folio program is under the direction of E. Krause, 5706 S. Harper, Chicago 37. To get particulars. club officers should write him immediately. In the meantime they should appeal to their members for 2 to 6 good slides from each to represent their club in a traveling show. Folios from other clubs can fill several of your club's empty program dates. Contributing members will receive helpful comments on their slides from each club the folio visits.

Academy of Stereoscopic Arts and Sciences

An organization named as above has lately been formed. Address 6112 Selma Ave., Hollywood 28, California, a "non-profit institution," Paul G. Horner, President.

One of its activities is to "find the 10 greatest stereo pictures in the world for each year and give each an Academy Award known as a STEREOSCAR." It is planned that duplicates will be sold to anyone interested. Now available are the selections for 1950 and 1951.

Dorothy MacLean— Smokies "Photoguide"

One of our newest SD members writes that she would be glad to show us the photogenic spots in and around Gatlinburg, Tennessee. You will find her at Woodcrafters and Carvers in that town. Her only charge is that you bring along a few of your own slides for her to see.

Dorothy has acted as a guide in the Smokies for many years. She originated the word "Photoguide" which is now generally used in the Park Service.

Standardization of Mounts

We are not permitted to anticipate the conclusions that may result in the standardization field. However it is well to know that there may soon be standards set for the space between window centers of mounts. Indications are that 2.45 inches may turn out to be the standard. It might be well for us not to load up too heavily with a stock of those mounts that run considerably less than that, particularly if we are interested in stereo projection.

Helpful Hint Column

George Mack suggests (in connection with taking pictures hand held) -don't put all the weight of the body on both feet. Put it mostly on one, just as a unipod; and you will be able to hold the camera much steadier, but of course, rest the other foot on the ground.

On this general subject also, -THE STEREO VIEW, publication of the Stereo CC of the East Bay (Alameda, Calif.) suggests that there is less likely to be camera movement in snap shooting if the thumb is placed as far forward as possible on the underside of the camera. Otherwise a camera tilt will result when the finger presses the release button of the Realist.

Those Long-Expected Permamounts

We hear the manufacturer of Permamounts has been having his troubles. Several times the mount was about ready to be released when a new problem turned up, -plastics that wouldn't stand the gaff, ineffective adhesives, film curvature and shrinkage, and a few others. We who have seen samples are impressed with the simplicity of the design. and the ease with which a permament mounting job can be done.

Labor-Union-Member Photogs-Help!

Stereo Slide Circuit No. 1 with 90 beautiful Kodachrome slides are resting (and probably deteriorating) on Steamer "Hawaiian Pilot" because of the Maritime strike If anyone who reads this, knows a labor official with photographic interests and a kind heart, will he please do what he can to get that express package off the boat and on its way, or at least into cool stomge.

Eastman Recognizes Stereol

1 new Kodachrome film, K-335, now available, is made especially for stereo cameras of 23x23 mm. pictures. It makes 20 pairs, netail price \$4.75. This includes the cost of a mounting job which is satisfactory for hand viewing.

Until January 1 the film must be sent to Rochester for processing and mounting. After that, the other Eastman laboratories may be equipped to do the job.

Obviously, those who prefer to do their own cutting and mounting will continue to use K-135 since the unit cost will be less.

However, if you have a stock of 135's and wish to have Eastman provide you with the

new mounting service, here is what you do. -Send the rolls to Rochester; place in the coin envelope \$1 to cover the cost of mounting the 20-exposure rolls; \$1.60 for the 36 exposure rolls. Cost of mailing the alides back to you is included in the above.

Making Singles out of Doubles

When we have that single picture from the stereo pair and would like to try projecting it to see whether it is something that we should add to our planar collection. the problem of mounting now has an answer. "Armme Kwik Mounts" are available,- -2 x 2 outside dimensions, made of substantial cardboard, with easy slip-in slots. They come in all the size windows demanded by the various stereo cameras. Series SI-5 is the 5-sprocket size (Realist). Series SI-7 is for the 7-sprocket cut, etc. Sometimes our pix taken with a stereo camera make useful additions to our travelogue collection of two-by-twos. Some have been known to win ribbons in the regular color slide exhibitions. Now it is easy to try them both ways.

Letters to the Editor

Passing of a fighter

Dear Don.
William Howard Gardiner died the other day. The notices and nothing of his photographic prosess, but he was a prominent pictorialist 15 years ago, a great exponent of the lassbender school.

but he was a prominent pictorialist 15 years ago, a great exponent of the lassbender school. In 1936 he was hiving an argument with Frapric about counting salon successes and needled me into accipting the charmanship of the PSA's Four-Frint Ishibiting Committee Our final report came out in 1948. It was primarily responsible for the practice of salons now routine to accipt only four entries from any one contributor, and for the abandonium it of the weighting system used by American Photography in those days for evaluating the different salons with a complicated mathematical formula Gardines supplied the pressure and did most of the writing of the final report. plied the pressure and did most of the writing the final report

He was the most o most contentions and the most DAVID R CHAIG

North Maishheld, Mass.

Mr. Gardiner's obituary in the New York Her-ald Iribune of June 23 does not mention his photographic activities but devotes nearly a column to his fight against the "naval holiday" in 1931. He was then president of the Navy League and was against President Hoover's play to redure the Navy and stop construction of new ships. Apparently, William Howard Gardiner was ever a fighter against what he thought were grievous wrongs.—Ed.

Wants more Johnny Appleseed

Dear Mr Bennett

Dean Mr. Bennett

I missed one article in the July Journal that I
think should be of interest to most everyone, beginner
or advanced. I think it is a good section and should
be kept going if it is at all possible.

I think that ads, good ads, will not hurt the
JOURNAL... But they must be quality advertisements.

FRED J. KERIL,

Pres. CICCA

Rock Island, Ill.

Johnny Appleseed will be back. You may recall that Johnny has been in and out, never a regular monthly feature. Johnny is one of the vital balancing elements we talked about when we spoke of a balanced format. It is our plan to have Johnny cater most often to the new comer, with some advanced material, but mestlementary ideas and techniques to help the new member and the new photographer.

Ads are an essential part of the JOURNAL. They pay the freight and help balance the budget, fou'll never see a high ad-editorial ratio because as more advertisers use our golumns, we will add editorial pages to maintain the balance. You readers can help this situation by following the suggestion at the bottom of each them the advertiser knows his at is being read in the JOURNAL, and welcomes our Advertising Manager when he calls.

We'd like to see more letters to the Editor. Most everyone finds them interesting reading. However, don't inst write beuquets, we won't print them. We'll pr'ut the brickhats, but we'd much rather print the things that interest you.—Ed.

By KONERT J. GOLDWAN 43 Plymouth Rd., Great Neck, L. I., N. Y.

Pre-convention notes include one about Charles Green (Richmond, Calif.) who handles the distribution of Color Division slide sets in the west and who does a large amount of judging-by-mail for clubs. He is quoted thus: "Last year a certain club sent a set of slides for judging, most of them flower slides. I spent a lot of time commenting. Now they've sent more and they claim that their newest flower portraits should be good because they've done everything I told them to do." What a spot to put a judge in! . . . Al Schwartz (Brooklyn. N. Y.) not only won in the snapshot contest preliminaries but the July 20 New York Herald-Tribune reproduced his prize-winning picture on its photography page.

The Canadian Rockies-especially Lake Louise and Banff--re-echo to the sound of the clicking shutters of R. B. Hargreaves (Denver, Col.), Eugenia Buxton (Memphis. Tenn.), Henry Greenhood (Los Angeles, Calif.) and Ruth Nicol (Butte, Mont.) . . . Carl Sanchez (New York, N. Y.) was hospitalized recently for an operation . . . Frank Fuller and his wife, Ruth, (Bloomington, Ill.) have taken to trailer life with Frank washing his prints under the shower . . . Louise Haz (formerly Skokie, Ill.) and Angel de Moya (Havana) shot Kodachrome ın Miamı's Parrot Jungle.

Once again, we remind PSA folks that this column is aimed at helping them to know who is doing what in PSA throughout the country. Please send personal news items such as appear here to Robert J. Goldman, 43 Plymouth Road, Great Neck. New York.

Garden Pix Wanted

Organic Gardening Magazine of Emmaus. Pa., wants pictures of "gardening and allied subjects such as insects and certain animals." This should be a cinch for members of the Nature Division.

Miss Ruth Rodale, Managing Editor does not state whether she can use color. It might be well to write her, telling her the type of material you have available. When offering your list, ask for rates and method of payment.

Membership Directory

Work starts soon on the annual Membership Directory. The last one was printed with the January issue of the PSA Journal. Look at that issue and see if your name is listed properly, that all your Division affiliations are shown, and, if you have honors or are on a committee, that you are properly listed.

If you find an error in your listing or that of a friend, won't you drop a line to "Directory, PSA Headquarters, 2005 Walnut St., Phila. 3, Pa."?

to him that the United States should have a similar organization. He was not able to realize his dream immediately. however. There was the matter of money for postage, etc. Then he managed to interest the Eastman Kodak Company in his plan. The company agreed to finance the organizing of an association of camera clubs to the extent of paying the expenses of starting such a group, but without paying any salaries. The Newark Camera Club gave its moral support and office space. Individual members gave their personal assistance to supplement the prodigious efforts of Bucher himself.

In 1919 the Associated Camera Clubs of America was formed and in the following years Bucher was its secretary, vice president and president. At that time there were fewer than 100 camera clubs in the U. S., so the field was limited.

The set-up of the Associated Camera Clubs of America still was not entirely satisfactory, in that it did not include individual members. In 1932, however, the ACCA was reorganized as the Photographic Society of America, with individual members included. A letterhead of that period contains the following wording: "Photographic Society of America, 683 High Street, Newark, N. J., Louis F. Bucher, chairman; Clare J. Crary, vice chairman; Dr. Max Thorek, FRPS, secretary; R. L. Van Oosting, treasurer. Organization Committee-William A. Alcock, FRPS, Charles K. Archer, W. Hurley Ashby, ARPS, Norton L. Avery, Charles Aylett, FRPS, Hillary G. Bailey, FRPS, F. C. Baker, Charles J. Barkhorn, Julia A. Barnes, Robert A Barrows, Karl A. Baumgaertel, A. H. Beardsley, Clark Blickensderfer, Sigismund Blumann, FRPS, A. Aubrey Bodine, Ralph P. Bonwit, Nicholis Boris, FRPS, Mrs. Ann Brigman, J. E. Brill, Stanley

Brooks, Louis F. Bucher, Frank V. Chambers, FRPS, Frederick H Chant, Byron H. Chatto, Harry G. Cleveland, Clare J. Crary, H. Richardson Cremer, Fred R. Dapprich, William S. Davis, James N. Doolittle, Edwin F Dreher, Louis Fleckenstein, Frank R. Fraprie, FRPS, Frank E. Geisler, ARPS, C. W. Gibbs, Forman Hanna, ARPS, Raymond E. Hanson, Geo. W. Harting, Kent C. Haven, John Helders, FRPS, Harry P. Herron, Mrs. Antoinette B. Hervey, U Stephen Johnson, ARPS, Franklin I Jordan, ARPS, Arthur F. Kales, FRPS, Dr. Kyo Koike, Sophie L. Lauffer, FRPS, James S. Lawshe. Alexander Leventon, ARPS, L. H. Longwell, J. H. Mackay, Ira Wright Martin, Bruce Metcalf, Elia E. McBride, J. Bruce McCracken, Louis R. Murray, Dr. Arthur Nilsen, Robert A. Officer, FRPS, Charles H. Partington, F. Albert Reager, Jane Reece, Oscar C. Reiter, William M. Ritasse, Harrie V. Schieren, ARPS, Thomas O. Sheckell, John W. Sheeres, C. B. Ceifert, Kenneth D. Smith, ARPS, J. O. Sprague P. F. Squier, Dr Max Thorek, FRPS, R. L. Van Oosting, L. E. Wagner, Charles A. Weddigen, Dr. E. P. Wightman, FRPS, Dr. William H. Woglom, ARPS, William L Woodburn, William H. Zerbe.

Progress of the PSA has been steady and satisfactory since that time. The conventions, the magazine, the portfolios and multitude of other activities carried on all testify to the success of the organization and the foresight of its founders.

In the course of the years a number of honors have come to Louis F. Bucher. The one which he prizes most higly is the title of Honorary President of the PSA. No one else has ever received this distinction. In 1949 the Metropolitan Camera Club Council of New York granted him its Award of Achievement. He is an honorary associate member of the Kodak Camera Club of Rochester and has received many other honors.

An outstanding lightweight portable designed specifically for application where small weight and size are required. The complete unit is housed in a narrow functional form-fitting case and provides adequate light output for news and magazine asslanments.

rent or self contained battery.

- Weight: 4 lbs. 12 oz. without battery, 61/2 lbs. with battery.
- Built-in charger.
- Condenser reforming circuit (reforms the electrolytic condensers at the same time the battery is charging).
- Light unit, which weighs only 12 ounces, is small and compact.
- Approximately 65 degree wide angle coverage reflector.
- Sturdy, durable con-struction.

Fun for all

(from page 534)

your interest in one of the most wonderful hobbies in the world, and what's more vou'll never succeed in becoming a good photographer. Mrs. Sam Vogan, the wife of one of our most successful photographers, says that she has always told Sam, "Don't get too elated nor too deflated."

There are many more fields of endeavor in color photography other than those of competing in your club or in salons. The record of a trip or of a vacation is a lot of fun to make, and will give you and your friends a great deal of pleasure and enjoyment, and by no means underestimate it's importance as contributing toward the enjoyment of your hobby. Exploit every phase of your hobby to its utmost. Do not get into the frame of mind where you regard your camera equipment solely as a means for success in exhibiting. No matter how successful you are, remember at all times that it is your hobby, and as such, to get all the fun you can out of it. Don't be a slave to your shutter and feel that every time you press the button you have to get a salon shot. Shoot for fun!

If you can learn to take things in stride and to control your emotions, you will not only gain a tremendous amount of added enjoyment out of photography, but you will also become a better color worker, a better salon exhibitor, a better contestant, and a better person.

ABOUT THE AUTHOR-Robert Goldman is a leading color exhibitor, and h won many medals and ribbons in both Club and International Exhibitions. An investment banker by profession, in which field he is the senior partner of his firm, he devotes much time to the advencement of interest in cole and to helping beginners. He has lectured in Clubs, Hospitals, Convales Homes and Veterans Hospitals, showing travelogues and giving instruction the "in's and Out's" of the Selons. He is a member of the Board of Direct the "in's and untre" of the Subsection and its memorial of the Rey York Color Slide Club, an Associate Member of the Chicago Consent Chib in whose annual members' contest last January he won two of ten medals awarded, and recently founded the Great Nock Color Camera (irded, and recently founded the is serving as its first Printdent.

The most ambitious undertaking of the National Lecture Program commences Sept 9th when Maurice H. Louis, APSA, of New York, speaks before the Telephone C C of Phila

This will be the first lecture on a five months trip which will bring Louis before over forty clubs from the Atlantic to the Parific to the Gulf of Mexico. It is expected that he will travel 14,000 miles in his laguar which is emblazoned with the scals of PSA and NLP.

The aims of this extensive tour are to stimulate interest and greater proficiency in portraiture. The difficult planning of this trip was in the capable hands of Barbara Green, FPSA, chairman of NLP

The itinerary of Louis' tour follows, al though there are some open dates on the final leg of the trip through the South

Dates marked (T) are tentative at this writing and should be confirmed by contacting the club listed if you plan to attend

Sept 9, Telephone CC of Phila, Pa; Sept. 12. Scranton CC; Sept. 16 (T), Hagerstown Photo Soc., Md.; Sept. 18, Ohio Valley CC, Wheeling, W Va.; Sept. 22, Youngstown Photo. Soc. Ohio; Sept. 23, Camera Guild of Cleveland O; Sept.

25, Seven Hills Photographers, Cincinnati; Sept. 27, Champion Shutterbug Club, Ham ilton, O., Sept. 29, Fine Arts CC, Evans ville, Ind , Sept 30, YMCA CC Club, Ow ensboro, Ky, Oct. 2, 3, 4 & 5, Open; Sept 8, (T), River Park Deaf Photo Club, Chicaro, Oct 10, La Crosse CC, Wis, Oct 13, Sloux City CC., Iowa; Oct 16, Fremont ((, Neb; Oct. 18, Newton CC, Kan; Oct. 2). Denver Council of Camera Clubs, Colo., Nov. 6, Borse Photo Soc. Nov 10 (T), Great Falls CC, Mont.; Nov. 12 (T), Kalis pell CC, Mont; Nov. 17 (T), Portland Photo Soc, Ore, Nov. 19 (T), Klamath Falls, Ore; Nov 21 (T), Sierra CC, Sacia mento, Cal; Nov 24 (T), Northern Cal (ouncil of Camera Clubs, Richmond

Later bookings for which no dates have been assigned include El Paso Photo Soc., Convair CC, Fort Worth, Baytown CC; Port Arthur CC, all in Texas, and Central Florida CC, St. Petersburg, Fla, Chattanooga Chapter PSA, Tenn, and Florence CC, Florence, S C

Some dates are still open, even in the carly stages of the tour and clubs may ar range bookings by wiring or writing Mrs. Barbara Green, FPSA, 30 Willow St., Brooklyn 2, N. Y.

Wu Lecture Dates Open

Response to the announcement of the short NLP lecture tour by Francis Wu of Hong Kong has been so enthusiastic that he has now been persuaded to extend his stay in the United States so that his tour can include a number of additional cities. Mr. Wu is being brought to this country through the joint efforts of PSA and PAA (the professional association) and has been featured on the convention programs of both organizations.

Widely acclaimed as the foremost photographer in the Orient, his prints have excited admiration and intense interest wherever they have been shown. They are

readily distinguished by an individual style which Mi. Wu modestly ascribes to the influence of traditional Chinese art. In his lecture, "Pictorial Photography from the Chinese Viewpoint", Mr. Wu will explain how he selects pictorial subject matter and how he secures his amazing results Many of his illustrations have been expressly prepared for this purpose.

The NLP tour will begin early in September, following the PAA Convention in Chicago and his expanded itinerary will take him through the East, returning to the Pacific Coast through the Southwest. The \$75\$ fee includes transportation. Local sponsors are expected also to provide hotel accommodations.

Although most of the tour has already

1932 Tops In Photography To Open In San Diego Sept. 13

The 1952-53 traveling exhibition "Tops in Photography" will open the season with a two-day stand in San Diego, Calif. on Sapt. 13 and 14. Milwaukee, Wis. will have the show on Oct. 15.

"Tops" consists of the best in black and white prints, color slides and movies, with subject matter spensored by the Pictorial, Nature, Movie and Technical Divisions of PSA. Mrs. Blanche Adams, President of the Phoenix CC, which sponsored a successful showing of Tops last year has said, "Tops gives us an opportunity to see the work of people we only read about. It gives us a criterion to judge our own work so that we may improve."

Paul Wolf, APSA was chairman of the '51-52 Tops committee and Les Mahoney is chairman for '52 53. R. B. (Jack) Horner of Chicago is in charge of assembling pictorial color slides, Dr. Harold L. Thompson of Los Angeles is contributing his color movie "Invitation to Hawaii", and new nature color slides are being selected.

In some cities where Tops has been featured, a whole day-long program is built around the presentation, with field trips, demonstrations and clinics in the daylight hours, the projection sessions in the evening The program is thrown open to the public and in some cases, dealers have sponsored contests in conjunction with the event. Many new PSA members are signed up at these events.

There is still time for other cities to book lops for showings during the coming season and groups, clubs or councils desiring dates should write at once to Les Mahoney, Chairman, Tops in Photography, P. O. Box 1828, Phoenix, Ariz.

Photo Job Open

Photogrammetric Engineers are wanted by the Eglin Air Force Base in Florida. The civil service appointments are in Grade GS 9, are indefinite in duration and pay \$5060. The work involves research, testing, design and operation of photogrammetric instrumentation, methods and assessment of results.

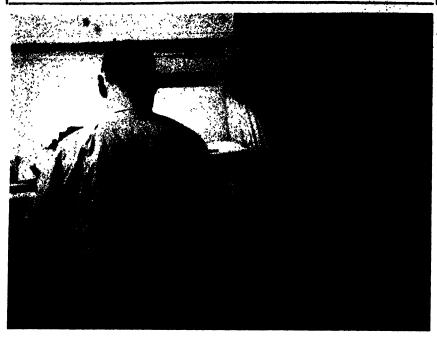

A minimum of four years of college or practical experience plus two years of experience is required. If interested, get Civil Service Form 57 from your post office and file it with Director of Civilian Personnel, Eglin AFB, Florida.

Royal Patronage Continued

The Royal Photographic Society of Great Britain has announced that Queen Elizabeth II has conferred her patronage on the Roy I, thus continuing the interest of her predecessors in the Society. Queen Victoria conferred the "Royal" title in 1894 and her consort, Prince Albert took a special interest in the affairs of RPS.

been booked, other clubs designing to take advantage of this opportunity should immediately wire Mrs. Barbara Green, 30 Willow St. Brooklyn, N. Y., for dates which may still be epen.

PICTURE OF THE MONTH, JUNE

This is not the Picture of the Month for June! It is, instead, a picture of all the prints of that month in process at the able hands of Chairman John Hogan. Since John needed the pictures to be mounted in the display books for the Convention where you have seen them, he couldn't spare them while we made cuts. So here you get an unusual view of John at work. (Frankly we think he sent it along to show how much work he does! Maybe he wants a raise and thinks this will soften us up.)

Remarks

If you have mislaid your copies of the PSA Journal In which the Rules were printed, you may get mimpo-graphed copies upon application to: John R. Hogan, Chairman, 1528 Walnut Street,

Philadelphia 2, Pa.

Good and Bad Publicity

Good publicity is that which gets printed. Bad publicity is that which goes in the wastebasket. How do you get good publicity?

First, you provide the editor with the facts. Facts are who, what, when, where and why. Just answer those five questions with simple statements, then tack on a clarifying paragraph that ties them together. The Editor knows how to take those facts and make a story. If you can write a story in news style, you save the Editor a little work, but if it is all opinion and sugar coating, it makes him no work except that of reaching for the waste basket.

Second, you give it to him in time for the item to be timely. For the general camera mags that means at least three months ahead, better four. (They come out almost a month early). For the JOURNAL it means two months ahead. (We come out the month of dating but need your story early if it is to give you any results). For your daily newspaper you take the same facts, add more facts of local interest and give it to him about a week ahead of time. You give him additional facts the day before the event.

Your daily paper is mechanically equipped to process news in a few hours. The magazines require a whole month to edit, set type, read proofs, lay out and assemble pages, read proof, check pages, read proof and print, bind and mail.

OFFICIAL NOTICES

Report of the 1952 Nominating Committee

J. Philip Wahlman, APSA, Chairman of the PSA Nominating Committee has announced the following slates, which will be voted upon by the membership of the Society during November. Elections are being held for a one-year term as Director for the Canadian Zone (to be elected by Canadian members only) and for all District Representatives for a two-year term-

CANADIAN DIRECTOR

RAYMOND CARON, APSA, ARPS, 620 Cathcart, Suite 315, Montreal, P.Q., Canada. By profession a lawyer specializing on corporation affairs. Is a past President of Montreal Camera Club, and still very active in programming and social affairs with this and other

Clube in the locality. Has acted as Salon Judge in numerous "Internationals" both in Cenada and the United Septes. Has a distinguished Salon record, sharing with his wife Ploseom, for many years, the wife Plessom, for many years, the thering water mis was transported and the first Montreal International Salon.

REE FROST, APSA, ARPS. Past President of Toronto Camera Club, Director of the Toronto School of Photographic Art, Ryerson Institute of Technology, Fellow of the Royal Society of Arts, London, Eng-land, Chairman of Toronto's International Salon for land, Casarman or Autonome and Managaria, Canadian counterpart of the U.S. periodical, "Holiday"), Editor of "Focus". Toronto C. C. monthly magazine, Member of Can-Amer Portfolio No. 2. Formerly Provincial Representative PSA for Ontario. Canadian Columnist PSA Journal. By profession, news commentator Radio Station CFRB, Toronto.

Camera \$99.50 Flash \$10.00 Case \$7.50

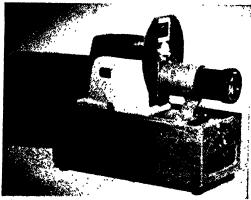

America's most distinguished 35mm camera argus c-four

No other camera combines such amazing ease of operation with this exclusive array of precision features!

Ultra-fast f:2.8 Cintar coated lens—a truly great lens—to give you beautifully defined pictures in color and black-and-white—even infailing light!

Combined rangefinder and viewfinder—to give you an in-focus "picture-window" view—even if you wear glasses!

Superaccurate shutter...1/10 to 1/200 second—perfect complement to the critically sharp lens. Built-in flash synchronizer. See the versatile Argus C4 at your dealer's!

© 1982 Argus Cameras, Inc., Ann Arbor, Mich. All prices include Federal Excise Tax where applicable, and are subject to change without notice.

America's Favorite way to look at color slides—Argus 200 Watt blower-cooled projector. See your highly-prized color slides in true, brilliant color. The "right-side-up" rotary slide carrier prevents upside-down pictures. Silent power blower protects valuable slides. It's the perfect companion for any 35 mm camera? An unmatched value at \$49.50.

argus

-world's largest manufacturer of 35mm cameras

No matter what your uses for color are, you'll find Kodak Ektachrome Film a practical, satisfying film to use.

Shoot your pictures, and in a day, or sooner, you'll be viewing your transparencies. Dependable processing service is now available from commercial processors conveniently located throughout the country...or, if you wish, you can process it yourself. And, because of Ektachrome's fidelity, soft gradation, long scale, and color brilliance, you have no special lighting problems. Just follow your usual lighting techniques.

Ektachrome comes in economical six-exposure roll films 120 and 620—and in sheets—both Type B* and Daylight Type. List price, \$1.79. Order Kodak Ektachrome Film from your Kodak dealer.

Price is subject to change without notice and includes Federal Tax.

* NEW—Kodak Ektachrome 120 and 620 Roll Film, Type B, is now available. It is equivalent in all photographic respects to the corresponding sheet film, balanced for exposure with 3200 K lamps. With clear flash lamps, it offers speed and quality advantages over the Daylight Type used with blue flash lamps.

For subtle textures and fine detail choose Ansco Supreme Film

NO MATTER how delicate the varying textures of the subject you photograph, or how fine the recorded detail, you can be sure of big enlargements without distracting grain from negatives made on Ansco Supreme Film.

This modern-type panchromatic emulsion combines extremely fine grain with high speed (exposure indices of 50 daylight, 32 tungsten) and excellent resolving power.

These qualities make Ansco Supreme the logical "all-purpose" choice for hand cameras. No matter what type of subject comes along, 99 times out of a 100 it's a "natural" for this fine film. Ansco Supreme is available in populas roll film and film pack sizes, and in 35mm magazines. For best results develop Supreme in new Finex-L Developer now on sale at all dealers.

The President Reports . . .

At the Convention you knew that practically everyone you met was a PSA'er, and because of that you knew they were interesting, good friends. Regardless of who they are and where you meet them, PSA'ers are just as good friends and just worth knowing—but the trick is to identify them.

Why not wear our PSA insignia everywhere?

Our emblem is a proud one. It marks the wearer as a member of the largest group of individuals in the photographic world and as one who has a keen interest not only in the making of better pictures but also in helping others to get more enjoyment from their photography by their heing able to make the kind of pictures they prefer.

As the Regional Activity grows, the PSA emblem will more and more identify you as one of the leaders of your community, as one of the valued core of those who use photography to create a new community spirit and to support new and valuable community efforts. As PSA advances in meeting the obligations imposed by its very name, PSA membership becomes important and more valuable, and wearing the emblem becomes more important accordingly.

We are all proud of PSA, and we are deeply interested in its progress and its service to our country and to photography. Let's wear the emblem regularly both to tell the world of our pride and to make sure that the other PSA'ers we meet recognize us and add to that invaluable aspect of PSA membership, the personal, friendly side of photography.

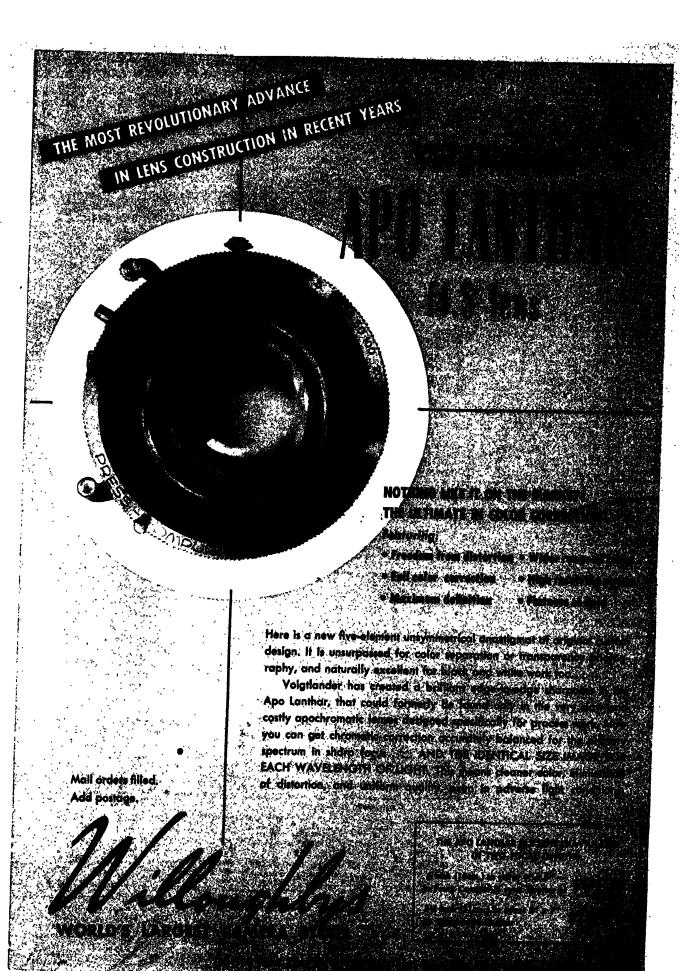

Those members who attended the Convention are now back at home again and many have met with their club associates and other photographic groups. It would be most interesting to know how many took with them enough of the enthusiasm that filled the convention to make the effort to carry the PSA message to their friends.

How many have offered PSA membership to the photographers who could not be in New York or have spoken to their own club or another about what PSA has to offer? In the near future, THE JOURNAL will have more material for those who want to tell some of that story, and the new membership cards will also help in that direction. But nothing from Headquarters or from Spee Wright—nothing official therefore comparatively impersonal—can possibly equal in effectiveness your own telling what PSA means to you and what it holds for any interested photographer.

No published material can help very much, either, in proving to new or old members how much more fun and satisfaction there is in PSA membership when one is active in it. Our publications can tell him, but he scarcely believes it until you tell him of your own experiences along that line. Of course, it is difficult unless you yourself throw the extra thrill that comes from using the services and being an active part of PSA—yourself!

There are big opportunities for added fun an excitement in the expansion of PSA work in many directions. Don't miss out.

NEW AIDS FOR BETTER PICTURE-MAKING

BY JACOB DESCHIN, FPSA_

A new favorite in the 35mm miniature camera field appears to have loomed on the horizon with the introduction recently of the improved new Canon IV Japanese-manufactured miniature. The camera is being marketed in the United States by Balfour, Guthrie & Co., Ltd., 67 Wall Street, through distributors. Already, the magazine boys are huzzing the news—or opinion—around that the new Canon is the new champ. Whether or not remains to be seen, as the phrase goes. But at the moment it looks good, very good, in fact.

Equipped with the 50mm f/1.8 Serenar lens, the camera sells for \$295. There are auxiliary lenses, three of which are wide angle, three telephoto. The first are the 28mm f/3.5, 35mm f/3.2 and f/2.8; the second, 85mm f/2, 100m f/4 and 135mm f/4. The camera has a combined coupled rangefinder and optical viewfinder. The rangefinder is of the coincidence type and has two degrees of image magnification for critical focusing in poor light and for modifying the viewfinder to give the fields for the 100mm and 135mm lenses. Other features of the Canon IV include a film winding knob which incorporates an exposure counter and a countersunk flush dial for ASA ratings; a focal-plane Leica-type shutter with speeds to 1/1000th second, plus time and bulb; a new-type take-up spool with spring-loaded extension grip; a film rewind knob, normally flush with the camera top but is withdrawn for use, and internal flash synchronization. Altogether, a compact, goodlooking job. Now, fellas, let's look at some pictures.

And here comes a camera made to grow up with photographically. Namely, the Bolsey Model A, made by the Bolsey Corporation of America, the very same folk who made photographic history a while back by producing a 35mm miniature camera with coupled rangefinder at \$55 (It's gone up since, but then so has everything else; in any event, at the time it made big news). The new camera fits in the palm of the hand, weighs less than 12 ounces and is designed for the beginner with no photographic knowledge but willing to learn. The Bolsey A costs \$39.75 equipped with the 44m f/4.5 coated lens.

One quick setting of a red line index readies the camera for the exposure; a warning flag that appears in the viewfinder signals the photographer to wind the film for the next shot; a new type of viewfinder shows the subject in normal size and distance from the camera.

For those in the know or for the time when the novice will want to know more, the camera has "slow" and "fast" markings on the shutter face, "dull" and "bright" indicators for lens openings, as well as conventional scales. The camera is 3x4-3/16x 2% inches, has built in flash synchronization for all flash lamps, double exposure preventipa, and a new type of take-up spool with a large slot and film-gripping hooks to assure even travel of the film. Because of the

new Bolsey's compact design, it is possible to get two to four more pictures from a casette loading than the indicated number.

A prewar favorite for the darkroom boys has made its reappearance. With some changes made, all for the better, of course, Ansco recently put on the market the long-heralded, and by many eagerly awaited, new Finex-L fine-grain developer and replenisher. It replaces the prewar original (warning: don't use the old-type replenisher with the new developer. Ansco claims these advantages for Finex-L: extremely fine grain results with no loss of film speed; consistent results; long working life—60 rolls of 120 rollfilm per quart of developer; easy handling. Finex-L costs \$1.25 for the quart size; the replenisher 90 cents per pint.

Another new camera on the American market is the German-made Baldix, which takes 12 2½x2½ pictures on 120 film and costs \$48.50 equipped with a coated 75mm f/3.5 lens, flash-synchronized Prontor-S shutter, automatic film stop and other features. The importer is Kling Photo Supply Corp., 235 Fourth Ave., New York City.

Three Dimension Company, 4555 W. Addison Street, Chicago 31, announces a new slide projector, the TDC Show Pak "300". Equipped with 300-watt blower cooling, 5-inch coated anastigmat lens, lift-off metal case and built-in slide file, the projector costs \$54.50.

Two new handbooks have been added by Eastman Kodak to its growing list of manuals for photographers in various fields. They are the Kodak Industrial Handbook, and the Kodak Professional Handbook, \$4 each. Both follow the familiar format of other Kodak handbooks and are bound in a multi-ring binder. The industrial handbook contains four data books on various phases of the field; the professional handbook deals with camera techniques, negative making, use, maintenance and repair of equipment, and a new set of twenty sample prints made on Kodak papers.

For the 8x10ers, Calumet Manufacturing Company has a new 8x10 metal view camera selling at \$245. It incorporates horizontal and vertical swings for both front and rear at center and off-center positions; a sliding back carriage for centering an accessory 5x7 reducing back; bellows draw of 31 inches; completely reversible back (360 degrees), and a new type of locking knobs. The Calumet has a new suspension of camera body and lens standard, is finished in pearl gray hammertone with red bellows, and measures when folded 16% inches high, 13% inches wide, 7 inches deep.

Weary of turning pages to get exposure data? Then consider the Kelly Cine Calculator, a sturdy dial, this cinematic alide rule is printed on both aides for quick computation of such information as depth of field, hyper-focal distance, field of view, filter factors, film speed per second, etc., etc. It comes in two models, 35mm model, which is also useful for 35mm miniature cameras, and the 3-16mm model. Price is \$3.95.

NOW...

LESS CORROSIVE TO STAINLESS STEEL TANKS!

SHELF LIFE INCREASED FROM 10 TO 24 MONTHS!

for more reasons than ever before.

DON'T FIX 'EM - JIFFIX 'EM

In laboratory tests, improved JIFFIX produced only nominal corrosion on type 302 stainless steel. In this respect it was superior to the older JIFFIX formulation and to ordinary acid-hardening hypo. Corrosion on type 316 stainless steel was negligible.

Also the improved JIFFIX now has a 140% longer shelf life. Yet, it is just as fast, effective and economical as ever. No weighing or mixing of chemicals... just dilute with water and use. JIFFIX is 3 to 4 times faster than hypo on pan and orthofilm... twice as fast on process film. It fixes from 1½ to 2 times more film per gallon than ordinary fixer.

JIFFIX is even more economical when used for fixing films for engraving and lithography. It gives excellent results diluted up to 11 times!

Hardener is bottled separately for your convenience in "tailoring" film hardness.

STEREO

DON BENNETT

One of the nicest things about a convention is the opportunity it gives you to renew old friendships and make new ones. Our PSA meet last month was especially nice for yours truly in that respect. Mail friends like Frank Rice and his lovely wife, Charlie Rosher, Stella Jenks, Herb MacDonough and a host of others became real people instead of a postmark.

Old friends like Nick Haz, Jack Norling, Gene Wightman, Fen Small, Ade Ter Louw and Harris Tuttle were seen again. But the biggest kick of all came from seeing and talking again with Herb McKay, "Mr. Stereo", who came to the convention to receive the David White Award from the hands of Frank Rice.

Herb and I have been friends for 25 years. We haven't see much of each other for the past ten. After the convention Herb came out to Stamford for a too-short visit and we had a chance to catch up on personal news and talk stereo. Herb first introduced me to stereo about 20 years ago, but it didn't catch on with me because of the high price of imported stereo equipment and the nuisance of registration and mounting of 6x6 stereo shots. I got hooked when David White introduced the simplified system we have today.

We covered a wide range of subjects in stereo, but the one thing that impressed me was that McKay, with all his experience in the involved forms of the past, looks on the future of stereo as being in simplified cameras, mounting, viewing and projection. He feels that it can be as big as planar photography for the snapshooter. Since photography didn't grow big until the snapshooter was taken care of, that portends a good future for stereo.

We discussed mounting. He pointed out that even though mounting for projection must be exact, the possible shift between the two images can't exceed one millimeter from the standard spacing. That is, any amount of fiddling with the stereo pair for normal work, can be very, very little.

He told me what he thinks to be the main fault with projection. I mentioned this several months back. It is not the mounting, it is the operator. Just because knobs are provided for image alignment, it doesn't mean you must use them. Herb cited a test he made. He frequently projects stereo for friends. He sets up and adjusts the projector before the show. Then he runs his alides without touching the adjustments. This time he warned them the show was going to be different, the kind they might experience from an amateur.

He made adjustment for every alide and before ten had been run off, one of the audience was sick. At 30 he had to give up, no audience was left!

Someone will now ask, "What type mount did he use?" Just a cheap paper mount he buys by the thousand and slips the films into the slots. Incidentally, the slides that made the audience sick were the same slides they had seen many times without trouble, and they saw them again many times with-

out trouble. The only difference was the "stereo itch" (same genus as "mixer's itch" in radio) of fiddling with the adjustment knobs.

I asked him about the paper mounts. What brand? No brand. Since the dies are deteriorating and don't cut good mounts anymore he is switching from them to the new Permamounts.

So I have a suggestion to all stereo projector manufacturers. Put a slip clutch on the interocular adjustment knobs so they won't work unless you put a quarter in the slot, said quarter to be collected by the machine as soon as you let go of the knob. If it costs two bits to fiddle, there will be less fiddling and more comfortable and satisfied audiences.

P.S. These remarks about adjustment and accuracy don't apply to professional and movie presentation where extreme care and manipulation are required. The professional is not plagued with stereo itch, he is a showman and knows enough to make his adjustments beforehand.

There's a bit of the pixie in McKay. I asked him to autograph my copy of his book, "Three Dimensional Photography". So what does he write?

"Dear Don—
Here it is so be proud of your pupil,

Herbert C. McKay"

So many people whom he has helped have claimed to be his teacher that he thought another should get on that bandwagon. Since the reverse of the inscription is true, you readers can have two free shots apiece with a .45 anytime I claim to have taught McKay anything.

Mr. Stereo (as first recipient of the D. W. Award he's entitled to that appelation!) also thinks you shouldn't waste stereo shots on subjects without depth. Fifty or sixty years ago, when parlor stereo was quite the

rage, the outstanding photographers picked their scenes carefully to give that feeling of seeing into the distance. They always had a close-in object from which you could feel your way into the picture . . . or a tunnel effect, like the deck of a boat, a wall or a gorge. Since we can record three dimensions in stereo, let's always do it. Let's not pick a subject that could be as well made in one-eyed shooting.

I promised several months ago not to write this column unless I had something to say. Out of my short visit with Mr. Stereo I found plenty to talk about for some time to come. I've given you a couple of ideas here. More will be forthcoming.

"Bwana Devil", Arch Obeler's stereo movie will be road-showed soon. Those who have seen the previews (and we don't mean advertising trailers) have sworn off planar movies! Wait until you see your first stereo movie kiss... WOW! And for those who want to know what camera was used... two Mitchells in a special stereo blimp with adjustable interocular and other needed adjustments. (Mitchell cameras start at about \$5000, how many do you want?)

Start thinking now about next year's David White Award. Frank Rice will welcome your nominations and the Stereo Division Honors Committee will weigh your suggestions in picking the 1953 recipient.

Have you seen any of the trick stereo slides that are floating around? Some of them are real clever. Practically every one is an old movie trick and made the same way. But it's lots harder, bub, lots.

Met a few stereo pros at the Convention. The field grows apace.

Take it easy

WITH STEREO-REALIST

Every REALIST picture is an exact reproduction of the original scene

JUNIOR'S curly locks are going to fall — and Dad's all set to record the event in full, natural color and true-to-life depth with his Stereo-REALIST camera. The proud parents will recall this event over and over through the years as they view the pictures in their REALIST viewer.

REALIST slides exactly duplicate what you see with your eyes. Children are so real you feel as if you could reach out and cuddle them . . . you can almost smell the fragrance of flowers . . . scenic views are glorious in all their natural splendor.

The REALIST camera is easy to operate, too. It's a precision product of American craftsmanshif, designed to give maximum photographic enjoyment with minimum effort. People who never before operated a camera get outstanding pictures on their very first roll of film.

If you haven't discovered the excitement of REALIST pictures, your camera dealer will be glad to show some to you. See how you too can "take it easy" with Stereo-REALIST. DAVID WHITE COMPANY, 387 W. Court Street, Milwaukee 12, Wisconsin

THE CAMERA THAT SEES THE SAME AS YOU

Cameras, Viewers, Projectors, and Accessories are products

CHECK THESE Realist FEATURES

- World's most complete system of stereo photography
- Microscopically matched, coated 35 mm f:3.5 lenses perfect alignment assured
- ☑ Direct vision, centered viewfinder — completely eliminates parallax
- Synchronized for flash
- Hinged lens cover with hyperfocal table.
- Electronically time-tested shutters for perfect color photography
- Wide base, split image range finder for more accurate focusing
- Easy to operate fewer picture failures
- Economical—29 stores pairs from 36 exposure roll, 16 from 20 exposure roll
- Full year warrantee against mechanical failure

October 1952

When writing advertisers, please mention PSA Journal

(July 1, 1961 - June 30, 1932)

With the thought in mind that the only justification for the existence of the Pictorial Division is service to its members this year's Annual Report of the Division has been prepared to reflect statistics on the approximate number of individuals that have participated in Pictorial Division activities and services.

While the figures included are approximate it should be remembered that this report is, of necessity, being prepared in advance of the end of the fiscal year, June 30th, and therefore the ectual figures for the entire 1951-1952 fiscal year will exceed the approximate figures used in this report. International Portfolios are presently composed of sixteen portfolios, comprised of forty circuits and serve 375 American members. Portfolios are in existence with: England, Australia, Aca Zcaland, Belgium, Brazil, Canada, Dominican Republic, Chiua, Costa Rica, Cuba, France, India, Mexico, The Netherlands, South Africa and Sweden. Duting the past year some structural defects in the International Portfolios became apparent and appropriate steps are now under way to correct the situation.

AMERICAN PORTFOLIOS—The American Portfolios are, at the moment, composed of 74 circles i.e., Pictorial 60, Ministure 4, Nature 2, Special 1, Star Exhibitor 4, Control Process 1, Photo-Journalism 2, with propocts for two new circles to be formed prior to June 20th.

There has been a very heartening upturn in the enrollment. Many who had dropped out are returning to the fold, some joining more than one circle. Approximately 1000 members are participating in the American Portfolios, each circle averaging 14 members to a circle.

PORTRAITY PORTPOLIO: -Membership in the Portrait Portfolios during the year increased from 181 members to 217 active participants. Two new portfolios, numbers 15 and 16, were activated and are made up of advanced portraitists only.

advanced pottraitists only.

Four issues of Portrait Pointers were issued during
the year and from correspondence received are to be
considered successful.

INTERNATIONAL EXHIBITE-The following is a tabulation of the scheduling of the various International Exhibits, by exhibit, up to and including May 20, 1952:

Francis Wu #1acheduled by 39 clubs. Hong Kongacheduled by 34 clubs.

Australian Showscheduled	by	56	clube.
Swedish Showscheduled			
South Africanscheduled	by	33	elube.
Francis Wu #2scheduled	by	35	clubs.
Australian #2 scheduled			
Holland #1scheduled			
England *R.P.Sscheduled			
Mexicanscheduled			

Australian 3A, 3B (99 prints) Sent to Eastman House. Arrangements being made to exhibit in New York City.

Postrolian Cluss—At the end of the 1950-51 fiscal vear there was a total of 8 Postfolian clubs with a membership of 71. At the end of this fiscal year, 1951-52 the total number of Portfolian Clubs has grown to 16 with a membership of 144. Portfolian Clubs are now located at Lincoln, Nebraska: Rochester, Minn.; Austin, Minn.; Sioux City, Iowa; Great Falls, Montana; Jersey City, N. J.; Tiov, Ohio; Bartleaville, Oklahoma; Montgometv, Ala.; Berkley, Calif.; Bend, Orc.; Bonne Terre, Mo.; Louisville, Ky.; St. Petersburg; Fla.; Orlando, Fia., and Shreveport, La. Prospects for additional Portfolian Clubs are very bright and by the time this report appears in print there should be several new Portfolian Clubs added to the roster.

INTERNATIONAL CIUS PRINT COMPRITTION—At the time this report was being made up there was still one more competition to be held, however, the Pictorial Digest carries a complete report following each competition therefore anything included here would be mere reportion.

CAMERA Cata Paint Judging Servick Following a serious break down in this service to camera clubs which necessitated the appointing of a new Director on November 24th this PD service to the camera clubs has shown a steady growth and since that time some thirty clubs have used this service. Plans are now being made to expand the staff of judges and also to expand the use of tape recorders for judging purposes. Many fine, and unsolicited comments have been received from clubs availing themselves of this PD service and it is expected that it will prove to become quite popular during the coming fiscal year.

PERSONALIZED PAINT ANALYSIS SERVICE This service has been well received by the membership with more than 500 priots having been individually analyzed and a personal letter written to each member submitting prints. Prints have been received

from practically every state in the Union as well as the following places outside of the U. S.; Vancouver, B. C.; Hawaii; Turkey; Puerto Rico; Allahabad; India; Mexico; Bankok; Slam; Dehru Dun; Cristobol; Managua; Tanganyika etc., etc. Many letters of approciation have been received for this service and are in the Director's files.

Portrolio or Portrolios—Due to a change in the Directorship of this activity it is impossible to give a complete report, however, since January 25, 1952 the Portfolio of Portfolios have been viewed by better than 600 people. No doubt the upswing in the American Portfolios can be attributed to the reactivation of the Portfolio,

SALON PRACTICES -- The mechanics of salon istration was strengthened by the listing of all open exhibitions in the monthly salon calendar in the Journal starting in September. This brought about a more complete salon calendar, better service to prospective exhibitors and better relations with salons not previously listed. The second improvement took in December with the establishment Pictorial Division Salon Board, composed of R. L. Mahon, Jack Wright and C. A. Yarrington. The creation of this Board brought sectional representation and more manpower to the job of stimulating and measuring adherence to the Minimum Requirements and the broadest possible outlook on various phases of salon administration. The third step, in February, myelved a revision of the Minimum Requirements, their duplication and distribution to salon committees the world over in March and April, followed by publication in the Journal in June. The fourth step, started well over a year ago, is nearing its end as the finishing touches are being given to a forty page handbook on suggested salon practices and procedures (for committees, directors, chairmen etc) culminating in a final statement, "the PSA Recommendations".

It is anticipated that this handbook will be printed

It is anticipated that this handbook will be printed in booklet form in September 1982 and will replace the 1915 booklet "How to Organize and Conduct a Photographic Salon", now out of print.

It is evident that there will be a substantial intrease in the number of PSA approved salons for the 1951-52 exhibition year. On March 31, 1952 31 exhibitions had already been approved as compared with 54 for the year ending June 30, 1951 and but 16 for the year ending June 30, 1950. It therefore appears probable that about 70 exhibitions (roughly 70%) of the world total will be certified as PSA approved this year, with a probable increase again for the 1952-53 exhibition year. PRW PALS This Pictorial Division service is gain-

PEN PALS This Pictorial Division service is gaining in popularity as evidence by over 300 inquiries having been received since September 1, 1951.

Awam of Menr- During the fiscal year 88 members have received Star Exhibitor Awards. The four degrees of awards were augmented during the year with a Five-Star classification to encourage those who had reached the Four-Star classification to continue their exhibition activity. Award of Merit recipients have been listed each month in the Pictorial Direct.

Who's Who in Pictorial Photocraphy.—This service actually consists of two objectives i.e., compiling a mailing list of individual exhibitors for a mailing list for salons and to record and list the acceptances of all-gaslon entrants. A mailing list, acquired from the Camera Club Committee during November and December 1951, was carefully checked against a complete collection of salon catalogues of the 1950-51 exhibition year and all names which showed no activity in this period were eliminated. To the remaining names on the list were added all new names appearing in catalogues of the 1951-52 season. At present this comprehensive list contains approximately 1200 names of exhibitors residing in Canada and the United States. A separate list of foreign names has been compiled listing some 500 names of those who are exhibiting outside of their own country.

RECORDED LECTURES PROGRAM—This Pictorial Division service expanded so repidly during the year just ended that much effort was required to keep up with the demand. Distribution centers, three in the U.S. and one in Canada, with fully stocked libraries have now been established and should prove adequate to meet the demands. Difficulties with slide production were encountered, however, steps to break this bottlemech have been taken and there is every expectation that production will be able to keep

TREASURER'S REPORT-FISCAL YEAR 1951-52

pace with demand by early fall. A number of new programs are, at the moment, in various stages of production and these should become available for distribution at a rate of better than one every two months beginning this fall. One of the important undertakings of the Recorded Lectures Program has been the recording and collecting of "Audible Autographs", short talks by important photographic con temporaries or personalities recorded on tape. These 'Audible Autographs" are to be preserved and when sufficient number are accumulated they will be transcribed on to discs and be made available to the general membership as well as placing a set in the archives of the Sourcey for preservation for posterity

Another undertaking successfully accomplished by the Recorded Lectures Program was sending tape recorded greetings by Norris Harkness, Gene thase, Rav Miss and Phil Maples to the lat South Island (New Zealand) Photographic Convention, held April 21 30, 1952

Number Six lecture has already been duped into Spanish for distribution to Mexico and other Latin American countries and escutually it is hoped to have all Receided Lectures available in Spanish

To date bookings of Recorded Lectures Programs have exceeded 150, with an average attendance per booking of 45, it is conservatively estimated that Recorded Lectures Programs have been seen by

approximately 5,500 people
Pumicariove During the past year the Pictorial Division rublished two Supplements to the Journal, the tober 1951 and May 1952 While the Pretorial Digest was rublished each month in the Journal. both the Princial Direct and the PD Supplements were edited entirely by PD members for the benefit of the members

In con luding this report I would be ungrateful indeed if I did not pinse to pay tribute to my fellow Off is and Directors for their untiring efforts to provide in it and bett i retricties and services to the manhors of the Pritorial Division and to thank them for the excellent cooperation they have so therrulls aren me

> Respectfully submitted W I CHASE APSA Churmin,

Report of P.S.A. **Honors Committee**

The cashe members of the Honors Committee for 1952 were to follows

Kul & Baumgartel APSA San Francisco, California Lou Gibson, FPSA Rochester New York Vincent H Hunter, APSA Hollywood, California C J Marinus, AP54 Detroit Michigan Hairy & Shigeta, FPSA Chicago Illinois Chester W Wheeler Hon PSA, APSA Rochester, New York Jack Wright, FPSA San Jose, California Herman H Duezr, FPSA, Chauma. Binghamton, New York

The work of the committee had to be finished in two months less time than usual in view of the earlier date for the National Convention. I am pleased

to report that this work was completed on schedule.

The new procedure proposed by the 1951 Committee, with Mr McFarlane as chalman, worked very satisfactorily The preparation by PSA Headquarters of the 8 copies of all applications lightened the burden of the chairman considerably. The Divisional Honors Recommendations Committees were also a great help in making certain that the applications were filed properly and in getting additional information on candidates where needed. The Divisional Honors Recommendations Committees also deserve credit for focusing attention on well deserving candidates who, due to extreme modesty or other reasons, may have been overlooked in the past. Honors applications can and have been submitted directly, without going

127 applications were carefully reviewed by the committee and through 8 letter ballots and 1 meeting

More than 1,000 new members joined the Color Division during the year ended June 30, 1963, making this Division the fastest growing unit in the Society. To take care of this 60 percent increase in membership, all major services have been expanded. New silications have been set up in all competitions, additional circuits have been added, and additional personnel enlisted to give prompt, efficient service in nore than 30 sperific projects.

New features undertaken include study groups and circuits for 21/4" x 21/4" slide workers, the Club Slide ert exchange directory, the International Slide Circuit and a ster rating system. In order to take proper rare of all services, a budget of \$2600 has been set up for the coming year. This is approximately equal to the meome from dues In order to keep a sound fin incial status, the Division strives to maintain s reserve equal to \$1.00 per member. Since this has been created, all current meome now goes back to members in services. No charge or entry fee of any kind is levied for participation by members of the Division in the many services offered

Color Print Services

Services in providing color print sets circuits, and competitions here expanded in keeping with the in creased interest in color photography The "Color Print set for Clubs' has set a new high record for requests A second set may be required to take one of the demand. The 'Color Print Set for Individuals' of the demand. Inc. Color artist Set for antisymmetrial has been requested 82 times. To meet this demand, a second set has been assembled and placed in circular tion The Color Print Circuit completed its circles 6 and 7 during the current year and will soon start circle No 8 with four new members Members have submitted for this circuit, prints made by four different col r processes The quality of work has shown noticeable improvement, and the members have given credit to this oppularity to compare their work with other members of the circuits. In the three Color Print Competitions" held during the year, an average of 12 pirileipants entered 37 prints for

Technical Services

Direct assistince in matters involving color proc cases and materials was furnished in many instances. meluding a forcion request from Montesideo, Crusuny Three of these requests involved the duplication of color transparences including steree, and the re-mainder involved the analysis for visious exposure and processing errors as indicated by the samples submitted for quality appraisal, and it was not estary to obtain the advice of qualified people in the photo mechanical field since the original copy was not available for direct comperison with the samples In addition several articles were prepared and published for the benefit of all PSA members

Color Slide Competition for Individuals

One hundred and seventy six color workers enrolled in this project with an average of 98 entering slides in each of the five contests. This represents an increase of about 30 percent in this activity over the previous year One change planned for the coming year is to divide the competition into two classes having all cutrants with two or more slides accepted in International Exhibitions in Class A, and all others in Class B. It is felt that this reclassification will encourage more beginners to take part in these con-

of the committee on July 21st in Rochester, 86 applications received the necessary votes for the awards requested.

2 Honorary Fellowships and 2 Honorary Memberships have been recommended for Roseil soproval.

24 FPSA Honors and 58 APSA Honors were awarded by the committee and presented at the annual banquet on August 16th in New York City.

It should be mentioned that with very few exceptions the honors applications followed the prescribed rules in regard to the information to be supplied. The uniform style of presentation simplified the prob-lem of evaluating the records of the candidates.

H. H. Dusan

National Club Slide Competition

This series of centests set a new raders with 198 clube entered from 35 states, District of Gelambie, Hausti, Canal Zone, Canada, and Japun. It was seessary to divide the compatition into three divisions instead of the previous two. A total of 2468 slides were submitted to the five contests, and each alide received a written appraisal. A total of 74 award ribbons, 357 honorable mention ribbons, 15 medals, and 18 plaques were asseed to clubs and individual

Slide Study Groups

these groups continue to expand with 125 partielpants, compared to 93 the previous year. One hundred and hve are enrolled in the 2 x 2 slide groups, and 20 in the two 21 x 214 slide groups organized during the year It is expected that two additional obsults will be added during the coming year to take care of the expanding demand.

Club Slide Circuits

bixty six clubs participated in this activity during the year, compared to 61 last year, 43 m 1980, 85 in 1919, and 29 in 1918. Four clubs entered slides for all three deadlines, 14 clubs entered two sets, and the remainder entered one set, making it possible to send nine circuits on the road compared to seven last year. It is estimated that over 4,500 camera club men have benefitted from this service.

International Circuits and Exchanges

The Netherland American Slide Circuit was organ ized and placed in successful operation during the current year This is the first International Slide Circust to be formulated by the Color Division. More are anticipated soon.

In the International Slide Set Exchange, color alide collections from England and Japan are circulating in the United States The set from Japan was prepared by the Circle of Confusion Camera Club of the American Occupation Forces in Tokyo; it consists of 72 dides with tupe recorded comments. The bookis these foreum sets total 68 clubs in 25 States. Canada. Hawan, and the District of Columbia. In exchange for these acts, the Color Division supplies each of the foreign clubs with sets of American slides for scheduling among interested groups abroad.

Instruction Slide Sets

bets were requested and delivered to 66 members residing in 30 States, Canade, and the Canal Zone. I wo new acts have been organized to provide for the greatly increased demand anticipated during 1952-53.

Exhibition Slide Sets

Interest in Exhibition Slide Sets Increased substantially. Special effort was made to revise old sets, add new ones, and increase the number in order to meet the demand These acts were requested by 172 clubs and 63 individuals, and shown approximatly 500 times to an estimated total of 10,000 interested photog-raphers. This represents 100 percent increase in viewings over the previous year A special Canadian circuit for these sets has been operating with complete bets have been sent to three clubs or individuals in Saskatchewan, three in British Columbia. and three in Ontario

Slide Circuits for Individuals

Fifty seven individuals took part in these circuits, with approximately six rounds completed in 1931-32.

A 2½" to 2½" to 2½" as alide circuit was organized in April with seven members, and will soon complete its first round. Interest in this activity is marreaung rapidly, it is expected that two carcules will start during this summer or early fall, which is in advance of previous years.

Master Mailing List

The division's Master Melling liet of over 2000 slide exhibitors was supplied to and used by all 29 major slide exhibitions held during the year. A larger number of the exhibitions this year received "special recognition" for outstanding management and operation compared with last year.

ANNUAL REPORTS-Color Division

Who's Who in Color

The 1951-1952 list includes 32 exhibitions with the names of 732 stide makers with two or more acceptances. It is estimated that more than 2800 color slide photographers take a direct interest in the recognized alide exhibitions. This compares with approximately 1300 seven years ago, an increase of over 100 percent.

Color Division Bulletin

The Color Division Bulistin was published bimonthly with the total mailings increasing from 1788 for the first to 2829 for the last mailing in the 1951-52 year. Entry forms, service fulders and other essential in-formation are mailed with this Bulletin to all CD members.

Honors Proposal Committee

The Division's Honors Proposal Committee assisted 20 applicants for Honors, 18 of which were sent to the PSA Honors Committee.

Hospital Project

The Color Division gathered, processed and distributed \$1,000 Color alides during the year ending June 30, 1952 to nearly 50 U. S. and U. N. Army, Navy and Veterans Hospitals in the United States, Kerea and Japan. While this is an impressive total, it is still short of what is needed to allow still further expansion of this project. For the coming year, at least 75,000 slides can be put to good use.

Stereo Activities Transferred

Anticipating the need for competitions and circuits in Stereo photography, the Color Division early in 1951 established a series of three Stereo competitions, and a Stereo Circuit. An average of 15 person participated in the contests during 1951-52, and the Circuit activity increased in popularity so that a second circuit was formulated. In November 1951, the Stereo Division was created by the Board of Directors SA, and all projects developed in this field by the Color Division were transferred to the new Division before the close of the 1951-52 year.

Club Color Slide Set Directory

Published for the first time in the Color Supplement of the September 1951 PSA Journel, the Club Color Slide Set Directory has proven to be one of the most popular services to clubs inaugurated in recent years. Seventeen sets were listed as available on loan from clube all over the country as well as from a club in the Canal Zone. This Directory will again be published in 1952 but will appear in the September-October issue of the CD Bulletin. A considerable increase in the number of sets listed is indicated.

Library Services

The Library facilities of the Division are being expanded in keeping with the growth of color interests.

The 14 books now in the Library are in constant circulation, and more copies will be required to take care of the demand.

Chicago Pictorial Slide Set

This set was scheduled and used by eight clubs, some of which are now preparing similar sets relating to their home cities.

Tops in Photography

The secretary of the Division was responsible for collecting the color section of the 1932 Tops in Pho-tography Show in New York. Color slides gathered from the leading alide photographers in the United States for this exhibition, proved an outstanding feature of the show.:

Two Supplements Issued

Two popular 25-page Collec Division Supplements to the PSA Journal owner propered and published as in-tructive factures of the September 1961, and the March 1963 Issues. Numerous feature articles, and a nearbly Color Division section in the Journal were other editorial efforts. The Chairman was ably assisted in this work by a Sational Editorial Committee of four members. mbers, gia four .me

Star Rating Plan

A star-rating plan for color photographers, based upon number of different slides accepted and total acceptances in recognized exhibition, was set up on a tentative basis. If the interest in this project is widespread, the project will be established as a permanent undertaking of the Division.

Miscellaneous Assistance

Hundreds of letters from members throughout the world have been received and answered fully by the officers and members of the Division's National Committee during the year. This is an extremely important phase of the Division's service, and special pride is taken in the fact that all correspondence is given prompt and serious attention.

Detroit Convention

The Color Division assumed a major role in the Detroit Convention, with attendance at its luncheon and programs setting a new high record.

Cooperation Unlimited

Numerous other services could be enumerated but space will not permit. Generous thanks are due to any untiring workers both members of the Division's National Committee and other volunteers. Among these special mention is due the following: Frank B. Bayless, Karl A. Baumgeertel APSA, George W. Blaha APSA, Mildred Blaha, Merle S. Ewell APSA, Vella L. Finne. Charles H. Green, Donald B. Grim, Harry Haimes APSA, R. B. Horner, H. J. Johnson FPSA, Charles A. Kinsley APSA, A. C. Klein APSA, Blanche Kolarik APSA, H. G. Mitchell, Charles B. McKee APSA, John Moddejonge APSA, Dennis W. Thurston, and Paul J. Wolf APSA.

GROSCE F. JOHNSON, APSA Chairman

Helen Manzer First 4-Star Color Winner

Helen C. Manzer, APSA of New York City is the first exhibitor to win the coveted 4-Star Award of Merit of the PSA Color Division. To win this rating a minimum of 64 different slides must achieve 320 acceptances. First to win the 3-Star Award is A. W. Papke of Chicago. Details of the award and the requirements may be obtained by writing Lloyd Robinson, Jr., Director, 1616 West 109th St., Los Angeles 47, Calif.

Fresno Town Meeting Set for Oct. 25-26

With a roster of names from among PSA's greatest, and a list of activities that will keep anyone busy, the PSA Town Meeting of Photography starts rolling at Fresno State College, Fresno, Calif. at 9 A.M. on October 25 and continues through the next

At the Grand Opening on Saturday the crowd will be there for one of two attractions, to meet celebrated photographers . . or to help pick "Miss PSA" from a bevy of California's most beautiful models.

There will be an exhibit of 200 superb pictures by famous salon exhibitors, print, color and movie clinics, a series of lectures and lots of opportunity to make pictures. Listed as clinic leaders and lecturers are: Harvey Brown, APSA, FRPS; Fred Archer, Hon. FPSA, FRPS; Grant Duggins, FPSA; Boris Dobro, FPSA, ARPS; Dr. Francis Wu, Hon. PSA, FPSA; FRPS; Shirley Hall, FPSA, FRPS; Floyd Evans, APSA; M. M. Deaderick, APSA, ARPS; Merle Ewell, APSA; Dr. Harold Lincoln Thompson, APSA, ARPS; Karl Baumgaertel, APSA; Adrian Ter Louw, FPSA; George Allan Young, APSA, and Paul Wolf, APSA.

Everyone is welcome whether they belong to PSA or not, and if you plan to attend, bring your camera and plenty of film. There will be picture opportunities indoors and out, with lighting arrangements by masters of the art. For those who want something extra there will be field trips to the Roma Winery and the Sun Maid raisin plant, Freemo parks and Zoo.

Additional information may be obtained from Nell Longtin, Fresno Camera Club. 1650 Chance Ave., Freeno, Calif.

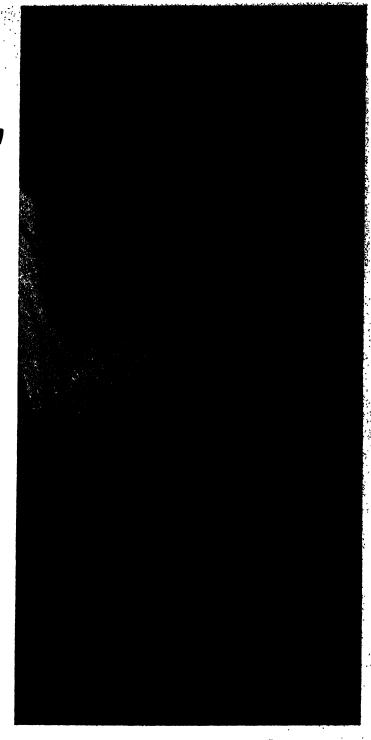

Halloween's a "natural" for picture-taking fun

catch the "candid" details with

G-E Photoflash

Everyone has fun on Halloween. Catch it and keep it all with your camera. Be sure you have plenty of film, plenty of General Electric Photoflash lamps, well ahead of time. Halloween...like Christmas... is a natural for good pictures. And with G-E Photoflash you'll catch all the fun—anytime, anywhere. For G-E Photoflash provides a portable punch of light that "stops" action, captures full detail. It gives you better snapshots of happy family scenes and of friends—pictures you'll treasure for years.

So, buy some G-E Photoflash today! And keep plenty handy for pictures of *every* occasion.

BONUS: Your Halloween shots can win valuable prizes! Ask your photo dealer about the big G-E Halloween Flash Picture Contest.

Remember, there's a G-E lamp for every photographic purpose

Tops In Photography

Would your camera club or your friends in your city like to see the finest assembly of photographic work ever put together?

PSA is proud of it, and wants you to have it, enjoy it, profit by viewing it, and the work of years and years of experienced top workers in photography! TOPS consists of the following:

- 1. Top quality black and white pictorials, 16"x20" mounted prints by star exhibitors. Yes, over 30 of these.
- 2. Top black and white Vature prints of sparkling quality. Over 20 beautiful 16"x20" mounted prints, again by the star workers.
- 3. Technical section prints in black and white, 15 or 20 of the most wonderful subject matter. Palomar astronomical photos, medical studies, color analysis, scientific photography of rare subject matter not ordinarily shown.
- 4. A 1200 foot Kodachrome in sound by Harold Lincoln Thompson, M. D., of Los Angeles. A beautiful movie of a wonderful spot entitled, "Invitation to Hawaii"
- 5. Slides, slides, "Tops" in salon quality by the PSA's best known names and workers, such as Baumgaertel, Beilbenberg, Manzer and fifty others, all top workers and beautifully composed and exposed slides as only the top salon workers do it.
- 6. Nature in color! Yes, a set of 50-35MM slides of nature subjects captured in full color on film by the top workers in this field.

Sounds good, huh!

- A. How to get it?
- B. How much does it cost?
- C. When can we have it?

Well, here are the answers:

- (a) Write Les Mahoney, Chairman, Tops in Photography, P. O. Box 1828, Phoenix, Arizona.
- (b) It will cost you nothing, it is free. All you have to do is pay the rail express from the city where it is being exhibited to your city. You exhibit it and ship it on to the next exhibitor or club or city at their expense.
- (c) You can have it as soon as the club or city nearest you close their show. It is well to allow four to six weeks time for handling, exhibiting and re-shipping.

How do we put it on?

One camera club talked it over at their meetings several times and decided they would simply "pass the hat" so to speak, at regular meetings and let each member donate whatever he or she wished towards defraying the shipping expense and gallery rental. if any.

Two members more plentifully endowed with wordly goods came forward and said "we will underwrite any deficit(if any)." There wasn't a deficit. Nobody missed the 25 or 50¢ donated. Not a bad stunt!

But who bosses the job? This club appointed a chairman whose task it was to arrange shipping dates, exhibition dates, exhibition places, and have tickets printed, and the club members pitched in and each took on a small task.

Arrangements can be made with a local gallery, a museum, or your public school for hanging space for the prints. It may be necessary to pay a small rental fee. Preferably the location should have a modest auditorium for showing the slides and movie. A photo dealer can help out with projectors.

You ask about tickets, what for?

Some clubs prefer to have a club night or showing then a public showing. Also it is discouraging to be invited to a showing and then not have a scat. We suggest printing inexpensive dated and numbered tickets corresponding with the number of seats in the small auditorium, then each ticket holder is assured of a comfortable seat.

OK, where is the best place to have it?

We think nature prints and slides go over best in a Botanical garden gallery, because they are somewhat specialized in their subject matter. Why not have the prints hung in the gallery and if a small auditorium is available, project the slides at the same place, or in the same room.

Technical prints are of wide public interest, because they deal with scientific subjects. The Science department of a college or school, if convenient to the public is a good location. A downtown bank window or brokers office is a good spot and you will be surprised at the interest it will create.

Write Les Mahoney, P. O. Box 1828, Phoenix, Arisona, for details and suggestions for staging your own TOPS.

Sam Vogan, APSA (Toronto) was seen in a New York camera store during the convention shopping for a wide-angle lens for his Contax; guess he wants to get more rain into his camera . . . Paul Gibbs (New York City), when asked by someone in which room a certain convention luncheon was to be held, answered, "The smell of food will be your guide" . . . Bernard Gorson (Flushing, N.Y.) entered pre-convention work six weeks before the convention and performed one of the most important jobs as a replacement.

In The Foreign Press

Each month we see many foreign photographic publications. When we find something of general interest we plan to note it in this column. Some of the publications listed are available in libraries, some through photo storm, all by direct subscription. We will gladly furnish the address and subscription rates, when known, of any magazine from which we quote. Frite your PSA Editor. Language in which publication is printed is indicated by suitable abbreviation following city of publication.

Photo-Munich, (Ger.) June 1952 Underwater photography with electronic flash. with exposure tables, suggestions for construction of equipment, pictures of it in use and three color pictures made underwater. The same issue has a brief tip for getting 13 pictures on the Automatic Rolleiflex. Naturwissenschaftliche Rundschau - Stuttgart, (Ger.) April, 1952. Discusses a new Swiss method for using electronic flash in documentary, nature and photomicrography. A series of nature pictures, including several photomicrographs are shown, along with a diagram showing how to attach electronic flash to a microscope.

Ferrania-Milan, (It.) June, 1952. Describes several ways of producing pendulum patterns. Several examples are shown as well as diagrams for both simple and compound pendulums. One diagram shows the use of a fixed light where the camera is being made to oscillate by securing it to a gimbalmounted pendulum.

Photography-London (Eng.) June, 1952. Ifor Thomas, ARCA quotes Fred Cook, one of his students, as follows: "I believe that I can only succeed in expressing my thoughts, feelings and ideas adequately by mastering the technical aspect of photography to such an extent that it becomes 'automatic' ".

Photo-Technik und-Wirtschaft-Berlin (Ger. w/Eng. summary). August, 1952. A list of 248 lenses made by 23 manufacturers in Western Germany and West Berlin. Shows focal length, aperture, plate covered, number of elements, schematic formula, price in local currency and applications. Same issue has article on control of lens radii in production with suggestions for increasing production without loss of quality by better methods and improved tools.

O. S. L.

Some Highlights of the 1952 PSA Convention

By Floyd A. Lewis

With more than 1400 registrants, the first vacation-time annual convention of the Photographic Society of America may be set down as a highly successful one. Held August 12-16, at the Hotel New Yorker in New York City, the convention brought together those who make their livelihood taking pictures, hobbyists for whom photography provides a needed means of expression, and those employed by manufacturers of equipment and supplies who are continually seeking new ways to improve the medium. They came from all parts of the United States and Canada and from points as far afield as Mexico, Brazil, and Hong

Good attendance was only one indication of the success of the convention. The spontaneous enthusiasm exhibited at the various convention functions was an unmistakable indication of the growing interest in photography. As PSA President Norris Harkness of New York so ably put it, "The enthusiasm of the convention leaders caught on so rapidly that the leaders had to hustle to keep up with the crowd." Many out-oftown registrants were amazed to find in New York a warmth that they never knew xisted in the big city.

Breadth of the convention program was a clear indication of the tremendous expansion of photography in recent years. All of the PSA divisions representing the various branches of the art, held sessions. Divisional lines, however, which in some earlier years have been much in evidence, were almost indistinguishable at the 1952 convention. This integration of interests means a stronger Society-one that can render greater service to photography.

Like the meeting program, the exhibition held in connection with the convention clearly reflected the growing interest in, and advancement of, photography. Some 540 black-and-white prints were hung which included 351 pictorials. The remainder were divided almost evenly among photo-journalism, nature, and technical prints, the last including a group on astronomical subjects. Color prints numbered 28, almost double the number exhibited at the 1951 convention, which bespeaks the growing interest in this branch of the art.

The color-slides exhibited were divided into three groups and included 409 pictorials, 316 on nature subjects, and 100 stereo. All were shown by projection to "full houses." Fourteen films were shown in the motion picture exhibition. In a larger sense, of course, the whole convention was one grand photographic exhibition, for there was scarcely a speaker who did not illustrate his talk with slides or movies.

Stereo Active

One of the "firsts" at the 1952 convention was the highly successful program arranged by the newest PSA division stereo. Although known for many years, stereo photography had to await the develop-ment of miniature color film to bring it to a

Fingers Talk

A highlight of Maurice H. Louis' national lecture tour came when he spoke to the River Park Deaf Photography Club of Chicago at their Field House, 5100 N. Francisco Ave., on October second.

During the three hour program which consists of a lecture, demonstration of equipment, analysis of members' prints, and a question and answer period, its meaning was conveyed to the audience by sign language. Truly, the educational aspects of photography are far reaching.

Although Louis will be on tour until March first, he may be reached by mail along his route. Address him care of Mrs. Barbara Green, 30 Willow, St., Brooklyn, N. Y., or to his permanent address: 333 West 56 St., New York.

He may be contacted at the following places where he expects to make stopovers: Oct. 1 to 8; c/o J. R. Tombaugh, 127 N. Catherine St., La Grange, Ill., Oct. 22 to

27, Bel-Air Lodge, Colorado Springs, Colo., and Nov. 25 to Dec. 25: c/o Alan L. Harris, 1111 Alta Loma Road, Los Angeles 46, Cal.

popular level. Most of the stereo features were aimed at stimulating further interest in this branch of the art. They included two illustrated travel talks by Paul J. Wolfe of Butler, Pa., with three dimensional projection of Western and Mexican scenes to overflow audiences. A talk "Simplified Stereo," by Kenneth S. Tydings, aimed at beginners, also drew a large and intensely interested audience.

Military Photography

How photography is aiding the U. S. Armed Forces in the development of today's super weapons was the subject of several presentations. Brig. Gen, Brooke Allen of the U. S. Air Force Photographic and Charting Service, Philadelphia, told how the Air Force is using motion pictures and showed two color films: "Operation Greenhouse," covering the building of the atomic bomb; and "Highway in the Sky," showing production of aeronautical charts.

Information obtained with cameras having effective focal lengths up to 80 feet has led to improved rocket flight control techniques, Henry M. Cobb of Aberdeen Proving Grounds told his audience. The equipment consists essentially of astronomical types of telescopes mounted on gun turrets which carry motion picture cameras that make 60 frames a second, as compared with 24 frames in ordinary sound movies. Additional equipment gives records of the intensity and kind of light emitted by the rockets. Accurate observations of the rocket's behavior may be obtained from distances as great as 20 miles, Mr. Cobb said.

Cameras nicknamed "Gooney Bird" and "Bright Eyes" used by the Navy in its rocket research at China Lake, California, were described by R. W. Herman. The Gooney Bird consists of two astronomical telescopes, of 48 and 24 inch focal length, respectively, mounted aide by side on a 50 caliber machine gun mount, both feeding into movie cameras. Its purpose is to make pictures of a distant missile.

you can add sound to any 16mm movie!

Another Bell & Howell engineering first... magnetic sound on double-perforated film ... makes sound movies cost even less!

If you have been considering the purchase of the famous Filmosound 202 ... remember, you can now buy it adapted to use double-perforated film. If you already own a Filmosound 202, have it adapted for double-perforated film for just \$35.00 . . . through your authorized Bell & Howell dealer.

IMPORTANT: With this new development in sound movie making, any 16mm movie camera now takes sound film. This includes magazine-loading film used in such cameras as the exciting, new Bell & Howell 200 ...or roll film used in the famous 70-DL and other spool-loading 16mm cameras.

Ask your authorized Bell & Howell dealer about making your own sound movies on any 16mm movie film. Or get complete information by mailing this coupon today!

Here is a pace-setting new development in low-cost sound movies! Now ... you can record and play back magnetic sound on double-perforated 16mm film ... with the new Bell & Howell Filmosound 202 recording projector!

No longer are you limited to single-perforated film for sound movies. SOUNDSTRIPE, the magnetic oxide sound track available through Bell & Howell laboratories, can now be applied to any 16mm movie film.

Therefore, if you already have 16mm silent movies which you would like to make into sound movies, all you need do is have this magnetic sound track added to the original films. No need to have them copied on single-perforated film, a tremendous savings in the cost of making your own sound movies.

Please and me, without cost or obligation, complete information on the making of low-cost sound movies. I am interested in their use for:

Burke & James, Inc.

Color Talks

The photographer using color film has just as much artistic freedom as a painter with his brush, Ralph M. Evans of Eastman Kodak Co., in Rochester, N. Y., nationally known color expert, told an audience of over a thousand at one of the evening sessions of the convention. Speaking on "Creative Directions in Color Photography," he said that subject matter is limited only by the imagination and the capacity for feeling of the photographer.

Denying the charge made by artists that color photography is merely a mechanical device for recording a natural scene, Mr. Evans said: "The only thing mechanical about a photograph lies in the fact that 'pressing the button' makes permanent the image which the photographer has already created."

Strike out boldly and don't hold back your emotions when approaching a photographic subject, Boris Dobro of Santa Barbara, California, advised his audience. Speaking of "Techniques of Creative Photography," he discussed at some length the importance of timing and other variables in picture making. He also described such advanced darkroom techniques as solarization and showed the various effects they will produce.

Nature enthusiasts heard some strong advice from Dr. Roman Vishniac of Woods Hole, Massachusetts, noted nature photographer whose work has recently appeared in Life Magazine. He told his listeners that if they want true-to-life nature pictures, they must take nature as and where they find it and not immobilize their subjects or move them to other surroundings where conditions may be more favorable for photography. If the photographer will remain in an area long enough to become part of the natural surroundings, nature subjects become less shy and are easier to photograph, he said. Since short exposures are necessary to stop movement, he uses flash in order that the lens aperture may be small enough to give the desired depth of field.

The convention included several how-todo-it sessions using live models. Two popular events of this type featured babies and dogs. In the first, Josef A. Schneider professional photographer of children, showed how he "outsmarts baby." In the second, the husband-and-wife team, Mr. and Mrs. Arthur S. Mawhinney, showed how they handle canine subjects.

Print and slide criticism sessions both proved to be popular features, although organized quite differently. Called "Trial by Jury," the print session was conducted like a court room with a prosecuting "attorney," and "attorney" for the defense, judges, and jury. A print's good points would be argued by the defense and its bad points by the prosecution. The jury rendered its decision on the basis of the "evidence," and the judge, of course, was the major domo. The slide clinic was organized or more orthodox lines. A panel of judges commented individually on the slides as they were projected.

Technical Talks

Highlighting the technical accaions of the convention were two symposis, one on the uses of photography in medicine and biology and the other on photography in engineering and science. These and other technical sessions held throughout the convention emphasized the increasing importance of photography in business, industry and research.

In the medical symposium attention was concentrated on the numerous ways in which general and specialized photographic techniques aid in advancing, documenting, and teaching medicine and biology. Some specific techniques of wide interest were included to point up the technical skills that are useful in these fields, but the important role of routine, conventional photographic methods to the practicing doctor and scientist was emphasized.

"Four aspects of photography-the power to analyze, the power to record, the power to communicate and the power to dramatize or sell-can be invaluable to the industrial engineer," G. H. Gustat of Rochester said in introducing the symposium on photography in science and industry. He pointed out that industrial photography does not require any special skills and can be done with relatively inexpensive equipment.

Closing event of the convention was the annual honors banquet. Two new Honorary Fellows and two new Honorary Members of the Society were named. The several medals and awards given annually by PSA were presented. In addition, a new award, the David White Company Award, was presented for the first time by the Society's new Stereo Division. The naming of 24 PSA members as Fellows and 58 as Associates completed the honors list.

Feature address at the banquet was delivered by Captain Ronald MacKay. RN (retired) recent naval adviser to the United Kingdom delegation to the United Nations. He discussed the various ways in which photography is helping the U. N. in its struggle to maintain world peace.

The books reviewed here may be ordered from your regular bookseller, your photo store or direct from the publishers.

Feininger on Photography, Andreas Feininger, 409 pp, freely illustrated, \$6.95, Crown Publishers, 419 Fourth Ave., New York 16, N. Y.

You have seen "Feininger" before, at \$15 the copy. This is the same book originally published by Ziff Davis but at a more modest price.

Feininger is practically a one-man school. We like particularly the little boxes of condensed information scattered through the book that sum up a chapter with wise and concise facts for those who don't want to wade in deep.

Part I covers the technique, and Part II the art of making a photograph. Smoothly submerged in the art section are many details of technique that give art a chance to shine through.

Feininger hasn't hesitated to use the camera to teach photography. Clever visualizations like the one showing the effect of focal length and image size, wherein the subject; the three lenses and the resultant pictures are all included in one shot, or

the free mixture of picture and drawing, when a drawing shows more clearly the cause of a trouble. We liked, too, the generous ten pages devoted to mistakes . . . pictured.

There may be some important phase of making pictures left out of this book, but it would take a more careful study than ours to find it! There is something here for everyone, even for the color photographer, though there is nothing special on color, just basic facts.—db.

The Street of the Huguenots, text by Kenneth E. Hasbrouck, photographs by Erma R. DeWitt. 41 pp, 17 illus., privately printed, from Mrs. V. B. DeWitt, New Paltz, N. Y.

If you want to see how forceful well-taken and presented pictures, accompanied by well-chosen and written words can be, get a copy of this little book. The Street of the Huguenots is in New Paltz. The pictures show their homes as they look today, and their church, and their cemetery. The words tell simply the story of the founding of New Paltz in 1678 and the origin and changes in some of the homes.

You can exhaust the pictures and the words in half an hour, but you can't do it without being inspired to do the same thing for your town, and hope you can do it as well.- db.

Maybe you'll like..

Johnny Appleseed Is Back— With a NEW and BIGGER Job!

Many of you will remember Johnny Appleseed as a popular authority on all sorts of things dealing with photography. Those of you who attended the 1951 convention in Detroit will centainly remember the Johnny Appleseed program.

For the last year or so, Johnny has been in retirement, girding up his loins for a bigger and better job. Now Johnny's back, and we'd like to tell you all about his new job. Those of you who are newcomers to PSA will be particularly interested, we're sure.

Service for New Members

We've realized, for a long time, that many new members, particularly those in small towns where intimate fellowship with other PSAers is not possible, find it difficult to become oriented in PSA. These newer members, and those older members who haven't yet learned the ropes, are Johnny's particular concern.

Do you have a suggestion for the betterment of PSA, or the improvement of any of its services? Tell Johnny Appleseed!

Do you want technical information of any phase of photography? Ask Johnny!

Do you have a gripe of any kind? Johnny wants to know about it! (And will act on it!)

Do you want a job in PSA? Johnny will see to it that you get the kind of job you want, in the field in which you're most interested.

Do you have any questions about PSA and its functions, or about your role in PSA activities? Johnny has the answers for you.

How Johnny Works

Actually, of course, there is no person at Headquarters named Johnny Appleseed. Johnny is just the symbol of a service, as Uncle Sam is the symbol of our United States, and as Santa Claus is the symbol of Christmas. Uncle Sam is all of us, and Johnny is all of us,

If you have a suggestion, and send it to Johnny, your suggestion will be passed on immediately to that person in PSA who is best cualified to pass on the merit of your suggestion, and to act on it.

If you ask for information, technical or otherwise, it will be given to a person who can give you the information you want and give it to you promptly . . . and authoritatively.

If you have a gripe, the proper person will be advised, and if the gripe is warranted, and something can be done about it, something will be done about it.

If you want a job in PSA—and those who put the most into PSA get the most out of it!—your request will be passed on to the very person who is looking for someone with your qualifications, and who will be tickled pink to have you volunteer for service to the Society.

If you have any kind of question to ask,

it will be channeled to the person who can give you the right answer.

One Name; One Address

Some of the old-timers know the name of the person to whom they should write. But most of the Society's members will find it mighty handy to just "Ask Johnny!" or "Tell Johnny"—addressing him always at PSA headquarters, 2005 Walnut Street, Philadelphia 3, Pa.

Headquarters know what the old-timers know: the name and the address of the PSAer who is best qualified to act on any question or suggestion. Your letter, addressed to Johnny Appleased, FPSA, at Headquarters, will always reach the right person.

Each letter addressed to Johnny will be acknowledged by post eard, and will give the name of the person to whom the letter has been referred. A carbon copy of that person's reply will be sent Johnny, so that Johnny may be sure his assistant has taken care of the matter satisfactorily. And if the subject is one of popular interest, Johnny may put it in the Journal.

There's just one rule to remember—and that's a VERY important one: if your letter to Johnny deals with more than one subject, each subject MUST be discussed on a separate sheet of paper. The reason should be obvious. If you bring up three different matters, Johnny may have to refer you to three different assistants, and your letter, in such an event, must be exactly divisible by three!

Write each problem as a complete letter, with your name and address on each. Then, if we must split it amongst three of Johnny's helpers, each will know where to send his answers to your questions. And you'll get an answer, Johnny will see to that.

"One call does it all!" is the slogan of the super-service stations. One name and one address does it all, too—if the name is Johnny Appleseed, FPSA, and the address is 2005 Walnut St., Philadelphia 3, Pa.!

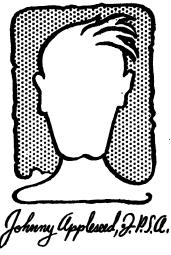

The Old Job, Too!

Johnny hasn't given up his original job, though; not by any means! The reactivated Johnny will do a series of articles on a variety of subjects; down-to-earth articles that will be as practical as ham and eggs.

These articles will be written, in some cases, by slipstick artists to whom cosines and logs are old and familiar friends, but every Jöhnny Appleased article will be the kind that all of us can understand and profit by, even if we don't know the difference between an H. and D. curve and the kind we admire on the beach.

Look for Johnny's page next month, and every month, in the JOURNAL; you'll find it easy to spot Johnny's page by the outline picture of Johnny which you see here.

As Johnny himself says, "I'll be serving

Who is Johnny Appleseed, FPSA? Not any one person, certainly; no one person could know all Johnny knows, do all the things Johnny can do, be all the things Johnny can be.

Johnny is everyone in PSA, including you. He's the officers, from the President on down. He's the Board, the Division Chairmen, the top experts in each Division. He's all the big wheels in PSA.

Johnny is also the middle-sized wheels and the little wheels that are just as essential in that great train of gears which makes PSA tick. Each of us who knows something, who can offer a helping hand, who is willing to do some job, great or small, is an essential part of Johnny Appleseed, FPSA.

HELLUP!

There are a lot of shrinking violets in PSA. I want to ferret them out. Johnny needs a lot of helpers to carry out this new scheme . . . fellas and gals who are real sharp about something. It may be something as simple as adjusting the pH of Hydrazine hydrate (!) or something as complex as the composition of a still life. It may be the problem of setting up a year's programs, of getting speakers to come out to Grinder's Switch to talk. Somewhere in your experience you have encountered problems, the solution of which would also be somebody else's solution. Won't you paste the coupon on a postcard and mail it to me at Headquarters, 2005 Walnut St., Philadelphia 3, Pa., so I can inscribe your name on my roster of Johnny's Helpers and refer pleas for help to you? JOHNNY APPLESEED, FPSA

Johnny Appleseed, FPSA, 2005 Walnut St., Phila. 3, Pa. Dear Johnny: Sure I can help. My subjects might lie in the fields listed below:

## Louis Philippe Clerc, Hon. FPSA

By Glenn E. Matthews, FPSA

Louis Philippe Clerc, one of two Honorary Fellows* of PSA for 1952, was born in Paris on August 20, 1875. His influence and work have dominated the whole field of photography in France for more than fifty years and have extended far beyond the borders of his native land. A popular, familiar figure at every International Congress of Photography since the first meeting in August, 1889, Mr. Clerc has labored intensively and unceasingly for the advancement of photography throughout the world. His contributions have been particularly outstanding in the fields of graphic arts, color photography, aerial photography, photographic chemistry and scientific applications of photography.

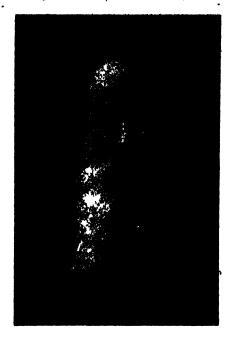

At 14 years of age, he was already an expert amateur photographer and he noted that documentation on photography in France was very poor. As a result of this observation, he spent part of his holidays every year studying foreign publications. As early as 1896 he began to contribute to various photographic journals in France and to publish summaries of foreign works. Among others he published French translations of the principal articles by Hurter and Driffield, the pioneers in sensitometry, who at that time were completely unknown in France.

As a teacher of chemistry and photography, Mr. Clerc has had a long distinguished career. He taught analytical chemistry at the Paris University from 1898 to 1937. He founded in Paris in 1926 and directed for many years a Technical School of Photography and Cinematography. He also taught physics and chemistry applied to the graphic arts at the Ecole Municipale Estienne in Paris. Finally he was asked to teach photographic photometry at the Paris Institute of Optics. He took an active part in the organization of the International Congress of Photography in Paris in 1889 and has served for many years as the permanent secretary for France. In that capacity he edited the proceedings of the fifth, sixth, and ninth International Congresses of Photography.

After a few months service in the infantry in the first World War, he was asked to direct one section of aerial photography. The results were reported in the 24th Traill Taylor Memorial Lecture of the Royal Photographic Society of Great Britain, (Phot. J. 61: 382, November, 1921). He discussed aerial photographs, and aerial stereoscopy. For his services in aerial photography during the war, 1914-1918, he was decorated with the Croix de guerre.

In 1921 he began publication in each issue of Revue Française de photographie of a supplement entitled Science et Industries Photographiques which eventually hecame a separate journal. This publication has been edited for more than 30 years by Mr. Clerc, entirely alone, without a col-

The other Honorary Fellow of the PSA for 1982 is Fred R. Archer of Los Angeles, Calif. A hiographical account of Mr. Ascher appeared in the PSA JOHNAL, Vol. 12, pp. 118-179, March 1946.

laborator of any kind, thus doing the work of a large staff of experts. This formidable task can be appreciated somewhat when it is realized that the work requires an ability to translate several languages and a sound knowledge of many fields of photographic science. Science et Industries Photographiques is one of the three leading photographic abstract publications in the world and the principal outlet for scientific and technical articles in France.

His life has been one of unremitting toil with every moment of each day devoted to teaching, writing, organization, translation, and editing. Through all of this intense program he has managed to find time to form friendships with his colleagues in many different countries.

A few of the important positions held by him besides his editorship of Science et Industries Photographiques, 1921 to date, are as follows: Co-director of the magazine La Photographie, 1896-1901; Secretary to the editorial staff, La Photographie Francaise, 1901-1904; Editor-in-chief, Les Procédés Photomecaniques since 1901: Editorin-chief, Revue des Sciences Photographiques from 1914 to date; Collaborator for: Grand Encyclopedie; Dictionnaire de Chemie by Wurtz (2nd Suppl.); Dictionnaire Larousse; Journal de Physique; Bulletin de la Société Française de Photographie et Cinematographie; Photographic Journal (RPS-London); Camera Obscura (Amsterdam); etc.

In the past fifty years Mr. Clerc has written no less than twenty books on several different fields of photography. Some of these books have been translated into several languages. He is probably best known for his authoritative work, La Technique Photographique, first published in two volumes in 1926 and since appearing in four other editions, two of which were translated into English in 1930 and 1937. He has pub-

lished extensively in many photographic magazines over a long period of years.

Besides the Croix de guerre which recognized his aerial photography services to the French 10th Army (June 22, 1915), the French government in 1949 decorated him with the Chevalier de la Legion d'honneur. This decoration was given him in recognition of the quality of his university work and the services rendered to science; for his work in the practical application of acience to industry, particularly in the field of photography and cinematography by his publications of periodicals.

Some of the other honors which have been given to Mr. Clerc are the following: Bronze Medal of the ministere de l'Instruction Publique—1914; Bronze Medal of the Ligue de l'Enseignement—1912; Peligot Medal of the Societe Française de Photographie—1923; Vermeil Medal of the Societe Nationale d'Encouragement au Progres—1924; Honorary Fellow of the Royal Photographic Society of Great Britain—1924, and the Progress Medal of that Society in 1951.

It has been the privilege of very few men to have contributed so effectively and lastingly in as many fields of photographic science during their lifetime as has Louis Philippe Clerc. In so doing, he has honored his country and he continues to labor faithfully for the advancement of photography throughout the world.

## **Determining Exposure for Night Football Games**

By Harris B. Tuttle, Hon. PSA. FPSA* and Donald F. Lyman**

Many football games are now placed at night by attificial light. In cases where it is desirable to make motion pictures of such games, methods of determining the correct exposure become quite important if the best pictures are to be obtained. Schools that have not started filming night games need information about the selection of equipment that will enable them to make satisfactory pictures. It is the purpose of this article to provide helpful information on both problems. First, let us consider cameras, lenses, and films.

There are two sizes of amateur movie film, 16mm and 8mm. The 16mm film is recommended for this purpose because 8mm film is intended for home use only and has several limitations if an attempt is made to use it for serious professional or semiprofessional purposes.

For example, the light used to illuminate sports areas at night is adequate for visual observation of football games and other sports, for in such cases the human eye can readily adapt itself to reasonably low levels of illumination, which permits the observer to see comfortably. But the photographic film used for night filming is less sensitive than the human eye and, therefore, things that can be seen very clearly cannot always be photographed as easily as one might suppose. The fastest movie film available is 16mm Cine-Kodak Super-XX Panchromatic Film, while the

fastest film available for 8mm cameras is Cine-Kodak Super-X Panchromatic. Super-XX Film is two and one-half times as fast as Super-X Panchromatic Film. This means that 16mm Super-XX Film requires only 40 percent of the light that would be needed for 8mm Super-X Panchromatic Film. In addition, the picture made on 8mm film is about ¼ the size of the picture made on 16mm film. Thus, when the picture is viewed, 16mm film can be enlarged to about four times the area or twice the screen width of 8mm pictures, if the same brightness and definition are to be obtained.

Another prime requirement for good football movies at night is a fast lens. A lens having an aperture of from f/1.4 to f/1.9 or f/2.0 is essential.

Then there is the question of the proper camera speed. For silent motion pictures the normal camera speed is 16 frames per second. When such pictures are projected at the same rate, the movement on the screen appears normal. But since football is a fast-moving game, pictures made for purposes of study are more revealing if the action is slowed down slightly. This is accomplished if the camera speed is faster than the projection speed. Most schools shoot their games at 24 or 32 frames per second. Then, if the film is projected at the silent speed of 16 frames per second, the speed of the players will be slowed to two-thirds speed for 24 frames per second and one-half speed for 32 frames per second.

From these notes it is now apparent that, in order to PSA JOURNAL

"Sales Service, Division, Esstman Kodak Company, Rochester, New York enDevelopment, Department, Esstman Kodak Company, Rochester, New York

582

make pictures at 24 or 32 frames per second, one must use 16mm Super-XX Film. It is also clear that the illumination on the field would make objects effectively 40 percent as bright to 8mm Super-X Panchromatic as it would to 16mm Super-XX Film. If the brightness of the field was satisfactory for normal motion at 16 frames per second, it would be only half bright enough for 32 frames per second.

Thus, the slower speed and the limitations in the projection of 8mm film practically rule out its use for sports photography by artificial light.

Although a few schools using 8mm Super-X Panchromatic Film at f/1.9 and 16 frames per second find the results acceptable for their particular purpose, this combination is not recommended if the best possible results are wanted.

#### Light requirements

For filming at night, there must be a certain minimum amount of illumination on the playing field. Cine-Kodak Super-XX Film requires at least 30 foot-candles of incident light for 16 frames per second at a lens setting of f 1.9 or f/2.0. Since this amount of light may produce slight underexposure in the case of dark subjects, it is generally felt that 45 foot-candles should be the basic value. This provides a safety factor slightly in excess of  $\frac{1}{2}$  stop.

Since most football films are exposed at 24 or 32 frames per second, the amount of light needed would be 50 to 100 percent more than for 16 frames per second, or 65 foot-candles at 21 frames per second, and 90 foot-candles at 32 frames per second. For other f values and camera speeds, see Table I.

The exact amount of illumination required and the f value employed depends a great deal upon the reversal development given to the film when it is processed. The values given above are for Cine-Kodak Reversal Film when processed by one of the Kodak processing laboratories. When films are developed by other laboratories, the recommended exposure may vary considerably one way or the other.

Black-and-white motion-picture films, such as Cine-Kodak Super-X Panchromatic (ASA 32 in tungsten) and Super-XX Films (ASA 80 in tungsten), manufactured by the Eastman Kodak Company, are available in two types. In one case, the processing of the film is included in its purchase price; in the other, the price of the film does not include a charge for processing. The former type is designated Cine-Kodak Film. The latter type includes Kodak Blue Base Super-X and Super-XX Films. The Cine-Kodak Films can be sent to any Kodak processing laboratory and will be processed and returned free of charge. The Blue Base Reversal Films must be processed by the customer or by any commercial laboratory. There are many commercial laboratories equipped to do this work.*

This introduces another very important factor in the exposure problem. The results obtained by the various commercial laboratories can and often do vary from one to two stops in exposure. If Blue Base Super-X or Super-XX Film is used and sent to a commercial laboratory, it should always be sent to the same laboratory because their results will be uniform throughout the season.

Unexposed as well as exposed film can, of course, be affected by heat and humidity. Film left over from the previous year, for example, will probably be slower and will produce results which will appear different from those

*While Kodak processing laboratories remain open on Saturdays and Sundays during the football season, there are many cities that have commercial laboratories. Some colleges can obtain a little faster service by using Blue Base Film and having the processing done locally by such laboratories.

†Each commercial laboratory has its own processing methods. The solutions used and development times may change the effective exposure.

obtained on fresh film. Therefore, film should not be held over from one season to the next unless it can be emposed within the period designated by the expiration date printed on the film carton.

Furthermore, in order to be realistic about the exposite of motion-picture film by artificial light, we must recognize the many variable factors which are always present when the film is exposed and developed.

These variables are shown below, grouped under several headings.

#### Brightness of the Subject

- 1. Illumination on the subject
  - a. Initial output of the lamps (Important if exposure tests are made with new lamps)
  - b. Distribution of the light on the playing field.
  - c. Superimposition of light from the various sources
  - d. Blackening of the lamps with age
  - e. Blackening of the reflectors caused by moths, insects, and corrosion, or deposits of tungsten on the inside of the lamp
  - f. Variations in the line voltage
  - g. Contrast ratio of the lighting
  - h. The effect of side or back lighting
- 2. Reflectance of the subject
  - a. Reflectance of the principal part of the subject.
    (In football photography, this is usually the color of the uniforms, helmets, and ball.)
  - b. The over-all brightness ratio
  - c. Extreme changes in reflectance, such as from a white uniform to a dark-colored uniform. These effects may be partly real, caused by differences in the way the light is reflected to other parts of the subject, and partly psychological effects obtained during the process of viewing the pictures.
  - d. The effect of the background, whether it is light or dark in the final picture.

#### Speed of the lens used

- 1. Accuracy of the calibrated scale on the diaphragm
- Transmission of the lens, which is affected by the transparency of the glass, the number of elements, and the lens coating

#### Time of exposure

- The taking speed or the number of frames per second at which the camera is actually operating under working conditions
- 2. Size of the opening in the camera shutter
- The resulting exposure time expressed as a fraction of a second

#### Exposure index

- The speed and contrast of the emulsion used when it is developed by regular processing
- 2. Variations in speed and contrast encountered in regular processing
- The effects of other types of processing, which vary among independent laboratories

It might be well to point out briefly the significance of some of the factors just listed. Under "Illumination on the subject," the initial output of new lamps is slightly higher than that of lamps which have been burned for several hours. The amount of the drop depends on the type of lamp. Some lamps drop only 25 to 30 percent before they burn out, while others drop 50 percent or more. Those used in football stadiums, however, will usually be of the first type.

The distribution of the light on the field is quite im-

portant for photography, much more so than it is for pristial observation. When the illumination from the lamps is not distributed uniformly over the field, there may be dark spots to which the eye readily accommodates but which may become quite noticeable in the finished pictures.

If the lamps are placed on high stands and close to the playing field, much of the light may be from the top and will be less effective photographically than lights placed at a lower angle in such a position that they provide frontal

illumination on the players.

As a matter of fact, the placing of lights around the entire gridiron helps provide fairly uniform illumination on the field. However, from a photographic standpoint, this method of lighting has some disadvantages. If the camera is placed, let us say, in the grandstand or bleachers on one side of the field in such a position that it is shooting across the field and slightly downward along the 50yard line, only the lights that are on the same side of the field as the camera are contributing materially to the total exposure of the picture. The light from the other side of the field is falling on the other side of the players and is being reflected back in the opposite direction so that it never reaches the camera lens. However, some that strikes the ground and is reflected toward the camera may help considerably in the exposure of such areas. Nevertheless, the light that is actually doing the most to illuminate the players from the camera's point of view are the lights that are on the same side of the field as the camera. Lamps at the ends or on the opposite side of the playing field merely furnish side or back-lighting.

The reflectance of the subject is quite important, and it may vary considerably during a game. We have seen pictures made at night in which both teams had light-colored uniforms and white helmets, and a white ball was used. During the first ten minutes or so of play, these light-colored subjects reflected sufficient light to produce a good exposure. However, because the field was muddy, it was not long before the uniforms, helmets, and the football were darkened with mud.. This, of course, cut down the reflectance of these objects and made their brightness possibly a third or a quarter of its original value. Rolls of film exposed later in the game appeared underexposed even though all other photographic conditions had remained constant.

#### Effect of background

The effect of the background on the appearance of the subject is quite important. For instance, if the pictures are shot downward from a slight elevation, the grass will provide a background for many of the players, and if they are in light uniforms, the grass will appear much darker and will provide fairly good contrast so that the movements of the ball and the players can be followed easily.

If the camera is low, the lights on the opposite side of the field usually show in the picture. The excessive flare light which results reduces the contrast, causing an overall flattening of the picture quality and making it more difficult to follow the movements of the players.

Under "Time of exposure," the camera taking speed, of course, is important, and the actual speed at which the camera is operating should be checked from time to time in the following manner: Make a two-foot length of unexposed film into a loop by splicing its two ends together. Load this loop into the camera in the usual way, leaving the camera door open. Wind the camera spring fully. Using a second-timer or the second hand on a watch, and with the splice as reference point, time the interval required for the loop to pass through the camera. At 16 frames per

second, the two-foot loop should make one transit in five seconds, or two in ten seconds, etc.; at 24 frames per second, it should pass through once in 3-1/3 seconds, or three times in ten seconds; and at 32 frames per second, it should pass once in 2½ seconds, or four times in ten seconds. If the camera is not operating at speeds that correspond with the settings indicated, have it adjusted at the factory.

#### Shutter ratings

Motion-picture camera shutters are usually rated in the number of degrees that the shutter is open for exposure. These vary from 204 degrees for some 16mm cameras to 120 degrees for some 8mm cameras. A large percentage of both 16 and 8mm cameras operate at about 165 degrees. Thus, the exposure time at 16 frames per second is approximately 1/35 second; at 24 frames per second, 1/52 second; and at 32 frames per second, 1/70 second.

Exposures indicated by most exposure meters, tables, and guides are based on an exposure time of 1/35 second, or a 165-degree shutter opening and a camera-operating speed of 16 frames per second. If the camera has a 120-degree or 204-degree shutter opening, slight variations in lens opening will be necessary in order to obtain constant exposures when two or more cameras made by different manufacturers are used to photograph the same game.

Large differences in exposures are usually not caused by any one factor, but rather by an accumulation of several factors tending in one direction. For example, a certain basic exposure might be recommended for a camera equipped with a 165-degree shutter opening and a camera-operating speed of 16 frames per second. If, instead, a person had a camera that had a 204-degree shutter opening, making the exposure time 1/28 second instead of 1/35, and if the camera was running slightly slow, say at 13 or 14 frames per second instead of 16, the accumulation of exposure might add up to the equivalent of a half a diaphragm stop. There have been cases where this has actually occurred. A cameraman photographing games regularly every week on the same field, from the same position, with the same light, etc., obtained satisfactory exposure one week. The following week he used a camera, made by a different manufacturer, which was running slower and had a larger shutter opening. These pictures appeared to have at least one stop more exposure than pictures taken the previous week under similar circumstances. On the other hand, a camera equipped with a 120-degree shutter, and running 18 to 20 frames per second, would produce underexposure. Therefore, it is well to be aware of the variations that can occur in exposure merely due to the mechanical performance

Of course, another important factor along this same line is the proper use of an exposure meter, and we will say more about that in a later parageaph.

Under "Exposure index," each type of motion-picture film is assigned an exposure index number by the manufacturer. The exposure index is based upon exhaustive tests in which the light used for photography can be measured accurately and the general conditions of exposure and processing are held normal. All Cine-Kodak Reversal Films are developed in Kodak processing laboratories under normal processing conditions. On the basis of exhaustive tests, an exposure index of 80 has been assigned to both Cine-Kodak Super-XX and Blue Base Super-XX Films.

Kodak processing has been carefully worked out to produce the most satisfactory projection positives of all types of average subjects. In the assignment of an exposure index to film, a safety factor is allowed so that the exposure recommended is never the absolute minimum exposure that will just yield a good picture on the film. Black-and-white re-

versal film has moderate latitude in exposure when processed with controlled second exposure. Pictures given a half-stop, one stop, or even two stops more exposure than is recommended will be usable. This is due to the automatic printing given to all black-and-white reversal films processed in Kodak laboratories.

It is possible to use different formulas for the first developer, and it is also possible to develop for a longer period of time. Some of the commercial laboratories do use formulas they have devised themselves, and they may in some cases give a longer first development than is given by the Kodak processing laboratories. The result is that the finished picture appears to have had more exposure; that is, appears lighter on the screen. The differences that can occur among commercial laboratories in processing Kodak Blue Base Reversal Films can result in speeds as much as one to two stops above that normally recommended for the Cine-Kodak Films developed by the Kodak laboratories. Therefore, you can see why it is important that when test exposures are developed, they be made on the same kind of film and developed by the same laboratory that will be developing all subsequent films. Exposures for future pictures can then be safely based on information obtained from the test rolls.

In the beginning of this article, we pointed out that for f/1.9 and 16 frames per second both Cine-Kodak and Blue Base Super-XX Film require 45 foot-candles—a recommendation which includes a safety factor. It might be possible to so process Blue Base Film that the same photographic results would be obtained if the illumination were only 15 to 20 foot-candles.

You can thus see how difficult it is to give any specific exposure instructions for a film unless the film is exposed and processed under conditions similar to those recommended by the manufacturer.

#### Determining exposure

We also mentioned the importance of properly measuring the light falling on the field. This can be done in a number of ways with exposure meters. If the photographer can gain access to the field for preliminary measurements, a meter that reads incident light may be found preferable to one that reads reflected light.

The incident-light meter is held so that it points toward the light sources that illuminate the side of the subject to be photographed. Actually, this type of meter should be held in such a position that if it were a mirror instead of a meter, it would reflect rays of light from the light source directly into the camera lens. In other words, if an incident-light meter without any diffusing medium in front of the cell is pointed directly toward the light source, it reads, of course. the illumination on a plane perpendicular to the direction of the lamp. But the camera lens is recording objects in planes perpendicular to its axis, and the illumination from the sources is lower on these planes. That is why a meter should be held so that it will reflect the light toward the camera. Most meters, however, have diffusing hemispheres or cones that make them less sensitive in this respect. The Weston and General Electric meters can be adapted so that they can be used as incident-light meters, while the Norwood meter was designed specifically for measuring incident light. We suggest that if a meter is going to be used, it be carefully checked and calibrated, either by the manufacturer or some competent laboratory, to make sure that it is measuring light properly.

When a reliable value of illumination has been obtained by use of a suitable incident-light meter, it is not difficult to determine by calculation or by reference to a table what the lens diaphragm opening should be for a certain camera speed, film speed number, and exposure time. It is essential, however, that the illumination be corrected by integrating devices, such

as the diffusing cone or hemisphere, so that it indicates approximately the amount of light falling on surfaces facing the camera, for they are the surfaces that are of chief interest in pictures of this type.

American Standard for General Purpose Photographic Meters (Photoelectric Type) Z38.2.6-1948 gives the following formula:

$$T = \frac{C A^2}{I S}$$

where T is the exposure time in seconds, A is the relative aperture (f-value), S is the exposure index, I is the illumination incident on the exposure meter expressed in foot-candles, and C is a constant for which limits of 15 and 30 are specified. If C is assigned a value of 25, which is now considered best for films used for football pictures, the formula can be rearranged as follows:

$$1 = CA^2 = 25A^2.$$

$$TS \qquad TS$$

The following table was derived from this formula:

#### TABLE I

Foot-Candles Required for Various f-values and Camera Speeds for Cine-Kodak and Blue Base Reversal Super-XX Film (Exposure Index 80) and a Shutter Opening of 165 Degrees.

	I	rames per Seco	nd
<i>f</i> -value	16	24	32
1.4 1.9 or 2 2.8 4	20 45 85 175	30 65 130 260	45 90 170 350

It is clear from the table that there will seldom be enough light for high camera speeds or small lens openings.

Another method of making readings on the field is to hold a reflection-type meter within a foot or so of a gray card having a reflectance value of 18 percent, such as the Kodak Neutral Test Card. Readings should be taken at various parts of the field, with the card always held perpendicular to a line between its center and the camera.

Still another way of determining exposure is to use the regular reflection type of meter pointed toward the subject. This method is best when the photographer cannot take readings on the field.

In the case of reading light reflected from a gridiron, it is difficult to obtain accurate results if the lights on the far side of the field are shining on the meter, for it will then be reading light that does not effectively illuminate the subject. Therefore, when a reflection-type meter is used, it is important to shield the meter from the light coming directly across the field.

All these methods involving meters introduce so many variable factors that it is really difficult to say which is best or to guarantee that any one of them will work satisfactorily. If the photographer has an opportunity to photograph some previous practice session or previous game, he should make the final determination by photographic test.

Before making the test, he should make sure that all the lamps illuminating the field are turned on and functioning in the prescribed manuer. Then he should arrange to have some football players on the field in the kind of uniforms they will wear during play. He should load the camera that is to be used all season, making sure that the film is fresh and not a year or so old just because it seems uneconomical to throw it away.

As soon as he has established that all of the conditions are fairly normal and represent an average of conditions to be encountered throughout the season, he should proceed to make a series of exposures as follows:

Scene No.	Camera Speed	<i>f</i> -Value	
1	8	1.4	
2	16	1.4	
3	16	2.0	
4	16	2.8	
5	16	4.0	
6	16	5.6	

and beyond if there seems to be plenty of light. Furthermore, if there seems to be enough light to properly expose the Super-X type of film, he should run the same type of test on it Then the films should be sent to be processed by the method to be used for future games. It is then a simple matter to select the best exposure from the full-stop steps or to pick some intermediate value. From this value, he can easily calculate the f-values required for other camera speeds, such as 24 or 32 frames per second.

The advantage of this method is that the lighting would be checked with the camera, film, processing, etc., to be used later for the final exposures. If the voltage across the lamps varies, the results will be affected somewhat, and the reflectance of the uniforms will be another variable. But all the main factors have been covered in such a way that the exposure should be nearly correct.

In making the tests, the photographer should place his hand over the lens between each change in exposure and press the exposure lever long enough to expose several frames of film. This will produce a black flash on the screen and thus help him to separate and identify the exposures.

When the film is shipped for processing, it is a good idea for the photographer to write to the laboratory, stating that the film is a test and that he wants it processed under the average conditions that will exist later when he sends in his football films.

After the film has been returned from the processing laboratory, it should be projected under recommended conditions.

When the projector is set up to run the test film, it should be equipped with a lamp of the recommended wattage, and the picture should be of the recommended size for the type of screen used. It may lead to serious errors if a 750-watt lamp is used in the projector and a picture about 8 x 10 inches in size is shown on a white paper fastened to the wall at the end of a desk.

This is an important test to determine exposure, and it

should be viewed under normal, recommended projection conditions. A 500-watt projection lamp should be used o project a picture about 36 x 50 inches for a beaded screen or 30 x 40 inches for a matte-surface screen. As the tests are run through the projector, an exposure made at f/2.0, for example, may be picked arbitrarily as the most suitable one. However, if the film is run backward so that the darkest scene comes first and the scenes become progressively lighter, an exposure made at f/2.8 may be chosen as best. Thus, it is important to allow for the psychological effect introduced by a change in the order in which the pictures are projected.

It is better to have two or three other observers present, and after the above effect has been demonstrated, they should agree on the best exposure, which may lie between two steps,

The fine grain and high contrast of the Super-X type of film will improve the quality of the pictures if there is enough light. The results of these actual photographic tests will always be on hand for future reference, and from them it is possible to tell what the exposure conditions are during actual play. These tests will also serve as a means of checking the efficiency of the lights from time to time.

It is, of course, a good idea to take meter readings when the photographic test is made and to keep a record of these values. Then, when the photographic test has indicated that the f/2 or f/2.8 opening produces the best exposure, there will be some correlation to aid in making pictures on other gridirons or under other circumstances.

It would be wise for any school to invest in a roll or two of film for such tests each fall because operating conditions change from year to year. Blackening of the lamps or changes in the load on the line that supplies your playing field could cause a drop in illumination, and other factors discussed here may affect the results when they have not caused any great trouble previously. An actual exposure test processed by the laboratory that is going to do your processing is the best guarantee you have of getting good results.

It can be seen from the information given here that it is often difficult to determine in advance whether or not pictures with your lighting setup are possible. A meter reading taken improperly may indicate that there is not enough light, and a photographic test may reveal that there is. On the other hand, a meter used improperly may indicate that there is enough light, and if you proceed on that basis and expose ten or 12 rolls of film, you may be disappointed to find them badly underexposed. Thus, investment in one roll of film for an actual photographic test may be repaid many times in the course of the football season.

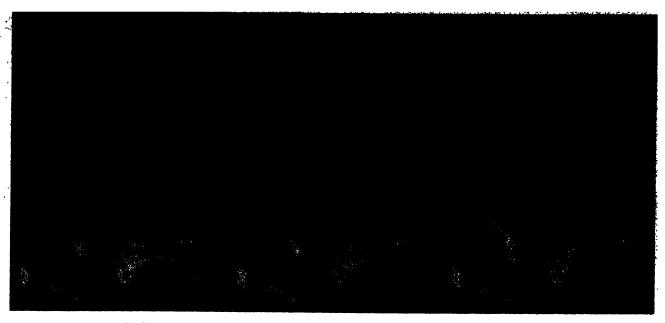

Fig. 1.—This series shows the action of the new reducer on a negative which has been grossly overdeveloped. Kodak Super-XX Film was given normal exposure and development as seen on the left . . . then normal exposure and double normal development time as seen in the center . . . then normal exposure, double normal development time, and reduction in the new hypo reducer as shown on the right.

## REDUCE WITH HYPO

As anyone who has done much photographic processing knows, you can't leave a print or negative in the fixing bath for too long, especially if the bath contains ammonium hypo. If you do, the image will soon be attacked by the solution and will begin to reduce and disappear.

This action is particularly noticeable in the case of prints. Many photographers have had the experience of seeing prints that have been left for an excessive period in the fixing bath greatly reduced in density. The technique has not, however, been generally employed as a reducer for either films or prints because the action is so slow. It has long been felt, however, that if some method could be warked out to speed up this operation, some very worthwhile results might be obtained. Toward that end, work has been done recently with solutions which take advantage of the reducing action of the thiosulfates as used in rapid liquid fixing baths. These experiments have led to the conclusion that some very useful reducers can be compounded from these preparations.

The new reducers have the following characteristics. They will (1) selectively dissolve the finely dispersed dichroic silver characteristic of many stains, and (2) then slowly and proportionately reduce the image. This gives a uniform reduction in the contrast of the print or negative without loss of shadow detail. Furthermore, and more important, the re-

ducers will not appreciably change the color of the image except in the case of strong reduction. This is particularly important in the case of prints.

The secret of these new reducing formulas lies in increasing the acidity of the thiosulfate bath. This speeds up the action of the solution just as raising the temperature of the solution would also speed up the action, but without the undesirable results that come from raising the temperature.

The formulas given in Table 1 represent acid hardening ammonium thiosulfate fixing baths in which the acidity has been increased by the addition of citric acid. In these baths, the ammonium thiosulfate is the active reducing agent, while the other ingredients produce the correct degree of acidity without causing sulfurization of the hypo. These baths also allow hardening to continue so that supplementary hardening is not required as with so many other reducers. Another advantage of these baths is that the materials for preparing the bath may already be in the photographer's possession.

The speed with which these fixing baths operate is determined largely by the concentration of citric acid in the solution. Table II shows how speed of reduction to the same relative density is tremendously increased by adding more acid. The faster speeds are such that the use of this new method of reducing prints and negatives becomes very practical indeed.

Most reducers operate in a general overall manner. In other words, the usual "cutting" reducer used to reduce a negative by one-tenth of its density will take the same amount out of the highlight areas as out of the shadow areas. This

A popular abridgement of a practical research paper describing a new method of reducing negatives and prints. Originally published in PSA Journal (Phot. Sci. and Tech.) 17B: 110-118, November, 1951. Article entitled "An Ammonium Hypo Reducer" by R. W. Henn, J. I. Crabtree, and H. D. Russell, Kodak Research Laboratories, Eastman Rodak Company, Rochester, New York.

#### TABLE I REDUCER FORMULAS

Basic Solutions	Per Liter of D Stock Hypo	iluted Reducer Hardener	r Citric Acid	рН
1. Kodafix Solution	330 сс.	*******	(a) 15 grams (b) 30 grams	4.10 3.55
2. Kodak Rapid Liquid Fixer with Hardener	250 сс.	30 cc.	(a) 15 grams (b) 30 grams	3.66 3.2
3. Ammonium Thiosulfate Kodak F-5a Stock Hard		200 сс.	<ul><li>(a) 15 grams</li><li>(b) 30 grams</li></ul>	3.4 3.1

may result in the complete elimination of shadow detail while bringing the highlights down to printable quality. The contrast of the negative or print is not changed by such reducers. The use of the reducer merely results in a somewhat thinner negative which may be used in printing. This means that less time may be required to print the picture, but the same paper contrast will be needed for the reduced negative as was called for before.

#### Proportional Reduction of Negatives

The proportional action of the hypo reducers described here is, however, much more pronounced. This is because these reducers act on a percentage basis. While reducing highlight density 10 per cent, they also reduce shadow density 10 per cent. This might at first seem to be the same as reducing over-all density by a fixed amount with a cutting reducer, but actually it is quite different. That's because the removal of 10 per cent of the silver in the highlight area represents far more silver removal than is the case when shadow areas are reduced by 10 per cent.

As a result of this proportional reduction, the contrast of the negative or print is changed. Consequently, a negative that heretofore required printing on a No. 1 grade paper may be printed successfully on No. 2 or possibly a No. 3 grade paper.

The way this works out in practice is well illustrated by Figure 1 and by the characteristic curves shown in Figure 2. These characteristic curves represent strips of Kodak Plus-X 35mm Film which have been subjected to a series of reducing times. Since these curves look very much like a time-of-development series, it can be seen from them that they show very small loss of shadow detail.

Similar results have been obtained in experimental work with other films also. The times of reduction will vary, of course, depending upon the emulsion, but an idea of the magnitude of the variations with several different films can be obtained from Table III. Loss of shadow detail or toe on the characteristic curves is found, however, only with the

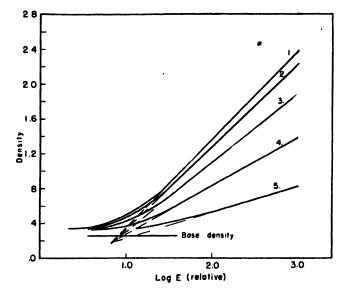

Fig. 2.—Characteristic curves obtained by a series of increasing times of reduction. The reducer variation 2 (b), containing 30 grams of citric acid per liter, was employed for 0, 4, 8, 16, and 32 minutes at 68F. Note the resemblance to the usual time-of-development series. Kodak Plus-X 35mm Film, developed in Kodak DK-60a for 7 minutes at 68F.

the contrast of negatives, this new reducer is capable of compensating, when necessary, for a very great degree of over-development. For example, similarly exposed rolls of Plus-X Film were developed (a) in Kodak D-76, and (b) in Kodak D-11 for 15 minutes. In the latter case, the resulting negatives were so dense that the image was visible only when viewed with intense illumination. Yet, following prolonged reduction,

As a result of this ability of the hypo reducer to change finest grain materials after particularly strong reduction.

	TABLE II		•
	RATE OF REDUCT	ION	
	(Kodak Super-XX Sheet	Film)	Time for Reduction of
		Citric Acid	20% in Density
Reducer No.	Basis	(Grams per Liter)	(Min.)
1	Kodafix Solution	0	50
1 (a)	Kodafix Solution	15	22
1 (b)	Kodafix Solution	30	13
2	Kodak Rapid Liquid Fixer	0	40
2 (a)	Kodak Rapid Liquid Fixer	15	17
2 (b)	Kodak Rapid Liquid Fixer	30	12
3	Ammonium thiosulfate + Kodak F-5s	ı 0	38 `
3 (a)	Ammonium thiosulfate + Kodak F-5		15
3 (b)	Ammonium thiosulfate + Kodak F-5		10

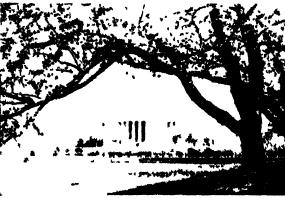

Fig. 3.—This shows the type of results that may be expected from similarly exposed films with different degrees of development. The top picture was made on Kodak Super-XX Roll Film developed in Kodak D-76 for the normal time. The middle picture was made on the same film but developed for 15 minutes in Kodak D-11 The bottom picture shows a print from a D-11 developed negative after reduction in the new hypo reducer

this roll was printed on the same grade of paper and with approximately the same times as the properly developed roll See Figure 3.

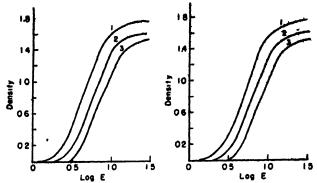

Fig. 4.—Characteristic curves of paper emulsions reduced in the ammonium hypo reducer. Figure IVa is for Kodak Royal Bremide Paper, Grade F-3, unreduced (1) and treated for 4 minutes (2) and 8 minutes (3) at 68F. Figure IVb is for Kodak Velox Paper, Grade F-3, reduced for 0, 2, and 4 minutes. Reducer variation (2) (a), containing 15 grams of citric acid per liter.

#### Reduction of Prints

Perhaps the greatest usefulness of these new reducers lies, however, in their use with photographic papers. This is true because such reduction may well serve to "save" a badly over-exposed and overdeveloped print on a fine, expensive paper. If vou're technically minded, you can see what happens as represented by characteristic curves for paper as shown in Figure 4 which shows the action of one of these hypo reducers on a high speed bromide paper such as Kodak Royal Bromide Paper and a "contact speed" chloride paper, such as Kodak Velox Paper after reduction for various times. A more graphic illustration of exactly what may be accomplished in reducing overexposed and overdeveloped prints can be seen in Figure 5 (a, b, and c).

With papers the effect of these reducers is (1) to reduce the density so as to compensate for overexposure or overdevelopment, and (2) to increase contrast somewhat (a not undesirable feature in most instances) and, (3) on prolonged reduction there is a tendency to cause a shift in the image tone with some papers.

In the reduction of papers and prints, however, one point should be remembered: Although the action of this reducer can be easily followed in full light, reduction should not be judged entirely on what apparently occurs while the print is in the reducer solution. This is because the print or negative, after immersion in the wash water, will tend to reduce still further. Therefore, reduction in both cases should be carried out on a rather tentative basis and halted from time to time to permit some washing to judge the final reduction in density attained.

#### Removal of Silver and Silver Sulfide Stains

Usefulness of these new reducers is not confined, however, to reducing merely negatives and prints. The reducers are equally practical for the removal of silver and silver sulfide stains which occur very frequently in photography. These

RED	UCING	TABLE RATE VE		ULSION

tig. 6a. Print made from negative showing extreme dichroic stain.

Fig. 6b. Print from negative from which stain has been removed completely by ammonium hypo reducer.

stains may form in the developer when it is contaminated with hypo or sulfide and in the fixer if rinsing, acidity, or agitation are insufficient. They may be yellow, brown, metallic, or a hazy gray by reflected light, and are yellow, red, purple, or gray to transmitted light.

What these stains do to a picture can readily be observed from Figure 6a and 6b. This set of pictures shows a print from a badly stained negative, and a print after the stains on the negative had been removed completely.

To remove silver and silver sulfide stains the variation of the hypo reducer best suited to this purpose is the one containing 15 grams of citric acid per liter. The film or print is immersed in this bath and the stained area swabbed with cotton. Action is often complete in two minutes but may occasionally require five minutes or more.

One advantage of the use of this hypo reducer in the elimination of such stains is that it quite rapidly removes the stain from negative materials and causes no detectable loss of image density or shadow detail. In practical use, this reducer and technique has already proved extremely valuable in the trade. In one instance, a machine load of roll filth which had been badly spotted with silver sulfide fixing bath stain was recovered fully and entirely normal prints were produced.

Silver and silver sulfide stains are quite often produced on clothing when silver-laden hypo baths are spilled. This is particularly true with ammonium thiosulfate baths. These

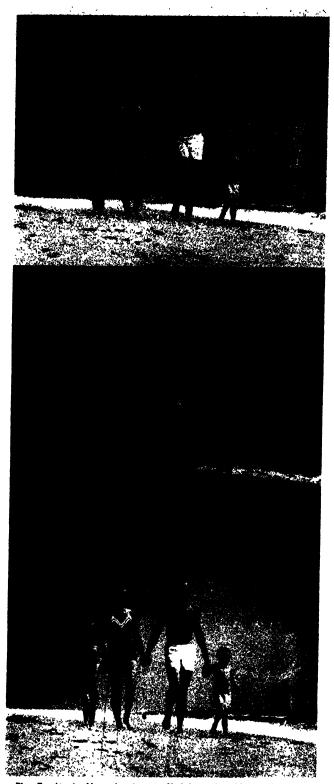

Fig. 5a (top). Normal print on Kodabromide #2. 5b (center) over-exposed print on same paper. 5c (bottom) Over-exposed print after reduction with one of the new hypo reducers.

stains can be removed from white garments by the use of the hypo reducers. The weaker variation (a) is usually suitable. Light stains, investigation has shown, can be removed by sponging, but dense stains may require soaking overnight. The garment is then rinsed in cold water, after which it may be given a regular laundering procedure. The bath may bleach some dyes, however, so it is not recommended for colored garments.

Another application of these new hypo reducers is the re-

moval of the intense yellow-orange stain which usually results when color films are inadvertently given black-and-white development. For this purpose, the variation (h) of the typo reducer with the higher citric acid content is best. This may require from five to as much as twenty minutes to remove the stain, depending upon the intensity. It is best to leave the last traces of the stain, however, provided it is uniform, or loss of shadow detail may occur.

As far as the keeping properties of these new hypo reducers are concerned, the addition of the citric acid to the fixing bath slowly causes sulfurization of the hypo. The time of this sulfurization varies with the quantity of the citric acid employed and with the temperature. As a result, the safe keeping time may vary from as little as two days with active variations to four weeks or more. Reducers compounded from Kodafix Solution, however, have the greatest stability and have not precipitated in storage periods of eight weeks.

The action of these hypo reducers is very straightforward and few precautions are required. Reduction may be carried out in daylight and he followed readily since the solutions are not colored. Strong agitation is not particularly important, except as it affects the time required.

As far as the use of the reducers is concerned, the only appreciable inconvenience is the odor of the sulfur dioxide evolved particularly in the case of the most acid variations. Sulfur dioxide is evolved from all acid fixing baths, but in this case the quantities are unusually intense. The gas is unpleasant, and toxic in high concentration, but the penetrating quality of the odor makes the breathing of large quantities improbable. Sulfur dioxide can also affect sensitized materials. Reduction should, therefore, be carried out in a well-ventilated room and away from sensitized materials. Deep vessels, such as tanks, beakers, and cylinders will give off less gas than shallow layers in trays. This reducer will, like other fixing haths, attack ordinary stainless steel (Types 302 or 304) on prolonged contact, particularly in the vapor phase.

#### **Practical Recommendations**

While any of the alternative baths shown in Table I are suitable, preference is given to Formula No. 1 employing Kodafix Solution, because of the simplicity of mixing and the stability of the resulting reducers.

#### (a) NORMAL REDUCER

(For use in removing silver stains and dichroic fog and for reduction of papers and fine-grain films.)

	Avoirdupois	
	U.S. Liquid	Metric
Kodafix Solution (stock)	10 fl. oz.	300 cc.
Water	20 fl. oz.	600 cc.
Kodak Citric Acid	$\frac{1}{2}$ oz.	15 grams
(b)	STRONG REDUCER	
(For reduction of n	egative materials.)	
	Avoirdupois	
	U.S. Liquid	Metric
Kodafix Solution (stock)	10 fl. oz.	300 cc.
Water	20 fl. oz.	600 grams

The following general procedures are recommended and should be followed for the best results:

1 oz.

30 grams

.

Work in a well-ventilated room away from sensitized materials. Clean the negative or print, freeing it from grease with Kodak Film Cleaner if it has received much handling. The film may be pre-wet (for example, in Kodak Photo-Flo Solution, diluted 1:200) to ensure uniformity, or, if the reducing action is to be slow, the film is immersed directly in the reducer.

Removal of Silver Stains and Dichroic Fog.  or print in the tray and swah locally with absorber cotton to hasten removal of surface scum. The action is usually complete in 2 to 5 minutes. Remove the film or print from the tray immediately, if any reduction of shadow detail is noted. Wash thoroughly and dry.

(2) Reduction of Negatives.

Use variation (b), especially if considerable reduction is required. Agitate occasionally, observing the progress of reduction. A guide as to the degree of reduction is given in Table IV for several materials. A reduction of 20 percent will correspond to a change of about 1 grade of printing paper. Wash well following reduction.

(3) Reduction of Prints and Fine-Grain Negative Materials. This reducer is particularly useful for slight overexposures or overdevelopment but strong reduction may result in loss of image quality, particularly with prints. Use variation (a), pre-wet, and remove from the reducer after 1 to 5 minutes. Wash well.

## Don't Be A Sphinx, Sell PSA!

By Alfred C. Schwartz, Chairman, N. Y. Convention Membership Committee.

After 5000 years the Sphinx still stands as one of the original Seven Great Wonders, a monument to the fact that creations wellconceived are half-sold. A week behind the Membership Desk at the recent convention convinces one that PSA, like the Sphinx is well-conceived and half-sold. The other half of the selling job is still to be done.

PSA JOURNAL and a small proportion of PSA'ers have carried the load as the task force which has created PSA and constructed a membership of which we may well be proud. However, much of their gospel reaches PSA members. We have not completed the job of piercing the line of ennui and disinterest surrounding that great mass of camerists who are not yet enjoying PSA.

This is an operation that can be successful if all PSA'ers join the attack. To await requests for information on PSA membership is to wage a defensive action. We must go forth and aggressively beard non-members wherever we encounter them and preach PSA. We must be prepared to answer the inevitable question: What do I get out of PSA? We must not stop after telling them about our JOURNAL. We must convey the scope and activities of our organization; our portfolios, contests, criticism services, lecturers, conventions, regional meetings, etc.

We must communicate to all camera enthusiasts the impact and dynamism of our seven great divisions. We must eschew the traditional silence of the Sphinx, As an individual you can talk PSA to camerists and photographic assemblies. You can hand your outdated copies of the Journal to prospective members.

Here is the nub and substance of a plan which has great potentialities. Practically every photographic judge and lecturer is a member of PSA. They represent the finest PSA selling force possible. Let them be armed with literature, application blanks and information, and have them devote only five minutes of each appearance before a camera group, to a discussion of PSA. Thus, repeatedly, camera organizations will hear the story of PSA from reputable and respected people of our world. This is a powerful approach built around the fact that no other means of communication has ever exceeded the personal one.

We of the Convention Membership Committee have tried it, and we believe in its atomic force. Among our pre-convention activities was an arrangement with 20 of the popular judges and lecturers operating in our community, who talked up the PSA Convention and membership before clubs in Connecticut, New Jersey and New York.

It required no special visits. We asked only that they talk PSA for a few minutes whenever they had any occasion to visit a camera group or class. It is simple, costs nothing, and is effective. We need the cooperation of these photographic leaders, who are in the main, loyal PSA'ers.

Let's not be Sphinxes; but let us join the crusade to carry the joys of PSA to every camera club and enthusiast we can reach. If membership is valuable to you, it must be valuable to your brother photographers.

Kodak Citric Acid

# All about Great Miniatures

## (Including the brand-new Kodak Retinette Camera)

Here's Kodak's newest—the Retinette Camera. Look at it! It has the unmistakable Continental style, plus obviously beautiful workmanship. Heft it! It's heavy enough for steady handheld shots, light enough to ride on a strap over your shoulder all day and make you happy to have it along.

You'll like the fact that the settings are easy to see and adjust . . . controls handily grouped. Good camera for sports

coverage!

A fine Schneider Reomar f/4.5 Lens, a wide range of shutter speeds—from one second to one three-hundredth of a second, including delayed action—add to its picture-taking versatility. It also has accurate built-in synchronization for M and F flash

lamps and electronic flash equipment.

It's a really durable travelling companion. The body of the Retinette is made of die-cast aluminum alloy covered with pin-grain leather. A coupled film advance provides automatic film stop, counter, and double-exposure prevention. Plunger-type body shutter release also adds to picture-taking steadiness. Use Kodak 135 film—20- or 36-exposure magazines—black-and-white or Kodachrome. The price . . . \$59.50.

Kodak Retina IIa Camera. A top-quality precision miniature. Beautiful, too. It gives you a fast Schneider Retina Xenon f/2.0 Lens that doubles your color picture opportunities. It gives you fast action in color or lets you work easily in subdued light.

It gives you a film advance lever for fast action, for sequence shots, or to take advantage of fleeting picture opportunities. A flick of the thumb advances the film and positions it, re-sets the exposure counter, cocks the shutter and the synchronizer, leaves you ready for the next shot.

It gives you a combined range finder and

view finder for greater picture-taking convenience.

It gives you a new 1/500 Synchro-Compur shutter, providing nine speeds from 1 to 1/500 second and with built-in flash synchronization for Class M or F lamps or for electronic flash equipment.

As rugged as they come, the Retina IIa is built of die-cast aluminum alloy with pin-grain leather covering. Closes when not in use so that cover protects lens and shutter. Takes Kodak 135 film—black-and-white or Kodachrome—20-or 36-exposure. Price. \$164.10.

Kodak Signet 35 Camera. Why should camera connoisseurs be so amazed at the Signet's unexcelled performance—the sharpness, brilliance, and quality it delivers? After all, that's what you expect from a Kodak Ektar f/3.5 Lumenized Lens, in a truly superb shutter, on the best focusing mount ever designed.

The amazing thing is not the Signet's topquality performance, but its budget-low price —less than \$100 for a true precision miniature!

Kodak Ektar lenses, as you well know, are unsurpassed. The Signet's Kodak Synchro 300 Shutter lives up to Ektar quality—gives you uniform release rate, a quick opening-closing rate for maximum efficiency, and reliable syn-

chronization for all Class M lamps up to 1/300 second.

And that Signet lens mount! It rides on 50 ball bearings, for exact alignment and perfect smoothness... and the focusing helix is held to a lateral play of .001-inch or less!

That precision of detail is maintained all through the Signet—through the convenient combined range-and-view finder, the film transport that's so smooth you advance film with a flick of the thumb, the other features that make your Signet a joy to use. Accepts No. 135 Kodak black-and-white and Kodachrome Film, 20- or 36-exposure. Only \$92.50.

Kodak Pony 135 Camera. Here's a thrifty teammate for any beginner's photographic ambitions, and an ideal "second camera" for the expert.

You'll like the simplicity of its modern design, matched by its simplicity of operation.

You'll like the sharp, clear pictures—blackand-white or color—provided by the Kodak Anaston f/4.5 Lumenized Lens. You'll also like the Kodak Flash 200 Shutter with built-in synchronization, the body shutter release, simplified exposure settings marked in red, and automatic film stop and counter. Takes Kodak 135 Film, black-and-white or Kodachrome—20-or 36-exposure. Price, \$35.75. Kodak Pony 828 Camera is similar in design; takes 8-exposure Kodak 828 Film, black-and-white, Kodachrome, and Kodacolor. Price, \$31.15.

## ...and KODAK Flash Equipment

Flexible, Reliable, Handsome, and Economical

#### KODAK EKTALUX FLASH EQUIPMENT

Here's real professional flash—for single-lamp shots, on the camera, or off... for multiple-lamp set-ups... for long extension flash work... for remote control... for trim compactness and pleasant portability... and, above all, for reliable response every time you press the button!

The Kodak Ektalux Flasholder is a high-energy, battery-condenser unit. One tiny battery, 22½ volts, powers one to three lamps; two batteries, tucked away in that firm "saw-grip" handle, will kick off seven lamps, spread out over 120 feet of extension cable. Batteries last over a year—thousands of flashes—and the dependable Ektalux condenser circuit assures accurate timing right up to the limit of battery life.

The Kodak Ektalux Flasholder works directly with any shutter that has built-in flash contacts; with Standard Bracket and 15-inch payonet-connector cord, it is \$29.75. Kodak Ektalux Extension Units (at left), complete with 20-foot cord, \$12.40. For non-flash shutters, Kodak Ektalux Solenoid, \$15.40, and Kodak Ektalux Synchro-Switch, \$6.20.

#### KODAK STANDARD FLASHOLDER

Here is dependable flash for any internally synchronized camera at a new low price.

**NEW** design—Sturdy plastic battery case is designed for holding; shaped to provide a secure comfortable grip, to add a note of smartness. **NEW** bracket of the U-beam type is unusually

strong and well made, tapped for either rightor left-hand use, and adaptable to any camera with a tripod socket. Rubber gripping cushion holds camera securely, prevents marring, is inlaid in bracket and riveted in place.

**NEW** mounting between flasholder and bracket permits quick and easy removal of flasholder for off-camera lighting. Support on bracket is toothed with matching teeth on flasholder screw attachment so that flasholder can be angled to match any camera or taking distance, and locked securely in place.

**NEW** rugged socket accepts lamps easily and holds them.

**NEW** heavy-duty ejector spring kicks out used lamps at a touch of the ejector button.

**NEW** "self-shorting" extension input . . . no need to bother with "shorting plugs."

NEW low price, \$8.25.

Takes two standard "C" batteries or Kodak B-C Flashpack. Has exposure decal on reflector, keeping all exposure data right where it's most convenient.

Kodak B-C Flashpack converts the Kodak Standard Flasholder—or any flasholder which takes two standard "C" cells—to a modern, high-energy battery-condenser outfit. Peak energy is delivered every time throughout battery life; no gradual weakening, no lagging of ignition

from weak batteries. Provides sufficient power to fire several extension units at the same time. Takes one 22½-volt battery. Complete unit with battery inserted slides into your passent flasholder; no alterations needed. Price, without battery, only \$2.95.

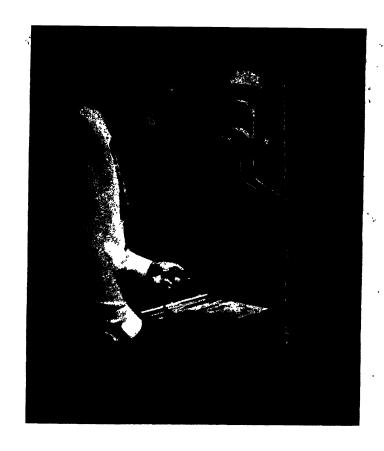

Prices include Federal Tax where applicable and are subject to change without notice.

EASTMAN KODAK COMPANY, Rochester 4, N. Y.

# GIVE YOUR DARKROOM A NEW LEASE ON LIFE WITH

# Kodak Darkroom Equipment

This is the season when you can really begin to enjoy your darkroom. But this season or any season, you'll heighten that enjoyment with these Kodak Darkroom Aids.

#### KODAK FLUROLITE ENLARGER

First and foremost on any schedule of darkroom purchases is an enlarger, and the first-choice enlarger on anyone's list should be the Kodak Flurolite Enlarger. For this is the enlarger which, since it was introduced, has set new standards of darkroom performance. Instant starting cold light. Circline fluorescent lamp, in "integrating sphere" lamphouse, provides cool illumination of high actinic quality and excellent visual contrastgives you easy focusing, ample printing speed, and proper printing contrast; minimizes negative grain, dust, and minor scratches, and climinates risk of heat damage to valuable negatives.

Perspective correction, or deliberate distortion, is easy in any plane with the rotating negative carriers and tilting negative platform. High stability and freedom from vibration are assured by the extra-large, rigid steel pillar.

Ample paper storage space is provided in the light-tight all-steel cabinet base, which also provides rigid double support for the enlarger column.

Convenience and speed of operation are enhanced by the two velvet-smooth hand controls which permit simultaneous elevation and focusing.

Versatility is provided by the long bellows draw, permitting use of lenses of various focal lengths and wide choice of negative carriers in seven sizes up to 2½ x 3½ inches. With accessories, enlarger also doubles as a view, copying, slide-making camera, and cine-titler.

Price, with one Kodak Glassless Negative Carrier, lamp, and 2-inch filter holder, without lens or lens board, \$99.50.

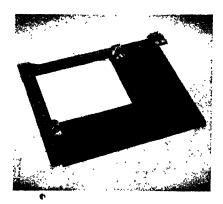

To complete your enlarger set-up you will want an enlarging lens and a masking easel. Kodak offers you a wide choice of Kodak

Enlarging Ektar Lenses and Kodak Enlarging Ektanon Lenses. Matched to your enlarger and to your exact requirements, they are available in 2-inch, 3-inch, and 4-inch focal lengths, priced from \$14.00 to \$49.90. For the very finest work, both in color and in blackand-white, and to bring out the full capabilities of your Flurolite enlarger, you will want the Ektar lenses, the finest ob-

tainable anywhere. Both Ektar and Ektanon lenses are Lumenized.

When you start working with your enlarger, you will want a Kodak Masking Easel, 11 x 14, to hold the paper in position. Actually, the Kodak Masking

Easel does far more than that. For use with any vertical enlarger, it handles papers up to 11 x 14 inches and can be adjusted for from ¼- to ¾-inch margins. Paper insertion is casy, sure, and quick because of the specially designed back guide which holds the paper down while it is positioned against the side guide. Masking arms have wide base with spring clamp handles, giving rapid, sure adjustment; they keep things completely on the square. A stand arm holds the mask off the board while paper is being inserted. Warp-proof base with non-slipping felt bottom. Price, \$9.60.

Light to work by is most conveniently provided by the new Kodak Two-Way Safelight Lamp. Here is a safelight as versatile as they come. Triangular in shape, it is

equipped with a filter on one side and a metal plate on the other. Both can be easily and quickly removed to change filters or to insert filters on both sides for more light. Connect it with an extension cord and set it on a table or bench handy to your work, or insert it directly in a socket in the conventional manner for wall or overhead lighting. An added advantage—the unit can be completely rotated in the socket, to aim the light exactly where you want it, in the concentration you want. Price, \$4.50—complete with one filter and 15-watt lamp.

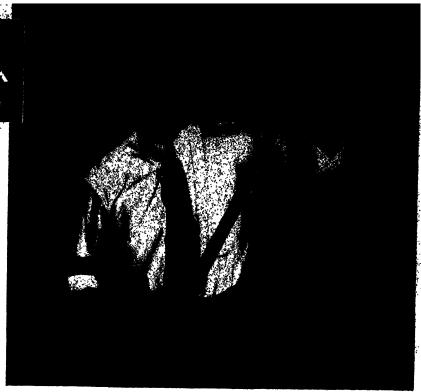

Beginner or professional, you will be interested in the new book, "Bigger and Better, the Book of Enlarging," by Don Nibbelink, FRPS, APSA. Here is an accurate, compre-

hensive, clear, concise, and up-to-date guide on enlarging, from simple print making to advanced control processes.

This book tells everything that goes into the final print—negatives, papers, solutions, the darkroom . . . and you. It helps you analyze your work from artistic and technical viewpoints. It gives detailed step-by-step instructions for making good pictures better. For the first time, it also describes the new control process, monochrome-dye printing. Eighteen chapters with more than 100 illustrations make this the complete book on enlarging. Price, \$2.95.

When planning and equipping your darkroom see your Kodak dealer.

### MATCH PAPER AND NEGATIVE PERFECTLY.

## with Kodak Medalist Paper

Kodak Medalist Paper is more than a fine exhibition medium. It is a new kind of photographic paper—a unique and winning combination of high speed, uniform speed in all contrast grades, fine tonal quality, broad adaptability to toning, and flexibility in contrast control.

Medalist's flexibility offers a new key to print quality. It enables you to match paper and negative so perfectly that print quality need never be compromised. All Medalist grades, I through 4, can be manipulated up or down the contrast scale to meet adjoining grades . . . giving you, in effect, an infinite series of grades.

Furthermore, merely by adjustment of the exposure-development ratio, you can choose freely between soft, normal, and brilliant prints from the same negative—without risking muddiness, fog, or shifts in image tone.

Medalist on direct development yields rich, clear, warm blacks—just a hint warmer than the true neutral blacks of Kodabromide Paper. In Kodak Brown Toner, Medalist tones to a beautiful warm brown. In Kodak Selenium Toner, it yields rich, deep browns. In Kodak Blue Toner, it acquires gray-blue tones.

Several popular surfaces — including glossy F, fine-grained lustre G, and sparkling high-lustre J—and printing grades Nos. 1 through 4.

And it's a high-speed paper, with the same effective printing speed for all four contrast grades.

In brief, it is the most remarkable photographic paper in many years. If you are seeking a finer medium for your work—if you have not yet discovered what Kodak Medalist Paper can do for you—your Kodak dealer is the man to see. See him today.

Prices include Federal Tax where applicable and are subject to change without notice.

## VIEWS AND REVIEWS

BY THE DIGEST EDITOR

#### The Convention In Retrospect

The New York Convention is now history—and all who were there agreed that it made pleasant history. The exceptional programs developed for the Pictorial Division by Doris Martha Weber made all of us proud.

As I remember the outstanding parts of this New York Convention—the programs were fine—they always are. There is a stimulation and continued challenge to know a little more this year than you did last year about this fascinating subject of photography.

There were social get-togethers too. Look at the number of photographers who hauled their equipment aboard the boat which took us on that interesting and instructive trip around Manhattan Island. Shutters clicked and movie cameras buzzed all around us. Cameras were compared, flash bulbs put man-made sun in the darker corners. Cameras turned toward Manhattan's towers and chasms—and the lovely curves of the models aboard. And everyone had a good time.

Those attending had a chance to express themselves. A Members' Meeting and audience participation in all programs gave everyone a chance to have his say or to have the experts give him an opinion. And if attendance at some of the programs indicates interest in pictorialism—there is plenty. For several programs overflowed their rooms and the interested audience sat on the floor in the aisles.

And the climax to the meetings came at the annual banquet and presentation of the awards. Those of us who attended had the rare privilege of glimpsing briefly into the future of PSA and seeing revealed there the outline of a project which will permit us—as amateur photographers — to interpret America to the rest of the world.

PSA is on the threshold of becoming more than a group of photographers seeking only photographic knowledge...PSA is entering its maturity as an ambassador of a wider truth—as an interpreter of liberty and freedom—as a vital factor in world peace and understanding.

These may be just so many words to many of you—but remember them—they are a prophecy, for Captain Mackay's talk at the banquet was prophetic of the things that are to come.

And after two or three or four days of being together at our annual convention—there comes the hardest thing—that of bidding goodbye to friends. For the thing that makes our PSA Conventions worth attending isn't the programs nor the social events, although they play a large part. No, the central core, the heart of a PSA Convention is FRIENDSHIP.

For PSA friendship is a heady distillate

The newly elected P-D officers were introduced Friday night. They are, left to right, Ray Miess, APSA, Chairman, Norris Harkness, APSA, President of PSA, Stella Jenks, APSA, Secretary, and Loren Root, APSA, Vice-Chairman. Robert Lauer, Treasurer, was unable to attend.

of love and respect and mutual interests. Those who have tasted the friendship in PSA are forever lost—they must return again and again to drink of it—and the thirst grows stronger the longer they partake.

But it is not a selfish thirst—it reaches out and ennobles all with whom it comes in contact. Through the growing friendships, more and more people know the true delight of convention attendance—know how warm and enduring friendships started there can become.

Leave taking is poignant—among friends it always is. We have been together for several too-short days—and suddenly it is time again to go our separate ways. But the inspiration of the programs—the opportunity to know each other better during these few short days—the deepening of our bonds of friendship—these sustain us in our leave taking. For we know that if the Great Master of us all is willing another year will soon roll by and we can be together again.

Yes, the New York Convention is over and already preparations are being made for next year—and the by-words now are "see you in Los Angeles next year."

---Stella Jenks

C. "JERRY" DERBES, Director

The Salon Workshop is off to a terrific start. A number of groups have already been started, applications are coming in

strong and new groups are being formed right along.

Additional incentive has been provided by two of our Masters, Mr. Wellington Lee, APSA, and Mr. J. M. Endres, APSA. These well known exhibitors have offered their group winners more than the standard reward, that is the autographed Salon Print, for making the best print of their group. Mr. Lee has offered a medal as a first award and four honorable mention ribbons.

Mr. Endres has offered "The Endres Award", a very beautiful plaque made of hammered brass mounted on a mahogany base. He has, in the past, offered this award to members of his camera club who hung their first print in an International Salon. Now he has extended it to the person who makes the best print in his Salon Workshop group.

Participating in the salon workshop is fun for both the Master and the inexperienced worker. Groups of 15 persons each are formed containing people with about the same experience. In the first circuit box is a real salon negative made by a well known salon exhibitor. The box also contains a printed article titled "How to Make a Salon Print". This article, written by one of the foremost Salon Exhibitors of all times, is in itself well worth the service charge. Anyone willing to follow the clear cut rules given in this article should, with a little practice, be able to make prints from their own negatives which will hang in the International Salons.

To begin with you will receive a very fine salon negative from which you will be required to make an 11" x 14" print. You can crop the print in any way you care to. You can tone it or not, depending on how you think it would look better.

Also included in the negative box and the print box is a small notebook in which the Master of your group has given a full account of his photographic background and included a picture of himself. You in turn are to do likewise, giving any information about yourself you care to and each of you will be expected to also include a small picture of yourself. It's fun to meet your fellow members through the notebook.

Later, when the negative has completed the fire round, everyone will receive all of the fifteen prints made by each member of his group, plus a print of like size made by the Master. He will then be able to compare his print with that of the others and the Master's print. Five days time will be allowed each member to inspect these prints. There will be times when the prints will arrive near your camera club meeting date and you might want to take them down to show them to the gals and guys at your meeting. Do not, however, delay the circuit beyond your five days allotted time. Remember, the member next on your list is anxiously awaiting the arrival of the prints and the others down the line are doing likewise.

The cost of mailing both the negative box and the print box is very small since they will weigh very little. The Salon Workshop is operated on a yearly basis and each member will be able to work with at least two negatives from two different Masters in a year's time for the one dollar service charge.

The Salon Workshop is fun for the Master too. The well known Salon Exhibitor who is interested in helping the less experienced worker will derive great pleasure in seeing the results of his effort and how each member interprets his negative and prints from it. If you are a One Star Exhibitor or better and would like to become one of the Masters of a group we would like to hear from you.

Members of the Pictorial Division wishing to join one of the groups are urged to write the Director, whose name and address appears in the mast head, for application blank and detailed information.

A. LYNNE PASCHALL, Associate Editor

#### The Convention

Many of the directors were at the National Convention in August, and they all look hale and hearty. It is wonderful what a meeting like that can do to a man's morale.

One morning when I went down to the Coffee Shop, Jake Endres gave me the high sign and we had breakfast together. We had a pleasant little chat and one of the first things Jake asked about was a picture that I had laid aside a year or two ago. "It had the makings of a salon print," he said, "I hope you haven't given up on it yet."

I had little to say in self defense because I realized that I had been negligent, but I have often thought since: In what other organization could such an incident have happened? How many men as busy and important as Mr. Endres would have taken time out to pick up a lagging member and give him a push in the right direction?

#### Camera Club Judging Service

Fred Bauer, the director of this activity, gave me a friendly pat on the shoulder, one evening when we were going up in the elevator at the New Yorker, and I wished that he had been with me at some of the sessions where the judging problem was discussed by camera club officers. It is a subject that worries them all. There is nothing we can say here about PSA Service that would be more convincing than this message from a satisfied customer. We quote from a letter that Fred received recently from the Ashville Photographic Society:

'I would like to add that we feel this Camera Club Judging Service in itself is worth more than the cost of a membership.

"I have long recognized that I have personally been neglecting to take advantage of my membership, mostly for the lack of time; and I have also recognized that the Club has been neglecting its privileges and this proves it." How about you? Has your club been paying for something that you have failed to get for them?

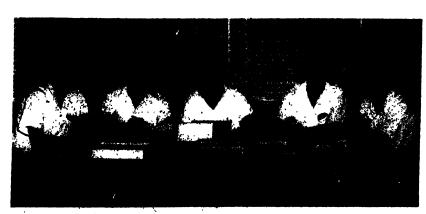

Mr. Bauer says: "We have added a new feature at some of our judging points. Where equipment is available our judges will make tape recordings of their comments on the prints sent in for judging. These records can be played back at the meetings when the prints are returned, and the clubs that have used this method report back most enthusiastically."

#### Recorded Lectures

A new recorded lecture has been added to the list. This talk is by J. Elwood Armstrong and is based on a hundred pictures selected from the PSA Permanent Print Collection. It will be No. 6 on our reper-

Some of the pictures are quite well known in photographic circles and are the work of people of world renown, such as: Ansel Adams, Cecil Atwater, E. C. Crossett, Adolph Fassbender, Frank Fraprie, Nicholas Haz, John R. Hogan, Yousef Karsh, P. H. Oelman, and Max Thorek, to name only a few.

This talk has been translated into Spanish for Latin American distribution, and in time some of the other talks may be translated, for there is an urgent demand for them.

Getting out applications and routing the first groups of the Salon Workshop are, left to right, PSAers C. L. Anderson, J. M. Endres, APSA, C. "Jerry" Derbes, Director, Walter J. Bone, Jr., and T. G. James, all of Jackson, Mississippi.

**ORGANIZATION** John R. Hogan, Hon. PSA, YPSA. Direct 1528 Walaut Street, Philadelphia 2, Ponus. Some new lectures are also planned, but it is too early to announce any of them yet.

If your club has access to a tape recorder, write to Philip Maples, Brockport, N. Y. for particulars. Be sure to tell him what dates you have open, as well as the name of the recorded program in which you are interested.

The West Coast distributor is Mrs. Vella L. Finne, 1827 E. Fourth St., Long Beach 12. California.

The distributor for Canada is Mr. Frank L. Pogue, 810 Duplex Ave., Toronto, Ontario. Canada.

I may add that your letter to Phil will likely be answered by his charming wife, Jessie. She was the last person to whom I talked at the PSA Convention and my B & O Coach was called before I could finish the conversation. There wasn't even time to tell her that she misplaced a comma in a letter to me last winter.

#### American Exhibits

Two new shows are now ready for scheduling. One is an excellent pictorial exhibit from the Omaha Camera Club and the other is an equally fine set from the Syracuse Camera Club. In addition, the Standard Oil Company Documentary Exhibit is again open for scheduling and has some open dates during the fall months.

Other exhibits are pretty well booked up through December so that clubs desiring one or more of them for January or later should write to Fred Fix as soon as possible.

#### Portfolio of Portfolios

Under the able direction of James T. Johnson, this activity has been a very busy one during the past few months.

As you know, a Portfolio of Portfolios is a collection of prints that have traveled in international portfolios. The individual prints are not large (say 5" x 7" on the average) but the mounts are all of uniform salon size (16" x 20") and each one contains as many pictures as can be conveniently grouped on a card of this size. They make ideal pin-up displays for club meeting rooms.

Nine new sets have recently been added, giving a lot of new material, and the exhibits have all been travelling, some even to far-off Hawaii. More than nine hundred people have viewed them and expressed their satisfaction.

Among the places that have had sets may be listed the following:

Brooks Institute of Photography, Santa Barbara, Calif.
Santa Maria Camera Club, California
Batou Rouge Camera Club, Louisiana
Bayou County Camera Club, Louisiana
Tejon Camera Club, Bakersfield, Calif.
Standard Oil Co. Camera Club, Sant Francisco
Lake Charles Camera Club, Louisiana
Channel City Camera Club, Santa Barbara, Calif.
Oznard Camera Club, California
Kahuiut Camera Club, Hawaii
Seven Hilla Camera Club, California
San Luis Obispo Camera Club, California
San Luis Obispo Camera Club, California
Lahahuj Camera Club, California
Lahahuj Camera Club, Hawaii
Lincoln, Nebraska
Boise, Idabo.

Mr. Johnson will be pleased to hear from any PSA club that is interested. He has recently purchased a new home in Santa Barbara, so be sure to send your correspondence to the new address as shown in the masthead.

#### Portfolian Clubs

We were very sorry that Sten Anderson, the director of this activity, was unable to be at the New York Convention, but he has been very busy out at Lincoln, Nebraska, and tells us that the Portfolian idea is gaining right along.

Oklahoma reports: "The Bartlesville Portfolian Exhibit is over and our club feels it was a worthwhile project. There were over 45 prints displayed in a public place and they attracted a great deal of attention during the two-weeks period. At the close of the show we photographed each picture in order to have a record for our files. A poster was prepared and displayed along with the exhibit, giving the names of the contributors and where they were from." From Berkeley, California: "Things mov-

From Berkeley, California: "Things moving nicely in the 'Eager Beavers'. Boris Dobro (Sponsor) couldn't get up here for a week of cramming, so we organized a class on The Negative, by Minor White, which has just completed six weekly meetings, with projects or home work. Jim Johnson of Santa Barbara was up here and we had an informal gathering with him."

If you know four or more members of PSA and the Pictorial Division, and wish to form a Portfolian Club, write to Sten Anderson for his latest circular. No fee is charged.

Although Sten couldn't get to the Convention, some of his staunch Portfolian Club members did get there. When we started out from the New Yorker for the boat ride, it was Frank Heller of the Bartlesville, Oklahoma, Club who took charge and got four of us into a cab in short order. I can see why he is so well thought of around the Y. at Springfield, Ohio, where I also have many friends.

#### Camera Club Print Circuits

Our old stand-by for last minute scheduling is the Print Circuit. There is always a new one in the making.

The prints in these circuits are not made by nation-wide celebrities but are the work of average camera club members like you and me. Such shows are a great help and encouragement to beginners and are enjoyed by the most expert exhibitors. If your club wishes to know how it measures up with other clubs across the country, by all means join a Print Circuit.

Only three prints are required from your club, but there will be a total of twenty-four in the circuit.

After a number of years of faithful work, our old friend, William R. Hutchinson has found it necessary to give up this work, so now address your letters to George J. Munz, whose address appears in the masthead.

#### Instruction Print Sets

And now we have something for the small PSA clubs, especially those whose geographical location makes it difficult for the members to attend national conventions, to view leading salons, or be present at judgings.

The Instruction Print Sets are intended to bring the highest type of salon work to these clubs. The sets that are sent out are one-man shows and each is accompanied by a discussion such as a panel of judges might make.

. We have had collections of fine pictures before, but had to depend upon the criticicisms of the club's own members, who we all think are prejudiced in their views. With these prints, we have the comments of topranking salon judges. It is interesting to learn what the leading experts think of this picture and that, and such knowledge may enable us to see why our own work doesn't get recognition beyond the local club.

The director of this new activity is Dr. John S. Anderson, First National Bank Building, Grand Island, Nebraska, and we suggest that you write him for further information.

## INTERNATIONAL CLUB PRINT COMPETITION

ROBERT J. LAUER, Associate Editor

October 20 is closing date for the first International Club Print Competition of the 1952-53 season. Baltimore CC will handle the judging. Judges for first round are A. Aubrey Bodine, FPSA, Mark Mooney, APSA and Edward L. Bafford, APSA.

Send your club's four top prints right away to Baltimore CC, 601 W. North Ave., Baltimore, Md. Entry blanks and information from Dr. Grant Haist, 166 Valley Crest Rd., Rochester 16, N. Y.

#### Introducing A New Director

Taking over as new director of the International Club Print Competition is Grant M. Haist of Kodak Camera Club, Rochester, New York. Grant is active in photography, both as a vocation and as a hobby. He finished his education at Michigan State College, receiving his Doctor's degree in Physical Chemistry in 1949. Since then he has been a member of the Photographic Chemistry Department of the Research Laboratories of Eastman Kodak Company.

Active in Club work, Grant has served on the pictorial committees of the Kodak and Rochester International Photographic Exhibitions, and has just completed one year as chairman of the Monochrome Section of the Kodak Camera Club.

#### AN INVITATION

This is an invitation to every PSA member to participate in the PSA American Portfolios.

Enrollments are now being received in the following specialized groups:

PSA Pictorial Portfolios
PSA Portrait Portfolios
PSA Miniature Portfolios
PSA Control Process Portfolios
PSA Star Exhibitor Portfolios
(For PSA Award of Morit Winners)
PSA Nature Portfolios
PSA Photo-Journalium Portfolios

For information concerning any of the foregoing activities and for enrollment blanks, write to the Director of the PSA American Portfolios, Eldridge R. Christhilf, Hon. PSA, APSA, Suite 406, 800 Davis Street, Evanston, Illinois. When asked to give a thumbnail sketch of his photographic background, Grant said that this was a little tough to do, but with a little probing here is what we were able to find out: As with many serious amateurs his "photographic life" dates from the time he won a 35mm camera in a newspaper contest. He maintains that the exclusive use of color film to take snapshots taught him to carefully consider each exposure before taking it. From there he worked up to a 4 x 5 Super D Graflex for serious black and white work.

Exhibition photography looked interesting and enough acceptances and honor prints in International Exhibitions spurred his efforts in nature, pictorial, and documentary fields. Color slide exhibiting in nature and pictorial round out his photographic efforts. This year the Buffalo Nature group selected Grant M. Haist as one of the color jury for their International Nature Exhibition. He also served as a judge for the PSA Nature print competition.

As a director of this PSA activity Grant will have a good background to take care of all the planning which is necessary for a smooth running operation. From there on out, with a little imagination and with the interest and help of PSA Camera Clubs, the International Club Print Competition, we predict, will continue to grow and prosper.

STANLEY D. SOHL, Associate Editor

#### International Portfolios

With the New York Convention of 1952 a matter of history and the Los Angeles Convention of 1953 a pleasant anticipation, the International Portfolios found new life and new hope during this summer.

The Portfolio room on the fourth floor of the Hotel New Yorker was not only a meeting ground for the internationalists, but it truly emphasized the friendliness and mutual feeling of warm cooperation that exists among us. Although all phases of the several portfolio activities of Pictorial Division were on display, it was at the International Table where one found Mexico and Canada with their arms around the shoulders of China, discussing the beautiful work presented by the pictorialists of New Zealand and France! Kipling's admonition that "East is East and West is West, and ne'er the two shall meet" again was kicked into a cocked hat—as it usually is when the members of the International Portfolios assemble to discuss their common hobby.

Plans for the betterment of the International Portfolios were discussed and those problems which in the past have been bothersome seemed to vanish into thin air. More and better activity is in store for all internationalists, and encouraging announcements will be released in the very near future.

Our days of stagnation and doldrums are gone—the future is bright! Stay in there punching and watch the interest and activity perk up, but fast!

See you all again in Los Angeles in 53?

#### Comments Into Spanish

Col. Charles J. Perry, Director of the International Portfolios, has been working hard getting materials together and ready for translation into Spanish for our South American and Mexican members. The latest translation is done by Juan Garcia from Elwood Armstrong's, F.P.S.A., commentary on the One Hundred Pictures of the PSA Permanent Collection. This translation is then recorded on tape to be used by local clubs for their programs. It is now already in use in Mexico. This new service is good publicity for our International program and the PSA. In the near future Philip B. Maples will have some new English originals ready for translation.

#### Miess In Mexico

Ray Miess, APSA, the newly elected Chairman of the Pictorial Division, spent a week in Mexico City this spring. Actually a delegate to the Rotary International meetings, he was privileged to visit the beautiful Club Fotografico de Mexico as well as many places in the photogenic city.

In preparation for his trip, Ray had studied the Spanish language for over a year, and had succeeded in gaining a vocabulary approximately equal to that of a fourteen year old boy.

He was greeted at the airport by a delegation headed by Francisco Sobrino. In the group was the president of the Club Fotografico de Mexico, Sr. Jose Turu. ex-president, Manuel Ampudio, Arturo Vives, and Mario Sabate. Later he was honored by the Society and he responded with a short talk. During his stay in the capital he attended a number of meetings of various sections of the club.

He left Mexico with Turu and Sabate and he promised to aid the club with forms and circulars, relative to the approaching Salon International de Art Fotografico.

This information came from the "June lssue Bulletin" published by the Club Fotografico de Mexico.

MISS EVELYN ROBBINS, Associate Editor

#### Chirps From The Robbins

Were YOU at the PSA Convention, just finished, in New York?, I hope so for it was a grand one.

It was my great privilege and honor to spend quite a bit of time in the Portfolio Room, and there meet with a great many Portfolioists that I had not met before and to renew acquaintances with those I had. Of course, that isn't to mention the tremendous thrill gotten out of talking with these who were quite new to the activity and convincing them that they really were missing semething BIG by not joining in this great organization of ours and becoming a part of italicant is the semething at least I hope I was sufficiently convincing, because if you haven't yet been "bitten" by the Portfolio bug, you just aren't quite in the swing of things.

Overheard conversations covered everything from the various merits and advantages of print finishes, such as varnish vs. wax, etc.; how to apply it and what the results should be to give the very best possible quality-the advantages and disadvantages of Portfolios that used a maximum of 11 x 14 prints—and the same controversy on the ones using exclusively 8 x 10 prints, and the comparison of one against the other in size. Discussions on the different papers, developers, toners, etc. Doesn't that sound familiar? Of course it does! isn't that the usual trend of the notebook entries in the Portfolios themselves? It was only natural, because after all, they were simply carrying on where they had left off in their own particular circles.

During the course of the conversations the following question was put to me, and I wonder now if perhaps there might not be others who have the same problem. "I'd like very much to belong to a Portfolio, but I've always felt that it was impossible because my address is constantly changing—it is one locale in the winter and another in the summer. Would there be any way I could join a Portfolio?"

Of COURSE you may join a Portfolio! Just keep your Portfolio Secretary informed at all times, giving him or her the address to which the Portfolio must be mailed at that particular point in its circuit, allowing ample time for the setting up of the schedule so that you will receive it promptly and at the proper address. There really isn't much of a trick to it, and certainly very little extra work involved. It does work, and works beautifully. I belong to one that works just exactly that way, and so far as I know, from the schedules, that Portfolio has yet to bog down a single time due to a delay on the part of the person who carries a different address in the summer than he does in the winter. If it is held up, it is due to some other reason, you can always place a very sure bet on that.

One point which was brought up in the Portfolio Members' Meeting that I think it might be well to discuss with your fellow Portfolio members was this. It was agreed that it would be an excellent idea to add to the Portfolios a section just for remade prints. The rest of it would remain the same. What do you think of the idea of carefully noting the comments on your print, and then doing it over according to those comments and putting it into the Portfolio again in this particular section, chiefly as a check for those that advised the changes, to see if you DID understand what help they had tried to give you. It's something that might well be discussed with your fellow Portfolio members, and if you agree that it would be good, then I'm sure that just that sort of thing can and will be put into use.

It is my sincere wish that more of you could attend those meetings in the Portfolio Room—truly, they are unbelievably wonderful. I was privileged to introduce

several members of Portfolios that had not met before, and then sit back and watch them. It was but a matter of a couple of minutes until they were chattering away as though they had known each other all their lives. It was nothing unusual to see them from then on at various programs together, either in twos, or even a larger group, if that particular Portfolio happened to have better than average representation present. That those particular Portfolios will really hum from now on would be my guess from experience.

Several met their Commentators for the first time. That is an experience beyond description. Will it suffice if I simply say, "Both wore grins from ear to ear"? And that is actually the story. It never failed to happen that in no time at all the Portfolio members were asking the Commentator's advice and help; and the Commentator would give it without hesitation and no matter how long and detailed an explanation it took. The loyalty to THEIR own particular Portfolio is tremendous, too, because before the conversation was ended the Portfolioist had been urged, and more than urged, to enter the Print of the Month Contest that John Hogan is so ably guiding, with the reminder that THEIR Portfolio just had to win the most points!

Yea, a visit to the Portfolio Room at a PSA Convention is a truly unforgettable event and one that I hope you may all experience soon. You'll find a warm hearty welcome there!

#### Tape Recorded Portfolios

By ELDRIDGE R. CHRISTHILF, Hon. PSA Director—PSA American Portfolios

The fact that a number of PSA members have tape recorders has brought a suggestion from Sam Levy, Harristown, Illinois, which we feel has considerable merit—Tape Recorded Pictorial Portfolios.

Briefly, and subject to change, the mechanics will be the same as those under which the PSA Pictorial Portfolios are operated, with the exception that all comments, criticisms, etc. will be via tape recordings instead of by writing. Each member will supply his own 5" roll of tape along with his prints, and all comments and criticisms on that particular print will be made on the member's tape, along with his technical data and any other information that he may wish to give about that print. As the Portfolio will contain no writing it will be able to travel by parcel post instead of Railway Express.

Do not send in your enrollments now—but if you do have a tape recorder, and wish to participate in such a Portofolio please let us know at once. Whether we inaugurate such a Portfolio will depend entirely upon the response that we receive to this initial announcement. It is hoped that the response will be sufficient to enable us to start several Circles in the near future.

Address all commounications in reference to this to:

E. R. Christhilf, Director PSA American Portfolios, Rooft 406-800 Davis Street, Evanston, Illininois

#### Meet Another Portfolio Member

The following was picked up by the alert secretary of Pictorial Portfolio #64, Miss

Susan Sherman, and I wonder just how many of us feel the same way. Let's see if you aren't in agreement. Grant Reed tells us of the three phases through which he passed since starting photography as follows:

"1st: A great awe, bordering on reverence of anyone or anything connected with a darkroom—and a fear that any step I might do wrong would absolutely ruin my whole picture. This I call my 'wonder phase'. Wonder why I ever got out of it?

"2nd: This phase I call my 'hot shot' phase. After a few rolls of film I began to notice that a little more or less, a little hotter or colder, a little lighter or darker, etc. etc. etc., didn't seem to make much difference—I still got an image. Nothing to this photography. Look, I'm a photographer—I make Pitchers!! Well, this phase persisted for quite some time. Then I began to compare my prints to others: 'Boy, what's the matter with you?' I says to myself, 'Why are these shots of yours not so good?' And that word 'why' has helped me no end. Which brings me to:

"3rd: The Renaissance: I 'awoke' to several facts;

- a. Exposure must be right.
- b. Film development must be right (including fixing, washing and drying).
- c. Print development must be right. (Don't stretch development or pull the print too soon.)
- d. Print finishing must be right. Drying, flattening, spotting, varnishing, etc.

"And if you don't believe real care and attention to details will improve the final result, just fill out the attached coupon, and I will send postpaid some prints made a short two years ago—you'll be convinced!"

#### "STAR DUST"

A monthly column devoted to the "Wit and Wisdom" of the Stars as taken from Note Books in the Star Exhibitor Portfolios.

By ROY E. LINDAHL, Gen. Sec'y Star Exhibitor Portfolios

This month's column is devoted to a letter from another member in Star Three who sets a high standard for his group with the following summary which he entitles CRITICISM.

"I intend this criticism to be constructive, but frankly, I was disappointed in Star Exhibitors Number Three. In fact, I might say that I was even disgusted with the general complexion of the prints in round one. In my opinion, only three prints out of the fifteen submitted are salon material. A fourth one is barely possible.

"On the basis of the 1950 Annual of Photography, I was correct in assuming that completed, technically correct salon prints was what one should expect from this group as that issue of the Annual shows an impressive salon record of twelve members in the last three years, namely an aggregate of 1.696 prints accepted and hung in various recognized salons. If the prints in round one are a sample of what was accepted and hung in those salons I certainly have little respect for the judgment of those juries. Some of these prints possibly can be made into real salon prints, but generally I feel that you will each have to agree that this is a very poor showing for fellows who have had the number of prints accepted and hung that you have. I know you have had prints rejected, as each of us have, and in my opinion this Star Exhibitors Portfolio should show only our best work.

"Most of you have no doubt attended the judging of several salons. You know how the three judges react to 2,000 or 3,000 prints that pass before them in the light box at the rate of one a minute and they vote in, hold or out. If sufficient 'Ins' are voted, your print hangs. If it is held it gets up for a second review, and it may hang or it may be ultimately out. None of us knows what the reaction of the judges will be to our print. We only know the actual result which was either 'In' or 'Out'.

"For this Portfolio I believe that we fifteen comprise a jury. Our vote is not in or out but in the notes on each print we will give our opinion as to why it is in or why it is out and what may be done about the print to make it one that other juries will vote in.

"This portfolio should be one that we can show to and discuss with our friends and before our clubs as an example of what is the best that can be produced. Technically it should be perfect. I showed this first round of fifteen prints to a small club here at the Federal Reserve Bank. The comments on quality and technique on most of these prints was something that I do not care to repeat, and honestly, these kids were right, for as a whole, these prints smell as compared to what should have been submitted in this first round.

"I know you fellows don't like this and would like to tell me where I get off, but what I am aiming at is this: Let's make this Portfolio what it is supposed to be-a reviewing clinic made up of salon exhibitors who know salon prints and who can be helpful to each other in making real constructive suggestions for improvements. Technically, we should all be tops. Our ideas as to what is a pictorial or salon picture may differ. That is to be expected; but, frankly, let's have Star Exhibitor Portfolio number Three made up of prints that sing and that will establish a reputation for this group that will be the envy of the members of the other portfolios."

F. L. PURRINGTON, Wheaton, Illinois

## Highlights from the PORTRAIT PORTFOLIOS

FREDERIC CALVERT, Associate Editor

It is with regret, that I announce the resignation of Maurice H. Louis as Assistant Director of Portrait Portfolios. In his place, William H. Turner of Wallingford, Pa. will assume the duties as Assistant Director.

The 1952 Convention was well represented by many Portrait Fortfolio members. Those who signed the registration book were: William H. Turner, Wallingford, Pa., Henry C. Radon, New York, Henry C. Sollman, Cobleskill, New York, Edna V. Tucker, Utica, New York, Arnold W. Wise, Albany, New York, Caryl R. Firth, Trappe, Md., Lyle M. Wilson, Roanoke Rapida, N. C., Henry O. Forrest West Englewood, N. J., J. G. Whetson, Youngstown, Ohio, H. L. Garrison, Westfield, N. J., Susan Sherman,

N. Y. C., Carl C. Shutt, Warren, Ohio, Belle McMullin, Lansing, Mich., Rietta Scofield, Waterbury 8, Conn., Stanley Vlattas, N. Y. C., Florence Jordy, Madison, N. J., C. Oliver Proctor, Washington, D. C., George Munz, Bergenfield, N. J., B. Kleban, Wilmington, Del., George Braun, Ridgefield, Conn., Louis Lehman, Trenton, N. J., Maurice H. Louis, N. Y. C., Herbert Jackson, Signal Mt., Tenn., Fernald S. Stickney. West Caldwell, N. J., W. F. Small, Newburgh, N. Y., Alfred Weber, Bridgeton, N. J., Gerald F. Greenridge, Brooklyn, N. Y., Catherine Dorr Whetson, Youngstown, Ohio.

Romance has blossomed in the Portfolios. Miss Catherine E. Dorr of Brooklyn, N. Y. met Mr. J. George Whetson of Youngstown, Ohio at the Baltimore Convention, became engaged at the Detroit Convention and were married in June of this year in time for the convention.

GEORGE GREEN, Associate Editor

I've come to the conclusion that it doesn't pay to plan too for in advance. I'm not diluting my "soup" with tears but I sure had planned on attending the Convention this year. But "Hypo" was ordered back to bed by the medics. So, instead of meeting all you grand PSAers and flapping the humid air with photographic chin-chin, I'm up to my elbows in suds and clothes which three active images can dirty quicker than you can dry a negative.

Although my skill with the skillet can in no manner equal "Hypo's" it nevertheless is nothing to be thrown to the dogs. Nevertheless the kids didn't eat as much nor with the zest that accompanies the better-half's platters. I had the technique but not the presentation! I tossed the food into the plate instead of making it attractive to their eyes so that their little atomachs would want to eat my cookery.

What has all this to do with Pictorialism? Well, like the proof of the cooking is in the cating, the test of the photographer is in the presentation.

Presentation requires technique. Technique calls for knowledge of both the tools and the subject matter.

Knowledge is divided into two categories: book (theory) and practical (working). Although it is best to acquire them in the above order it doesn't matter too greatly UNLESS you have taken on bad habits while attempting to do it first and read about it afterwards. Good, solid knowledge is based upon reading and learning first and then going out to put it to use.

Once you know what you're doing you must go one step further. You must learn how to apply this technique. You must begin to see what impressed you and then you must strive to capture that impression. After you've done that you have to create this impression all over again in order that

those who view your print will in turn see what caught your eye and warranted your taking and making the picture.

Like ham goes with eggs, knowledge goes with technique. You can have one without the other and do alright but it takes the combination of both plus the seasoning of impressions to bring acclaim.

We can't hold the camera for you or help in your darkroom processes but we can be of aid. P. D. is here to serve you. Tell us your problem and show us your prints and we'll carry the development from there,

#### Award of Merit

The following changes have been made in Star Exhibitor ratings since the last list was published:

#### New One Star Exhibitors

Nils Lindstrom, Ljungby, Sweden Alice Ingersheimer, Brookline, Mass. Dr. S. N. Sarkar, Calcutta, India Stanley D. Sohl, Lincoln, Nebr. C. Bronson Weed, Hamden, Conn. George J. Munz. Bergenfield, N. J. Claude Vivier, Roubaix, France Emile Descamps, Roubaix, France R. W. Beede, M.D., Youngstown, Ohio

New Two Star Exhibitors

W. Arthur Young, Webster, N. Y. John O. Hay, Cleveland, Ohio

Advanced from One to Two Star
A. E. Woolley, Baton Rouge, La.
Lawrence W. Spaven, Rochester, N. Y.
Howard A. Hartman, Chicago, 111.
Walter F. Wood, Montreal, Canada

New Three Star Exhibitor

Mrs. Ann-Marie Gripman, Gothenburg, Sweden

Advanced from Two to Three Star J. Wallace Galloway, Edmonton, Canada Glenn E. Dahlby, Oak Park, III. Charles N. Chambers, Calcutta, India John F. Barnes, San Jose, Calif. John I. Fish, Rochester, N. Y. Martin W. Lentz, Wichita, Kan. Blanche M. Lentz, Wichita, Kan. P. N. Mehra, Allahabad, India

Advanced from Three to Four Star Harry L. Waddle, APSA, Port Dover, Canada C. F. Luce, Jr., Atlanta, Ga. Newell Green, FPSA, Hartford, Conn.

If you feel you are eligible for the Star Exhibitor ratings, write to Glenn E. Dahlby, Director, for full information about the requirements for the various ratings.

#### Report of the Personalized Print Analysis Service

#### J. ELWOOD ARMSTRONG, FPSA Director

The Personalized Print Analysis Service has truly been such to the P.D. members of the P.S.A. Without discussing the fact that it is rendered free to members of the Pictorial Division it evidently is and has been of some value because during the past two years more than 500 prints have been individually analyzed, and a personal letter written by the director to each member sub-

mitting prints with helpful suggestions for the PSAer's guidance. Reproductions from Salon Catalogues have been returned with the analyzed prints to help members see how good photographs could be made with the same material.

A review of this prodigious number of analyzed prints brings two compelling needs to the fore; 1) a better understanding of picturization and composition and 2) a more definite approach to print quality.

Both of these shall be given treatment in the P.D. section of the Journal from time to time. Suffice it to state that the first four ratings of the Analysis are: Subject interest, originality and impact, emphasis on center of interest, and compositional design. Just look at some of your prints and see for yourself whether you have a picture, a print, or a snapshot. How can you tell? Just use the above as your guide. And we'll meet in the Journal sometime soon to see whether you see eye to eye with us.

Evidently, everyone is interested in making good and/or better photographs. How do we know? Hecause out of the vast number of prints received for analysis every state in the Union and distant parts of the world were represented.

Space prohibits publishing all of the letters of appreciation the Service has received. Perhaps this one will enable you to understand why we feel so proud of the work Mr. Armstrong has done and is doing.

W. C. Streib, 94 South St., Somerville, N. J., writes: "Your helpful criticisms of the prints forwarded to you last February were so valuable that one of our members, Mr. Lee Hedges, was able to win "best in show" with a revised print of one which he had submitted to you. Needless to say, both Hedges and I were delighted with the services you so ably and conscientiously gave. Your comments were fair and just and they were accepted with the full understanding that we have a lot to learn."

How about you? Do you have a lot to learn? If you do we offer the free service of the Personalized Print Analysis by J. Elwood Armstrong.

## Coming Salons Agreeing to Follow PSA Recommendations

Note: M-monochrome prints, C-color prints, T-color transparencies, SS-stereo alides, L-monochrome alides, A-architectural prints, S-acleutific or nature prints. Entry fee is \$1.00 in each class unless otherwise specified. Recognition: The monochrome portions of salons listed have initial Piotorial Division approval. Check salon list of appropriate division for recognition of other sections. TOKYO (M, T) Exhibited during October and November at Tokyo and Osaka. Data: Katsuo Takakuwa, 1948 Kichijoji, Near Tokyo, Japan.

NEW ZEALAND (M, T) Exhibited beginning Oct. 4 at Art Gallery. Data: H. A. Larnsen, Salon Secy., P. O. Box 324, Hemilton, New Zealand.

IRISH (M) Exhibited Oct. 20 to Nov. 1 at Dawson Hall. Data: Geo. McLean, Exhib. Secy., 11 Hume St., Dublin, Iveland.

HOUSTON (M) Exhibited Oct. 12,26 at Museum of Fine Arts. Data: Katherine Wray, Museum of Fine Arts, Houston 5, Texas.

GHENT (M) Exhibited Oct. 21 to Nov. 9 at club.
Data: Julien Tack, Secy., Nieuwland 37, Ghent,
Belgium.

MISS. VALLEY (M) Exhibited Stix-Baer & Fuller, Oct 5-19. Data: E. A. Tucker, 3625 Carter Ave., St. Louis 7, Mo.

CHICAGO (M) Exhibited Oct. 18 to Nov. 16 at Museum of Science and Industry. Data: Miss Mabel Young, 231 S. LaSaile St. Room 1382, Chicago 4, III.

DOMINICAN REPUBLIC (M, C, T) Closes Oct. 12.

Exhibited Oct. 24-31 at Art Gallery. Data: Juan U. Garcia, Rosa Duarte 29, altos, Ciudad Trujillo, Dominican Republic.

MEXICAN (M, T) Closes Oct. 15, Exhibited Nov. 15 to Dec. 15 at club. Data: Ray Miess, 1800 N. Farwell Ave., Milwaukee 2, Wis. or Club Fotografice de Mexico, San Juan de Latran 80, Mexico 1, D. F., Mexico.

SANTA BARBARA (M. T) Closes Oct. 18. Exhibited Nov. 1-10. Data: Wm. A. McBride, 12221/2 State St., Santa Barbara, California.

HONG KONG (M. C) Closes Oct. 18. Entry form and fee waived. Exhibited Dec. 1-6. Data: Se-Leuk Keen, e/o Hang Shing Co. Ltd., 52 Bonham Strand East, Hong Kong, China.

VICTORIA (M. T) Closes Oct. 18. Entry fee \$1.50 for prints. Exhibited Nov. 16-23 at Empress Hotel. Data: Jas. A. McVic, 2171 Bartlett Ave., Victoria, B. C., Canada.

ARIZONA STATE FAIR (M. T) Closes Oct. 24. Entry fee \$1.50 for prints. Exhibited Nov. 7-16. Data: Miss Agnes Holst, Supt. of Photography, Arizona State Fair, Phoenia, Arix.

SAYTIAGO (M, T) Closes Nov. 4. Exhibited Nov. 20 to Dec. 20. Data: C. A. Yarrington, 50 Church St., N. Y. 7, N. Y. or Foto Club de Chile, Calle Huerfanos 1223, Santiago, Chile.

CUBAN (M. T) Closes Dec. 2. Exhibited Dec. 18 to Jan. 20 at club. Data: Club Fotografico de Cuba, O'Reilly 366, altos, Havana, Cuba.

SPRINGFIELD (M, T) M closes Dec. 3; T Dec. 10. \$2 entry fee for prints. Exhibited Jen. 4-25 at Smith Art Museum. Data: J. E. Phelps. G. W. V. Smith Art Museum, Springfield 5, Mass.

MINNEAPOLIS (M, C) Closes Jan. 13. Entry fee 82.00. Exhibited Feb. 5-22 at American Swedish Institute. Data: Warren Anderson, 123 S. 7th St., Minnespolis, Minn.

ROCHESTER (M. C. T. S. ST, SS) Closes Feb. 12. Exhibited Maich 6-29 at Art Gallery. Data: Lowell Miller, 99 Parkside Road, Rochester 16, N. Y.

SYRACUSE (M. C. T. S. ST) Clores Apr. 20. Print fee \$1.00 and return postage. Data: Allen Ruch, 1421 Butternut St., Syracuse, N. Y.

#### Other Salons

ROYAL (M. C. T. S. SS. A. MP) Exhibited at Leeds and Bristol Oct. 25 to Dec. 31. Data: Secy. Royal Photographic Society, 16 Princes Gate, London SW 7. England.

STOCKHOLM (M) Exhibited in October, Data: Swedish Master Competition, Box 3221, Stockholm 3, Sweden.

LJUBLIANA (M) Exhibited Nov. 29 to Doc. 20. Data: Foto in Kino-amaterska Zveza, Lepi Pot 6, Ljubljana, Jugoslavia.

ZARAGOZA (M) Exhibited Oct. 5-28. Data: Secretary, Sociedad Fotografica de Zaragoza, Plaza de Sas 7, Hajos, Zaragoza, Spain.

BATH (M. T, C, L, S, Record) Exhibited Oct. 4-25. Data: J. R. H. Cade, 25 Upper Horo Walls, Bath, Somerset, England.

RHODESIAN (M, A, S, C, T) Exhibited during Octuber. Data: Max B. Kew, The Mashonsland Photographic Society. P. O. Box 2038, Salisbury, Southern Rhodesia, So. Africa.

SOUTHAMPTON (M, T) Closes Oct. 7. Exhibited Oct. 25 to Nov. 22, Data: Southampton Camera Club, 36 Carlton Crescent, Southampton, England.

PETROPOLIS (M. C., M Press, T) Closes Oct. 30, 1952. No fee. Exhibited in December at Hotel Quintandinha. Data: L. A. Pimental, Sociedade Fluminense de Fotografia, Gaixa Pustal 118, Niterol, State of Rio de Janeiro, Brazil.

LINCOLN (M. A. S. I., T) Closes Nov. 8. Exhibited Dec. 6 to Jan. 4 at club. Data: A. J. Hawkins, Branston, Lincoln, England.

SAN SEBASTIAN (M) Closes Nov. 10. Exhibited Dec. 1952. Data: Club Vasco de Camping, San Marcial 19. San Sebastian, Spain.

JAPAN (M. T) Closes Nov. 15. Exhibited Jan. 15-22 at Galleries of Mitsukosht, Tokyo; later at other Japanese cities. Data: Goro Ueso, The Asahi Shim. bun Bldg., Yurakucho, Tokyo, Japan.

LUCKNOW (M, C, T) Closes Dec. 15. Enhibited Feb. & Mar. Data: S., H. H. Razair, 63 Yahlapur, Allahebad 3, India.

BENGAL (M) Closes Dec. 25. Exhibited Feb. 15 to Mar. 1. Data: B. K. Muckerjee, 24B Hindusthan Park, Calcutta 29, India.

CHARLEROI (M) Closes Feb. 15. Deta: R. Populaire, 18 Rue Destree, Charleroi, Belgium.

## **PSA COLOR DIVISION**

Forestry Building, State College, Penna.

The C.D. Hospital Project In Action In the U. S. Army Hospital in Tokyo Japan, American Red Cross Gray Lady Mrs. Edward X Blaschka of Seattle, Washington brings happy memories of the New England countryside to PFC. Daniel Hamel (right) of Brownville, Maine even though Cpl. Andrew J. Barry (left) of Klamath Falls, Oregon seems somewhat skeptical. Color slides donated by PSA members and others, either hand viewed by individuals or projected to larger groups bring great pleasure to thousands of Korean War casualties and other patients in more than 50 U. S. Army, Navy and Veterans Hospitals in the United States, Japan and Korea. Please identify your spares and rejects as to subject matter and/or geographical location and send them to the PSA Hospital Project, 353-31st Ave., San Francisco. Official ARC photo by Mori.

#### Nine Years of Progress

(Editorial note For a complete report on Color Division work during 1951-1952. See Page 571.)

In the November 1944 annual issue of the PSA JOURNAL, Mr. John S. Rowan, FPSA, in the President's report said, "The Color Division has sprung to life under Mr. H. J. Johnson and put on a bang-up International Color Slide Salon. This Division is now showing results which include many color slide interchanges and the encouragement of several additional color salons throughout the country, including the present one in connection with the PSA Exhibition. Recognizing that color photography is in for a big advance, many interesting plans are being laid so that due consideration and encouragement will be given to all phases of color, I feel that this is going to prove one of the most active Divisions in the Society,"

Mr. Rowan unfortunately did not live long enough to see that his prediction was an understatement of Color Division's poten-

In the years prior to 1943, Color Division existed in a state of inactivity. There was no treasury to finance its activities. Yet, without asking anything from PSA, it began to develop an extensive SERVICE program for color photographers. Most of the activities, by efficient organization and by

keeping expenses within receipts, from the very beginning were able to carry their own weight. C. D.'s philosophy always has been that dues should be spent for the benefit of those who pay them, at the same rate they are paid in, subject only to the statistical margin necessary for safety. And so today, your \$1 a year dues entitles you to participate in all of the division's activities without any further charge and to compete for the sterling silver medals and ribbons which are awarded in the various competitions.

A profound tribute to the success of its activities and services is found in the growth of its membership. From only a few hundred in 1943, the division now boasts a membership of almost 3,000. This represents a little over 40% of PSA's total enrollment.

Interest and participation in the various activities has kept pace with the increase in membership. From the very beginning, color exhibitions have been enthusiastically supported by color photographers. A little over 300 persons submitted entries to the first exhibit held in Chicago in December 1943. Just 8 years later, 1,111 persons entered Chicago's 1951 exhibition—the largest all color show ever to be field anywhere in the world.

: Who's Who in Color, which first appeared in the September 1944 issue of the JOURNAL listed the names of 217 persons who were successful in two or more color shows. The

1952 Who's Who contains almost 31/2 times that number (732). In addition, there were a few less than 1,000 persons who were successful in only one exhibition. One of the most important factors in the development of this activity is C.D.'s master mailing list which was used by 29 exhibitions this past year. This list of names and addresses of contributors is made available to each color show which promises to follow the Division's standards and agrees to reciprocate with the names and addresses of its contributors so that the list can be kept up to date. In the past year, five exhibitions were accorded special recognition for efficiency and exceptional service to their entrants.

A glance through the Color Division report for 1951-52, will reveal many new records for service. The bi-monthly slide competition for clubs with 138 clubs catered, is the largest activities of its kind in the world. In addition, 66 clubs enrolled in slide circuits. The exhibition slide set distribution service throughout North America and the International Exchange sets provide world-wide review of the work of our Color photographers. Interest in slide competitions for individuals has expanded so that two classes will be required this year to take care of the demand. The slide study groups, one of the newer services, has grown steadily during the past four years and now over 100 persons are enrolled with special groups for the larger size transparencies.

The slide circuits for individuals which were among the original activities of the Color Division continue in popularity with the 24th circuit completed last June. Since the inception of the Slides-for-Veterans program, approximately 250,000 slides have been distributed to hospitals in the United States, Japan and Korea, Several new services were introduced during the year just ended, including foreign slide circuits, a star-rating plan for Color photography, and a club Color Slide Directory which lists slide sets available for loan to other clubs.

The very first circuits and competitions for stereo workers were conducted under the direction of Color Division. In the January 2002 2004 of the PSA JOURSAL, President Norris Harkness, APSA, who will be highest compliments and commendations to the officers and members of Color Division for a most praiseworthy accomplishment.

"They saw the possibilities in stereo photography as a potent area of photographic interest. With finest forethought, they went to work at a time when few others had any great faith in the rebirth of this old kind of camera work. They laid out a program for both immediate activity and long-range value, and they implemented that program efficiently and well. Today the infant they found on the doorstep and took in as a beloved foundling has reached the point where it can stand alone. Its training, health and its basic and vital strength are firm: thanks to CD it can now begin to make its own way in a world that seems to demand a good start for its new citizens. Accordingly, the Board of Directors have voted to establish a new Stereo Division. . . . When you join Stereo Division . . . Keep in mind . . . all that every PSA member owes to Color for what they have done for photography and PSA in giving our youngest division such a grand start."

As in the past, Color Division will continue to serve its membership by inaugurating new activities, services and benefits which will create further participation in and enjoyment of our hobby—color photography.

The accomplishments of the past nine years are not the results of the efforts of just one individual but those of many persons. To H. J. Johnson, FPSA, who gave Color Division its firm foundation-to those chairmen who succeeded him-wand to all the committee members and volunteer workers whose unselfish devotion to the work of Color Division and PSA has been invaluable, are extended our sincere thanks. The list includes H. J. Johnson, FPSA; George W. Blaha, APSA; Rev. Herman Bielenberg, APSA; Karl A. Baumgaertel, APSA; George F. Johnson, APSA; Frank B. Bayless; Mildred Blaha; Walter Carter; Donald Eaton; Merle S. Ewell, APSA; Vella L.

Charles Greene; Donald B. Grim; Harry Haimes, APSA; R. B. Horner, APSA; Charles Kinsley, APSA; A. C. Klein, APSA; Blanche Kolarik, APSA; Charles B. McKee, APSA; H. G. Mitchell; John Moddejonge, APSA; John Mulder, FPSA; Dennis W. Pett; L. F. Plummer; Frank Proctor.

Finne.

W. K. Raxworthy, APSA; Fred Richter; W. H. Savary, APSA; Harrison S. Sayre; Fenwick G. Small; Emmett E. Smith; Eric Sorensen; Sam Vogan, APSA; and Paul J. Wolf, APSA.

- - MILDRED C. BLAHA

#### Korean Communication

From the 25th Evacuation Hospital somewhere in Korea comes the following note of thanks for the slides donated through the C. D. Hospital Project.

"We should like to thank all for the assortment of Color Slides which we received this week. We have sorted all of them by States and when we have a slide social in the wards, the servicemen are delighted to see their State projected on the screen. We have the hand viewers that can be checked out to the bed patients and that helps fill the long hours of the day. At every showing there are interested "Shutter Bugs" who comparent on the composition, exposures, and so forth. The patients here at the 25th Evacuation Hospital are most grateful to you for your interest in them. The Staff wishes to thank you also."

Donations of slides received are still running a thousand or more a month short of the quantity needed. Please send any slides you can spare with a simple identification as to subject matter if possible to Karl A. Baumgaertel, 353-31st Avenue, San Francisco, California.

#### First International Circuit

The first International Slide Circuit has been established by the Color Division. This Circuit is made up of two slides each from 10 American slide makers and will circulate in The Netherlands. A similar collection of slides from that country is now circulating among the circuit members in this country. Each circuit includes hiographies and photographs of the participants, and complete technical data on the slides.

The ten American participants in this new Color Division Service are: Helen Merkel, Philadelphia; Ken Barton, Cornell, Il-

#### Coming Color Exhibitions

CHICAGO, Nov. 5-16, deadline Oct. 18. Four slides (all sizes), 21. Forms: Arthur Papks, 4106 Gilbert Av., Western Springs, Ill.

ARIZONA, Nov. 7-16, deadline Oct. 24. Four stides (up to 4x5), \$1. Forms: Agnos Holst, 1902 E, Willetta, Phoenix, Aris.

SANTA BARBARA Nature (slide section), Nov. 1-10, deadline Oct. 18. Four slides, \$1. Forms W. A. McBride, 12221/2 State St., Santa Barbara, Calif.

These International Circuits are under the supervision of John C. Moddejonge, 7414 Manhattan Avenue, Cleveland, Ohio.

#### Star-Rating Plan

Many inquiries are being received about the new Color Division project called the "Star-rating plan."

This plan has been set up by the Division to give a rating for exhibition slide acceptances. A rating certificate will be issued from one to four stars depending upon number of different slides and total acceptances. Applicants send in a list of titles of accepted slides in recognized color exhibitions, listing the names of the exhibitions and the year accepted. For full information, write: Lloyd Robinson, Jr., 1616 West 109th Street, Los Angeles 47, California.

#### Color at the Convention

Members of the Color Division again gathered in full force for the annual Convention of the PSA in New York to renew old friendships and to enjoy the thrill of becoming personally acquainted with those faces which had heretofore been names only. The intermittent dampness of the weather at no time dampened the enthusiasm of the CD clan for the get-together and the enjoyment of the many excellent programs scheduled for their entertainment. Much credit is due Paul J. Wolf, APSA, for the magnificent ground-work which he as local Chair-man of the CD Program Committee had performed prior to his unexpected departure for the West coast. His duties were graciously assumed by Mrs. Amy Mintel Walker, APSA, who in addition to her responsibilities as Chairman of the International Color Slide Exhibition, handled her job in a highly efficient manner.

The International Color Slide Exhibition had its first showing at the Manhattan Center, adjacent to the New Yorker Hotel, on Wednesday evening. Aug. 13th before an audience of some 2000 people. A total of 1800 slides were submitted by 456 entrants from 33 States, the District of Columbia, the Canal Zone, Hawaii and 12 foreign countries from which the jury accepted 402 slides for exhibition. The slides, shown in

Carl L Gumpert

Informally posed, this is a strong, masculine, character-revealing portrait. Inclusion of the ship, out of focus, both complements the subject's profession and adds apparent depth to the photograph. Hersh lighting from direct sunlight has been tamed by the use of a reflector, revealing transparent shadows so desirable in outdoor portraiture.

Double trouble! Practice, patience, releasing the shutter at the split second, and sheer luck, will help you make an occasional pertrait like this. An old Army blanket, faintly illuminated, acts to set off the fair holr, while the reverse is true. Crumpled coat, stray hairs, eyes partially opened . . . that's what makes this photograph alive and real.

Maurice H Louis, APSA

# Why Not Better

By Maurice H.

There are few photographers, regardless of their specialty, who do not take at least an occasional portrast. It may be only an informal outdoor picture of a member of the family, or it may be a more ambitious portrait for exhibition purposes, made by artiheial illumination.

Although a professional photographer now. I graduated from amateur ranks. Since I know, and have experienced, the problems of both, I feel I can evaluate amateur portraiture impartially.

From the hundreds of prints continually passing through my hands as Assistant Director and Commentator of PSA's Portrait Portfolios, I have come to the conclusion that the average amateur-made portrait is inferior in quality to any other type of pho tograph he makes. I decided to find the reasons for this. After considerable study, I drew the following conclusions.

Portraits take patience, practice, and planning. But in what phase of photography are not these equally necessary? There is no short cut to proficiency, and many amateurs lose heart before mastering the technique which, in reality, is easily learned. Equipment is inexpensive; models, especially children, are readily available, and what better time can one find for this type of photography than during the winter months, or at night, or in inclement weather? Practice makes perfect, so why not make more portraits?

If the beginner could only learn the true importance of simplicity, most of his consequent problems would never arise. Simplicity in equipment, simplicity in proccosing, simplicity in lighting, simplicity in composition, and simplicity in models' dress and grooming!

Were I asked to name the greatest difference between amateur and professional photographers, I would answer: If there are two ways of doing a particular job, the singteur will always also the more difficult

# Make

# Portraits?

Louis, APSA

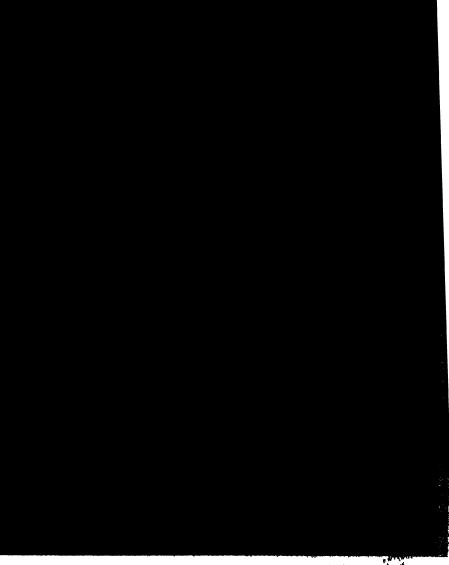

before you attempt to walk! There will be plenty of time later for you to exercise your imagination and initiative, but first ground yourself well in the fundamentals

The inexperienced look but do not see In the excitement of taking infrequent por traits, they are overly anxious to make the exposure and hustle into the darkroom to view their efforts What a rude awakening they receive when they finally study the finished print The unpracticed eye must be trained to note minute detail If jewelry 19 worn, does it draw undue emphasis? Is hair properly groomed? Do eleeves hang without objectionable creases? Are high lights and shadows properly placed and of correct intensity? Are facial weaknesses minimized by corrective posing or lighting? These and many other details must be recognized and dealt with at this stage. If you wait until mistakes appear on your negative, you are only asking for trouble, for many can not be corrected then So, look before you re lease that shutter!

A major criticism leveled at amateur pho tography concerns subject matter It is repetitious, it fails to elicit an emotional reaction, and it contains much extraneous material. These faults, as well as others, are just as valid in portraiture as in other forms of photography. However, they are harder to remedy, for in the making of a portrait we are concerned with the handling of fewer and larger masses, the face alone usually being of primary importance.

Remember, the larger you reproduce the face, the greater you emphasize your own technical shortcomings, as well as your subject's facial weaknesses. Expression is the keynote of a portrait, and this is transmitted by the eyes and mouth. Are they adequately lighted? Are they relaxed but still alive looking? Is background and dress in key with subject and mood? This is especially important in the making of character studies where the portrait often looks posed and unmatural.

How does one improve print quality? This is a favorite question of the amateur,

Theodore L Bronson, APSA

The judicious use of "propo" has elevated this partrait from a strictly conventional photograph into something much more appropring. The oval hat and veil accontuate the blonde hair and fair pith coloring. They also separate the subject from the backgraying. They dark dress offers a firm "base" found so necessary in the compaging of a portrait

#### Cover Picture by Charles Baptie, Jr., APSA

By capturing the expression of this truly noble character and combining it with flawless photographic technique, Charles Baptie, Jr., APSA, of Fairfax Hills, Va., has created a portrait of rare, artistic excellence.

The most difficult task of obtaining depth and roundness in a low-key portrait, while using a dark background, has been achieved by careful and delicate lighting.

Nowhere do you find disturbing mergers. Here again the subject's expression is paramount. It vividly bespeaks hundlity, kind-liness, patience and knowledge, Through these weary but agaless eyes, the weight trials and sorrows have been viewed. Yet faith in an eternal delay radiates through the medium of this photograph.

Maurice H Louis, APSA

The use of strebe has made it simpler to catch the peak of expression and action of this baby. No harsh lighting to Sestrey delicate flesh tones. A spatlight helps separate subject from background. The body is angled to such a degree as to eliminate any distortion of the near leg. An artistic touch is the inclusion of the baby's first shoe

Expression is the dominant factor of any portrait and often overshadows trivial short-comings. The striped jersey, deep shadows and prominent ear may disturb pictorialists but who will gainsay that this portrait has caught the impish and realistic expression of the All-American Boy? No salon winner, but this photograph will stand the test of time!

and more often than not he receives a pretty inconclusive reply. To me, perfect print quality is arrived at only by doing everything correctly—no easy task. A portrait is made by a series of steps, all related to each other. Just where the maker has erred is often difficult to ascertain on viewing the finished print.

To me, the most common weakness of amateur pertraits is their flatness, washedout high lights and lack of depth. Possibly
to avoid the much-publicated dense shadows,
or to escape retouching, the maker swings
to the other extreme. To correct this fault,
one often hears the instruction to give fuller
development to the print. Not had advice
but hardly of value in this particular

The fault lies in incorrect lighting belance. The occasional portraitist arranges his lights, views the highlight and shadow areas, and often lets it go at that liturity is any consideration given to the background. Hence, there will be light against light or

dark against dark—the result being a merger, with no separation between subject and background. The portrait resembles a "cutout," lacking roundness and depth. When you check your lighting arrangement, look through your subject at your background. Then evaluate your illumination—the highlights, the shadows and the background—not by themselves, but each in relation to the other.

While there is no substitute for practice, there is plenty that has been written on the subject of potraiture which will prove helpful to amateurs. I can recommend two volumes, understandably written from a practical viewpoint. They are: "Lighting for Portraiture" by Walter Nurnburg and "Portraiture" by Fred Archer. Studying "Faces of Destiny" by Karsh will acquaint you with the technique of the most famous of modern poternitiets.

Composition has been amide to apposed a bet sport complicated that is really in H a sport to the synt to me, it is

well composed. While not written primarily for the portraitist, "Image Management" and "Emphasis in Pictures," both by Nicholas Haz, will tell you, in a simple way, all you need to know on this subject.

The ephotography of children is always fascinating and extremely satisfying. Reading "Child Photography, The Modern Way," by Josef Schneider answers many of your problems in the handling of babies and youngsters. Or you may refer to this writer's article, "Practical Pointers on Photographing Children," which appeared in the June, 1951, issue of the PSA Journal.

There is nothing particularly mysterious or difficult about portraiture. Take stock of yourself and your photographs. From what I have written, it may be possible for you to spot your weaknesses at once. But if it means retracing your stops and starting on a new tack, do so. There are many helpful hands, waiting to assist you.

Let us hope you now have the answer to: Why hot make better perturbe? the little of the later of the later of the Photographic School of the Society than the one who was honored with a position unique in photographic organisations—that of Headers of President.

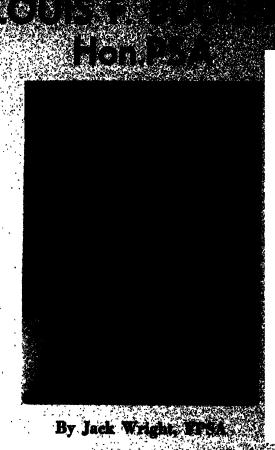

In the years prior to 1919 there was no national photographic organization in this country. This idea was merely a gleam in Louis Bucher's eye. In that year the Associated Camera Clubs of America was organized. But before telling this story it might be well to say a few words about the history of Louis F. Bucher.

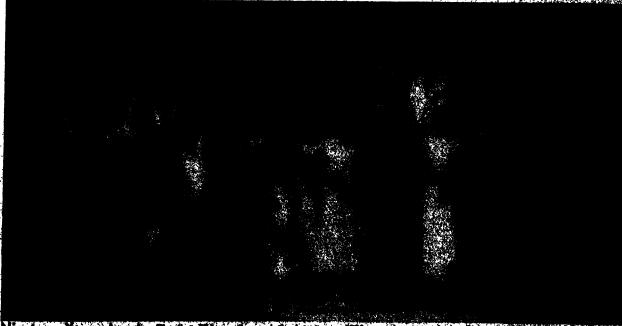

Lou Bucher was born in Paterson, N. J., but moved to Newark at an early age. There he built up a successful career in insurance. From his earliest years he was an excellent salesman, and he got his first camera, a 4 by 5 plate "joh," by selling a certain number of bars of soap. From then on photography played a great part in his life. The hobby has had two manifestations. One has been the making of pictures, the other has been in helping to "spread the Gospel" of photography by working in photographic organizations.

Mr. Bucher got his first contact with organization work when a friend took him to a meeting of the Newark Camera Club. He immediately became interested in that phase of photography and during the years of his service to the club was elected to the various offices from director to secretary, vice president and president. During his connection with the Newark club he helped make it one of the outstanding organizations of its kind in the country, being one of the few clubs at that time to own its own building.

During the years prior to 1919 Bucher was a member of the Royal Photographic Society of Great Britain. It seemed

A STATE OF THE PARTY OF THE PAR

## the baltimore show . . .

For a good many years now the Baltimore International Salon has been hung in the Baltimore Museum of Art. Last year it did not hang.

We understand the Museum authorities accused the Salon of having become trite, stodgy, static, and repetitious. They wanted something alive and progressive on their walls. This year the Museum people and the Baltimore Camera Club collaborated in an experiment. The Museum picked the judges . . . not photographers, but artists.

They picked good men—Benton Spruance, Guggenheim Fellowship winner in 1950 and professor of Art at Beaver College, Pa; Harry Steinberg, teacher at New York Art Student's League and a Guggenheim Fellow in 1936; and Jacob Kainen, Curator of Graphic Arts at the Smirhsonian Institute in Washington.

Each man is a practicing artist and has had his work hung in many exhibitions of art. Mark Mooney, Jr., in his editorial in the August Camera, writes: "To salons which may consider duplicating the Baltimore Experiment, we would sound this note of warning—be sure that your artist jury, when it is selected, is composed of sensitive, capable people as was the Baltimore jury."

Because this experiment was such a radical departure from the usual salon judging. Mooney took a recorder to the scene and recorded the judges' comments. CAMERA has given us permission to reproduce portions of the report as it appeared in the August issue, together with their reproductions of the winning prints and honorable mentions. We found Mooney's editorial as significant as the judges' comments. You should read them both.

The jury examined 800 prints by 180 U. S. photographers and 20 foreign entrants. Prints varied from 6 x 8 inches to 20 x 24. One of the medal winners was a 6 x 8. The jury selected 94 for hanging. No limits were placed on the jury, they selected 94 prints as suitable.

The jury knew none of the famous names of photography. Some of the famous collected four rejects. Unknowns were hung. Only two color prints were accepted. According to

reports, the feeling about the show is divided, some think it is great, some think it is terrible. In that it doesn't differ much from any salon. Let's quote Mooney again . . .

"Any print which was contrived, phony, too stilted or obviously set up, was too romantic, or proclaimed 'look—here is an S curve,' went out— but fast. And that included a lot of prints which have regularly hung in photographic exhibitions. Prints which said something, which showed that their maker had seen and captured a fragment of human experience, were those which were accepted, and likewise, many were regular exhibition prints. There are familiar names and new names in this salon catalog."

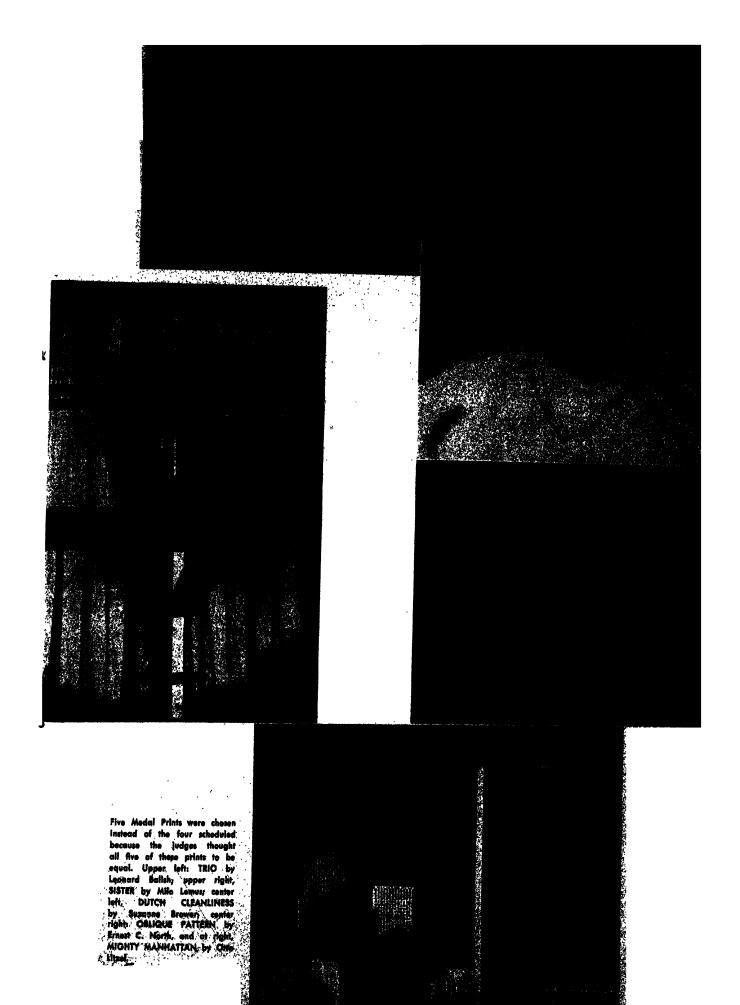

It is not possible, nor would it be fair, to take the comments of the judges out of context. Instead, your Editor would much rather report the *feeling* he gets from reading the discussion by the judges as recorded.

The judges were not too concerned with technique. They were most sensitive to *ideas* and *feeling*. They were often unanimous in their reactions to a picture. They tried to see what the creator had in mind in making a picture, not the way he exposed or printed it, or even composed it.

Whether they were right or not is a matter of opinion, an opinion that cannot safely be formed at this remote spot. We hear that those who have seen the show, like it.

One valuable outcome is the way these artist-judges thought about what they had done. CAMERA has done a distinct service to exhibition photography by reporting the verbatim proceedings of the discussion following the judging. We suggest you get a copy of CAMERA'S August issue and read for yourself... there is much food for thought in the eight pages of reading matter that forms the report.

Then, we'd like to open these pages to a discussion of what you think about it. Your Editor has some ideas, too, which he has carefully tried to keep out of this discussion but which he might divulge in company with others on these pages. So why not write us what you think of the Baltimore Experiment and what you think it means? Just one thing, let us know if you have seen the show...or just read about it.—db.

# Fun For All

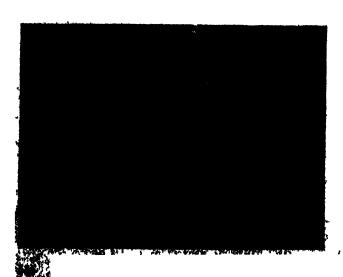

By Robert J. Goldman

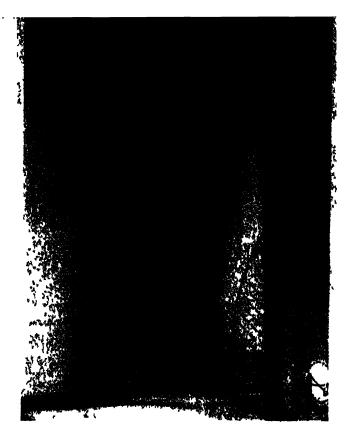

Much has been written about technique in the making of color slides. Eloquent authorities have given invaluable advice and assistance for the purpose of helping the serious worker in improving his photographic skill. Many excellent articles have been published on the Do's and Don'ts of exhibiting, but little if any on the emotional side of this phase of photography.

We who work in color as a hobby, are undoubtedly aware of the tremendous field at our disposal for expressing ourselves, and of the many opportunities afforded us for developing our creative and imaginative abilities. The response to the recently announced competitions in Modern and Creative Photography by the Metropolitan Camera Club Council in New York gives definite proof that there is no dearth of initiative or lack of imagination and originality among the ranks of the members of the camera clubs.

But let's look into the emotional side of this business called Photography, and see if some of us are not inclined to take it all a little too seriously. Let's look into ourselves and see if we would not be happier as individuals, and particularly as club members, if we could think of this hobby of ours strictly in the light of having fun, and even more important, as a means of giving fun and pleasure to others. To my way of thinking one of the nicest things about our hobby is that we whe work in color are definitely in that very postion of being able to share our hobby with others, and that by so doing we can contribute much to the well-being and happiness of others who may not be so fortunate.

R's lots of fun to compete in our camera clubs with our fellow members. But do we get angry, when we are not the winners? No! For if we do, then we are angry at those who win, and that is hardly conducive to a healthy club spirit. Remember: It's not a matter of life and death, and an Award or an Honorable Mention, as desirable as it may be, is and should be secondary to the spirit of good sportsmanship and good fellowship.

It's fun to compete in the many International Exhibitions that dot the calendar throughout the year. We all get a big kick out of the report cards when they arrive, indicating that one or more of our slides have been accepted. And again we suffer keen disappointment when we haven't done as well as we had expected, or as well as we thought we should have, or when a forbidding-looking circle appears around the "NONE".

Here again is where the emotional side enters into the picture. Whether competing in club or international exhibitions, we must learn to control our emotions and desires for success. This is particularly important for novice or beginner. The inexperienced contestant or exhibitor must learn that only through criticism and analysis of his work, can he learn to improve his technique and gain ability to create better slides.

Most judges are not only kind and considerate in their criticisms, but are extremely helpful and constructive in their remarks and suggestions. Strict attention to the remarks of a judge concerning your own slides as well as those of your competitors will contribute more to your ultimate success than anything in the world. Never take a judge's remarks as an insult or in a manner that you might consider as personally disparaging. Benefit by them! By the same token, only through failure of your slides in international exhibitions and by observation of the types of material submitted by your successful competitors, will you learn to recognize the acceptable subject matter that you may have for entering in international competition.

Try not to take it too seriously. Remember it's all for fun, it's your hobby, and the judges are only human after all. If you think your slides are good, even though you may not have been successful, the chances are that the next time you said the same ones out you'll his the jack-pot. Don't let your amostops get the best of you, because if you do you'll list the

(Cintinual in page \$54)

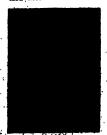

# Manuer over! It's really just beginning!

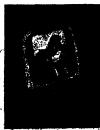

aybe summer, and the summer's sun tan, are beginning to fade. But to members of the camera fraternity, summer's pleasures are only now beginning. For now we start making use of the shots we made... now we start re-enjoying our summer... now we begin sharing it with old friends, and the new friends the summer brought us.

if you shot Kodacelor Film . . . you'll need prints for your permanent collection, prints to send to your hosts and summer friends. And enlargements of your best shots as gifts (Christmas is just around the corner) or as decorations for your home. And to take care of your color negatives, a negative album is a common-sense necessity. Your Kodak dealer will help you set things up.

if you used Kodachrome Film... you'll want to keep your slides in order in a Kodaslide File. The Kodaslide Compartment File holds 240 Kodaslides or 96 glassmounted slides, in twelve swing-out compartments. With index; price, \$3.94.

Then, having arranged your slides, there's the matter of showing them properly. For home viewing by a few, a table viewer is the answer.

The Kodaside Table Viewer, 4X, shows your pictures blown up better than four times. A neat achievement in mahogany-toned plastic, \$49.50; case, \$15.50. The Model A Kodaside Table Viewer is the aristocrat of viewers; gives you a good big, sharp, colorful image (on the order of 5 x 7 inches) and works beautifully even in a lighted room, Price, \$97.50; case, \$27.50.

Screen projectors are, understandably,

favored by many. The Kodaslide Merit Projector is the popular home-use job. It has an easy-to-use top feed for slides: 150-watt lamp, the full brilliance of which is utilized by the lumenized 5-inch f/3.5 Ektanon Projection Lens; and fills as large a screen as most homes require. For auditorium, church, or club presentation of your slides, the Kodaslide Projector, Master Model, is away out front. It will take a 1000-watt lamp if you need it, and keep cool, too. You've a choice of great lenses with which to "tailor" your projection to the actual needs. Price, governed by the lens desired, ranges from \$169.00 to \$246.00. Ask your Kodak dealer to put the Kodaslide Projectors through their paces for you.

Of course, the usefulness of your Kodaslides goes well beyond viewing or projection. You may have color prints and enlargements made from them, Good ones, too, Your dealer has the details.

Maybe your summer picturing was in B & W . . Color suthusiasts to the contrary notwithstanding, black-and-white photography will always appeal because its users can so intimately and personally control all its manifestations, from exposure through development and, most engagingly, in enlarging.

in enlarging.

Some of us, certainly, have yet to deyalon the last of summer's films. The Kodacraft Roll-Film Tank offers easily the singleest way through the development greater. There's another version of the said handles two 35mm, or Bassar college the regular model includes these aprons, for 127, 620, and 615 size Most After initial leading, you're out of the destriction tank, \$2.53; extra aprons, 60 said

With your negatives presented, their final full realization depends on enlargement. He your own work the Kodak Familie Hallarger is the answer. Impact one, Ma a relation in fine design and effectiveness. It can be adapted to become, in addition to an enlarger, a versatile view, quality for copying, small object photography, and see

# Experts Choices For Fine Prints

No. 6 of an informative series...how leading exhibitors choose papers to fit their salon aims

JOSEF SCHNEIDER is an illustrator whose child studies triumphantly combine psychological and photographic skill. He exhibits chiefly to advertising agency art directors, his salons are the advertising pages of national magazines. Each of his prints must be perfect for its intended use, and in selecting paper, he exercises the same careful discrimination as in choosing and lighting his small subjects

"Were I," he writes, "to make up some prints for Susan's mother's own personal use, I would use Kodak Opal G or Opal R For presentation to a client, my first choice is Kodak Illustrators' Special, the paper can take it and I really can make the print 'sing.' I use Kodak Medalist Paper. No. 3 if I need the added contrast

"Frequently I need to make up a large number of prints for display purposes I use Kodak Medalist Paper because it is fast and has terrific latitude. The tone values are superb. I do a lot of experimenting here, and really the Opal, Illustrators' and Medalist Papers do the job."

To keep children happy before the camera, Mr Schneider says—give them raisins It never fails Susan (see right) has a raisin now.

OTHER veteran photographers will promptly approve Josef Schneider's selections. More salon prints appear on Opal G than on any other paper . . . Illustrators' Special has long been the darling of topflight commercial studios . . . and Medalist, a young and sensational member of the Kodak paper family, is swiftly moving up to rank with both

Kodak Medalist is a paper specifically tailored to meet the serious worker's demand for a fast paper of exhibition quality, in a full range of contrast grades, adaptable to toning, easy to manipulate, with exposure-development latitude to permit close matching of negative and paper. Four grades, several surfaces Elmore C Adams' "Brush Burner" (to appear full-page later) is here reproduced from a print on white, high-lustre Medalist J.

#### FOR PRINT SUCCESS—PICK THE PAPER THAT FITS THE PURPOSE

These are the papers for fine exhibition enlargements, gift prints, home decoration, and specialized applications—in a range of types to fit your every need:

For fast printing, fine warm-black tones, and great flexibility in manipulation—Kodak Medalist Paper.

For rich neutral blacks in a top-speed paper—Kodebromide, five evenly spaced grades and nine combinations of sheen, texture, tint, and weight.

For rich warm blacks in a moderate-speed paper-Kodak Platine Paper. Three printing grades.

For widest choice of tint and surface in a low-speed paper of utmost tonal quality and adaptability to toning —brown-black Kedak Opel Paper. One printing grade.

For Opal quality with twice the speed of Opal—Rodak Ektalura Paper G.

For Opal quality in a special fine-grained surface suited equally to exhibition and reproduction—Kodak Illustrators' Special.

For photomurals-Kedah Mural R.

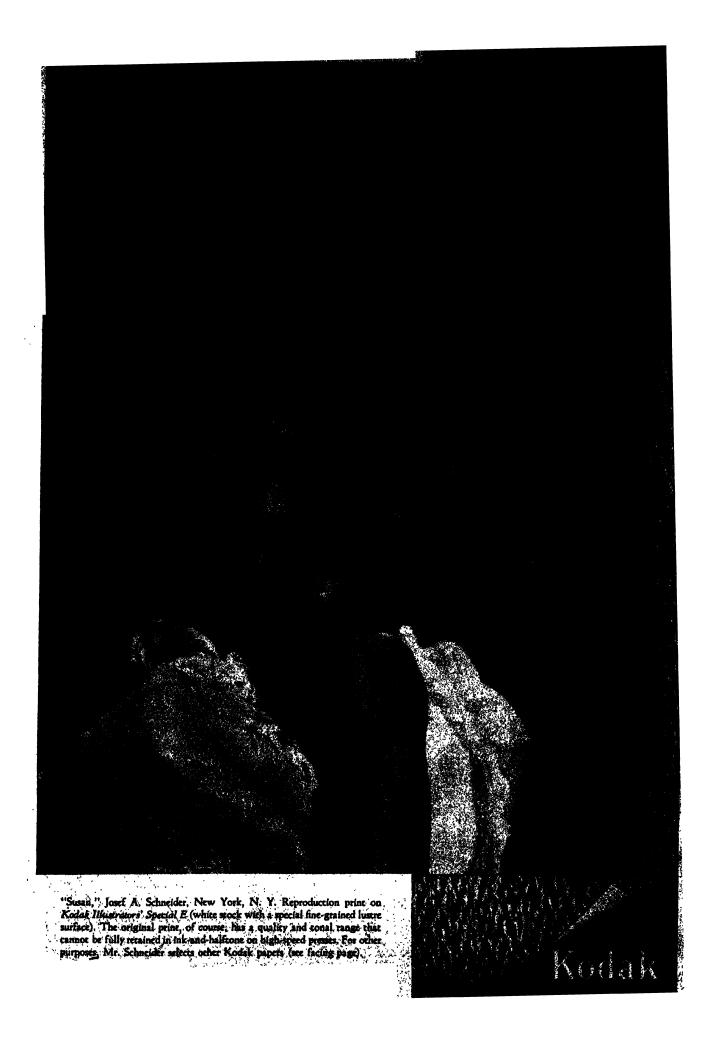

For transilluminated prints—Kedak Opalure Print Film and Kodak Translite Paper.

For extra-fast printing and processing—Kedah Resisto Rapid N. It's as fast as Kodabromide; and its special base allows washing and drying in ten minutes.

And for contact prints—Kodak Are, Velex, Resiste N, and others. Each Kodak enlarging paper has a contact-paper counterpart, equivalent in type and quality.

For full details on these fine Kodak papers—tints, surfaces, weights, processing—consult the Data Book on Kodak Papers, and your Kodak dealer.

#### Applegate's "The Queen Arrives"—Print Of The Year

By ROBERT J. LAUER, Associate Editor

It was a fight right to the finish, with the Photo Guild of Detroit overtaking Oakland Camera Club's long established lead, and thus winning first place in Class A, winding up the 1951.52 season of the International Club Print Competition. In Class B, the Mission Pictorialists weren't able to be beinged as they took first place, a position which they firmly held since last October. The Print of the Year was selected by the jedges from among the first place winners in the monthly contests. October to June.

feditis from among the first place winners in this monthly contests, October to June. After a 50 minute discussion on the merits of the 'sarlows prints the judges' decision went to "The Queen Arrives" by John H. Applegate of the Grosse Pointe Camera Clob. This print was first place winner in the February competition. Mr. Applegate will receive a gold medal.

Judging took place the last Saturday in Jane in Chicago, under the direction of the Fost Deathorn-Chicago Camera Club. Invitations were extended to all clubs in the Chicago area as attend. Trophy winners for last, the clabs scoring the most points for the month in their respective classes were Green, Brief (Chicago) in Class II. The last panel has county in Class II. The last panel has county were of her last panel has county and having served of informations. Exhibition survey and having the last panel has competitions of the Chicago floor floor than the Chicago for the last competition of the Chicago floor floors. All hering served of informations Rehibition survey and having the last panel floor floors. The competitions of the Chicago floor floors. Chicago director of the Chicago floor floors. Chicago director of the Chicago floor floors. Chicago director of the Chicago floors. Contern Clubs Association with

past president of Green Briar Camera Club (Chicago); M. D. Meiser, APSA, past president of the Elkhart Camera Club (Indiana); and J. Musser Miller, La Grange, Illinois, former president of the Photographic Guild of Detroit and West Suburban Camera Club (Chicago).

Individual winners were as follows: First Place: "Tilting to Windward" by Victor A. Lookanoff, M. D., Grosse Pointe

Camera Club.

Second Place: "Approaching Storm" by James T. Johnson, Channel City Camera Club.

Third Place: "Industrial" by Bob Wilkins, Tiro de Los Padres.

Each finishing the season with over 300 points, the following clubs will be competing in Class A beginning in October: Mission Pictorialists (San Francisco, Cali-Mission Pictorialists (San Francisco, California), Bartlesville (Okla) Camera Club, Albany (N. Y.) Camera Club, Orleans Camera Club (New Orleans, I.a.), Atascadero (California) Photographic Society, and Oklahoma Camera Club (Oklahoma City). Next month the 1952-53 section gets best for the October inderner club will be host for the October inderner way Baltimore Camera Club will be

the host for the October judging—or wild has host for the October judging—or wild the deadline date in October 20th, You still have time to enter if you haven's duke as a yet. Write to the director for information, and outer forms.

In October well sell gen about his first has been director for information. Competition, Grant M. Hales, of Kodon C.

MISS EVELYN ROBBINS, Associate Editor

Reward For Promptness
By Eldripg: R. Christhilf, Hon. PS A
Director—PSA American Portfolios

For years you folks have been telling usthat it was impossible for a Portfolio to complete its schedule on time, that the time between stops was too short, etc., etc. We, on the other hand had maintained that the schedules had been carefully worked out, and if more time were allotted between stops, the Portfolios would still come in behind schedule—inasmuch as the delays, in our opinion, were due to thoughtlessness on the part of some members, that is, unless strikes or embargoes interfered, as they sometimes do.

At Detroit, John Hogan made available two Portfolios covering darkroom controls and showing the steps from the original contact print to the finished salon print. Knowing that there would be a great demand for the two Portfolios we offered to have them travel the Portfolio Circles that completed their schedules AHEAD of time. We felt that, judging from past performances, the demand would not be too great and that we would not be beset by any problems.

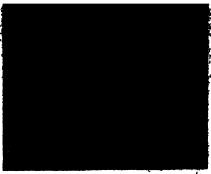

What happened? Well, it seems that Portfolios that had never travelled on time before began to come in ahead of schedule, and, as this is being written, the following Pictorial Circles have qualified to have the Hogan Portfolios travel their respective circuits: Circles 60, 59, 30, 43, 36, 44, 42, 55, 21, 15, 32, 10, 31, 19, 51, 9, 28, 60.

The Circles listed above are in the order of their going on the reservation list. Don't write and ask when your Circle will get the Hogan Portfolio, just figure it out for yourself. The best that we can do at the present is to travel six Circles a year, which means that we are now booked ahead into 1955.

Our only hope is to speed up the Portfolios a'bit in their travels, or else, perhaps Uncle John can be induced, in his spare time (?) to provide additional Portfolios. In the meantime I am looking for a good place to hide out in until all Circles have been covered.

#### . Chirps From The Robbins

If you will remember, several mentils ago the hope was expressed that we might be

Industrial

Bob Wilkins

3rd Place-June

able to obtain another article from Challis Gore a member of Pictorial Portfolio #47. Mr. Gore has been kind enough to comply with our wishes and sends along the following:

#### Photography vs. Golf

By CHALLIS GORE Pictorial Portfolio #47

Four years-plus ago I built my darkroom, joined Berkeley Camera Club, and took up photography in a serious way. It wasn't long after that that I did what many a person has wanted to do and has often threatened to do: I quit golf. I resigned from the country club and sold my clubs in order to have more time for photography—and I have never regretted the change. After 25 years of golf and four years of photography, here is how I see it:

A round of golf kills a whole day, including time consumed in getting ready, organizing a foursome, refreshing one's self at the 19th Hole, and getting a shower. And for this, what do you get? You sink maybe one long putt or two, smack one or two down the middle, make a lot of bad shots, lose your temper and \$2.00, hawl out your caddy and learn something new in the way of alibis. Your permanent possession is a bad score. Golf demands everything and gives nothing.

Photography, on the other hand, is the ideal hobby because, like golf, it gives you companionship with kindred souls, plenty of exercise, and, unlike golf, gives you something permanently worthwhile for your time and effort. Photography takes you places and trains you to see things.

True, pictures are everywhere; you need not go farther than your own backyard or town to find salon subjects. But for my part, I like to get around, and there is far more pleasure in travel when you travel with a camera and with eyes searching for pictures.

With photography, you can always improve your product; no one ever reaches the top or limit of achievement.

Every phase of photography is satisfying or rewarding. Every picture looks fine in the ground glass, no matter how badly it turns out in the print. There is pleasure in work done in total darkness: time to relax, and when the safe light goes on, what a thrill as we witness the mirsele we have performed! Finally, the print—consthing permanent as a reward and as a restinger. No phase of photography ever gets old or tiresomy to me.

# grandi AF Chambantanari Minin M. Unipawoon, PPSA Pintulia Portfellö #74

in injurished on and we march with it, it pictures remain to be checked and our pictures remain to be chapted and led by those who succeed us. This should he the first rule to improve each and every time we expose a negative or make a print, either from an old negative or a new sac. This thought has been brought to light en observation of the portfolio now at hand. The improvement of the portfolio now under criticism is far better than the portfolios of past years and it is encouraging and much more interesting to me than the average exhibition. In the exhibits we expect to see the best at all times. Whether we do or not is sometimes a question—at times I have my doubts.

It has been my good fortune to observe many exhibits and to have been elected to judge salons and camera club competitions for the past fifteen years and truthfully, the portfolios have a place no other source can fill. They reach those who want to improve their work, talk shop with other members, and last but not least, acquire friends all over the world. Stop and think - what is better than a good friend, a photographic pal, one with whom we have the same in common-talking the same language -swapping thoughts and enjoying things together. Or would you rather he like some exhibitors who are continually peeved with themselves, or with the judges whose opinions they criticize forever and a day.

Criticism is a strong word and many photographers cannot take it-those who cannot have no place in photography or in any other hobby for that matter. It is from good constructive criticism that improvement in one's work or play will eventually show. Those of us who have gone through this trying time can well reflect back and point to the critic's hard words about our pet print at the camera club, and well we can remember how true his point of view was. And-upon making the print with the critic's suggestions, how much improved it was, or if he suggested the waste basket. how much better off we were to start over again and do something better.

How can we judge our own prints? This is not always as simple as it might seem, yet there is one method to be tried-having had a fair amount of success. Make the best print from your negative that can be made (your first print will not be the one-maybe the twelfth or the twenty-fourth will be) mount, spot and polish it-hang it in a place you can readily see at all times for a one month period. If you like it as well at the end of the month period, the picture has something. Then ask your friends for their opinion. If they like it, it is successful. Then send it out in a portfolio and see what the commentators have to suggest. Suggestions will be made. No print will be perfect, and all of us have differences of opinion, and living in a democracy we have the right to state them, and most of us do in no small

Once again much improvement has been made, and as time goes on you too will be in the exhibition field. When all is said and done, this is what you are striving for. Hest of luck, both picterially and other-

# Mighlights from the

#### FREDERIC CALVERT, Associate Editor

Have you ever tried outdoor portraiture? Very good results can be had outside in the shade. In the shade we get nice, soft, even lighting. A white cardboard reflector can be held close to one side of the face to lighten up the shadows and give a little more roundness.

In either event, indoor or outdoor portraiture suffers greatly from loss of character. Very few amateurs as well as professionals have the knack or ability to capture the true character of the sitter. Most photographers set up the camera, lights, pose the model, then say "smile", click the shutter and there is supposed to be a picture. Many wonder why.

While getting the lights ready, the photographer should engage the model in conversation about his interests. In so doing the model relaxes and when the time comes to snap the shutter, you get a natural smile, with life and sparkle in the eyes, and in most cases the true character of the model shines forth. Even if the picture is not to be a smile picture, with sparkle in the eyes you capture a more lifelike expression. Who wants a picture of a dead pan?

For more information about how to take good portraits, join a Portrait Portfolio. We can help you to make better use of the lights, pose your model in a more pleasing manner, and do all those other little things to help you make a better portrait. Our Commentators are among the best portrait makers in the United States.

#### Dance Pictures On Display

One of our Commentators, Miss Gerda Peterich, had the second in a series of three exhibitions on "Modern Dance Today" on view through June in the Music Library, a branch of the New York Public Library.

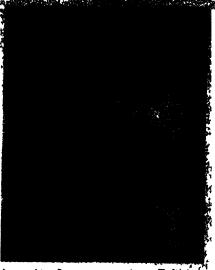

Miss Peterich uses chiefly a Speed Graphic with multiple flash synchronized to the focal plane shutter. The photographic style, she says, should reflect the personality of the dancer and the style of the dance rather than the personality of the photographer.

C. "JERRY" DERBES, Director .

Being the Director of this new activity has its rewards and compensations for the work involved.

For instance, I recently received, among others, three outstanding negatives, Groups

Approaching Storm

James T Johnson

2nd Place-June

are being formed now to receive these negotives but I would like to tell all of you shout them because I would like to see every that feels the need for improving their plus-tography participate in the Salen Workshop.

The first of these is a character study. The picture is that of a native Guatemalas in the attitude of prayer. Regarding the negative, the Master advised that he purposely overexposed it one stop and nuderdeveloped it 20%. As a result it shows

#### PSA Recorded Lecture Program

The Recorded Lecture Program of the Pictorial Division offers the following programs for your club.

No. 1 An Analysis of Recognized Salon Prints by Ragnar Hedenvall, APSA.

No. 2. Commentary on Recognized Salon Prints by Morris Gurrie No. 3. Outdoor Photography by D.

Ward Pease, FPSA No. 4. Still Life by Ann Pilger Dewey, APSA, Hon. PSA. No. 5. New Prints for Old by Bar-

bara Green, FPSA. SPECIAL Photography of the Nude by P. H. Oelman, FPSA

A deposit of \$25.00 should secompany an order. A service charge is made for each Lecture. The SPECIAL costs \$10.00 and should be ordered directly from Mr. Oelman, For clube which are members of PSA but are not affiliated with the PD the charge is \$6.50. Clubs which are affiliated with the PD will be charged \$5.00. The service charge is deducted from your deposit, when lecture is returned. Clubs or groups not members of PSA will be quoted prices on request to the Director.

For Nos. 1 to 5 order from Philip B. Maples, Director, Recorded Leeture Program, 29 Spring Street, Brockport, New York. For the SPECIAL please contact:

P. H. Oelman, FPSA, 2505 Moorman Avenue, Cincinnati 6, Ohio.

Addition decall in such the highlight and philitage decay. He reverted the negative when withing to improve the composition and used a slight tilt forward of the head. He betted it off by flashing all four sides alightly with raw light to hold the eye within the picture area. This particular negative could be printed by tilting the head backward with eyes looking up. It could also be printed straight without reversing the negative. Both variations would make a very satisfactory print. It has all kinds of possibilities. His IL x 14 print and his actual Salon Print which will be awarded to the winner of his group are out of this world as far as print quality is concerned.

The second of these negatives is a marine scene, a sailboat heading out to sea pulling a small dinghy. The sails are full and there are just a few small clouds which incidentally need burning in a little to bring out their full beauty. This print was made just as the Master took the picture but the burning in of the clouds and again flashing all four sides slightly with raw light improved it immensely. The print is blue toned and

very beautiful indeed.

Do you have aspirations to make an abstract that will hang in the Salons over seventy-five percent of the time? I have a negative at hand belonging to a Master who is a "master of abstracts." It has details galore and beautiful tonal quality from white to black. The center of interest is properly placed in the lower left dominant third and contains the lightest and darkest parts of the whole picture area. The Master wrote me that certain changes in composition would work equally as well as the way he printed it. This print was slightly toned in Nelson's Gold Toner. Subject matter? Oh, that's a secret.

If you haven't already gotten in on the fun of printing from one of the Master's negatives you don't know what you are missing. You will find more of the details of this new activity in the August issue of the Pictorial Digest. Write me for an ap-

plication blank.

STANLEY D. SOHL, Associate Editor

#### Ambassador's Position Open

Yes, your eyes are not deceiving youthere is an Ambassador's job open and YOU can qualify.

First, and probably most important, is that you be whole-heartedly interested in a hetter world, in a free world and a world where photographers can take pictures where they want to, when they want to, and how they want to. You must have a profound interest in people of the fareign country in which you are to want, that it, you, must be exting about their establish.

their philosophy, and their ways of life. You should be interested annual as injuried a function of the less than the second of the less than the policy down life, you see, the less part of this jab is that you will get in return as much or more from the people you work with as you put into your new position.

Photographers in a foreign country are much interested in exchanging not only prints for constructive criticism but also ideas on techniques, ideas on the conception of a picture and ideas on a full story

of composition.

It has been a long proven fact that if there is a problem of misunderstanding or indifference in front of you—back up and find a common ground or interest and then walk right over the situation. In other words, using photography as your common interest—work together through this subject to learn about each other and in turn you will soon understand each other.

Now I know that there will still be problems but as an Ambassador of Good Will from American Photographers, to some foreign photographers, you can do as much good as a hundred bushels of wheat, or some item of machinery to stimulate under-

standing.

Right now, today, there are some very rich positions open to YOU, if only you will accept. Any individual, or a group in the Society, that is interested in such a position, with the exchange being prints in a portfolio, should make application to Col. Charles J. Perry. There are people waiting m both Japan and Chile as well as other countries to start an exchange with YOU. Won't you take the job?

#### First Dominican Republic Salon

Juan Ulises Garcia, General Secretary of the Dominican-American and Caribbean-American Portfolios, has completed the organization for the First International Salon of Photography. The Salon is under the joint sponsorship of the Dominican Photographic Society and the Dominican American Institute of Culture.

The latest news of the Salon is the magnificent gesture of the Dominican Republic President, Dr. Molina, in donating \$200 as top prize to the best print of the salon. This prize is to be in the form of a Cornerstone Membership in the PSA. This gift is tangible evidence of the warm feeling existing in our International Portfolio program. This is particularly true in the Dominican-American Portfolio under the able direction of Sten Anderson, the U. S. General Secretary and Juan Garcia, the General Secretary for our southern friends. This type of gift must be most gratifying to these two men who have worked so hard and who have built up such splendid cooperation between the two nations. They are both true Ambassadors in the International parade.

#### New Chairman Visits Mexico

Ray Micsa, A.P.S.A., the new Chairman of the Pictorial Division and a secretary for the Second Caribbean-American International Portfolio has just finished a trip to Maxica City. He actually word form there is a delegate to the finished found photones, but he also existing as a paint plant, of PUA business while there.

A. LYNNE PASCHALL, Associate Editor .

#### September

". . . And then the whining school-hey, with his satchel

And shining morning face, cresping like snail

Unwilling to school."

Did your brat act like that on the first day of school? If he did, you haven't trained him right. The American public school system is one of the great democratic institutions of the world, and school attendance should be held up as a reward for being born an American, not as a punishment for heing under foot for five years.

We trust you got out the old camera and made a record of Junior as he started off on that great adventure, and we hope that you caught the eager look on his "ahining

morning face."

In years to come, you will look upon that picture as one of your prized possessions, but guard it well from Junior. In a few short years, he will be grown up, or think he is, and he will resent your insistence that he once looked like that.

The old verse that starts: "Thirty days hath September" is still true and they are all busy days. As far as camera clubs are concerned this is really the beginning of the year and the first week of school will scarcely be under way until we have to start scurrying around to get the winter's program started.

#### **Print Circuits**

If you plan to get in on a Camera Club Print Circuit, better not wait to see what your members did over the summer vacation, but gather up the three best prints of last year. Then write for an entry blank and get an early start.

The director is William R. Hutchinson. When filling out the blank give him second and third preference on dates if possible.

#### Recorded Lectures

44

If your club has some money in the treasury but still has to keep within a limited budget, there is nothing quite equal to a recorded lecture. See the list of available subjects on an adjoining page.

Several of your members will have elide projectors, and if you can find someone with a tope recorder you will be all est.

Write to Philip H. Maples for a satisfactory date.

#### Judging Service

At some time during the year, you will want to have a dinner meeting accompanied by a big print contest in which averabledy is represented, ify all exists during the printe finding and integrable or the way the printer way histories. First, Second, Topol, or on what his arms.

in the second se

#### Portfolio of Portfolios

If you have a club room with malding ground the walls for the display of pictures, you should hang a Portfolio of Portfolios at some meeting during the winter. This can be done along with your negative process.

be done along with your regular program.

Perhaps the director of this activity will let you keep a show on display for a longer period. For a suitable schedule write to James T Johnson.

#### American Exhibits

There is no real substitute for the prints the members make, and as long as enough of them come in, the meetings will be full of life and vigor, but after a few meetings there will come a lull. Then is the time to bring in a show from the outside.

Write to Fred Fix, Jr., for his latest list. Be sure to tell him the approximate date the pictures are wanted.

#### **Portfolian Clubs**

If you live in a district where a number of PSA members belong to Pictorial Portfolios, you may take part in an enjoyable side activity by organizing a Portfolian Club. A club with as few as four members will get recognition. The director is Sten T. Anderson.

### VIEWS AND REVIEWS

BY THE DIGEST EDITOR

#### Dissatisfaction

The July PSA JOURNAL and the August CAMERA magazine both report new methods in the judging of photographic exhibitions Both of these reports indicate further the growing dissatisfaction with present methods of judging, and photography's desire to strengthen its position as one of the aris—to come of age.

For the more we study photography and the more we study painting, the closer the two seem to come. They are both concerned with conveying feeling within a space bounded by four sides and lying on one plane.

The rules of photography and the rules of painting are the rules of graphic art. Who is to say which method of conveying feeling is better.

The rules of grammar govern both the apoken word and the written word. Can we say either is better? No, they are used by people for different purposes, and by different people for the same purpose. But the rules are guideposts for both methods of

Pitrhaju, as one of the judges of the Splainters show suggests, we who are photographics, have been too percompled with splainters, picture than sector, pictures. Perture view house heavies into completes of the subject of sempted by first and have Arthur the subject what the subject of party Pitrhals and subject of the subject of the

house, or for abatting house on comments of an evil, Painting out do this shade of a comment of the hands of a good phalographs can be an instrument of truth or an instrument of truth or an instrument of truth or an instrument of distortion. It depends on the photographer.

Maybe the whole dissatisfaction about the present status of photographic exhibitions is a reflection of our own dissatisfaction with what we are producing. We are looking for the road which will lead us to greater satisfaction in our photographic work.

Maybe if we change our methods of judging our exhibitions, as suggested in the Puyallup, Washington experiment, we can get away from the impact type of picture and become more aware of the picture which grows in appreciation and importance the longer it is seen. With this system our pictures would need to convey more emotion to the viewer—they would need to arouse more emotion in the photographer who takes the picture originally.

The PSA is dissatisfied with many things in photography as it is today. And the workers in the Society are striving toward progress—they are working to make photography better—technically, esthetically, creatively.

Photography can come of age. Photography will come of age—but whether that coming of age is hastened or retarded—only the photographers of today can decide. Through dissatisfaction comes change—and through change, properly directed, comes progress—Stella Jenks

## **PSA COLOR DIVISION**

GEORGE F. JOHNSON, APSA ______
Forestry Building, State College, Penna.

#### CD Officers, 1952-1954

Mrs. Blanche Kolarik, APSA, of Chicago, Illinois will be the Chairman of the Color Division for the 1952-54 term. She is widely recognized for her outstanding exhibition record, for her efficient compilation of "Who's Who in Color Slide Photography" over many years, and for her untiring efforts in behalf of color photography in the Chicago area. Mrs. Kolarik served as CD Vice-Chairman during the past two years. The Vice-Chairman will be Paul J. Wolf,

The Vice-Chairman will be Paul J. Wolf, APSA, of Hawthorne, N. Y. Mr. Wolf has ably served the Color Division as Chairman of the Honors Proposal Committee. Eastern Editorial representative, and as Secretary during the 1950-52 term. His enthusiastic efforts for the advancement of color photography as an exhibitor, judge and exhibition director, as an officer of local color clubs, and as a PSA Committee Chairman, are widely known.

Merle S. Ewell, APSA, of Los Angeles, will serve as Secretary. Mr. Ewell has been for many years one of the leaders in his widely recognized local Color Camera Club, and has performed a most creditable service to the Color Division during the past two years as supervisor of the National Club Slide Competition with 138 Clubs from 35 States and several foreign countries taking part.

The Color Division is fortunate that three such able and experienced individuals, have agreed to accept major responsibility in the Division for the next two years. Our congratulations and best wishes go out to them on the eve of assuming their new tasks.

GFI.

#### Tokyo Tidings

The Color Division Hospital Project has received the following note from the American Red Cross in Tokyo, Japan, which distributes the color slides we donate to U. N. Army and Navy Hospitals in Japan and Kores. We quote:

"During the past week we have received three boxes of color slides from you. We thank the wonderful members of the Photographic Society of America most heartily. They could not have come at a more opportune moment, as for the first time we had no back log of slides to fill our monthly quota of 3000 and those three boxes enabled us to fill the need on time."

The Red Cross quota of 3000 slides per month is only enough to provide slides for the hospitals now receiving service. To allow for an expansion of service we should be sending them at least 4000 slides per month. Actually, due to a slow-down in the number of slides being received we have in recent months been able to send only 2000 to 2500 slides a month. So as can be understood, slides are needed badly for this outstanding service to hospitalized service men and women; Please send whatever slides

you can, with a simple identification as to subject matter if possible, to Karl A. Baumgaertel, 353 31st Avenue, San Francisco, California.

#### Medal Winners in National

The fifteen medal winners—top slides of the 3468 entered in 1951-52 in the National Club Slide Competitions, has been announced by Merle S. Ewell, APSA, supervisor.

In Class AA, with 39 Clubs entered, the final winning individuals were: First: "Last Gleam" by H. N. Fulbright, Boston Camera Club: Second: "November Skies" by Mrs. F. N. Decker, Salt Lake Photochrome; Third: "R.R. Snow-Melter IV" by Harold Schwartz, Shorewood Camera Club; Fourth: "Lazy Canvas" by Helen C. Rahe, Ft. Dearborn-Chicago Camera Club; Fifth: "Breaking Surf" by Herbert Weihrich, Science Museum Photo Club.

In Class A, with 47 Clubs taking part, medals were awarded as follows: First: "Design in Glass" by David Murray, Rockefeller Center Camera Club; Second: "Secured" by Meida Hammond, Los Angeles Cinema Club: Third: "Ma's Glasses" by Art F. Shea, Tripod Camera Club; Fourth: "San Blas" by A. B. Hinkle, Diablo Camera Club: Fifth: "Dunes of Ibex Pass" by Ivan Murry, Taft Camera Club.

In the Class B contests with 52 Clubs enrolled, the awards were issued as follows: First: "Quo Vadis" by J. S. Boeckh, Toronto Camera Club; Second: "Routine Heroes" by E. G. Tozer, Toronto Camera Club; Third: "Pals" by George Merritt, Jackson Camera Club; Fourth: "Excelsior" by G. K. Smith, Equitable Life Camera Club; Fifth: "Patricia" by E. V. Mayer, Equitable Life Camera Club.

All clubs desiring to enroll in this series of five competitions in 1952-53 should contact at once Merle S. Ewell, 1422 W. 48th Street. Los Angeles 62, California. Clubs affiliated with the Color Division pay no entry fee, others pay \$4.00 or \$6.00 depending upon PSA membership.

#### Chantler Leads Who's Who

Dr. M. A. Chantler of New Toronto, Canada, topped "Who's Who in Color Slide Photography" for the period from July 1, 1951 to July 1, 1952, published elsewhere in this issue. Dr. Chantler was the only exhibitor to have slides accepted in every listed exhibition. He also led in total slide acceptances with an aggregate of 85. He was followed closely by Helen C. Manzer, APSA, of New York City, who had 84 acceptances in addition to judging one exhibition where judge's slides are not listed as accepted.

Other exhibitors who had more than 60 acceptances include: Karl A. Baumgabriel, APSA, San Francisco; Norman R. Brice. Clayton, Missouri; Louise Cramer, Salt Lake City, Joe M. Dixon, Roseville, Calif.;

#### Coming Color Exhibitions

PITTSBURGH ALL COLOR, Oct. 5-12, despites Sept. 22. Four slides, \$1. Four prints, \$1 plus postage. Former James Dince, 219 Seventseath Av., Hemostead, Po.

TULSA, Oct. 13-14, deadline Sept. 30. Four slides, \$1. Forms: Ruth Canaday, 1779 S. Victor, Tules, Oklá. CHICAGO, Nov. 8-16, deadline Oct. 18. Four alldes (all sizes), \$1. Forms: Arthur Papke, 4106 Gilbert Av., Western Springs, Ill.

MISSISSIPPI VALLET, Nov. 5-8, deadline Oct. 22.
Four slides, \$1. Forms: E. A. Tucker, 3625 Carter
Av., St. Louis 7, Mo.

MINNEAPOLIS, Feb. 10-13, deadline Jan. 19. Four slides \$1. Forms: Warren Anderson, 123 S. 7th St., Minneapolis, Minn.

Edward A. Hill, APSA, Fleetwood, Pa.; H. J. Johnson, FPSA, Chicago; James A. Kirkland, Chicago; Chas. B. McKee. APSA. Sacramento, Calif.; Arthur Papke, Chicago; B. B. Randall, Orinda, Calif.; Mabel Ross, Salt Lake City; A. Stewart. Santa Barbara, Calif.; Mrs. Sandra Thaw. Washington, D. C.; and Adolf Vignale, New Toronto, Canada.

#### Color by First Class Mail

Starting July 7 and until further notice all Cine Kodak films, Kodachrome film 135, 335 and 828 will be returned by the Kodak Company to the customer by first-class mail. This will apply only to processing laboratories in the United States and Hawaii. No additional charge will be made for this service which is intended to avoid the many serious delays that have occurred in the use of third-class mail. Several months will clapse before notice of this change appears in the cartons and instruction sheets but the service is now in effect.

#### Whoops

On page 439 of the July issue we pulled a boo-boo. In W. K. Raxworthy's excellent article on 35mm leaders and trailers, the typesetter left out a couple of lines and the whole corps of proofreaders missed it.

The third paragraph should read:

"According to the specification, the leader, including the tapered tongue, is the first 8½ (8.228) inches of film, and the trailer is the last 1.87 inches. In addition to the tapered tongue, the 8½ inches of leader include the equivalent of three 24 x 36mm frames ahead of the first exposure."

As it ran the statement didn't make too much sense but with the italicized portion put back in, it does.

Our spologies to you readers and to Mr. Raxworthy, -- D. B.

#### Who's Who in Color Slide Photography 1951-52

In the following listing are the names of those who have had acceptances in at least two of the recognized exhibitions during the past season. Such listing is indicative of better than average ability in color slide making.

The period covered is approximately July 1, 1951 to July 1, 1952, with some irregularities represented by exhibitions held within the period but catalogs not available in time.

30

Only the following exhibitions are inoladed ARIZONA Bergen, CHICAGO, Cin-cinnati, Cloveland, Columbus, Caba, Dixie, El Camino, HARTFORD 1951, HAWAII, Louisville, Milwaukee, Minneapolia, MIS-SISSIPPI VALLEY, Philadelphia, Pitteburgh, PSA, Rochester, Sacramento, Salt Lake City 1951, San Francisco, SOUTH-GATE (England) 1951, Southgate 1952, Southwest 1951, St. Louis, Toronto, Tulsa, Valparaiso (Chile), Victoria, Whittier, and Wilmington.

One Canadian show did not meet requirements for listing, nor did any of the foreign shows except the three listed. (Most foreign shows permit too many entries, or keep entries too long.) Altho finally included, three of the American shows were borderline in performance and future listing will depend upon improvements in those shows. On the other hand, five American and one English show (capitalized in the list) were so efficiently managed that they received "special recognition", including silver medals for their contributors.

Since nature photography exhibitions are covered by a separate "Who's Who", they are not included in this listing.

A total of 732 exhibitors are represented this year, a slight increase over the last year, tho the number of exhibitions is the same. In addition there were 971 contributors who were successful in only one exhibition, and more than 1000 who submitted entries and had none accepted.

Judges' slides are not included in the following list, but asterisks indicate how many exhibitions the individual has judged.

The "Who's Who" list is compiled annually by national committee member Blanche Kolarik, APSA, from card files (approximately 3600 individual cards) on which are recorded acceptances from the various exhibition catalogs. Catalog errors, variations in names and addresses, etc., require considerable investigation by direct inquiry, Color Division's cross reference files, and other sources developed for this purpose. Most such irregularities have been eliminated, but if there are any questions, these may be addressed directly to Mrs. Kolarik at 2824 S. Central Park Ave., Chicago 23, Illinois.

# NO MORE PRINT-CURL

New effective solution for your print flattening and conditioning problems.

- MAKES PRINTS LIE FLAT
- ELIMINATES CRAZING
- IMPROVES GLOSS
- GALLON TREATS 3000 8x10's

### NO MORE HYPO STAIN

BFi No. 30 frees prints and films from hypo faster, more completely, and with less water. Saves up to 80% time and water. Assures permanence of record prints. Aids successful toning.

Gallon treats 5000 8x10's. Keeps indefinitely, under normal storage conditions.

#### TD Executive Committee Meets

When the brass hats of the Technical Division gathered for an Executive committee meeting at Ansco Lake, near Binghamton, recently, they took time out to watch the birdie. In the usual order, those seated are: Walter Litten, Joseph Friedman, George Eaton, William Swann and H. Lou Gibson. Standing: Fritz Dersch, Frank Carlson, Earl Clark, Norris Harkness, Hubert Scheffy, Paul Arnold, R. C. Hakanson, Herbert MacDonough.

## **PSA NATURE DIVISION**

HARRY R. REICH, APSA

286 Schenck St., No. Tonawanda, New York

#### More Nature Exhibitions In Process

If it appears to the readers of this column that the advent of more new nature exhibits is of sufficient interest to rate top billing in this column month after month please remember that as chairman of the Nature Division it is my business and extreme pleasure to sell Nature Photography to the PSA member-body, and to the world at large. The advent of new shows reflects an increased interest in our favorite form of photography and should furnish the necessary impetus to increase the membership in the Nature Division and also in the Society.

This past week the writer received a request to furnish the minimum requirements for Nature Division approval of a nature section to an exhibition of photography conducted by the Newcastle-upon-Tyne Photographic Society in Northumberland, England. The Newcastle show is not a new exhibit but it is their intention to conduct their spring show to conform with PSA practices in order that they might be favored with PSA sanction and approval. The Nature Section I feel certain is new to the show. The information requested has been furnished them and they have been advised that the official Nature Division mailing list is available to them if they wish it.

On this very day I am in receipt of a letter from the Secretary of The Syracuse Camera Club. I take the liberty of quoting from

this letter for your approval.

"I read with interest your article in the PSA Journal on Nature Salons. The Syracuse Camera Club is planning a salon for May of 1953. Our first consideration is to keep the cost of it down to a point where we will not go into debt. We also have a relatively small active membership who can be counted

on to do the actual work.

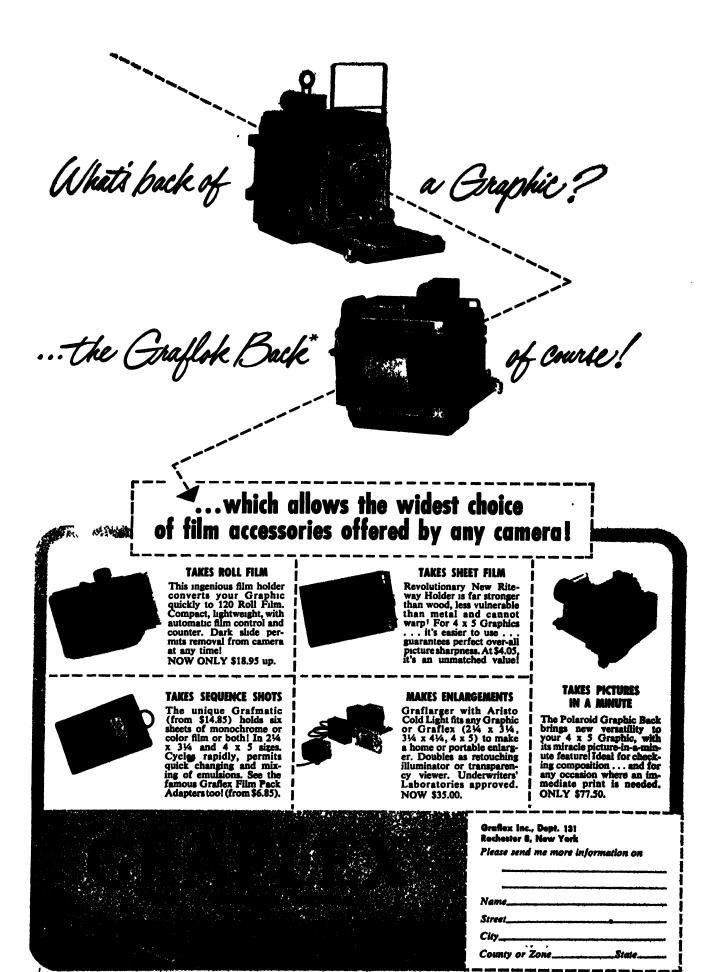

"We are considering adding a nature section in our salon. First, what are the minimum requirements to meet PSA Nature Division approval? Secondly, if we had such a section, would we get enough response to make the effort worth while? We would like to support your efforts if is is possible."

The Salon Committee of the Syracuse Camera Club is meeting with some of the Rochester Salon Committee on Wednesday night, July 30th, in Rochester. I shall make it a point to be present at that meeting and I assure you their committee will have all the necessary information for having the show recognized by the Nature Division of PSA and all the advice I can render. It will be up to you nature photographers, however, to furnish the necessary support to the show to guarantee its success. I am counting on all of you to do just that.

#### Permanent N.D. Print and Slide Sets

As most of you know the Nature Division has three permanent sets of nature prints and also several sets of nature slides for circulation. These sets have proven very popular as programs for camera clubs since they were first announced, numerous clubs have requested these sets and to date they have not had them. The print sets have been scheduled in defined areas in order to save as much expense in shipping charges as possible to the clubs requesting them.

Scheduling them in this manner makes it possible to send out a set of prints, say for instance, to the middle west area so that the club first on the schedule will receive the prints postpaid. They will then mail them to the second club prepaid. That club will then mail them to the next club, pay-

hig the postage when they mail them. In that way each clab has but one shipping charge to pay, and the Nature Division has hat one postage to pay per set for a given area.

Several of these sets will soon complete such schedules and will be returned for rescheduling. If your club has previously made requests for print sets and has not as yet had them please make a second request now before schedules are again completed for these sets.

Requests for print sets should be made to Dr. Stanley H. Seeman, 331 Euclid Avenue, Kenmore 17, New York. Requests for slide sets are to be made to Louise K. Broman. APSA, 6058 South Troy St., Chicago 29, Illinols.

#### New York State Museum Announces Second Exhibition of Nature Photography

The New York State Museum has announced its second exhibition of nature photography which consists of a series of six different exhibits occuring on alternate months beginning with the month of December 1952. For a time it was thought possible to arrange for this exhibit to meet the minimum requirements for PSA Nature Division sanction but due to the fact that it is a State sponsored exhibit certain conditions prevailed that prevented this. The writer thinks this exhibit is a very fine show and worthy of the support of all nature photographers.

Each of the six exhibits is restricted to classified subject matter. The First:-Wild Birds, on display December 1, through December 31, 1952. Closing date, November 10. The Second:-Scenery, on display February 1, through February 28, 1953. Closing date, January 10. The Third:-Wild Animals. on display April 1, through April 30, 1953. Closing date, March 10. The Fourth:--Trees, on display June 1, through June 30, 1953. Closing date, May 10. The Fifth:--Flowers, on display August 1, through August 31, 1953. Closing date, July 10. The Sixth:-Nature Photographs, (all natural history subjects not included in the other exhibits) on display October 1, through October 31, 1953. Closing date, September

## First International Exhibition of Nature Photography

Some time ago in this column we mentioned the possibility of a new nature exhibit to be sponsored by the Channel City CC of Santa Barbara, Calif. this fall. This prediction has materialized and the show is scheduled for November 1 and as it will be conducted to conform with the recommended practices of the PSA, it will be included in the Nature Division's Who's Who listing for 1953.

The exhibition calendar for this show is as follows:

Closing date.....Oct. 18, 1952
Judging.....Oct. 25, 26
Notification cards sent....Oct. 27
Total rejections mailed....Oct. 30
Exhibition.....Nov. 1 to 10
All entries analled.....Nov. 20

As this is the first Santa Bethere Exhibition it means that all of your prints and slides, if they are nature material, are eligible. There is no excuse therefore for not entering. Let us all help to make this show a success.

#### You Can't Win If You Don't Enter

Time and again the writer has pleaded with the nature workers to refrain from hiding their lights under a bushel. Pardon the old saw, but it is so appropriate. After you have worked hard over a print to submit to the handfull of Nature Exhibitions and have had the pleasure of seeing it accepted in one after the other of the existing shows why not give it a chance to compete with the best the pictorialists, and the photo-journalists have to offer.

If you don't send them out and let them compete how can you expect to win with them. How can you expect to learn the true quality and excellence of your efforts? The recent announcement of the winners in the 1952 Graflex Contest proves the point

in question graphically. One of the manners of the nature division, a very due nature worker who however requires constant unging by the writer to submit his prints to this and that contest or competition, had the pleasure of seeing one of his prints win first prize in the action class of the Graffer contest which netted him three hundred delars and then saw the same print win first in a special news class which netted another three hundred dollars, making six hundred in all for one print. I feel certain that this particular N.D. member will need no further urging to submit.

I have in mind another member of the division who in 1950 had created a very superior print of a flight of gulls on gull island which he dutifully submitted to all of the nature exhibitions and then filed away, only to see another photographer enter the same subject in the Popular Photography Contest of 1951 and win first prize in that contest with his print. I am also satisfied that that member will need no further urging to submit.

Why not get into the swim? Enter your prints for you can't win if you don't enter.

## MOTION PICTURE DIVISION NEWS

H. A. McDonouch, APSA R. D. #3, Binghamton, N. Y.

#### "Tops" In Movies

Elsewhere in this issue you will read of the first of the "Tope" shows for this year, to be held in San Diego on Sept. 13-14. The MP Division will play a heavy role in this opening meeting of the 1952-53 Tops season.

Among the outstanding events will be a movie clinic at which Dr. Harold Lincoln Thompsen, APSA, will preside as Chairman. "Color in Motion" will be presented by Lynn Fayman. Station KSMB-TV will demonstrate movies for use in television. Dr. Thompson will screen a color picture of his own making. Question and answer clinics will be featured and a number of live models, many with costumes, will be available for shooting.

#### Birds After Birds

Dick and Ada Bird have been battling the elements up in the North Atlantic. A portion of their report written to their good friend, Harris Tuttle, is printed below. This will give you an idea of the hazards under which movie makers work to bring documentary pictures to our acreens.

"For the past four days we have been working on some very small islands off the Atlantic choreline whereon, in addition to the "Western Birds" there are tens of thousands of Puffins, Murres, Kittiwakes and other sea birds.

"To get to these islands it is necessary to hire fishing boats and fishermen to assist in the landing operation—and this is just what it is because the isles are masses of rock on which it, is difficult to land. One has to trainafer from the larger boat to a deep, no easy task if the water is rough, then row

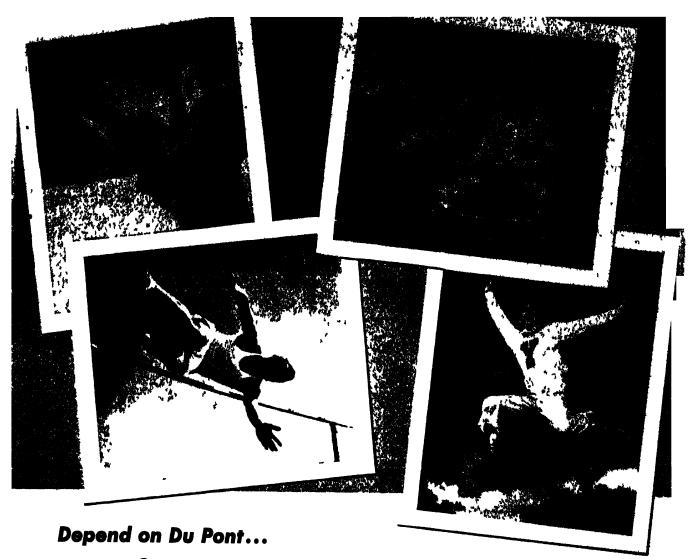

shorewards and between swells, the boatman rows the dory against the rocks and the photographer and his mate, scramble overboard onto the rocks, slipperv with wet kelp, and, if you are lucky, get a fingerhold on the boulders or rocks and bellyflop on them as the dory slips away from under into 30 feet of very chilly Atlantic, Passing ashore the equipment is just one of those things you try not to worry about until you do it, that's the time you worry and how!

"When you are ashore, perched on the barren but slippery rocks, keeping an anxious eye on the camera cases and tripods to anticipate any of them sliding back into the briny, you toss the gaze upwards to the face of a 70 to 80 foot cliff that has to be climbed by clinging to its sheer sides by fingers and toes and every hope the mind can conjure until you crawl gratefully over the ridge near the top where you tie a stout rope and haul the gear up in stages and finally your companion Atlantic Alpiner until everything and everybody is ready to go to work. We consumed an hour each day to climb this cliff, and a half hour each evening to reverse the process.

"The isle is barren of tree growth, not even a bush, considerable green grass in which the puffins dig their burrows and which makes walking an ordeal, falls are frequent with one or both feet plunging down a foot or more into a hole occupied by a nesting bird.

"Weather closes in, sun goes, rain comes and the wind breaks out from the east, white caps appear and the waves best against the cliffs below. You realize the fishermen in their small bests couldn't get to the rock let alone take you off it. You are in for the night and its cold, its sain-

September 1952

for Pictures You'll Never Forget

When the cool breath of autumn bathes the countryside in a garment of vivid color and students flock back to their studies and Saturday afternoon

sports, there are a million pictures in the making... pictures that in the years ahead beckon you to walk down Memory Lane and enjoy again happy, carefree moments. Only photographs can stop time and catch forever that pageant of memories, the tête-à-tête on a campus wall, or the exciting highlight of the big game.

So, carry your camera wherever you and don't miss a single memory. If it's a sheet-film camera, load your holders with Du Pont High Speed Pan Film, snap away, and you'll be sure you get the best pictures possible. Its high speed (ASA: 160 daylight, 125 tungsten) lets you shoot fast, or cut the aperture way down for sharpness and depth of field, without worrying about thin negatives. Even if you mist the exposure by a stop, the wide latitude of High Speed

Pan ensures you a full-bodied negative that shows every tone from deep, rich black to whitest white, with shadows and highlights packed full of detail.

If you do your own darkroom work, print your negatives on Du Pont "Varigam" variable contrast paper . . . the one paper that gives you any of ten contrasts in a single sheet through easy-to-use filters. Or, when you drop your films off at the photo shop, ask for "Varigam" prints. Either way you'll thrill at the better, livelier print quality. E. I. du Pont de Nemours & Co. (Inc.), Photo Products Dept., Wilmington 98, Delaware. In Canada: Consult your photographic dealer or Canadian Industries, Ltd., Montreal.

# Du Pont Photographic Products

150 Maniagreary

ing, the wind makes it difficult to even stand upright and there is no shelter. No trees, no wood, not even a twig to build a fire for warmth, the thermos coffee is cold, the sandwiches, those that are left in the haver-sack, are soggy, the grassy spots are honey-combed with puffins burrows and its getting dark. You have a tent but no poles to erect it, you stretch it between two rocks and its roof is two feet from the ground and every moment it may blow away with the breeze, whatta breeze.

"Cold and wet hands pull up tufts of grass in an attempt to fill in the hurrows for your reclinnig body beneath the sopping canvas but the job would require hours to do for any semblance of comfort. With the wet canvas sagging onto your face every few minutes to prevent more than seconds of dozing you spend the long night.

"Up at dawn, crawling out of your soggy shelter into a dripping world and survey the prospect of leaden skies still spilling driving rain and a sullen ocean expending itself against the cliffs nearly a hundred feet below and wonder what the new and uninviting day holds for you other than anxiety and frustration.

"You hear the putter of a small engine and around the headland comes the fishermen, their tiny craft bouncing crazily with the heave and fall of the ocean, they have realized your plight and braved the high winds and waters to haul you to safety and comfort. The ordeal of getting down the cliff again is one we don't want to repeat, every foot of the incline was dripping wet and made more treacherous by the soaked bird excreta with which the rock is plastered. The descent by rope is made with many misgivings, for a slip means broken bones if not worse. The transfer of selves and equipment from rocks to dory is one of those adventures that are in the realms of the impossible until you have had to engage in it. Here a slip means drowning, for sure. The transhipping from dory to fishboat of equipment provides more nervous flutterings until finally we are bouncing and rolling towards the fishing village, a hospitable welcome a hearty and filling breakfast and much, much relief in the mind but. we've got aches and pains in various parts of our anatomies that we didn't, until now, seem to know we had, and bruises on shins, knees, thighs, buttocks, backs, arms, elbows and places where you can't see without looking in the mirror and gawd knows we look like the devil without that aid. Wanna be a wildlife cinematographer?"

#### PHOTO-JOURNALISM

WILLIAM A. PRICE ______ 78 Elbert St., Ramsey, N. J.

Dear Don:

I am on a field assignment away from home and can't pick up much of anything for the P-J Division column this month.

Long before this I had hoped to write a general "hello" letter to all the PSAers and to P.Jers in particular through the JOURNAL. I want to start the ball rolling towards member participation and invite correspondence from all PSA members with regard to P.J. I would like to run a sort

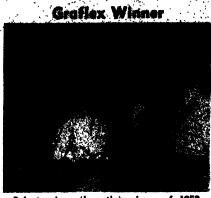

of Question and Answer box, for example.

I feel sure that most amateurs consider Photo-Journalism to be photography for profit, from their individual viewpoints at least, and I myself can think of related questions that I cannot answer without professional advice.

I think P-J can do much towards building up spirit and pride for and among amateur photographers. Suppose that an amateur has an investment of about \$200 in his equipment. If P-J, through the JOURNAL, can give him an idea or furnish information that will enable him to make just one \$5 sale, to a picture service or a neighbor, you can imagine his enthusiaam for P-J.

On the basis of economics \$5 is certainly small potatoes from a \$200 seed, but it isn't the crop that counts, its the pride in the fact that the seed did sprout! The guy will probably plant a lot more expensive seeds for small sprouts but he will love it—just like you and I love our \$5 radishes from our own garden in the Spring.

What can we do to get the questions

Bob Jennings (bow tie) winner of 1952 Graflex-INP Press Fellowship chats with Bob Dixon, Mary Collins and Ken Carson on Sheriff Bob Dixon TV show. Jennings spent a week in New Yerk working with top editors and specialists at INP under terms of the Fellowship.

rolling in for the box so we can get some seeds sprouting?

BILL PRICE

## **PSA STEREO DIVISION**

FRANK E. RICE, APSA

228 N. LaSalle St., Chicago 1

#### Stereo Slide Instruction Set

L. B. (Red) Dunnigan, in charge of stereo slide circuits, together with a couple of capable assistants, James W. Stower and Rohert L. Howard, have put together a set of 45 slides selected to illustrate various good points in picture making, and otherwise.

In the series are slides showing interesting ways to shoot a subject. The commentary that accompanies the set says in this connection: "But look around you and you will see millions of simple items and scenes... photographing them in a way that will interest an audience is far greater satisfaction than recording a scene that almost photographs itself."

A portion of the series shows shooting straight up (through tree branches) and straight down. You are directed to try pointing the viewer at the same elevation as the camera was pointed. What a difference it makes! Also, in some measure it shows why such slides often look better in the viewer than on the screen.

There are also illustrations of having foreground objects too far from background, shooting with daylight and floods as against flash, and various other points that make for good and not so good pictures.

This instruction set is being circulated just now to those in the slide circuits Nos. 1 and 2. When it has completed the rounds, it will be available for clubs or individuals who wish to be "wised up" on good stereo shooting.

#### Circuit No. 3 Is About to Start

"Red" Dunnigan reports that he can take on more slide makers in his circuits. Fifteen people make a circuit. Each puts in slides. The set, together with note books, moves from one member to another by express. Every member adds comments about every other member's slides. The whole thing is fun, and most profitable to those who wish to improve their picture making.

Write Red.—His address is 519 S. Vermont, Royal Oak, Michigan.

#### Stereo Folio Program

The Stereo Club Traveling Folio program is under the direction of E. Krause, 5706 S. Harper, Chicago 37. To get particulars. club officers should write him immediately. In the meantime they should appeal to their members for 2 to 6 good slides from each to represent their club in a traveling show. Folios from other clubs can fill several of your club's empty program dates. Contributing members will receive helpful comments on their slides from each club the folio visits.

## Academy of Stereoscopic Arts and Sciences

An organization named as above has lately been formed. Address 6112 Selma Ave., Hollywood 28, California, a "non-profit institution," Paul G. Horner, President.

One of its activities is to "find the 10 greatest stereo pictures in the world for each year and give each an Academy Award known as a STEREOSCAR." It is planned that duplicates will be sold to anyone interested. Now available are the selections for 1950 and 1951.

#### Dorothy MacLean— Smokies "Photoguide"

One of our newest SD members writes that she would be glad to show us the photogenic spots in and around Gatlinburg, Tennessee. You will find her at Woodcrafters and Carvers in that town. Her only charge is that you bring along a few of your own slides for her to see.

Dorothy has acted as a guide in the Smokies for many years. She originated the word "Photoguide" which is now generally used in the Park Service.

#### Standardization of Mounts

We are not permitted to anticipate the conclusions that may result in the standardization field. However it is well to know that there may soon be standards set for the space between window centers of mounts. Indications are that 2.45 inches may turn out to be the standard. It might be well for us not to load up too heavily with a stock of those mounts that run considerably less than that, particularly if we are interested in stereo projection.

#### Helpful Hint Column

George Mack suggests (in connection with taking pictures hand held) -don't put all the weight of the body on both feet. Put it mostly on one, just as a unipod; and you will be able to hold the camera much steadier, but of course, rest the other foot on the ground.

On this general subject also, -THE STEREO VIEW, publication of the Stereo CC of the East Bay (Alameda, Calif.) suggests that there is less likely to be camera movement in snap shooting if the thumb is placed as far forward as possible on the underside of the camera. Otherwise a camera tilt will result when the finger presses the release button of the Realist.

#### Those Long-Expected Permamounts

We hear the manufacturer of Permamounts has been having his troubles. Several times the mount was about ready to be released when a new problem turned up, -plastics that wouldn't stand the gaff, ineffective adhesives, film curvature and shrinkage, and a few others. We who have seen samples are impressed with the simplicity of the design. and the ease with which a permament mounting job can be done.

#### Labor-Union-Member Photogs-Help!

Stereo Slide Circuit No. 1 with 90 beautiful Kodachrome slides are resting (and probably deteriorating) on Steamer "Hawaiian Pilot" because of the Maritime strike If anyone who reads this, knows a labor official with photographic interests and a kind heart, will he please do what he can to get that express package off the boat and on its way, or at least into cool stomge.

#### Eastman Recognizes Stereol

1 new Kodachrome film, K-335, now available, is made especially for stereo cameras of 23x23 mm. pictures. It makes 20 pairs, netail price \$4.75. This includes the cost of a mounting job which is satisfactory for hand viewing.

Until January 1 the film must be sent to Rochester for processing and mounting. After that, the other Eastman laboratories may be equipped to do the job.

Obviously, those who prefer to do their own cutting and mounting will continue to use K-135 since the unit cost will be less.

However, if you have a stock of 135's and wish to have Eastman provide you with the

new mounting service, here is what you do. -Send the rolls to Rochester; place in the coin envelope \$1 to cover the cost of mounting the 20-exposure rolls; \$1.60 for the 36 exposure rolls. Cost of mailing the alides back to you is included in the above.

#### Making Singles out of Doubles

When we have that single picture from the stereo pair and would like to try projecting it to see whether it is something that we should add to our planar collection. the problem of mounting now has an answer. "Armme Kwik Mounts" are available,- -2 x 2 outside dimensions, made of substantial cardboard, with easy slip-in slots. They come in all the size windows demanded by the various stereo cameras. Series SI-5 is the 5-sprocket size (Realist). Series SI-7 is for the 7-sprocket cut, etc. Sometimes our pix taken with a stereo camera make useful additions to our travelogue collection of two-by-twos. Some have been known to win ribbons in the regular color slide exhibitions. Now it is easy to try them both ways.

#### Letters to the Editor

#### Passing of a fighter

Dear Don.
William Howard Gardiner died the other day. The notices and nothing of his photographic prosess, but he was a prominent pictorialist 15 years ago, a great exponent of the lassbender school.

but he was a prominent pictorialist 15 years ago, a great exponent of the lassbender school. In 1936 he was hiving an argument with Frapric about counting salon successes and needled me into accipting the charmanship of the PSA's Four-Frint Ishibiting Committee Our final report came out in 1948. It was primarily responsible for the practice of salons now routine to accipt only four entries from any one contributor, and for the abandonium it of the weighting system used by American Photography in those days for evaluating the different salons with a complicated mathematical formula Gardines supplied the pressure and did most of the writing of the final report. plied the pressure and did most of the writing the final report

He was the most o most contentions and the most DAVID R CHAIG

North Maishheld, Mass.

Mr. Gardiner's obituary in the New York Her-ald Iribune of June 23 does not mention his photographic activities but devotes nearly a column to his fight against the "naval holiday" in 1931. He was then president of the Navy League and was against President Hoover's play to redure the Navy and stop construction of new ships. Apparently, William Howard Gardiner was ever a fighter against what he thought were grievous wrongs.—Ed.

#### Wants more Johnny Appleseed

Dear Mr Bennett

Dean Mr. Bennett

I missed one article in the July Journal that I
think should be of interest to most everyone, beginner
or advanced. I think it is a good section and should
be kept going if it is at all possible.

I think that ads, good ads, will not hurt the
JOURNAL... But they must be quality advertisements.

FRED J. KLEHL,

Pres. CICCA

Rock Island, Ill.

Johnny Appleseed will be back. You may recall that Johnny has been in and out, never a regular monthly feature. Johnny is one of the vital balancing elements we talked about when we spoke of a balanced format. It is our plan to have Johnny cater most often to the new comer, with some advanced material, but mestlementary ideas and techniques to help the new member and the new photographer.

Ads are an essential part of the JOURNAL. They pay the freight and help balance the budget, fou'll never see a high ad-editorial ratio because as more advertisers use our golumns, we will add editorial pages to maintain the balance. You readers can help this situation by following the suggestion at the bottom of each them the advertiser knows his at is being read in the JOURNAL, and welcomes our Advertising Manager when he calls.

We'd like to see more letters to the Editor. Most everyone finds them interesting reading. However, don't inst write beuquets, we won't print them. We'll pr'ut the brickhats, but we'd much rather print the things that interest you.—Ed.

By KONERT J. GOLDWAN 43 Plymouth Rd., Great Neck, L. I., N. Y.

Pre-convention notes include one about Charles Green (Richmond, Calif.) who handles the distribution of Color Division slide sets in the west and who does a large amount of judging-by-mail for clubs. He is quoted thus: "Last year a certain club sent a set of slides for judging, most of them flower slides. I spent a lot of time commenting. Now they've sent more and they claim that their newest flower portraits should be good because they've done everything I told them to do." What a spot to put a judge in! . . . Al Schwartz (Brooklyn. N. Y.) not only won in the snapshot contest preliminaries but the July 20 New York Herald-Tribune reproduced his prize-winning picture on its photography page.

The Canadian Rockies-especially Lake Louise and Banff--re-echo to the sound of the clicking shutters of R. B. Hargreaves (Denver, Col.), Eugenia Buxton (Memphis. Tenn.), Henry Greenhood (Los Angeles, Calif.) and Ruth Nicol (Butte, Mont.) . . . Carl Sanchez (New York, N. Y.) was hospitalized recently for an operation . . . Frank Fuller and his wife, Ruth, (Bloomington, Ill.) have taken to trailer life with Frank washing his prints under the shower . . . Louise Haz (formerly Skokie, Ill.) and Angel de Moya (Havana) shot Kodachrome ın Miamı's Parrot Jungle.

Once again, we remind PSA folks that this column is aimed at helping them to know who is doing what in PSA throughout the country. Please send personal news items such as appear here to Robert J. Goldman, 43 Plymouth Road, Great Neck. New York.

#### Garden Pix Wanted

Organic Gardening Magazine of Emmaus. Pa., wants pictures of "gardening and allied subjects such as insects and certain animals." This should be a cinch for members of the Nature Division.

Miss Ruth Rodale, Managing Editor does not state whether she can use color. It might be well to write her, telling her the type of material you have available. When offering your list, ask for rates and method of payment.

#### Membership Directory

Work starts soon on the annual Membership Directory. The last one was printed with the January issue of the PSA Journal. Look at that issue and see if your name is listed properly, that all your Division affiliations are shown, and, if you have honors or are on a committee, that you are properly listed.

If you find an error in your listing or that of a friend, won't you drop a line to "Directory, PSA Headquarters, 2005 Walnut St., Phila. 3, Pa."?

to him that the United States should have a similar organization. He was not able to realize his dream immediately. however. There was the matter of money for postage, etc. Then he managed to interest the Eastman Kodak Company in his plan. The company agreed to finance the organizing of an association of camera clubs to the extent of paying the expenses of starting such a group, but without paying any salaries. The Newark Camera Club gave its moral support and office space. Individual members gave their personal assistance to supplement the prodigious efforts of Bucher himself.

In 1919 the Associated Camera Clubs of America was formed and in the following years Bucher was its secretary, vice president and president. At that time there were fewer than 100 camera clubs in the U. S., so the field was limited.

The set-up of the Associated Camera Clubs of America still was not entirely satisfactory, in that it did not include individual members. In 1932, however, the ACCA was reorganized as the Photographic Society of America, with individual members included. A letterhead of that period contains the following wording: "Photographic Society of America, 683 High Street, Newark, N. J., Louis F. Bucher, chairman; Clare J. Crary, vice chairman; Dr. Max Thorek, FRPS, secretary; R. L. Van Oosting, treasurer. Organization Committee-William A. Alcock, FRPS, Charles K. Archer, W. Hurley Ashby, ARPS, Norton L. Avery, Charles Aylett, FRPS, Hillary G. Bailey, FRPS, F. C. Baker, Charles J. Barkhorn, Julia A. Barnes, Robert A Barrows, Karl A. Baumgaertel, A. H. Beardsley, Clark Blickensderfer, Sigismund Blumann, FRPS, A. Aubrey Bodine, Ralph P. Bonwit, Nicholis Boris, FRPS, Mrs. Ann Brigman, J. E. Brill, Stanley

Brooks, Louis F. Bucher, Frank V. Chambers, FRPS, Frederick H Chant, Byron H. Chatto, Harry G. Cleveland, Clare J. Crary, H. Richardson Cremer, Fred R. Dapprich, William S. Davis, James N. Doolittle, Edwin F Dreher, Louis Fleckenstein, Frank R. Fraprie, FRPS, Frank E. Geisler, ARPS, C. W. Gibbs, Forman Hanna, ARPS, Raymond E. Hanson, Geo. W. Harting, Kent C. Haven, John Helders, FRPS, Harry P. Herron, Mrs. Antoinette B. Hervey, U Stephen Johnson, ARPS, Franklin I Jordan, ARPS, Arthur F. Kales, FRPS, Dr. Kyo Koike, Sophie L. Lauffer, FRPS, James S. Lawshe. Alexander Leventon, ARPS, L. H. Longwell, J. H. Mackay, Ira Wright Martin, Bruce Metcalf, Elia E. McBride, J. Bruce McCracken, Louis R. Murray, Dr. Arthur Nilsen, Robert A. Officer, FRPS, Charles H. Partington, F. Albert Reager, Jane Reece, Oscar C. Reiter, William M. Ritasse, Harrie V. Schieren, ARPS, Thomas O. Sheckell, John W. Sheeres, C. B. Ceifert, Kenneth D. Smith, ARPS, J. O. Sprague P. F. Squier, Dr Max Thorek, FRPS, R. L. Van Oosting, L. E. Wagner, Charles A. Weddigen, Dr. E. P. Wightman, FRPS, Dr. William H. Woglom, ARPS, William L Woodburn, William H. Zerbe.

Progress of the PSA has been steady and satisfactory since that time. The conventions, the magazine, the portfolios and multitude of other activities carried on all testify to the success of the organization and the foresight of its founders.

In the course of the years a number of honors have come to Louis F. Bucher. The one which he prizes most higly is the title of Honorary President of the PSA. No one else has ever received this distinction. In 1949 the Metropolitan Camera Club Council of New York granted him its Award of Achievement. He is an honorary associate member of the Kodak Camera Club of Rochester and has received many other honors.

An outstanding lightweight portable designed specifically for application where small weight and size are required. The complete unit is housed in a narrow functional form-fitting case and provides adequate light output for news and magazine asslanments.

#### Fun for all

(from page 534)

your interest in one of the most wonderful hobbies in the world, and what's more vou'll never succeed in becoming a good photographer. Mrs. Sam Vogan, the wife of one of our most successful photographers, says that she has always told Sam, "Don't get too elated nor too deflated."

There are many more fields of endeavor in color photography other than those of competing in your club or in salons. The record of a trip or of a vacation is a lot of fun to make, and will give you and your friends a great deal of pleasure and enjoyment, and by no means underestimate it's importance as contributing toward the enjoyment of your hobby. Exploit every phase of your hobby to its utmost. Do not get into the frame of mind where you regard your camera equipment solely as a means for success in exhibiting. No matter how successful you are, remember at all times that it is your hobby, and as such, to get all the fun you can out of it. Don't be a slave to your shutter and feel that every time you press the button you have to get a salon shot. Shoot for fun!

If you can learn to take things in stride and to control your emotions, you will not only gain a tremendous amount of added enjoyment out of photography, but you will also become a better color worker, a better salon exhibitor, a better contestant, and a better person.

ABOUT THE AUTHOR-Robert Goldman is a leading color exhibitor, and h won many medals and ribbons in both Club and International Exhibitions. An investment banker by profession, in which field he is the senior partner of his firm, he devotes much time to the advencement of interest in cole and to helping beginners. He has lectured in Clubs, Hospitals, Convales Homes and Veterans Hospitals, showing travelogues and giving instruction the "in's and Out's" of the Selons. He is a member of the Board of Direct the "in's and untre" of the Subsection and its memorial of the Rey York Color Slide Club, an Associate Member of the Chicago Consent Chib in whose annual members' contest last January he won two of ten medals awarded, and recently founded the Great Nock Color Camera ( irded, and recently founded the is serving as its first Printdent.

The most ambitious undertaking of the National Lecture Program commences Sept 9th when Maurice H. Louis, APSA, of New York, speaks before the Telephone C C of Phila

This will be the first lecture on a five months trip which will bring Louis before over forty clubs from the Atlantic to the Parific to the Gulf of Mexico. It is expected that he will travel 14,000 miles in his laguar which is emblazoned with the scals of PSA and NLP.

The aims of this extensive tour are to stimulate interest and greater proficiency in portraiture. The difficult planning of this trip was in the capable hands of Barbara Green, FPSA, chairman of NLP

The itinerary of Louis' tour follows, al though there are some open dates on the final leg of the trip through the South

Dates marked (T) are tentative at this writing and should be confirmed by contacting the club listed if you plan to attend

Sept 9, Telephone CC of Phila, Pa; Sept. 12. Scranton CC; Sept. 16 (T), Hagerstown Photo Soc., Md.; Sept. 18, Ohio Valley CC, Wheeling, W Va.; Sept. 22, Youngstown Photo. Soc. Ohio; Sept. 23, Camera Guild of Cleveland O; Sept.

25, Seven Hills Photographers, Cincinnati; Sept. 27, Champion Shutterbug Club, Ham ilton, O., Sept. 29, Fine Arts CC, Evans ville, Ind , Sept 30, YMCA CC Club, Ow ensboro, Ky, Oct. 2, 3, 4 & 5, Open; Sept 8, (T), River Park Deaf Photo Club, Chicaro, Oct 10, La Crosse CC, Wis, Oct 13, Sloux City CC., Iowa; Oct 16, Fremont ((, Neb; Oct. 18, Newton CC, Kan; Oct. 2). Denver Council of Camera Clubs, Colo., Nov. 6, Borse Photo Soc. Nov 10 (T), Great Falls CC, Mont.; Nov. 12 (T), Kalis pell CC, Mont; Nov. 17 (T), Portland Photo Soc, Ore, Nov. 19 (T), Klamath Falls, Ore; Nov 21 (T), Sierra CC, Sacia mento, Cal; Nov 24 (T), Northern Cal (ouncil of Camera Clubs, Richmond

Later bookings for which no dates have been assigned include El Paso Photo Soc., Convair CC, Fort Worth, Baytown CC; Port Arthur CC, all in Texas, and Central Florida CC, St. Petersburg, Fla, Chattanooga Chapter PSA, Tenn, and Florence CC, Florence, S C

Some dates are still open, even in the carly stages of the tour and clubs may ar range bookings by wiring or writing Mrs. Barbara Green, FPSA, 30 Willow St., Brooklyn 2, N. Y.

#### Wu Lecture Dates Open

Response to the announcement of the short NLP lecture tour by Francis Wu of Hong Kong has been so enthusiastic that he has now been persuaded to extend his stay in the United States so that his tour can include a number of additional cities. Mr. Wu is being brought to this country through the joint efforts of PSA and PAA (the professional association) and has been featured on the convention programs of both organizations.

Widely acclaimed as the foremost photographer in the Orient, his prints have excited admiration and intense interest wherever they have been shown. They are readily distinguished by an individual style which Mi. Wu modestly ascribes to the influence of traditional Chinese art. In his lecture, "Pictorial Photography from the Chinese Viewpoint", Mr. Wu will explain how he selects pictorial subject matter and how he secures his amazing results Many of his illustrations have been expressly prepared for this purpose.

The NLP tour will begin early in September, following the PAA Convention in Chicago and his expanded itinerary will take him through the East, returning to the Pacific Coast through the Southwest. The \$75\$ fee includes transportation. Local sponsors are expected also to provide hotel accommodations.

Although most of the tour has already

#### 1932 Tops In Photography To Open In San Diego Sept. 13

The 1952-53 traveling exhibition "Tops in Photography" will open the season with a two-day stand in San Diego, Calif. on Sapt. 13 and 14. Milwaukee, Wis. will have the show on Oct. 15.

"Tops" consists of the best in black and white prints, color slides and movies, with subject matter spensored by the Pictorial, Nature, Movie and Technical Divisions of PSA. Mrs. Blanche Adams, President of the Phoenix CC, which sponsored a successful showing of Tops last year has said, "Tops gives us an opportunity to see the work of people we only read about. It gives us a criterion to judge our own work so that we may improve."

Paul Wolf, APSA was chairman of the '51-52 Tops committee and Les Mahoney is chairman for '52 53. R. B. (Jack) Horner of Chicago is in charge of assembling pictorial color slides, Dr. Harold L. Thompson of Los Angeles is contributing his color movie "Invitation to Hawaii", and new nature color slides are being selected.

In some cities where Tops has been featured, a whole day-long program is built around the presentation, with field trips, demonstrations and clinics in the daylight hours, the projection sessions in the evening The program is thrown open to the public and in some cases, dealers have sponsored contests in conjunction with the event. Many new PSA members are signed up at these events.

There is still time for other cities to book lops for showings during the coming season and groups, clubs or councils desiring dates should write at once to Les Mahoney, Chairman, Tops in Photography, P. O. Box 1828, Phoenix, Ariz.

#### Photo Job Open

Photogrammetric Engineers are wanted by the Eglin Air Force Base in Florida. The civil service appointments are in Grade GS 9, are indefinite in duration and pay \$5060. The work involves research, testing, design and operation of photogrammetric instrumentation, methods and assessment of results.

A minimum of four years of college or practical experience plus two years of experience is required. If interested, get Civil Service Form 57 from your post office and file it with Director of Civilian Personnel, Eglin AFB, Florida.

#### Royal Patronage Continued

The Royal Photographic Society of Great Britain has announced that Queen Elizabeth II has conferred her patronage on the Roy I, thus continuing the interest of her predecessors in the Society. Queen Victoria conferred the "Royal" title in 1894 and her consort, Prince Albert took a special interest in the affairs of RPS.

been booked, other clubs designing to take advantage of this opportunity should immediately wire Mrs. Barbara Green, 30 Willow St. Brooklyn, N. Y., for dates which may still be epen.

## PICTURE OF THE MONTH, JUNE

This is not the Picture of the Month for June! It is, instead, a picture of all the prints of that month in process at the able hands of Chairman John Hogan. Since John needed the pictures to be mounted in the display books for the Convention where you have seen them, he couldn't spare them while we made cuts. So here you get an unusual view of John at work. (Frankly we think he sent it along to show how much work he does! Maybe he wants a raise and thinks this will soften us up.)

#### Remarks

If you have mislaid your copies of the PSA Journal In which the Rules were printed, you may get mimpo-graphed copies upon application to: John R. Hogan, Chairman, 1528 Walnut Street,

Philadelphia 2, Pa.

#### **Good and Bad Publicity**

Good publicity is that which gets printed. Bad publicity is that which goes in the wastebasket. How do you get good publicity?

First, you provide the editor with the facts. Facts are who, what, when, where and why. Just answer those five questions with simple statements, then tack on a clarifying paragraph that ties them together. The Editor knows how to take those facts and make a story. If you can write a story in news style, you save the Editor a little work, but if it is all opinion and sugar coating, it makes him no work except that of reaching for the waste basket.

Second, you give it to him in time for the item to be timely. For the general camera mags that means at least three months ahead, better four. (They come out almost a month early). For the JOURNAL it means two months ahead. (We come out the month of dating but need your story early if it is to give you any results). For your daily newspaper you take the same facts, add more facts of local interest and give it to him about a week ahead of time. You give him additional facts the day before the event.

Your daily paper is mechanically equipped to process news in a few hours. The magazines require a whole month to edit, set type, read proofs, lay out and assemble pages, read proof, check pages, read proof and print, bind and mail.

#### OFFICIAL NOTICES

#### Report of the 1952 Nominating Committee

J. Philip Wahlman, APSA, Chairman of the PSA Nominating Committee has announced the following slates, which will be voted upon by the membership of the Society during November. Elections are being held for a one-year term as Director for the Canadian Zone (to be elected by Canadian members only) and for all District Representatives for a two-year term-

CANADIAN DIRECTOR

RAYMOND CARON, APSA, ARPS, 620 Cathcart, Suite 315, Montreal, P.Q., Canada. By profession a lawyer specializing on corporation affairs. Is a past President of Montreal Camera Club, and still very active in programming and social affairs with this and other

Clube in the locality. Has acted as Salon Judge in numerous "Internationals" both in Cenada and the United Schief. # America's most distinguished 35mm camera argus c-four

No other camera combines such amazing ease of operation with this exclusive array of precision features!

Ultra-fast f:2.8 Cintar coated lens—a truly great lens—to give you beautifully defined pictures in color and black-and-white—even in failing light!

Combined rangefinder and viewfinder—to give you an in-focus "picture-window" view—even if you wear glasses!

Superaccurate shutter...1/10 to 1/200 second—perfect complement to the critically sharp lens. Built-in flash synchronizer. See the versatile Argus C4 at your dealer's!

© 1982 Argus Cameras, Inc., Ann Arbor, Mich. All prices include Federal Excise Tax where applicable, and are subject to change without notice.

America's Favorite way to look at color slides—Argus 200 Watt blower-cooled projector. See your highly-prized color slides in true, brilliant color. The "right-side-up" rotary slide carrier prevents upside-down pictures. Silent power blower protects valuable slides. It's the perfect companion for any 35 mm camera? An unmatched value at \$49.50.

# argus

-world's largest manufacturer of 35mm cameras

No matter what your uses for color are, you'll find Kodak Ektachrome Film a practical, satisfying film to use.

Shoot your pictures, and in a day, or sooner, you'll be viewing your transparencies. Dependable processing service is now available from commercial processors conveniently located throughout the country...or, if you wish, you can process it yourself. And, because of Ektachrome's fidelity, soft gradation, long scale, and color brilliance, you have no special lighting problems. Just follow your usual lighting techniques.

Ektachrome comes in economical six-exposure roll films 120 and 620—and in sheets—both Type B* and Daylight Type. List price, \$1.79. Order Kodak Ektachrome Film from your Kodak dealer.

Price is subject to change without notice and includes Federal Tax.

* NEW—Kodak Ektachrome 120 and 620 Roll Film, Type B, is now available. It is equivalent in all photographic respects to the corresponding sheet film, balanced for exposure with 3200 K lamps. With clear flash lamps, it offers speed and quality advantages over the Daylight Type used with blue flash lamps.

# For subtle textures and fine detail choose Ansco Supreme Film

NO MATTER how delicate the varying textures of the subject you photograph, or how fine the recorded detail, you can be sure of big enlargements without distracting grain from negatives made on Ansco Supreme Film.

This modern-type panchromatic emulsion combines extremely fine grain with high speed (exposure indices of 50 daylight, 32 tungsten) and excellent resolving power.

These qualities make Ansco Supreme the logical "all-purpose" choice for hand cameras. No matter what type of subject comes along, 99 times out of a 100 it's a "natural" for this fine film. Ansco Supreme is available in populas roll film and film pack sizes, and in 35mm magazines. For best results develop Supreme in new Finex-L Developer now on sale at all dealers.

#### The President Reports . . .

At the Convention you knew that practically everyone you met was a PSA'er, and because of that you knew they were interesting, good friends. Regardless of who they are and where you meet them, PSA'ers are just as good friends and just worth knowing—but the trick is to identify them.

Why not wear our PSA insignia everywhere?

Our emblem is a proud one. It marks the wearer as a member of the largest group of individuals in the photographic world and as one who has a keen interest not only in the making of better pictures but also in helping others to get more enjoyment from their photography by their heing able to make the kind of pictures they prefer.

As the Regional Activity grows, the PSA emblem will more and more identify you as one of the leaders of your community, as one of the valued core of those who use photography to create a new community spirit and to support new and valuable community efforts. As PSA advances in meeting the obligations imposed by its very name, PSA membership becomes important and more valuable, and wearing the emblem becomes more important accordingly.

We are all proud of PSA, and we are deeply interested in its progress and its service to our country and to photography. Let's wear the emblem regularly both to tell the world of our pride and to make sure that the other PSA'ers we meet recognize us and add to that invaluable aspect of PSA membership, the personal, friendly side of photography.

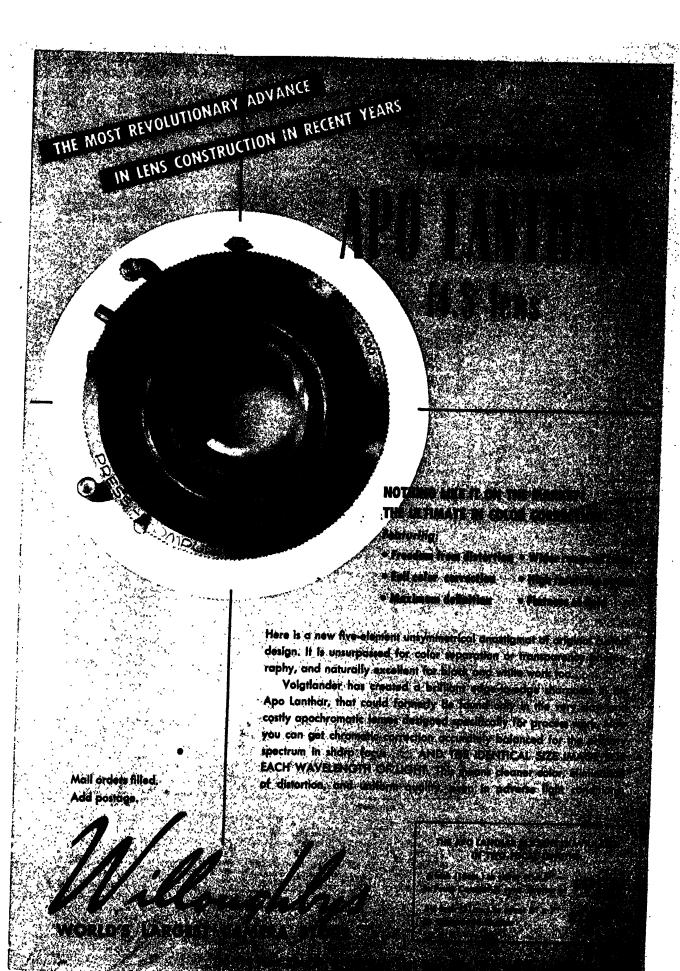

Those members who attended the Convention are now back at home again and many have met with their club associates and other photographic groups. It would be most interesting to know how many took with them enough of the enthusiasm that filled the convention to make the effort to carry the PSA message to their friends.

How many have offered PSA membership to the photographers who could not be in New York or have spoken to their own club or another about what PSA has to offer? In the near future, THE JOURNAL will have more material for those who want to tell some of that story, and the new membership cards will also help in that direction. But nothing from Headquarters or from Spee Wright—nothing official therefore comparatively impersonal—can possibly equal in effectiveness your own telling what PSA means to you and what it holds for any interested photographer.

No published material can help very much, either, in proving to new or old members how much more fun and satisfaction there is in PSA membership when one is active in it. Our publications can tell him, but he scarcely believes it until you tell him of your own experiences along that line. Of course, it is difficult unless you yourself throw the extra thrill that comes from using the services and being an active part of PSA—yourself!

There are big opportunities for added fun an excitement in the expansion of PSA work in many directions. Don't miss out.

## NEW AIDS FOR BETTER PICTURE-MAKING

BY JACOB DESCHIN, FPSA_

A new favorite in the 35mm miniature camera field appears to have loomed on the horizon with the introduction recently of the improved new Canon IV Japanese-manufactured miniature. The camera is being marketed in the United States by Balfour, Guthrie & Co., Ltd., 67 Wall Street, through distributors. Already, the magazine boys are buzzing the news—or opinion—around that the new Canon is the new champ. Whether or not remains to be seen, as the phrase goes. But at the moment it looks good, very good, in fact.

Equipped with the 50mm f/1.8 Serenar lens, the camera sells for \$295. There are auxiliary lenses, three of which are wide angle, three telephoto. The first are the 28mm f/3.5, 35mm f/3.2 and f/2.8; the second, 85mm f/2, 100m f/4 and 135mm f/4. The camera has a combined coupled rangefinder and optical viewfinder. The rangefinder is of the coincidence type and has two degrees of image magnification for critical focusing in poor light and for modifying the viewfinder to give the fields for the 100mm and 135mm lenses. Other features of the Canon IV include a film winding knob which incorporates an exposure counter and a countersunk flush dial for ASA ratings; a focal-plane Leica-type shutter with speeds to 1/1000th second, plus time and bulb; a new-type take-up spool with spring-loaded extension grip; a film rewind knob, normally flush with the camera top but is withdrawn for use, and internal flash synchronization. Altogether, a compact, goodlooking job. Now, fellas, let's look at some pictures.

And here comes a camera made to grow up with photographically. Namely, the Bolsey Model A, made by the Bolsey Corporation of America, the very same folk who made photographic history a while back by producing a 35mm miniature camera with coupled rangefinder at \$55 (It's gone up since, but then so has everything else; in any event, at the time it made big news). The new camera fits in the palm of the hand, weighs less than 12 ounces and is designed for the beginner with no photographic knowledge but willing to learn. The Bolsey A costs \$39.75 equipped with the 44m f/4.5 coated lens.

One quick setting of a red line index readies the camera for the exposure; a warning flag that appears in the viewfinder signals the photographer to wind the film for the next shot; a new type of viewfinder shows the subject in normal size and distance from the camera.

For those in the know or for the time when the novice will want to know more, the camera has "slow" and "fast" markings on the shutter face, "dull" and "bright" indicators for lens openings, as well as conventional scales. The camera is 3x4-3/16x 2% inches, has built in flash synchronization for all flash lamps, double exposure preventipa, and a new type of take-up spool with a large slot and film-gripping hooks to assure even travel of the film. Because of the

new Bolsey's compact design, it is possible to get two to four more pictures from a casette loading than the indicated number.

A prewar favorite for the darkroom boys has made its reappearance. With some changes made, all for the better, of course, Ansco recently put on the market the long-heralded, and by many eagerly awaited, new Finex-L fine-grain developer and replenisher. It replaces the prewar original (warning: don't use the old-type replenisher with the new developer. Ansco claims these advantages for Finex-L: extremely fine grain results with no loss of film speed; consistent results; long working life—60 rolls of 120 rollfilm per quart of developer; easy handling. Finex-L costs \$1.25 for the quart size; the replenisher 90 cents per pint.

Another new camera on the American market is the German-made Baldix, which takes 12 2½x2½ pictures on 120 film and costs \$48.50 equipped with a coated 75mm f/3.5 lens, flash-synchronized Prontor-S shutter, automatic film stop and other features. The importer is Kling Photo Supply Corp., 235 Fourth Ave., New York City.

Three Dimension Company, 4555 W. Addison Street, Chicago 31, announces a new slide projector, the TDC Show Pak "300". Equipped with 300-watt blower cooling, 5-inch coated anastigmat lens, lift-off metal case and built-in slide file, the projector costs \$54.50.

Two new handbooks have been added by Eastman Kodak to its growing list of manuals for photographers in various fields. They are the Kodak Industrial Handbook, and the Kodak Professional Handbook, \$4 each. Both follow the familiar format of other Kodak handbooks and are bound in a multi-ring binder. The industrial handbook contains four data books on various phases of the field; the professional handbook deals with camera techniques, negative making, use, maintenance and repair of equipment, and a new set of twenty sample prints made on Kodak papers.

For the 8x10ers, Calumet Manufacturing Company has a new 8x10 metal view camera selling at \$245. It incorporates horizontal and vertical swings for both front and rear at center and off-center positions; a sliding back carriage for centering an accessory 5x7 reducing back; bellows draw of 31 inches; completely reversible back (360 degrees), and a new type of locking knobs. The Calumet has a new suspension of camera body and lens standard, is finished in pearl gray hammertone with red bellows, and measures when folded 16% inches high, 13% inches wide, 7 inches deep.

Weary of turning pages to get exposure data? Then consider the Kelly Cine Calculator, a sturdy dial, this cinematic alide rule is printed on both aides for quick computation of such information as depth of field, hyper-focal distance, field of view, filter factors, film speed per second, etc., etc. It comes in two models, 35mm model, which is also useful for 35mm miniature cameras, and the 3-16mm model. Price is \$3.95.

NOW...

## LESS CORROSIVE TO STAINLESS STEEL TANKS!

SHELF LIFE INCREASED FROM 10 TO 24 MONTHS!

for more reasons than ever before.

#### DON'T FIX 'EM - JIFFIX 'EM

In laboratory tests, improved JIFFIX produced only nominal corrosion on type 302 stainless steel. In this respect it was superior to the older JIFFIX formulation and to ordinary acid-hardening hypo. Corrosion on type 316 stainless steel was negligible.

Also the improved JIFFIX now has a 140% longer shelf life. Yet, it is just as fast, effective and economical as ever. No weighing or mixing of chemicals... just dilute with water and use. JIFFIX is 3 to 4 times faster than hypo on pan and orthofilm... twice as fast on process film. It fixes from 1½ to 2 times more film per gallon than ordinary fixer.

JIFFIX is even more economical when used for fixing films for engraving and lithography. It gives excellent results diluted up to 11 times!

Hardener is bottled separately for your convenience in "tailoring" film hardness.

## STEREO

DON BENNETT

One of the nicest things about a convention is the opportunity it gives you to renew old friendships and make new ones. Our PSA meet last month was especially nice for yours truly in that respect. Mail friends like Frank Rice and his lovely wife, Charlie Rosher, Stella Jenks, Herb MacDonough and a host of others became real people instead of a postmark.

Old friends like Nick Haz, Jack Norling, Gene Wightman, Fen Small, Ade Ter Louw and Harris Tuttle were seen again. But the biggest kick of all came from seeing and talking again with Herb McKay, "Mr. Stereo", who came to the convention to receive the David White Award from the hands of Frank Rice.

Herb and I have been friends for 25 years. We haven't see much of each other for the past ten. After the convention Herb came out to Stamford for a too-short visit and we had a chance to catch up on personal news and talk stereo. Herb first introduced me to stereo about 20 years ago, but it didn't catch on with me because of the high price of imported stereo equipment and the nuisance of registration and mounting of 6x6 stereo shots. I got hooked when David White introduced the simplified system we have today.

We covered a wide range of subjects in stereo, but the one thing that impressed me was that McKay, with all his experience in the involved forms of the past, looks on the future of stereo as being in simplified cameras, mounting, viewing and projection. He feels that it can be as big as planar photography for the snapshooter. Since photography didn't grow big until the snapshooter was taken care of, that portends a good future for stereo.

We discussed mounting. He pointed out that even though mounting for projection must be exact, the possible shift between the two images can't exceed one millimeter from the standard spacing. That is, any amount of fiddling with the stereo pair for normal work, can be very, very little.

He told me what he thinks to be the main fault with projection. I mentioned this several months back. It is not the mounting, it is the operator. Just because knobs are provided for image alignment, it doesn't mean you must use them. Herb cited a test he made. He frequently projects stereo for friends. He sets up and adjusts the projector before the show. Then he runs his alides without touching the adjustments. This time he warned them the show was going to be different, the kind they might experience from an amateur.

He made adjustment for every alide and before ten had been run off, one of the audience was sick. At 30 he had to give up, no audience was left!

Someone will now ask, "What type mount did he use?" Just a cheap paper mount he buys by the thousand and slips the films into the slots. Incidentally, the slides that nade the audience sick were the same slides they had seen many times without trouble, and they saw them again many times with-

### PSA BULLETIN BOARD

Nov. 19	Annual Meeting	American Standards Association	Waldorf-Astoria New York, N. Y.
		<b>—</b> 1953—	•
Mar. 19-21	Meeting	Optical Society of America	Hotel Statler New York, N. Y.
Apr. 13-17	Convention	MPDFA	Conrad Hilton Chicago, Ill.
Apr. 27-May 1	Convention	Soc. of Motion Picture and TV Engineers	Hotel Statler Los Angeles, Calif.
May 1-4	Convention	Nat. Press Photographers	Galveston Beach Texas
Aug. 3-8	Convention	Photographic Society of America	Los Angeles Biltmore Los Angeles, Calif.

out trouble. The only difference was the "stereo itch" (same genus as "mixer's itch" in radio) of fiddling with the adjustment knobs.

I asked him about the paper mounts. What brand? No brand. Since the dies are deteriorating and don't cut good mounts anymore he is switching from them to the new Permamounts.

So I have a suggestion to all stereo projector manufacturers. Put a slip clutch on the interocular adjustment knobs so they won't work unless you put a quarter in the slot, said quarter to be collected by the machine as soon as you let go of the knob. If it costs two bits to fiddle, there will be less fiddling and more comfortable and satisfied audiences.

P.S. These remarks about adjustment and accuracy don't apply to professional and movie presentation where extreme care and manipulation are required. The professional is not plagued with stereo itch, he is a showman and knows enough to make his adjustments beforehand.

There's a bit of the pixie in McKay. I asked him to autograph my copy of his book, "Three Dimensional Photography". So what does he write?

"Dear Don—
Here it is so be proud of your pupil,

Herbert C. McKay"

So many people whom he has helped have claimed to be his teacher that he thought another should get on that bandwagon. Since the reverse of the inscription is true, you readers can have two free shots apiece with a .45 anytime I claim to have taught McKay anything.

Mr. Stereo (as first recipient of the D. W. Award he's entitled to that appelation!) also thinks you shouldn't waste stereo shots on subjects without depth. Fifty or sixty years ago, when parlor stereo was quite the

rage, the outstanding photographers picked their scenes carefully to give that feeling of seeing into the distance. They always had a close-in object from which you could feel your way into the picture . . . or a tunnel effect, like the deck of a boat, a wall or a gorge. Since we can record three dimensions in stereo, let's always do it. Let's not pick a subject that could be as well made in one-eyed shooting.

I promised several months ago not to write this column unless I had something to say. Out of my short visit with Mr. Stereo I found plenty to talk about for some time to come. I've given you a couple of ideas here. More will be forthcoming.

"Bwana Devil", Arch Obeler's stereo movie will be road-showed soon. Those who have seen the previews (and we don't mean advertising trailers) have sworn off planar movies! Wait until you see your first stereo movie kiss... WOW! And for those who want to know what camera was used... two Mitchells in a special stereo blimp with adjustable interocular and other needed adjustments. (Mitchell cameras start at about \$5000, how many do you want?)

Start thinking now about next year's David White Award. Frank Rice will welcome your nominations and the Stereo Division Honors Committee will weigh your suggestions in picking the 1953 recipient.

Have you seen any of the trick stereo slides that are floating around? Some of them are real clever. Practically every one is an old movie trick and made the same way. But it's lots harder, bub, lots.

Met a few stereo pros at the Convention. The field grows apace.

## Take it easy

### WITH STEREO-REALIST

## Every REALIST picture is an exact reproduction of the original scene

JUNIOR'S curly locks are going to fall — and Dad's all set to record the event in full, natural color and true-to-life depth with his Stereo-REALIST camera. The proud parents will recall this event over and over through the years as they view the pictures in their REALIST viewer.

REALIST slides exactly duplicate what you see with your eyes. Children are so real you feel as if you could reach out and cuddle them . . . you can almost smell the fragrance of flowers . . . scenic views are glorious in all their natural splendor.

The REALIST camera is easy to operate, too. It's a precision product of American craftsmanshif, designed to give maximum photographic enjoyment with minimum effort. People who never before operated a camera get outstanding pictures on their very first roll of film.

If you haven't discovered the excitement of REALIST pictures, your camera dealer will be glad to show some to you. See how you too can "take it easy" with Stereo-REALIST. DAVID WHITE COMPANY, 387 W. Court Street, Milwaukee 12, Wisconsin

## THE CAMERA THAT SEES THE SAME AS YOU

Cameras, Viewers, Projectors, and Accessories are products

### CHECK THESE Realist FEATURES

- World's most complete system of stereo photography
- Microscopically matched, coated 35 mm f:3.5 lenses perfect alignment assured
- ☑ Direct vision, centered viewfinder — completely eliminates parallax
- Synchronized for flash
- Hinged lens cover with hyperfocal table.
- Electronically time-tested shutters for perfect color photography
- Wide base, split image range finder for more accurate focusing
- Easy to operate fewer picture failures
- Economical—29 steres pairs from 36 exposure roll, 16 from 20 exposure roll
- Full year warrantee against mechanical failure

October 1952

When writing advertisers, please mention PSA Journal

(July 1, 1961 - June 30, 1932)

With the thought in mind that the only justification for the existence of the Pictorial Division is service to its members this year's Annual Report of the Division has been prepared to reflect statistics on the approximate number of individuals that have participated in Pictorial Division activities and services.

While the figures included are approximate it should be remembered that this report is, of necessity, being prepared in advance of the end of the fiscal year, June 30th, and therefore the ectual figures for the entire 1951-1952 fiscal year will exceed the approximate figures used in this report. International Portfolios are presently composed of sixteen portfolios, comprised of forty circuits and serve 375 American members. Portfolios are in existence with: England, Australia, Aca Zcaland, Belgium, Brazil, Canada, Dominican Republic, Chiua, Costa Rica, Cuba, France, India, Mexico, The Netherlands, South Africa and Sweden. Duting the past year some structural defects in the International Portfolios became apparent and appropriate steps are now under way to correct the situation.

AMERICAN PORTFOLIOS—The American Portfolios are, at the moment, composed of 74 circles i.e., Pictorial 60, Ministure 4, Nature 2, Special 1, Star Exhibitor 4, Control Process 1, Photo-Journalism 2, with propocts for two new circles to be formed prior to June 20th.

There has been a very heartening upturn in the enrollment. Many who had dropped out are returning to the fold, some joining more than one circle. Approximately 1000 members are participating in the American Portfolios, each circle averaging 14 members to a circle.

PORTRAITY PORTPOLIO: -Membership in the Portrait Portfolios during the year increased from 181 members to 217 active participants. Two new portfolios, numbers 15 and 16, were activated and are made up of advanced portraitists only.

advanced pottraitists only.

Four issues of Portrait Pointers were issued during
the year and from correspondence received are to be
considered successful.

INTERNATIONAL EXHIBITE-The following is a tabulation of the scheduling of the various International Exhibits, by exhibit, up to and including May 20, 1952:

Francis Wu #1 .....acheduled by 39 clubs. Hong Kong .....acheduled by 34 clubs.

Australian Showscheduled	by	56	clube.
Swedish Showscheduled			
South Africanscheduled	by	33	elube.
Francis Wu #2scheduled	by	35	clubs.
Australian #2 scheduled			
Holland #1scheduled			
England *R.P.Sscheduled			
Mexicanscheduled			

Australian 3A, 3B (99 prints) Sent to Eastman House. Arrangements being made to exhibit in New York City.

Postrolian Cluss—At the end of the 1950-51 fiscal vear there was a total of 8 Postfolian clubs with a membership of 71. At the end of this fiscal year, 1951-52 the total number of Portfolian Clubs has grown to 16 with a membership of 144. Portfolian Clubs are now located at Lincoln, Nebraska: Rochester, Minn.; Austin, Minn.; Sioux City, Iowa; Great Falls, Montana; Jersey City, N. J.; Tiov, Ohio; Bartleaville, Oklahoma; Montgometv, Ala.; Berkley, Calif.; Bend, Orc.; Bonne Terre, Mo.; Louisville, Oklahom; Yille, Orlando, Fia., and Shreveport, La. Prospects for additional Portfolian Clubs are very bright and by the time this report appears in print there should be several new Portfolian Clubs added to the roster.

INTERNATIONAL CIUS PRINT COMPRITTION—At the time this report was being made up there was still one more competition to be held, however, the Pictorial Digest carries a complete report following each competition therefore anything included here would be mere reportion.

CAMERA Cata Paint Judging Servick Following a serious break down in this service to camera clubs which necessitated the appointing of a new Director on November 24th this PD service to the camera clubs has shown a steady growth and since that time some thirty clubs have used this rervice. Plans are now being made to expand the staff of judges and also to expand the use of tape recorders for judging purposes. Many fine, and unsolicited comments have been received from clubs availing themselves of this PD service and it is expected that it will prove to become quite popular during the coming fiscal year.

PERSONALIZED PAINT ANALYSIS SERVICE This service has been well received by the membership with more than 500 priots having been individually analyzed and a personal letter written to each member submitting prints. Prints have been received

from practically every state in the Union as well as the following places outside of the U. S.; Vancouver, B. C.; Hawaii; Turkey; Puerto Rico; Allahabad; India; Mexico; Bankok; Slam; Dehru Dun; Cristobol; Managua; Tanganyika etc., etc. Many letters of approciation have been received for this service and are in the Director's files.

Portrolio or Portrolios—Due to a change in the Directorship of this activity it is impossible to give a complete report, however, since January 25, 1952 the Portfolio of Portfolios have been viewed by better than 600 people. No doubt the upswing in the American Portfolios can be attributed to the reactivation of the Portfolio,

SALON PRACTICES -- The mechanics of salon istration was strengthened by the listing of all open exhibitions in the monthly salon calendar in the Journal starting in September. This brought about a more complete salon calendar, better service to prospective exhibitors and better relations with salons not previously listed. The second improvement took in December with the establishment Pictorial Division Salon Board, composed of R. L. Mahon, Jack Wright and C. A. Yarrington. The creation of this Board brought sectional representation and more manpower to the job of stimulating and measuring adherence to the Minimum Requirements and the broadest possible outlook on various phases of salon administration. The third step, in February, myelved a revision of the Minimum Requirements, their duplication and distribution to salon committees the world over in March and April, followed by publication in the Journal in June. The fourth step, started well over a year ago, is nearing its end as the finishing touches are being given to a forty page handbook on suggested salon practices and procedures (for committees, directors, chairmen etc ) culminating in a final statement, "the PSA Recommendations".

It is anticipated that this handbook will be printed

It is anticipated that this handbook will be printed in booklet form in September 1982 and will replace the 1915 booklet "How to Organize and Conduct a Photographic Salon", now out of print.

It is evident that there will be a substantial intrease in the number of PSA approved salons for the 1951-52 exhibition year. On March 31, 1952 31 exhibitions had already been approved as compared with 54 for the year ending June 30, 1951 and but 16 for the year ending June 30, 1950. It therefore appears probable that about 70 exhibitions (roughly 70%) of the world total will be certified as PSA approved this year, with a probable increase again for the 1952-53 exhibition year. PRW PALS This Pictorial Division service is gain-

PEN PALS This Pictorial Division service is gaining in popularity as evidence by over 300 inquiries having been received since September 1, 1951.

Awam of Menr- During the fiscal year 88 members have received Star Exhibitor Awards. The four degrees of awards were augmented during the year with a Five-Star classification to encourage those who had reached the Four-Star classification to continue their exhibition activity. Award of Merit recipients have been listed each month in the Pictorial Direct.

Who's Who in Pictorial Photocraphy.—This service actually consists of two objectives i.e., compiling a mailing list of individual exhibitors for a mailing list for salons and to record and list the acceptances of all-gaslon entrants. A mailing list, acquired from the Camera Club Committee during November and December 1951, was carefully checked against a complete collection of salon catalogues of the 1950-51 exhibition year and all names which showed no activity in this period were eliminated. To the remaining names on the list were added all new names appearing in catalogues of the 1951-52 season. At present this comprehensive list contains approximately 1200 names of exhibitors residing in Canada and the United States. A separate list of foreign names has been compiled listing some 500 names of those who are exhibiting outside of their own country.

RECORDED LECTURES PROGRAM—This Pictorial Division service expanded so repidly during the year just ended that much effort was required to keep up with the demand. Distribution centers, three in the U.S. and one in Canada, with fully stocked libraries have now been established and should prove adequate to meet the demands. Difficulties with slide production were encountered, however, steps to break this bottlemech have been taken and there is every expectation that production will be able to keep

pace with demand by early fall. A number of new programs are, at the moment, in various stages of production and these should become available for distribution at a rate of better than one every two months beginning this fall. One of the important undertakings of the Recorded Lectures Program has been the recording and collecting of "Audible Autographs", short talks by important photographic con temporaries or personalities recorded on tape. These 'Audible Autographs" are to be preserved and when sufficient number are accumulated they will be transcribed on to discs and be made available to the general membership as well as placing a set in the archives of the Sourcey for preservation for posterity

Another undertaking successfully accomplished by the Recorded Lectures Program was sending tape recorded greetings by Norris Harkness, Gene thase, Rav Miss and Phil Maples to the lat South Island (New Zealand) Photographic Convention, held April 21 30, 1952

Number Six lecture has already been duped into Spanish for distribution to Mexico and other Latin American countries and escutually it is hoped to have all Receided Lectures available in Spanish

To date bookings of Recorded Lectures Programs have exceeded 150, with an average attendance per booking of 45, it is conservatively estimated that Recorded Lectures Programs have been seen by

approximately 5,500 people
Pumicariove During the past year the Pictorial Division rublished two Supplements to the Journal, the tober 1951 and May 1952 While the Pretorial Digest was rublished each month in the Journal. both the Princial Direct and the PD Supplements were edited entirely by PD members for the benefit of the members

In con luding this report I would be ungrateful indeed if I did not pinse to pay tribute to my fellow Off is and Directors for their untiring efforts to provide in it and bett i retricties and services to the manhors of the Pritorial Division and to thank them for the excellent cooperation they have un checriulis assen me

> Respectfully submitted W I CHASE APSA Churmin,

#### Report of P.S.A. **Honors Committee**

The cult members of the Honors Committee for 1952 were to follows

Kul & Baumgartel APSA San Francisco, California Lou Gibson, FPSA Rochester New York Vincent H Hunter, APSA Hollywood, California C J Marinus, AP54 Detroit Michigan Hairy & Shigeta, FPSA Chicago Illinois Chester W Wheeler Hon PSA, APSA Rochester, New York Jack Wright, FPSA San Jose, California Herman H Duezr, FPSA, Chauma. Binghamton, New York

The work of the committee had to be finished in two months less time than usual in view of the earlier date for the National Convention. I am pleased

to report that this work was completed on schedule.

The new procedure proposed by the 1951 Committee, with Mr McFarlane as chalman, worked very satisfactorily The preparation by PSA Headquarters of the 8 copies of all applications lightened the burden of the chairman considerably. The Divisional Honors Recommendations Committees were also a great help in making certain that the applications were filed properly and in getting additional information on candidates where needed. The Divisional Honors Recommendations Committees also deserve credit for focusing attention on well deserving candidates who, due to extreme modesty or other reasons, may have been overlooked in the past. Honors applications can and have been submitted directly, without going

127 applications were carefully reviewed by the committee and through 8 letter ballots and 1 meeting

More than 1,000 new members joined the Color Division during the year ended June 30, 1963, making this Division the fastest growing unit in the Society. To take care of this 60 percent increase in membership, all major services have been expanded. New silications have been set up in all competitions, additional circuits have been added, and additional personnel enlisted to give prompt, efficient service in nore than 30 sperific projects.

New features undertaken include study groups and circuits for 21/4" x 21/4" slide workers, the Club Slide ert exchange directory, the International Slide Circuit and a ster rating system. In order to take proper rare of all services, a budget of \$2600 has been set up for the coming year. This is approximately equal to the meome from dues In order to keep a sound fin incial status, the Division strives to maintain s reserve equal to \$1.00 per member. Since this has been created, all current meome now goes back to members in services. No charge or entry fee of any kind is levied for participation by members of the Division in the many services offered

#### Color Print Services

Services in providing color print sets circuits, and competitions here expanded in keeping with the in creased interest in color photography The "Color Print set for Clubs' has set a new high record for requests A second set may be required to take one of the demand. The 'Color Print Set for Individuals' of the demand. Inc. Color effect for anysymmethas been requested 82 times. To meet this demand, a second set has been assembled and placed in circular tion The Color Print Circuit completed its circles 6 and 7 during the current year and will soon start circle No 8 with four new members Members have submitted for this circuit, prints made by four different col r processes The quality of work has shown noticeable improvement, and the members have given credit to this oppularity to compare their work with other members of the circuits. In the three Color Print Competitions" held during the year, an average of 12 pirileipants entered 37 prints for

#### Technical Services

Direct assistince in matters involving color proc cases and materials was furnished in many instances. meluding a forcion request from Montesideo, Crusuny Three of these requests involved the duplication of color transparences including steree, and the re-mainder involved the analysis for visious exposure and processing errors as indicated by the samples submitted for quality appraisal, and it was not estary to obtain the advice of qualified people in the photo mechanical field since the original copy was not available for direct comperison with the samples In addition several articles were prepared and published for the benefit of all PSA members

#### Color Slide Competition for Individuals

One hundred and seventy six color workers enrolled in this project with an average of 98 entering slides in each of the five contests. This represents an increase of about 30 percent in this activity over the previous year One change planned for the coming year is to divide the competition into two classes having all cutrants with two or more slides accepted in International Exhibitions in Class A, and all others in Class B. It is felt that this reclassification will encourage more beginners to take part in these con-

of the committee on July 21st in Rochester, 86 applications received the necessary votes for the awards requested.

2 Honorary Fellowships and 2 Honorary Memberships have been recommended for Roseil soproval.

24 FPSA Honors and 58 APSA Honors were awarded by the committee and presented at the annual banquet on August 16th in New York City.

It should be mentioned that with very few exceptions the honors applications followed the prescribed rules in regard to the information to be supplied. The uniform style of presentation simplified the prob-lem of evaluating the records of the candidates.

H. H. Dusan

#### National Club Slide Competition

This series of centests set a new raders with 198 clube entered from 35 states, District of Gelambie, Hausti, Canal Zone, Canada, and Japun. It was seessary to divide the compatition into three divisions instead of the previous two. A total of 2468 slides were submitted to the five contests, and each alide received a written appraisal. A total of 74 award ribbons, 357 honorable mention ribbons, 15 medals, and 18 plaques were asseed to clubs and individual

#### Slide Study Groups

these groups continue to expand with 125 partielpants, compared to 93 the previous year. One hundred and hve are enrolled in the 2 x 2 slide groups, and 20 in the two 21 x 214 slide groups organized during the year It is expected that two additional obsults will be added during the coming year to take care of the expanding demand.

#### Club Slide Circuits

bixty six clubs participated in this activity during the year, compared to 61 last year, 43 m 1980, 85 in 1919, and 29 in 1918. Four clubs entered slides for all three deadlines, 14 clubs entered two sets, and the remainder entered one set, making it possible to send nine circuits on the road compared to seven last year. It is estimated that over 4,500 camera club men have benefitted from this service.

#### International Circuits and Exchanges

The Netherland American Slide Circuit was organ ized and placed in successful operation during the current year This is the first International Slide Circust to be formulated by the Color Division. More are anticipated soon.

In the International Slide Set Exchange, color alide collections from England and Japan are circulating in the United States The set from Japan was prepared by the Circle of Confusion Camera Club of the American Occupation Forces in Tokyo; it consists of 72 dides with tupe recorded comments. The bookis these foreum sets total 68 clubs in 25 States. Canada. Hawan, and the District of Columbia. In exchange for these acts, the Color Division supplies each of the foreign clubs with sets of American slides for scheduling among interested groups abroad.

#### Instruction Slide Sets

bets were requested and delivered to 66 members residing in 30 States, Canade, and the Canal Zone. I wo new acts have been organized to provide for the greatly increased demand anticipated during 1952-53.

#### Exhibition Slide Sets

Interest in Exhibition Slide Sets Increased substantially. Special effort was made to revise old sets, add new ones, and increase the number in order to meet the demand These acts were requested by 172 clubs and 63 individuals, and shown approximatly 500 times to an estimated total of 10,000 interested photog-raphers. This represents 100 percent increase in viewings over the previous year A special Canadian circuit for these sets has been operating with complete bets have been sent to three clubs or individuals in Saskatchewan, three in British Columbia. and three in Ontario

#### Slide Circuits for Individuals

Fifty seven individuals took part in these circuits, with approximately six rounds completed in 1931-32.

A 2½" to 2½" to 2½" as alide circuit was organized in April with seven members, and will soon complete its first round. Interest in this activity is marreaung rapidly, it is expected that two carcules will start during this summer or early fall, which is in advance of previous years.

#### Master Mailing List

The division's Master Melling liet of over 2000 slide exhibitors was supplied to and used by all 29 major slide exhibitions held during the year. A larger number of the exhibitions this year received "special recognition" for outstanding management and operation compared with last year.

#### ANNUAL REPORTS-Color Division

#### Who's Who in Color

The 1951-1952 list includes 32 exhibitions with the names of 732 stide makers with two or more acceptances. It is estimated that more than 2800 color slide photographers take a direct interest in the recognized alide exhibitions. This compares with approximately 1300 seven years ago, an increase of over 100 percent.

#### Color Division Bulletin

The Color Division Bulistin was published bimonthly with the total mailings increasing from 1788 for the first to 2829 for the last mailing in the 1951-52 year. Entry forms, service fulders and other essential in-formation are mailed with this Bulletin to all CD members.

#### Honors Proposal Committee

The Division's Honors Proposal Committee assisted 20 applicants for Honors, 18 of which were sent to the PSA Honors Committee.

#### Hospital Project

The Color Division gathered, processed and distributed \$1,000 Color alides during the year ending June 30, 1952 to nearly 50 U. S. and U. N. Army, Navy and Veterans Hospitals in the United States, Kerea and Japan. While this is an impressive total, it is still short of what is needed to allow still further expansion of this project. For the coming year, at least 75,000 slides can be put to good use.

#### Stereo Activities Transferred

Anticipating the need for competitions and circuits in Stereo photography, the Color Division early in 1951 established a series of three Stereo competitions, and a Stereo Circuit. An average of 15 person participated in the contests during 1951-52, and the Circuit activity increased in popularity so that a second circuit was formulated. In November 1951, the Stereo Division was created by the Board of Directors SA, and all projects developed in this field by the Color Division were transferred to the new Division before the close of the 1951-52 year.

#### Club Color Slide Set Directory

Published for the first time in the Color Supplement of the September 1951 PSA Journel, the Club Color Slide Set Directory has proven to be one of the most popular services to clubs inaugurated in recent years. Seventeen sets were listed as available on loan from clube all over the country as well as from a club in the Canal Zone. This Directory will again be published in 1952 but will appear in the September-October issue of the CD Bulletin. A considerable increase in the number of sets listed is indicated.

#### Library Services

The Library facilities of the Division are being expanded in keeping with the growth of color interests.

The 14 books now in the Library are in constant circulation, and more copies will be required to take care of the demand.

#### Chicago Pictorial Slide Set

This set was scheduled and used by eight clubs, some of which are now preparing similar sets relating to their home cities.

#### Tops in Photography

The secretary of the Division was responsible for collecting the color section of the 1932 Tops in Pho-tography Show in New York. Color slides gathered from the leading alide photographers in the United States for this exhibition, proved an outstanding feature of the show.:

#### Two Supplements Issued

Two popular 25-page Collec Division Supplements to the PSA Journal owner properted and published as in-tructive factures of the September 1961, and the March 1963 Issues. Numerous feature articles, and a nearbly Color Division section in the Journal were other editorial efforts. The Chairman was ably assisted in this work by a Santonial Editorial Committee of four members. mbers, gia four .me

#### Star Rating Plan

A star-rating plan for color photographers, based upon number of different slides accepted and total acceptances in recognized exhibition, was set up on a tentative basis. If the interest in this project is widespread, the project will be established as a permanent undertaking of the Division.

#### Miscellaneous Assistance

Hundreds of letters from members throughout the world have been received and answered fully by the officers and members of the Division's National Committee during the year. This is an extremely important phase of the Division's service, and special pride is taken in the fact that all correspondence is given prompt and serious attention.

#### **Detroit Convention**

The Color Division assumed a major role in the Detroit Convention, with attendance at its luncheon and programs setting a new high record.

#### Cooperation Unlimited

Numerous other services could be enumerated but space will not permit. Generous thanks are due to any untiring workers both members of the Division's National Committee and other volunteers. Among these special mention is due the following: Frank B. Bayless, Karl A. Baumgeertel APSA, George W. Blaha APSA, Mildred Blaha, Merle S. Ewell APSA, Vella L. Finne. Charles H. Green, Donald B. Grim, Harry Haimes APSA, R. B. Horner, H. J. Johnson FPSA, Charles A. Kinsley APSA, A. C. Klein APSA, Blanche Kolarik APSA, H. G. Mitchell, Charles B. McKee APSA, John Moddejonge APSA, Dennis W. Pett, Frank Proctor, Fred Quellmak, Jr. Hon. PSA, W. K. Raxworthy, Frank E. Rice APSA, Fred T. Richter, Lloyd Robinson. Jr., W. H. Savary APSA, Harrison S. Sayre, Erik Sorensen, Leonard A. Thurston, and Paul J. Wolf APSA.

GROSCE F. JOHNSON, APSA Chairman

#### Helen Manzer First 4-Star Color Winner

Helen C. Manzer, APSA of New York City is the first exhibitor to win the coveted 4-Star Award of Merit of the PSA Color Division. To win this rating a minimum of 64 different slides must achieve 320 acceptances. First to win the 3-Star Award is A. W. Papke of Chicago. Details of the award and the requirements may be obtained by writing Lloyd Robinson, Jr., Director, 1616 West 109th St., Los Angeles 47, Calif.

#### Fresno Town Meeting Set for Oct. 25-26

With a roster of names from among PSA's greatest, and a list of activities that will keep anyone busy, the PSA Town Meeting of Photography starts rolling at Fresno State College, Fresno, Calif. at 9 A.M. on October 25 and continues through the next

At the Grand Opening on Saturday the crowd will be there for one of two attractions, to meet celebrated photographers . . or to help pick "Miss PSA" from a bevy of California's most beautiful models.

There will be an exhibit of 200 superb pictures by famous salon exhibitors, print, color and movie clinics, a series of lectures and lots of opportunity to make pictures. Listed as clinic leaders and lecturers are: Harvey Brown, APSA, FRPS; Fred Archer, Hon. FPSA, FRPS; Grant Duggins, FPSA; Boris Dobro, FPSA, ARPS; Dr. Francis Wu, Hon. PSA, FPSA; FRPS; Shirley Hall, FPSA, FRPS; Floyd Evans, APSA; M. M. Deaderick, APSA, ARPS; Merle Ewell, APSA; Dr. Harold Lincoln Thompson, APSA, ARPS; Karl Baumgaertel, APSA; Adrian Ter Louw, FPSA; George Allan Young, APSA, and Paul Wolf, APSA.

Everyone is welcome whether they belong to PSA or not, and if you plan to attend, bring your camera and plenty of film. There will be picture opportunities indoors and out, with lighting arrangements by masters of the art. For those who want something extra there will be field trips to the Roma Winery and the Sun Maid raisin plant, Freemo parks and Zoo.

Additional information may be obtained from Nell Longtin, Fresno Camera Club, 1650 Chance Ave., Freeno, Calif.

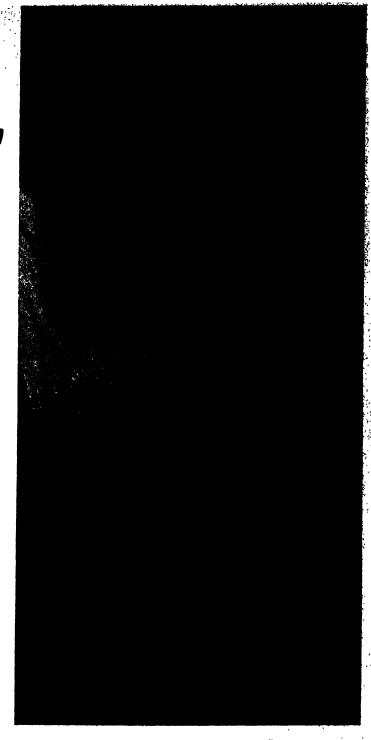

# Halloween's a "natural" for picture-taking fun

catch the "candid" details with

G-E Photoflash

Everyone has fun on Halloween. Catch it and keep it all with your camera. Be sure you have plenty of film, plenty of General Electric Photoflash lamps, well ahead of time. Halloween...like Christmas... is a natural for good pictures. And with G-E Photoflash you'll catch all the fun—anytime, anywhere. For G-E Photoflash provides a portable punch of light that "stops" action, captures full detail. It gives you better snapshots of happy family scenes and of friends—pictures you'll treasure for years.

So, buy some G-E Photoflash today! And keep plenty handy for pictures of *every* occasion.

BONUS: Your Halloween shots can win valuable prizes! Ask your photo dealer about the big G-E Halloween Flash Picture Contest.

Remember, there's a G-E lamp for every photographic purpose

## Tops In Photography

Would your camera club or your friends in your city like to see the finest assembly of photographic work ever put together?

PSA is proud of it, and wants you to have it, enjoy it, profit by viewing it, and the work of years and years of experienced top workers in photography! TOPS consists of the following:

- 1. Top quality black and white pictorials, 16"x20" mounted prints by star exhibitors. Yes, over 30 of these.
- 2. Top black and white Vature prints of sparkling quality. Over 20 beautiful 16"x20" mounted prints, again by the star workers.
- 3. Technical section prints in black and white, 15 or 20 of the most wonderful subject matter. Palomar astronomical photos, medical studies, color analysis, scientific photography of rare subject matter not ordinarily shown.
- 4. A 1200 foot Kodachrome in sound by Harold Lincoln Thompson, M. D., of Los Angeles. A beautiful movie of a wonderful spot entitled, "Invitation to Hawaii"
- 5. Slides, slides, "Tops" in salon quality by the PSA's best known names and workers, such as Baumgaertel, Beilbenberg, Manzer and fifty others, all top workers and beautifully composed and exposed slides as only the top salon workers do it.
- 6. Nature in color! Yes, a set of 50-35MM slides of nature subjects captured in full color on film by the top workers in this field.

#### Sounds good, huh!

- A. How to get it?
- B. How much does it cost?
- C. When can we have it?

#### Well, here are the answers:

- (a) Write Les Mahoney, Chairman, Tops in Photography, P. O. Box 1828, Phoenix, Arizona.
- (b) It will cost you nothing, it is free. All you have to do is pay the rail express from the city where it is being exhibited to your city. You exhibit it and ship it on to the next exhibitor or club or city at their expense.
- (c) You can have it as soon as the club or city nearest you close their show. It is well to allow four to six weeks time for handling, exhibiting and re-shipping.

#### How do we put it on?

One camera club talked it over at their meetings several times and decided they would simply "pass the hat" so to speak, at regular meetings and let each member donate whatever he or she wished towards defraying the shipping expense and gallery rental. if any.

Two members more plentifully endowed with wordly goods came forward and said "we will underwrite any deficit( if any)." There wasn't a deficit. Nobody missed the 25 or 50¢ donated. Not a bad stunt!

But who bosses the job? This club appointed a chairman whose task it was to arrange shipping dates, exhibition dates, exhibition places, and have tickets printed, and the club members pitched in and each took on a small task.

Arrangements can be made with a local gallery, a museum, or your public school for hanging space for the prints. It may be necessary to pay a small rental fee. Preferably the location should have a modest auditorium for showing the slides and movie. A photo dealer can help out with projectors.

#### You ask about tickets, what for?

Some clubs prefer to have a club night or showing then a public showing. Also it is discouraging to be invited to a showing and then not have a scat. We suggest printing inexpensive dated and numbered tickets corresponding with the number of seats in the small auditorium, then each ticket holder is assured of a comfortable seat.

#### OK, where is the best place to have it?

We think nature prints and slides go over best in a Botanical garden gallery, because they are somewhat specialized in their subject matter. Why not have the prints hung in the gallery and if a small auditorium is available, project the slides at the same place, or in the same room.

Technical prints are of wide public interest, because they deal with scientific subjects. The Science department of a college or school, if convenient to the public is a good location. A downtown bank window or brokers office is a good spot and you will be surprised at the interest it will create.

Write Les Mahoney, P. O. Box 1828, Phoenix, Arisona, for details and suggestions for staging your own TOPS.

By KOBERT J. GOLDMAN 43 Plymouth Rd., Great Neck, L. L., N. Y.

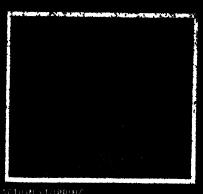

Special Events Committee sign at the New York City convention read: "Boat Trip Around Manhattan-Models and Everything." Ed Wilson (Brooklyn, N. Y.) wonders who changed the "and" to "with" . . . Isabella Sultzer (new member of Stereo Division from Westport, Conn.) just returned from a six months' 4rip to South Africa, Rhodesia, and Basutoland and says that Africa isn't the dark continent but has plenty of light for stereo . . . Henry M. Lester, EPSA (New York City) took Capt. Robert Quackenbush, U.S.N., to the convention and got so enthusiastic that he presented the Captain with a PSA membership . . .

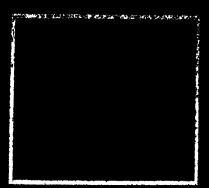

Among those who received honors at the convention was Manuel Ampudia of Mexico . . . Rev. Paul S. Williams was enrolled as a new member at the convention, giving Buenos Aires, Argentina, as his address, he'll spend the next six years there as a missionary . . . The Navy isn't the only organization getting recruits these days; Charles Martin (Excelsior, Minn.) U.S.N.R., on active duty as a Hospital Man, 1st class, now stationed at Brooklyn Navy Yard, joined PSA and its Color Division at the convention . . . Mr. and Mrs. Preston E. Minton and Capt. C. Stuart Townshend were the PSA'ers attending the convention from the Canal Zone .

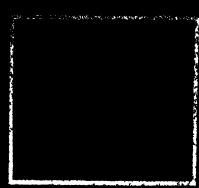

Dr. Fred Ruch (Plainfield, N. J.,) urges all to heed the voice of experience since he dropped his Kine into the salt water in Peggy's Cove because he didn't have a neck-strap on the camera . . . At a dinner welcoming the newly-appointed consul general of Japan, Harry Shigeta, Hon. FPSA (Chicago, Ill.), spoke on "America, The Land of Opportunities" upon invitation of the local "Voice of America" committee . . .

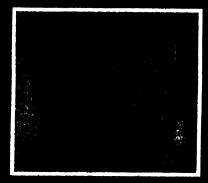

Gretchen Wippert, Magda White, Irene Moore (wife of Leo Moore, Culver City, Calif., who is General Eisenhower's personal photographer), and Florence Harrison belong to an organization they call the Click-Chicks—four members only . . . Francis Wu, Hon. IPSA (Hong Kong) conducted an impromptu tour of Chinatown restaurants with several PSA folks in tow one convention evening . . .

The Phoenix Camera Club reports that with a balance of sixty-six cents in the treasury and added expenses bringing club debts to a total of \$8.86, Mrs. Olga Mahoney, wife of Les Mahoney (Phoenix, Ariz.) worked out the idea of having a pot-luck dinner in her yard and charging a dollar per person; result was she built the club treasury up to \$30.50 . . . Arnold Askin (New York City) had planned a vacation trip to Europe and when convention plans got underway he decided to take his family over and fly back in order to work on the 

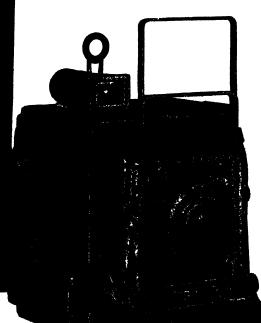

**MEETS EVERY CHALLENGE!**

Bernard Gorson (Flushing, N.Y.) entered pre-convention work six weeks before the convention and performed one of the most important jobs as a replacement.

#### In The Foreign Press

Each month we see many foreign photographic publications. When we find something of general interest we plan to note it in this column. Some of the publications listed are available in libraries, some through photo storm, all by direct subscription. We will gladly furnish the address and subscription rates, when known, of any magazine from which we quote. Frite your PSA Editor. Language in which publication is printed is indicated by suitable abbreviation following city of publication.

Photo-Munich, (Ger.) June 1952 Underwater photography with electronic flash. with exposure tables, suggestions for construction of equipment, pictures of it in use and three color pictures made underwater. The same issue has a brief tip for getting 13 pictures on the Automatic Rolleiflex. Naturwissenschaftliche Rundschau - Stuttgart, (Ger.) April, 1952. Discusses a new Swiss method for using electronic flash in documentary, nature and photomicrography. A series of nature pictures, including several photomicrographs are shown, along with a diagram showing how to attach electronic flash to a microscope.

Ferrania-Milan, (It.) June, 1952. Describes several ways of producing pendulum patterns. Several examples are shown as well as diagrams for both simple and compound pendulums. One diagram shows the use of a fixed light where the camera is being made to oscillate by securing it to a gimbalmounted pendulum.

Photography-London (Eng.) June, 1952. Ifor Thomas, ARCA quotes Fred Cook, one of his students, as follows: "I believe that I can only succeed in expressing my thoughts, feelings and ideas adequately by mastering the technical aspect of photography to such an extent that it becomes 'automatic' ".

Photo-Technik und-Wirtschaft-Berlin (Ger. w/Eng. summary). August, 1952. A list of 248 lenses made by 23 manufacturers in Western Germany and West Berlin. Shows focal length, aperture, plate covered, number of elements, schematic formula, price in local currency and applications. Same issue has article on control of lens radii in production with suggestions for increasing production without loss of quality by better methods and improved tools.

#### Some Highlights of the 1952 PSA Convention

#### By Floyd A. Lewis

With more than 1400 registrants, the first vacation-time annual convention of the Photographic Society of America may be set down as a highly successful one. Held August 12-16, at the Hotel New Yorker in New York City, the convention brought together those who make their livelihood taking pictures, hobbyists for whom photography provides a needed means of expression, and those employed by manufacturers of equipment and supplies who are continually seeking new ways to improve the medium. They came from all parts of the United States and Canada and from points as far afield as Mexico, Brazil, and Hong

Good attendance was only one indication of the success of the convention. The spontaneous enthusiasm exhibited at the various convention functions was an unmistakable indication of the growing interest in photography. As PSA President Norris Harkness of New York so ably put it, "The enthusiasm of the convention leaders caught on so rapidly that the leaders had to hustle to keep up with the crowd." Many out-oftown registrants were amazed to find in New York a warmth that they never knew xisted in the big city.

Breadth of the convention program was a clear indication of the tremendous expansion of photography in recent years. All of the PSA divisions representing the various branches of the art, held sessions. Divisional lines, however, which in some earlier years have been much in evidence, were almost indistinguishable at the 1952 convention. This integration of interests means a stronger Society-one that can render greater service to photography.

Like the meeting program, the exhibition held in connection with the convention clearly reflected the growing interest in, and advancement of, photography. Some 540 black-and-white prints were hung which included 351 pictorials. The remainder were divided almost evenly among photo-journalism, nature, and technical prints, the last including a group on astronomical subjects. Color prints numbered 28, almost double the number exhibited at the 1951 convention, which bespeaks the growing interest in this branch of the art.

The color-slides exhibited were divided into three groups and included 409 pictorials, 316 on nature subjects, and 100 stereo. All were shown by projection to "full houses." Fourteen films were shown in the motion picture exhibition. In a larger sense, of course, the whole convention was one grand photographic exhibition, for there was scarcely a speaker who did not illustrate his talk with slides or movies.

#### Stereo Active

One of the "firsts" at the 1952 convention was the highly successful program arranged by the newest PSA division stereo. Although known for many years, stereo photography had to await the develop-ment of miniature color film to bring it to a

## Fingers Talk

A highlight of Maurice H. Louis' national lecture tour came when he spoke to the River Park Deaf Photography Club of Chicago at their Field House, 5100 N. Francisco Ave., on October second.

During the three hour program which consists of a lecture, demonstration of equipment, analysis of members' prints, and a question and answer period, its meaning was conveyed to the audience by sign language. Truly, the educational aspects of photography are far reaching.

Although Louis will be on tour until March first, he may be reached by mail along his route. Address him care of Mrs. Barbara Green, 30 Willow, St., Brooklyn, N. Y., or to his permanent address: 333 West 56 St., New York.

He may be contacted at the following places where he expects to make stopovers: Oct. 1 to 8; c/o J. R. Tombaugh, 127 N. Catherine St., La Grange, Ill., Oct. 22 to

27, Bel-Air Lodge, Colorado Springs, Colo., and Nov. 25 to Dec. 25: c/o Alan L. Harris, 1111 Alta Loma Road, Los Angeles 46, Cal.

popular level. Most of the stereo features were aimed at stimulating further interest in this branch of the art. They included two illustrated travel talks by Paul J. Wolfe of Butler, Pa., with three dimensional projection of Western and Mexican scenes to overflow audiences. A talk "Simplified Stereo," by Kenneth S. Tydings, aimed at beginners, also drew a large and intensely interested audience.

#### Military Photography

How photography is aiding the U. S. Armed Forces in the development of today's super weapons was the subject of several presentations. Brig. Gen, Brooke Allen of the U. S. Air Force Photographic and Charting Service, Philadelphia, told how the Air Force is using motion pictures and showed two color films: "Operation Greenhouse," covering the building of the atomic bomb; and "Highway in the Sky," showing production of aeronautical charts.

Information obtained with cameras having effective focal lengths up to 80 feet has led to improved rocket flight control techniques, Henry M. Cobb of Aberdeen Proving Grounds told his audience. The equipment consists essentially of astronomical types of telescopes mounted on gun turrets which carry motion picture cameras that make 60 frames a second, as compared with 24 frames in ordinary sound movies. Additional equipment gives records of the intensity and kind of light emitted by the rockets. Accurate observations of the rocket's behavior may be obtained from distances as great as 20 miles, Mr. Cobb said.

Cameras nicknamed "Gooney Bird" and "Bright Eyes" used by the Navy in its rocket research at China Lake, California, were described by R. W. Herman. The Gooney Bird consists of two astronomical telescopes, of 48 and 24 inch focal length, respectively, mounted aide by side on a 50 caliber machine gun mount, both feeding into movie cameras. Its purpose is to make pictures of a distant missile.

# you can add sound to any 16mm movie!

Another Bell & Howell engineering first... magnetic sound on double-perforated film ... makes sound movies cost even less!

If you have been considering the purchase of the famous Filmosound 202 ... remember, you can now buy it adapted to use double-perforated film. If you already own a Filmosound 202, have it adapted for double-perforated film for just \$35.00 . . . through your authorized Bell & Howell dealer.

IMPORTANT: With this new development in sound movie making, any 16mm movie camera now takes sound film. This includes magazine-loading film used in such cameras as the exciting, new Bell & Howell 200 ...or roll film used in the famous 70-DL and other spool-loading 16mm cameras.

Ask your authorized Bell & Howell dealer about making your own sound movies on any 16mm movie film. Or get complete information by mailing this coupon today!

Here is a pace-setting new development in low-cost sound movies! Now ... you can record and play back magnetic sound on double-perforated 16mm film ... with the new Bell & Howell Filmosound 202 recording projector!

No longer are you limited to single-perforated film for sound movies. SOUNDSTRIPE, the magnetic oxide sound track available through Bell & Howell laboratories, can now be applied to any 16mm movie film.

Therefore, if you already have 16mm silent movies which you would like to make into sound movies, all you need do is have this magnetic sound track added to the original films. No need to have them copied on single-perforated film, a tremendous savings in the cost of making your own sound movies.

#### Color Talks

The photographer using color film has just as much artistic freedom as a painter with his brush, Ralph M. Evans of Eastman Kodak Co., in Rochester, N. Y., nationally known color expert, told an audience of over a thousand at one of the evening sessions of the convention. Speaking on "Creative Directions in Color Photography," he said that subject matter is limited only by the imagination and the capacity for feeling of the photographer.

Denying the charge made by artists that color photography is merely a mechanical device for recording a natural scene, Mr. Evans said: "The only thing mechanical about a photograph lies in the fact that 'pressing the button' makes permanent the image which the photographer has already created."

Strike out boldly and don't hold back your emotions when approaching a photographic subject, Boris Dobro of Santa Barbara, California, advised his audience. Speaking of "Techniques of Creative Photography," he discussed at some length the importance of timing and other variables in picture making. He also described such advanced darkroom techniques as solarization and showed the various effects they will produce.

Nature enthusiasts heard some strong advice from Dr. Roman Vishniac of Woods Hole, Massachusetts, noted nature photographer whose work has recently appeared in Life Magazine. He told his listeners that if they want true-to-life nature pictures, they must take nature as and where they find it and not immobilize their subjects or move them to other surroundings where conditions may be more favorable for photography. If the photographer will remain in an area long enough to become part of the natural surroundings, nature subjects become less shy and are easier to photograph, he said. Since short exposures are necessary to stop movement, he uses flash in order that the lens aperture may be small enough to give the desired depth of field.

The convention included several how-todo-it sessions using live models. Two popular events of this type featured babies and dogs. In the first, Josef A. Schneider professional photographer of children, showed how he "outsmarts baby." In the second, the husband-and-wife team, Mr. and Mrs. Arthur S. Mawhinney, showed how they handle canine subjects.

Print and slide criticism sessions both proved to be popular features, although organized quite differently. Called "Trial by Jury," the print session was conducted like a court room with a prosecuting "attorney," and "attorney" for the defense, judges, and jury. A print's good points would be argued by the defense and its bad points by the prosecution. The jury rendered its decision on the basis of the "evidence," and the judge, of course, was the major domo. The slide clinic was organized or more orthodox lines. A panel of judges commented individually on the slides as they were projected.

#### Technical Talks

Highlighting the technical accaions of the convention were two symposis, one on the uses of photography in medicine and biology and the other on photography in engineering and science. These and other technical sessions held throughout the convention emphasized the increasing importance of photography in business, industry and research.

In the medical symposium attention was concentrated on the numerous ways in which general and specialized photographic techniques aid in advancing, documenting, and teaching medicine and biology. Some specific techniques of wide interest were included to point up the technical skills that are useful in these fields, but the important role of routine, conventional photographic methods to the practicing doctor and scientist was emphasized.

"Four aspects of photography-the power to analyze, the power to record, the power to communicate and the power to dramatize or sell-can be invaluable to the industrial engineer," G. H. Gustat of Rochester said in introducing the symposium on photography in science and industry. He pointed out that industrial photography does not require any special skills and can be done with relatively inexpensive equipment.

Closing event of the convention was the annual honors banquet. Two new Honorary Fellows and two new Honorary Members of the Society were named. The several medals and awards given annually by PSA were presented. In addition, a new award, the David White Company Award, was presented for the first time by the Society's new Stereo Division. The naming of 24 PSA members as Fellows and 58 as Associates completed the honors list.

Feature address at the banquet was delivered by Captain Ronald MacKay. RN (retired) recent naval adviser to the United Kingdom delegation to the United Nations. He discussed the various ways in which photography is helping the U. N. in its struggle to maintain world peace.

The books reviewed here may be ordered from your regular bookseller, your photo store or direct from the publishers.

Feininger on Photography, Andreas Feininger, 409 pp, freely illustrated, \$6.95, Crown Publishers, 419 Fourth Ave., New York 16, N. Y.

You have seen "Feininger" before, at \$15 the copy. This is the same book originally published by Ziff Davis but at a more modest price.

Feininger is practically a one-man school. We like particularly the little boxes of condensed information scattered through the book that sum up a chapter with wise and concise facts for those who don't want to wade in deep.

Part I covers the technique, and Part II the art of making a photograph. Smoothly submerged in the art section are many details of technique that give art a chance to shine through.

Feininger hasn't hesitated to use the camera to teach photography. Clever visualizations like the one showing the effect of focal length and image size, wherein the subject; the three lenses and the resultant pictures are all included in one shot, or

the free mixture of picture and drawing, when a drawing shows more clearly the cause of a trouble. We liked, too, the generous ten pages devoted to mistakes . . . pictured.

There may be some important phase of making pictures left out of this book, but it would take a more careful study than ours to find it! There is something here for everyone, even for the color photographer, though there is nothing special on color, just basic facts.—db.

The Street of the Huguenots, text by Kenneth E. Hasbrouck, photographs by Erma R. DeWitt. 41 pp, 17 illus., privately printed, from Mrs. V. B. DeWitt, New Paltz, N. Y.

If you want to see how forceful well-taken and presented pictures, accompanied by well-chosen and written words can be, get a copy of this little book. The Street of the Huguenots is in New Paltz. The pictures show their homes as they look today, and their church, and their cemetery. The words tell simply the story of the founding of New Paltz in 1678 and the origin and changes in some of the homes.

You can exhaust the pictures and the words in half an hour, but you can't do it without being inspired to do the same thing for your town, and hope you can do it as well.- db.

## Johnny Appleseed Is Back— With a NEW and BIGGER Job!

Many of you will remember Johnny Appleseed as a popular authority on all sorts of things dealing with photography. Those of you who attended the 1951 convention in Detroit will centainly remember the Johnny Appleseed program.

For the last year or so, Johnny has been in retirement, girding up his loins for a bigger and better job. Now Johnny's back, and we'd like to tell you all about his new job. Those of you who are newcomers to PSA will be particularly interested, we're sure.

#### Service for New Members

We've realized, for a long time, that many new members, particularly those in small towns where intimate fellowship with other PSAers is not possible, find it difficult to become oriented in PSA. These newer members, and those older members who haven't yet learned the ropes, are Johnny's particular concern.

Do you have a suggestion for the betterment of PSA, or the improvement of any of its services? Tell Johnny Appleseed!

Do you want technical information of any phase of photography? Ask Johnny!

Do you have a gripe of any kind? Johnny wants to know about it! (And will act on it!)

Do you want a job in PSA? Johnny will see to it that you get the kind of job you want, in the field in which you're most interested.

Do you have any questions about PSA and its functions, or about your role in PSA activities? Johnny has the answers for you.

#### How Johnny Works

Actually, of course, there is no person at Headquarters named Johnny Appleseed. Johnny is just the symbol of a service, as Uncle Sam is the symbol of our United States, and as Santa Claus is the symbol of Christmas. Uncle Sam is all of us, and Johnny is all of us,

If you have a suggestion, and send it to Johnny, your suggestion will be passed on immediately to that person in PSA who is best cualified to pass on the merit of your suggestion, and to act on it.

If you ask for information, technical or otherwise, it will be given to a person who can give you the information you want and give it to you promptly . . . and authoritatively.

If you have a gripe, the proper person will be advised, and if the gripe is warranted, and something can be done about it, something will be done about it.

If you want a job in PSA—and those who put the most into PSA get the most out of it!—your request will be passed on to the very person who is looking for someone with your qualifications, and who will be tickled pink to have you volunteer for service to the Society.

If you have any kind of question to ask,

it will be channeled to the person who can give you the right answer.

#### One Name; One Address

Some of the old-timers know the name of the person to whom they should write. But most of the Society's members will find it mighty handy to just "Ask Johnny!" or "Tell Johnny"—addressing him always at PSA headquarters, 2005 Walnut Street, Philadelphia 3, Pa.

Headquarters know what the old-timers know: the name and the address of the PSAer who is best qualified to act on any question or suggestion. Your letter, addressed to Johnny Appleased, FPSA, at Headquarters, will always reach the right person.

Each letter addressed to Johnny will be acknowledged by post eard, and will give the name of the person to whom the letter has been referred. A carbon copy of that person's reply will be sent Johnny, so that Johnny may be sure his assistant has taken care of the matter satisfactorily. And if the subject is one of popular interest, Johnny may put it in the Journal.

There's just one rule to remember—and that's a VERY important one: if your letter to Johnny deals with more than one subject, each subject MUST be discussed on a separate sheet of paper. The reason should be obvious. If you bring up three different matters, Johnny may have to refer you to three different assistants, and your letter, in such an event, must be exactly divisible by three!

Write each problem as a complete letter, with your name and address on each. Then, if we must split it amongst three of Johnny's helpers, each will know where to send his answers to your questions. And you'll get an answer, Johnny will see to that.

"One call does it all!" is the slogan of the super-service stations. One name and one address does it all, too—if the name is Johnny Appleseed, FPSA, and the address is 2005 Walnut St., Philadelphia 3, Pa.!

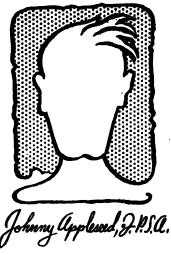

#### The Old Job, Too!

Johnny hasn't given up his original job, though; not by any means! The reactivated Johnny will do a series of articles on a variety of subjects; down-to-earth articles that will be as practical as ham and eggs.

These articles will be written, in some cases, by slipstick artists to whom cosines and logs are old and familiar friends, but every Jöhnny Appleased article will be the kind that all of us can understand and profit by, even if we don't know the difference between an H. and D. curve and the kind we admire on the beach.

Look for Johnny's page next month, and every month, in the JOURNAL; you'll find it easy to spot Johnny's page by the outline picture of Johnny which you see here.

As Johnny himself says, "I'll be serving

Who is Johnny Appleseed, FPSA? Not any one person, certainly; no one person could know all Johnny knows, do all the things Johnny can do, be all the things Johnny can be.

Johnny is everyone in PSA, including you. He's the officers, from the President on down. He's the Board, the Division Chairmen, the top experts in each Division. He's all the big wheels in PSA.

Johnny is also the middle-sized wheels and the little wheels that are just as essential in that great train of gears which makes PSA tick. Each of us who knows something, who can offer a helping hand, who is willing to do some job, great or small, is an essential part of Johnny Appleseed, FPSA.

#### **HELLUP!**

There are a lot of shrinking violets in PSA. I want to ferret them out. Johnny needs a lot of helpers to carry out this new scheme . . . fellas and gals who are real sharp about something. It may be something as simple as adjusting the pH of Hydrazine hydrate (!) or something as complex as the composition of a still life. It may be the problem of setting up a year's programs, of getting speakers to come out to Grinder's Switch to talk. Somewhere in your experience you have encountered problems, the solution of which would also be somebody else's solution. Won't you paste the coupon on a postcard and mail it to me at Headquarters, 2005 Walnut St., Philadelphia 3, Pa., so I can inscribe your name on my roster of Johnny's Helpers and refer pleas for help to you? JOHNNY APPLESEED, FPSA

Johnny Appleseed, FPSA, 2005 Walnut St., Phila. 3, Pa. Dear Johnny: Sure I can help. My subjects might lie in the fields listed below:

Louis Philippe Clerc, Hon. FPSA

By Glenn E. Matthews, FPSA

Louis Philippe Clerc, one of two Honorary Fellows* of PSA for 1952, was born in Paris on August 20, 1875. His influence and work have dominated the whole field of photography in France for more than fifty years and have extended far beyond the borders of his native land. A popular, familiar figure at every International Congress of Photography since the first meeting in August, 1889, Mr. Clerc has labored intensively and unceasingly for the advancement of photography throughout the world. His contributions have been particularly outstanding in the fields of graphic arts, color photography, aerial photography, photographic chemistry and scientific applications of photography.

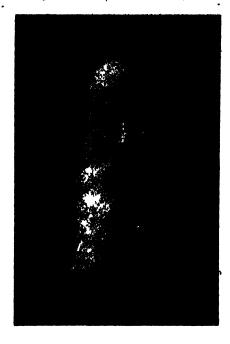

At 14 years of age, he was already an expert amateur photographer and he noted that documentation on photography in France was very poor. As a result of this observation, he spent part of his holidays every year studying foreign publications. As early as 1896 he began to contribute to various photographic journals in France and to publish summaries of foreign works. Among others he published French translations of the principal articles by Hurter and Driffield, the pioneers in sensitometry, who at that time were completely unknown in France.

As a teacher of chemistry and photography, Mr. Clerc has had a long distinguished career. He taught analytical chemistry at the Paris University from 1898 to 1937. He founded in Paris in 1926 and directed for many years a Technical School of Photography and Cinematography. He also taught physics and chemistry applied to the graphic arts at the Ecole Municipale Estienne in Paris. Finally he was asked to teach photographic photometry at the Paris Institute of Optics. He took an active part in the organization of the International Congress of Photography in Paris in 1889 and has served for many years as the permanent secretary for France. In that capacity he edited the proceedings of the fifth, sixth, and ninth International Congresses of Photography.

After a few months service in the infantry in the first World War, he was asked to direct one section of aerial photography. The results were reported in the 24th Traill Taylor Memorial Lecture of the Royal Photographic Society of Great Britain, (Phot. J. 61: 382, November, 1921). He discussed aerial photographs, and aerial stereoscopy. For his services in aerial photography during the war, 1914-1918, he was decorated with the Croix de guerre.

In 1921 he began publication in each issue of Revue Française de photographie of a supplement entitled Science et Industries Photographiques which eventually hecame a separate journal. This publication has been edited for more than 30 years by Mr. Clerc, entirely alone, without a col-

The other Honorary Fellow of the PSA for 1982 is Fred R. Archer of Los Angeles, Calif. A blographical account of Mr. Ascher appeared in the PSA JOHNAL, Vol. 12, pp. 118-179, March 1946.

laborator of any kind, thus doing the work of a large staff of experts. This formidable task can be appreciated somewhat when it is realized that the work requires an ability to translate several languages and a sound knowledge of many fields of photographic science. Science et Industries Photographiques is one of the three leading photographic abstract publications in the world and the principal outlet for scientific and technical articles in France.

His life has been one of unremitting toil with every moment of each day devoted to teaching, writing, organization, translation, and editing. Through all of this intense program he has managed to find time to form friendships with his colleagues in many different countries.

A few of the important positions held by him besides his editorship of Science et Industries Photographiques, 1921 to date, are as follows: Co-director of the magazine La Photographie, 1896-1901; Secretary to the editorial staff, La Photographie Francaise, 1901-1904; Editor-in-chief, Les Procédés Photomecaniques since 1901: Editorin-chief, Revue des Sciences Photographiques from 1914 to date; Collaborator for: Grand Encyclopedie; Dictionnaire de Chemie by Wurtz (2nd Suppl.); Dictionnaire Larousse; Journal de Physique; Bulletin de la Société Française de Photographie et Cinematographie; Photographic Journal (RPS-London); Camera Obscura (Amsterdam); etc.

In the past fifty years Mr. Clerc has written no less than twenty books on several different fields of photography. Some of these books have been translated into several languages. He is probably best known for his authoritative work, La Technique Photographique, first published in two volumes in 1926 and since appearing in four other editions, two of which were translated into English in 1930 and 1937. He has pub-

lished extensively in many photographic magazines over a long period of years.

Besides the Croix de guerre which recognized his aerial photography services to the French 10th Army (June 22, 1915), the French government in 1949 decorated him with the Chevalier de la Legion d'honneur. This decoration was given him in recognition of the quality of his university work and the services rendered to science; for his work in the practical application of acience to industry, particularly in the field of photography and cinematography by his publications of periodicals.

Some of the other honors which have been given to Mr. Clerc are the following: Bronze Medal of the ministere de l'Instruction Publique—1914; Bronze Medal of the Ligue de l'Enseignement—1912; Peligot Medal of the Societe Française de Photographie—1923; Vermeil Medal of the Societe Nationale d'Encouragement au Progres—1924; Honorary Fellow of the Royal Photographic Society of Great Britain—1924, and the Progress Medal of that Society in 1951.

It has been the privilege of very few men to have contributed so effectively and lastingly in as many fields of photographic science during their lifetime as has Louis Philippe Clerc. In so doing, he has honored his country and he continues to labor faithfully for the advancement of photography throughout the world.

Determining Exposure for Night Football Games

By Harris B. Tuttle, Hon. PSA. FPSA* and Donald F. Lyman**

Many football games are now placed at night by attificial light. In cases where it is desirable to make motion pictures of such games, methods of determining the correct exposure become quite important if the best pictures are to be obtained. Schools that have not started filming night games need information about the selection of equipment that will enable them to make satisfactory pictures. It is the purpose of this article to provide helpful information on both problems. First, let us consider cameras, lenses, and films.

There are two sizes of amateur movie film, 16mm and 8mm. The 16mm film is recommended for this purpose because 8mm film is intended for home use only and has several limitations if an attempt is made to use it for serious professional or semiprofessional purposes.

For example, the light used to illuminate sports areas at night is adequate for visual observation of football games and other sports, for in such cases the human eye can readily adapt itself to reasonably low levels of illumination, which permits the observer to see comfortably. But the photographic film used for night filming is less sensitive than the human eye and, therefore, things that can be seen very clearly cannot always be photographed as easily as one might suppose. The fastest movie film available is 16mm Cine-Kodak Super-XX Panchromatic Film, while the

fastest film available for 8mm cameras is Cine-Kodak Super-X Panchromatic. Super-XX Film is two and one-half times as fast as Super-X Panchromatic Film. This means that 16mm Super-XX Film requires only 40 percent of the light that would be needed for 8mm Super-X Panchromatic Film. In addition, the picture made on 8mm film is about ¼ the size of the picture made on 16mm film. Thus, when the picture is viewed, 16mm film can be enlarged to about four times the area or twice the screen width of 8mm pictures, if the same brightness and definition are to be obtained.

Another prime requirement for good football movies at night is a fast lens. A lens having an aperture of from f/1.4 to f/1.9 or f/2.0 is essential.

Then there is the question of the proper camera speed. For silent motion pictures the normal camera speed is 16 frames per second. When such pictures are projected at the same rate, the movement on the screen appears normal. But since football is a fast-moving game, pictures made for purposes of study are more revealing if the action is slowed down slightly. This is accomplished if the camera speed is faster than the projection speed. Most schools shoot their games at 24 or 32 frames per second. Then, if the film is projected at the silent speed of 16 frames per second, the speed of the players will be slowed to two-thirds speed for 24 frames per second and one-half speed for 32 frames per second.

From these notes it is now apparent that, in order to PSA JOURNAL

"Sales Service, Division, Esstman Kodak Company, Rochester, New York enDevelopment, Department, Esstman Kodak Company, Rochester, New York

582

make pictures at 24 or 32 frames per second, one must use 16mm Super-XX Film. It is also clear that the illumination on the field would make objects effectively 40 percent as bright to 8mm Super-X Panchromatic as it would to 16mm Super-XX Film. If the brightness of the field was satisfactory for normal motion at 16 frames per second, it would be only half bright enough for 32 frames per second.

Thus, the slower speed and the limitations in the projection of 8mm film practically rule out its use for sports photography by artificial light.

Although a few schools using 8mm Super-X Panchromatic Film at f/1.9 and 16 frames per second find the results acceptable for their particular purpose, this combination is not recommended if the best possible results are wanted.

Light requirements

For filming at night, there must be a certain minimum amount of illumination on the playing field. Cine-Kodak Super-XX Film requires at least 30 foot-candles of incident light for 16 frames per second at a lens setting of f 1.9 or f/2.0. Since this amount of light may produce slight underexposure in the case of dark subjects, it is generally felt that 45 foot-candles should be the basic value. This provides a safety factor slightly in excess of $\frac{1}{2}$ stop.

Since most football films are exposed at 24 or 32 frames per second, the amount of light needed would be 50 to 100 percent more than for 16 frames per second, or 65 foot-candles at 21 frames per second, and 90 foot-candles at 32 frames per second. For other f values and camera speeds, see Table I.

The exact amount of illumination required and the f value employed depends a great deal upon the reversal development given to the film when it is processed. The values given above are for Cine-Kodak Reversal Film when processed by one of the Kodak processing laboratories. When films are developed by other laboratories, the recommended exposure may vary considerably one way or the other.

Black-and-white motion-picture films, such as Cine-Kodak Super-X Panchromatic (ASA 32 in tungsten) and Super-XX Films (ASA 80 in tungsten), manufactured by the Eastman Kodak Company, are available in two types. In one case, the processing of the film is included in its purchase price; in the other, the price of the film does not include a charge for processing. The former type is designated Cine-Kodak Film. The latter type includes Kodak Blue Base Super-X and Super-XX Films. The Cine-Kodak Films can be sent to any Kodak processing laboratory and will be processed and returned free of charge. The Blue Base Reversal Films must be processed by the customer or by any commercial laboratory. There are many commercial laboratories equipped to do this work.*

This introduces another very important factor in the exposure problem. The results obtained by the various commercial laboratories can and often do vary from one to two stops in exposure. If Blue Base Super-X or Super-XX Film is used and sent to a commercial laboratory, it should always be sent to the same laboratory because their results will be uniform throughout the season.

Unexposed as well as exposed film can, of course, be affected by heat and humidity. Film left over from the previous year, for example, will probably be slower and will produce results which will appear different from those

*While Kodak processing laboratories remain open on Saturdays and Sundays during the football season, there are many cities that have commercial laboratories. Some colleges can obtain a little faster service by using Blue Base Film and having the processing done locally by such laboratories.

†Each commercial laboratory has its own processing methods. The solutions used and development times may change the effective exposure.

obtained on fresh film. Therefore, film should not be held over from one season to the next unless it can be emposed within the period designated by the expiration date printed on the film carton.

Furthermore, in order to be realistic about the exposite of motion-picture film by artificial light, we must recognize the many variable factors which are always present when the film is exposed and developed.

These variables are shown below, grouped under several headings.

Brightness of the Subject

- 1. Illumination on the subject
 - a. Initial output of the lamps (Important if exposure tests are made with new lamps)
 - b. Distribution of the light on the playing field.
 - c. Superimposition of light from the various sources
 - d. Blackening of the lamps with age
 - e. Blackening of the reflectors caused by moths, insects, and corrosion, or deposits of tungsten on the inside of the lamp
 - f. Variations in the line voltage
 - g. Contrast ratio of the lighting
 - h. The effect of side or back lighting
- 2. Reflectance of the subject
 - a. Reflectance of the principal part of the subject.
 (In football photography, this is usually the color of the uniforms, helmets, and ball.)
 - b. The over-all brightness ratio
 - c. Extreme changes in reflectance, such as from a white uniform to a dark-colored uniform. These effects may be partly real, caused by differences in the way the light is reflected to other parts of the subject, and partly psychological effects obtained during the process of viewing the pictures.
 - d. The effect of the background, whether it is light or dark in the final picture.

Speed of the lens used

- 1. Accuracy of the calibrated scale on the diaphragm
- Transmission of the lens, which is affected by the transparency of the glass, the number of elements, and the lens coating

Time of exposure

- The taking speed or the number of frames per second at which the camera is actually operating under working conditions
- 2. Size of the opening in the camera shutter
- The resulting exposure time expressed as a fraction of a second

Exposure index

- The speed and contrast of the emulsion used when it is developed by regular processing
- 2. Variations in speed and contrast encountered in regular processing
- The effects of other types of processing, which vary among independent laboratories

It might be well to point out briefly the significance of some of the factors just listed. Under "Illumination on the subject," the initial output of new lamps is slightly higher than that of lamps which have been burned for several hours. The amount of the drop depends on the type of lamp. Some lamps drop only 25 to 30 percent before they burn out, while others drop 50 percent or more. Those used in football stadiums, however, will usually be of the first type.

The distribution of the light on the field is quite im-

portant for photography, much more so than it is for pristial observation. When the illumination from the lamps is not distributed uniformly over the field, there may be dark spots to which the eye readily accommodates but which may become quite noticeable in the finished pictures.

If the lamps are placed on high stands and close to the playing field, much of the light may be from the top and will be less effective photographically than lights placed at a lower angle in such a position that they provide frontal

illumination on the players.

As a matter of fact, the placing of lights around the entire gridiron helps provide fairly uniform illumination on the field. However, from a photographic standpoint, this method of lighting has some disadvantages. If the camera is placed, let us say, in the grandstand or bleachers on one side of the field in such a position that it is shooting across the field and slightly downward along the 50yard line, only the lights that are on the same side of the field as the camera are contributing materially to the total exposure of the picture. The light from the other side of the field is falling on the other side of the players and is being reflected back in the opposite direction so that it never reaches the camera lens. However, some that strikes the ground and is reflected toward the camera may help considerably in the exposure of such areas. Nevertheless, the light that is actually doing the most to illuminate the players from the camera's point of view are the lights that are on the same side of the field as the camera. Lamps at the ends or on the opposite side of the playing field merely furnish side or back-lighting.

The reflectance of the subject is quite important, and it may vary considerably during a game. We have seen pictures made at night in which both teams had light-colored uniforms and white helmets, and a white ball was used. During the first ten minutes or so of play, these light-colored subjects reflected sufficient light to produce a good exposure. However, because the field was muddy, it was not long before the uniforms, helmets, and the football were darkened with mud.. This, of course, cut down the reflectance of these objects and made their brightness possibly a third or a quarter of its original value. Rolls of film exposed later in the game appeared underexposed even though all other photographic conditions had remained constant.

Effect of background

The effect of the background on the appearance of the subject is quite important. For instance, if the pictures are shot downward from a slight elevation, the grass will provide a background for many of the players, and if they are in light uniforms, the grass will appear much darker and will provide fairly good contrast so that the movements of the ball and the players can be followed easily.

If the camera is low, the lights on the opposite side of the field usually show in the picture. The excessive flare light which results reduces the contrast, causing an overall flattening of the picture quality and making it more difficult to follow the movements of the players.

Under "Time of exposure," the camera taking speed, of course, is important, and the actual speed at which the camera is operating should be checked from time to time in the following manner: Make a two-foot length of unexposed film into a loop by splicing its two ends together. Load this loop into the camera in the usual way, leaving the camera door open. Wind the camera spring fully. Using a second-timer or the second hand on a watch, and with the splice as reference point, time the interval required for the loop to pass through the camera. At 16 frames per

second, the two-foot loop should make one transit in five seconds, or two in ten seconds, etc.; at 24 frames per second, it should pass through once in 3-1/3 seconds, or three times in ten seconds; and at 32 frames per second, it should pass once in 2½ seconds, or four times in ten seconds. If the camera is not operating at speeds that correspond with the settings indicated, have it adjusted at the factory.

Shutter ratings

Motion-picture camera shutters are usually rated in the number of degrees that the shutter is open for exposure. These vary from 204 degrees for some 16mm cameras to 120 degrees for some 8mm cameras. A large percentage of both 16 and 8mm cameras operate at about 165 degrees. Thus, the exposure time at 16 frames per second is approximately 1/35 second; at 24 frames per second, 1/52 second; and at 32 frames per second, 1/70 second.

Exposures indicated by most exposure meters, tables, and guides are based on an exposure time of 1/35 second, or a 165-degree shutter opening and a camera-operating speed of 16 frames per second. If the camera has a 120-degree or 204-degree shutter opening, slight variations in lens opening will be necessary in order to obtain constant exposures when two or more cameras made by different manufacturers are used to photograph the same game.

Large differences in exposures are usually not caused by any one factor, but rather by an accumulation of several factors tending in one direction. For example, a certain basic exposure might be recommended for a camera equipped with a 165-degree shutter opening and a camera-operating speed of 16 frames per second. If, instead, a person had a camera that had a 204-degree shutter opening, making the exposure time 1/28 second instead of 1/35, and if the camera was running slightly slow, say at 13 or 14 frames per second instead of 16, the accumulation of exposure might add up to the equivalent of a half a diaphragm stop. There have been cases where this has actually occurred. A cameraman photographing games regularly every week on the same field, from the same position, with the same light, etc., obtained satisfactory exposure one week. The following week he used a camera, made by a different manufacturer, which was running slower and had a larger shutter opening. These pictures appeared to have at least one stop more exposure than pictures taken the previous week under similar circumstances. On the other hand, a camera equipped with a 120-degree shutter, and running 18 to 20 frames per second, would produce underexposure. Therefore, it is well to be aware of the variations that can occur in exposure merely due to the mechanical performance

Of course, another important factor along this same line is the proper use of an exposure meter, and we will say more about that in a later parageaph.

Under "Exposure index," each type of motion-picture film is assigned an exposure index number by the manufacturer. The exposure index is based upon exhaustive tests in which the light used for photography can be measured accurately and the general conditions of exposure and processing are held normal. All Cine-Kodak Reversal Films are developed in Kodak processing laboratories under normal processing conditions. On the basis of exhaustive tests, an exposure index of 80 has been assigned to both Cine-Kodak Super-XX and Blue Base Super-XX Films.

Kodak processing has been carefully worked out to produce the most satisfactory projection positives of all types of average subjects. In the assignment of an exposure index to film, a safety factor is allowed so that the exposure recommended is never the absolute minimum exposure that will just yield a good picture on the film. Black-and-white re-

versal film has moderate latitude in exposure when processed with controlled second exposure. Pictures given a half-stop, one stop, or even two stops more exposure than is recommended will be usable. This is due to the automatic printing given to all black-and-white reversal films processed in Kodak laboratories.

It is possible to use different formulas for the first developer, and it is also possible to develop for a longer period of time. Some of the commercial laboratories do use formulas they have devised themselves, and they may in some cases give a longer first development than is given by the Kodak processing laboratories. The result is that the finished picture appears to have had more exposure; that is, appears lighter on the screen. The differences that can occur among commercial laboratories in processing Kodak Blue Base Reversal Films can result in speeds as much as one to two stops above that normally recommended for the Cine-Kodak Films developed by the Kodak laboratories. Therefore, you can see why it is important that when test exposures are developed, they be made on the same kind of film and developed by the same laboratory that will be developing all subsequent films. Exposures for future pictures can then be safely based on information obtained from the test rolls.

In the beginning of this article, we pointed out that for f/1.9 and 16 frames per second both Cine-Kodak and Blue Base Super-XX Film require 45 foot-candles—a recommendation which includes a safety factor. It might be possible to so process Blue Base Film that the same photographic results would be obtained if the illumination were only 15 to 20 foot-candles.

You can thus see how difficult it is to give any specific exposure instructions for a film unless the film is exposed and processed under conditions similar to those recommended by the manufacturer.

Determining exposure

We also mentioned the importance of properly measuring the light falling on the field. This can be done in a number of ways with exposure meters. If the photographer can gain access to the field for preliminary measurements, a meter that reads incident light may be found preferable to one that reads reflected light.

The incident-light meter is held so that it points toward the light sources that illuminate the side of the subject to be photographed. Actually, this type of meter should be held in such a position that if it were a mirror instead of a meter, it would reflect rays of light from the light source directly into the camera lens. In other words, if an incident-light meter without any diffusing medium in front of the cell is pointed directly toward the light source, it reads, of course. the illumination on a plane perpendicular to the direction of the lamp. But the camera lens is recording objects in planes perpendicular to its axis, and the illumination from the sources is lower on these planes. That is why a meter should be held so that it will reflect the light toward the camera. Most meters, however, have diffusing hemispheres or cones that make them less sensitive in this respect. The Weston and General Electric meters can be adapted so that they can be used as incident-light meters, while the Norwood meter was designed specifically for measuring incident light. We suggest that if a meter is going to be used, it be carefully checked and calibrated, either by the manufacturer or some competent laboratory, to make sure that it is measuring light properly.

When a reliable value of illumination has been obtained by use of a suitable incident-light meter, it is not difficult to determine by calculation or by reference to a table what the lens diaphragm opening should be for a certain camera speed, film speed number, and exposure time. It is essential, however, that the illumination be corrected by integrating devices, such

as the diffusing cone or hemisphere, so that it indicates approximately the amount of light falling on surfaces facing the camera, for they are the surfaces that are of chief interest in pictures of this type.

American Standard for General Purpose Photographic Meters (Photoelectric Type) Z38.2.6-1948 gives the following formula:

$$T = \frac{C A^2}{I S}$$

where T is the exposure time in seconds, A is the relative aperture (f-value), S is the exposure index, I is the illumination incident on the exposure meter expressed in foot-candles, and C is a constant for which limits of 15 and 30 are specified. If C is assigned a value of 25, which is now considered best for films used for football pictures, the formula can be rearranged as follows:

$$1 = CA^2 = 25A^2.$$

$$TS \qquad TS$$

The following table was derived from this formula:

TABLE I

Foot-Candles Required for Various f-values and Camera Speeds for Cine-Kodak and Blue Base Reversal Super-XX Film (Exposure Index 80) and a Shutter Opening of 165 Degrees.

	Frames per Second			
<i>f</i> -value	16	24	32	
1.4 1.9 or 2 2.8 4	20 45 85 175	30 65 130 260	45 90 170 350	

It is clear from the table that there will seldom be enough light for high camera speeds or small lens openings.

Another method of making readings on the field is to hold a reflection-type meter within a foot or so of a gray card having a reflectance value of 18 percent, such as the Kodak Neutral Test Card. Readings should be taken at various parts of the field, with the card always held perpendicular to a line between its center and the camera.

Still another way of determining exposure is to use the regular reflection type of meter pointed toward the subject. This method is best when the photographer cannot take readings on the field.

In the case of reading light reflected from a gridiron, it is difficult to obtain accurate results if the lights on the far side of the field are shining on the meter, for it will then be reading light that does not effectively illuminate the subject. Therefore, when a reflection-type meter is used, it is important to shield the meter from the light coming directly across the field.

All these methods involving meters introduce so many variable factors that it is really difficult to say which is best or to guarantee that any one of them will work satisfactorily. If the photographer has an opportunity to photograph some previous practice session or previous game, he should make the final determination by photographic test.

Before making the test, he should make sure that all the lamps illuminating the field are turned on and functioning in the prescribed manuer. Then he should arrange to have some football players on the field in the kind of uniforms they will wear during play. He should load the camera that is to be used all season, making sure that the film is fresh and not a year or so old just because it seems uneconomical to throw it away.

As soon as he has established that all of the conditions are fairly normal and represent an average of conditions to be encountered throughout the season, he should proceed to make a series of exposures as follows:

Scene No.	Camera Speed	<i>f</i> -Value
1	8	1.4
2	16	1.4
3	16	2.0
4	16	2.8
5	16	4.0
6	16	5.6

and beyond if there seems to be plenty of light. Furthermore, if there seems to be enough light to properly expose the Super-X type of film, he should run the same type of test on it Then the films should be sent to be processed by the method to be used for future games. It is then a simple matter to select the best exposure from the full-stop steps or to pick some intermediate value. From this value, he can easily calculate the f-values required for other camera speeds, such as 24 or 32 frames per second.

The advantage of this method is that the lighting would be checked with the camera, film, processing, etc., to be used later for the final exposures. If the voltage across the lamps varies, the results will be affected somewhat, and the reflectance of the uniforms will be another variable. But all the main factors have been covered in such a way that the exposure should be nearly correct.

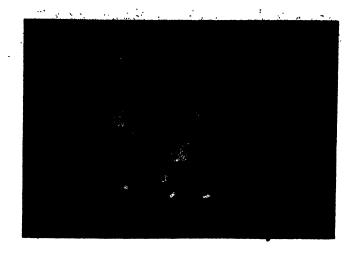

In making the tests, the photographer should place his hand over the lens between each change in exposure and press the exposure lever long enough to expose several frames of film. This will produce a black flash on the screen and thus help him to separate and identify the exposures.

When the film is shipped for processing, it is a good idea for the photographer to write to the laboratory, stating that the film is a test and that he wants it processed under the average conditions that will exist later when he sends in his football films.

After the film has been returned from the processing laboratory, it should be projected under recommended conditions.

When the projector is set up to run the test film, it should be equipped with a lamp of the recommended wattage, and the picture should be of the recommended size for the type of screen used. It may lead to serious errors if a 750-watt lamp is used in the projector and a picture about 8 x 10 inches in size is shown on a white paper fastened to the wall at the end of a desk.

This is an important test to determine exposure, and it

should be viewed under normal, recommended projection conditions. A 500-watt projection lamp should be used o project a picture about 36 x 50 inches for a beaded screen or 30 x 40 inches for a matte-surface screen. As the tests are run through the projector, an exposure made at f/2.0, for example, may be picked arbitrarily as the most suitable one. However, if the film is run backward so that the darkest scene comes first and the scenes become progressively lighter, an exposure made at f/2.8 may be chosen as best. Thus, it is important to allow for the psychological effect introduced by a change in the order in which the pictures are projected.

It is better to have two or three other observers present, and after the above effect has been demonstrated, they should agree on the best exposure, which may lie between two steps,

The fine grain and high contrast of the Super-X type of film will improve the quality of the pictures if there is enough light. The results of these actual photographic tests will always be on hand for future reference, and from them it is possible to tell what the exposure conditions are during actual play. These tests will also serve as a means of checking the efficiency of the lights from time to time.

It is, of course, a good idea to take meter readings when the photographic test is made and to keep a record of these values. Then, when the photographic test has indicated that the f/2 or f/2.8 opening produces the best exposure, there will be some correlation to aid in making pictures on other gridirons or under other circumstances.

It would be wise for any school to invest in a roll or two of film for such tests each fall because operating conditions change from year to year. Blackening of the lamps or changes in the load on the line that supplies your playing field could cause a drop in illumination, and other factors discussed here may affect the results when they have not caused any great trouble previously. An actual exposure test processed by the laboratory that is going to do your processing is the best guarantee you have of getting good results.

It can be seen from the information given here that it is often difficult to determine in advance whether or not pictures with your lighting setup are possible. A meter reading taken improperly may indicate that there is not enough light, and a photographic test may reveal that there is. On the other hand, a meter used improperly may indicate that there is enough light, and if you proceed on that basis and expose ten or 12 rolls of film, you may be disappointed to find them badly underexposed. Thus, investment in one roll of film for an actual photographic test may be repaid many times in the course of the football season.

It identifies you

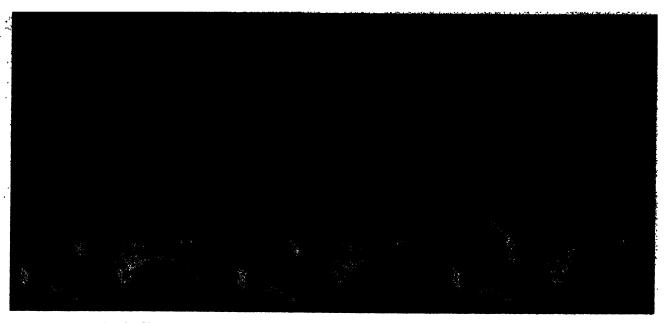

Fig. 1.—This series shows the action of the new reducer on a negative which has been grossly overdeveloped. Kodak Super-XX Film was given normal exposure and development as seen on the left . . . then normal exposure and double normal development time as seen in the center . . . then normal exposure, double normal development time, and reduction in the new hypo reducer as shown on the right.

REDUCE WITH HYPO

As anyone who has done much photographic processing knows, you can't leave a print or negative in the fixing bath for too long, especially if the bath contains ammonium hypo. If you do, the image will soon be attacked by the solution and will begin to reduce and disappear.

This action is particularly noticeable in the case of prints. Many photographers have had the experience of seeing prints that have been left for an excessive period in the fixing bath greatly reduced in density. The technique has not, however, been generally employed as a reducer for either films or prints because the action is so slow. It has long been felt, however, that if some method could be warked out to speed up this operation, some very worthwhile results might be obtained. Toward that end, work has been done recently with solutions which take advantage of the reducing action of the thiosulfates as used in rapid liquid fixing baths. These experiments have led to the conclusion that some very useful reducers can be compounded from these preparations.

The new reducers have the following characteristics. They will (1) selectively dissolve the finely dispersed dichroic silver characteristic of many stains, and (2) then slowly and proportionately reduce the image. This gives a uniform reduction in the contrast of the print or negative without loss of shadow detail. Furthermore, and more important, the re-

ducers will not appreciably change the color of the image except in the case of strong reduction. This is particularly important in the case of prints.

The secret of these new reducing formulas lies in increasing the acidity of the thiosulfate bath. This speeds up the action of the solution just as raising the temperature of the solution would also speed up the action, but without the undesirable results that come from raising the temperature.

The formulas given in Table 1 represent acid hardening ammonium thiosulfate fixing baths in which the acidity has been increased by the addition of citric acid. In these baths, the ammonium thiosulfate is the active reducing agent, while the other ingredients produce the correct degree of acidity without causing sulfurization of the hypo. These baths also allow hardening to continue so that supplementary hardening is not required as with so many other reducers. Another advantage of these baths is that the materials for preparing the bath may already be in the photographer's possession.

The speed with which these fixing baths operate is determined largely by the concentration of citric acid in the solution. Table II shows how speed of reduction to the same relative density is tremendously increased by adding more acid. The faster speeds are such that the use of this new method of reducing prints and negatives becomes very practical indeed.

Most reducers operate in a general over-all manner. In other words, the usual "cutting" reducer used to reduce a negative by one-tenth of its density will take the same amount out of the highlight areas as out of the shadow areas. This

A popular abridgement of a practical research paper describing a new method of reducing negatives and prints. Originally published in PSA Journal (Phot. Sci. and Tech.) 17B: 110-118, November, 1951. Article entitled "An Ammonium Hypo Reducer" by R. W. Henn, J. I. Crabtree, and H. D. Russell, Kodak Research Laboratories, Eastman Rodak Company, Rochester, New York.

TABLE I REDUCER FORMULAS

Basic Solutions	Per Liter of D Stock Hypo	iluted Reducer Hardener	r Citric Acid	рН
1. Kodafix Solution	330 сс.	*******	(a) 15 grams (b) 30 grams	4.10 3.55
2. Kodak Rapid Liquid Fixer with Hardener	250 сс.	30 cc.	(a) 15 grams (b) 30 grams	3.66 3.2
3. Ammonium Thiosulfate Kodak F-5a Stock Hard		200 сс.	(a) 15 grams(b) 30 grams	3.4 3.1

may result in the complete elimination of shadow detail while bringing the highlights down to printable quality. The contrast of the negative or print is not changed by such reducers. The use of the reducer merely results in a somewhat thinner negative which may be used in printing. This means that less time may be required to print the picture, but the same paper contrast will be needed for the reduced negative as was called for before.

Proportional Reduction of Negatives

The proportional action of the hypo reducers described here is, however, much more pronounced. This is because these reducers act on a percentage basis. While reducing highlight density 10 per cent, they also reduce shadow density 10 per cent. This might at first seem to be the same as reducing over-all density by a fixed amount with a cutting reducer, but actually it is quite different. That's because the removal of 10 per cent of the silver in the highlight area represents far more silver removal than is the case when shadow areas are reduced by 10 per cent.

As a result of this proportional reduction, the contrast of the negative or print is changed. Consequently, a negative that heretofore required printing on a No. 1 grade paper may be printed successfully on No. 2 or possibly a No. 3 grade paper.

The way this works out in practice is well illustrated by Figure 1 and by the characteristic curves shown in Figure 2. These characteristic curves represent strips of Kodak Plus-X 35mm Film which have been subjected to a series of reducing times. Since these curves look very much like a time-of-development series, it can be seen from them that they show very small loss of shadow detail.

Similar results have been obtained in experimental work with other films also. The times of reduction will vary, of course, depending upon the emulsion, but an idea of the magnitude of the variations with several different films can be obtained from Table III. Loss of shadow detail or toe on the characteristic curves is found, however, only with the

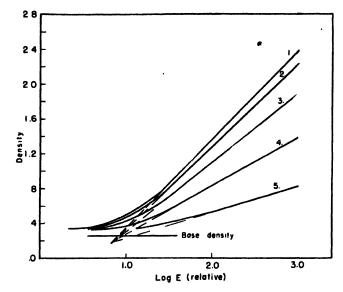

Fig. 2.—Characteristic curves obtained by a series of increasing times of reduction. The reducer variation 2 (b), containing 30 grams of citric acid per liter, was employed for 0, 4, 8, 16, and 32 minutes at 68F. Note the resemblance to the usual time-of-development series. Kodak Plus-X 35mm Film, developed in Kodak DK-60a for 7 minutes at 68F.

the contrast of negatives, this new reducer is capable of compensating, when necessary, for a very great degree of over-development. For example, similarly exposed rolls of Plus-X Film were developed (a) in Kodak D-76, and (b) in Kodak D-11 for 15 minutes. In the latter case, the resulting negatives were so dense that the image was visible only when viewed with intense illumination. Yet, following prolonged reduction,

As a result of this ability of the hypo reducer to change finest grain materials after particularly strong reduction.

	TABLE II	•	
	RATE OF REDUCT	ION

2 (b)	Kodak Rapid Liquid Fixer	30	12
3	Ammonium thiosulfate + Kodak F-5s	ı 0	38 `
3 (a)	Ammonium thiosulfate + Kodak F-5		15
3 (b)	Ammonium thiosulfate + Kodak F-5		10

Fig. 3.—This shows the type of results that may be expected from similarly exposed films with different degrees of development. The top picture was made on Kodak Super-XX Roll Film developed in Kodak D-76 for the normal time. The middle picture was made on the same film but developed for 15 minutes in Kodak D-11 The bottom picture shows a print from a D-11 developed negative after reduction in the new hypo reducer

this roll was printed on the same grade of paper and with approximately the same times as the properly developed roll See Figure 3.

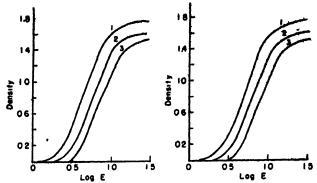

Fig. 4.—Characteristic curves of paper emulsions reduced in the ammonium hypo reducer. Figure IVa is for Kodak Royal Bremide Paper, Grade F-3, unreduced (1) and treated for 4 minutes (2) and 8 minutes (3) at 68F. Figure IVb is for Kodak Velox Paper, Grade F-3, reduced for 0, 2, and 4 minutes. Reducer variation (2) (a), containing 15 grams of citric acid per liter.

Reduction of Prints

Perhaps the greatest usefulness of these new reducers lies, however, in their use with photographic papers. This is true because such reduction may well serve to "save" a badly over-exposed and overdeveloped print on a fine, expensive paper. If vou're technically minded, you can see what happens as represented by characteristic curves for paper as shown in Figure 4 which shows the action of one of these hypo reducers on a high speed bromide paper such as Kodak Royal Bromide Paper and a "contact speed" chloride paper, such as Kodak Velox Paper after reduction for various times. A more graphic illustration of exactly what may be accomplished in reducing overexposed and overdeveloped prints can be seen in Figure 5 (a, b, and c).

With papers the effect of these reducers is (1) to reduce the density so as to compensate for overexposure or overdevelopment, and (2) to increase contrast somewhat (a not undesirable feature in most instances) and, (3) on prolonged reduction there is a tendency to cause a shift in the image tone with some papers.

In the reduction of papers and prints, however, one point should be remembered: Although the action of this reducer can be easily followed in full light, reduction should not be judged entirely on what apparently occurs while the print is in the reducer solution. This is because the print or negative, after immersion in the wash water, will tend to reduce still further. Therefore, reduction in both cases should be carried out on a rather tentative basis and halted from time to time to permit some washing to judge the final reduction in density attained.

Removal of Silver and Silver Sulfide Stains

Usefulness of these new reducers is not confined, however, to reducing merely negatives and prints. The reducers are equally practical for the removal of silver and silver sulfide stains which occur very frequently in photography. These

RED	UCING	TABLE RATE VE		ULSION		
	Ro	ducer Vari	ation 2b

tig. 6a. Print made from negative showing extreme dichroic stain.

Fig. 6b. Print from negative from which stain has been removed completely by ammonium hypo reducer.

stains may form in the developer when it is contaminated with hypo or sulfide and in the fixer if rinsing, acidity, or agitation are insufficient. They may be yellow, brown, metallic, or a hazy gray by reflected light, and are yellow, red, purple, or gray to transmitted light.

What these stains do to a picture can readily be observed from Figure 6a and 6b. This set of pictures shows a print from a badly stained negative, and a print after the stains on the negative had been removed completely.

To remove silver and silver sulfide stains the variation of the hypo reducer best suited to this purpose is the one containing 15 grams of citric acid per liter. The film or print is immersed in this bath and the stained area swabbed with cotton. Action is often complete in two minutes but may occasionally require five minutes or more.

One advantage of the use of this hypo reducer in the elimination of such stains is that it quite rapidly removes the stain from negative materials and causes no detectable loss of image density or shadow detail. In practical use, this reducer and technique has already proved extremely valuable in the trade. In one instance, a machine load of roll filth which had been badly spotted with silver sulfide fixing bath stain was recovered fully and entirely normal prints were produced.

Silver and silver sulfide stains are quite often produced on clothing when silver-laden hypo baths are spilled. This is particularly true with ammonium thiosulfate baths. These

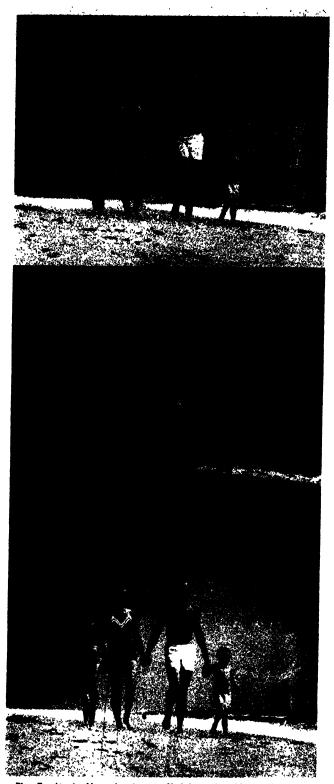

Fig. 5a (top). Normal print on Kodabromide #2. 5b (center) over-exposed print on same paper. 5c (bottom) Over-exposed print after reduction with one of the new hypo reducers.

stains can be removed from white garments by the use of the hypo reducers. The weaker variation (a) is usually suitable. Light stains, investigation has shown, can be removed by sponging, but dense stains may require soaking overnight. The garment is then rinsed in cold water, after which it may be given a regular laundering procedure. The bath may bleach some dyes, however, so it is not recommended for colored garments.

Another application of these new hypo reducers is the re-

moval of the intense yellow-orange stain which usually results when color films are inadvertently given black-and-white development. For this purpose, the variation (h) of the typo reducer with the higher citric acid content is best. This may require from five to as much as twenty minutes to remove the stain, depending upon the intensity. It is best to leave the last traces of the stain, however, provided it is uniform, or loss of shadow detail may occur.

As far as the keeping properties of these new hypo reducers are concerned, the addition of the citric acid to the fixing bath slowly causes sulfurization of the hypo. The time of this sulfurization varies with the quantity of the citric acid employed and with the temperature. As a result, the safe keeping time may vary from as little as two days with active variations to four weeks or more. Reducers compounded from Kodafix Solution, however, have the greatest stability and have not precipitated in storage periods of eight weeks.

The action of these hypo reducers is very straightforward and few precautions are required. Reduction may be carried out in daylight and he followed readily since the solutions are not colored. Strong agitation is not particularly important, except as it affects the time required.

As far as the use of the reducers is concerned, the only appreciable inconvenience is the odor of the sulfur dioxide evolved particularly in the case of the most acid variations. Sulfur dioxide is evolved from all acid fixing baths, but in this case the quantities are unusually intense. The gas is unpleasant, and toxic in high concentration, but the penetrating quality of the odor makes the breathing of large quantities improbable. Sulfur dioxide can also affect sensitized materials. Reduction should, therefore, be carried out in a well-ventilated room and away from sensitized materials. Deep vessels, such as tanks, beakers, and cylinders will give off less gas than shallow layers in trays. This reducer will, like other fixing haths, attack ordinary stainless steel (Types 302 or 304) on prolonged contact, particularly in the vapor phase.

Practical Recommendations

While any of the alternative baths shown in Table I are suitable, preference is given to Formula No. 1 employing Kodafix Solution, because of the simplicity of mixing and the stability of the resulting reducers.

(a) NORMAL REDUCER

(For use in removing silver stains and dichroic fog and for reduction of papers and fine-grain films.)

	Avoirdupois	
	U.S. Liquid	Metric
Kodafix Solution (stock)	10 fl. oz.	300 cc.
Water	20 fl. oz.	600 cc.
Kodak Citric Acid	$\frac{1}{2}$ oz.	15 grams
(b)	STRONG REDUCER	
(For reduction of n	egative materials.)	
	Avoirdupois	
	U.S. Liquid	Metric
Kodafix Solution (stock)	10 fl. oz.	300 cc.
Water	20 fl. oz.	600 grams

The following general procedures are recommended and should be followed for the best results:

1 oz.

30 grams

.

Work in a well-ventilated room away from sensitized materials. Clean the negative or print, freeing it from grease with Kodak Film Cleaner if it has received much handling. The film may be pre-wet (for example, in Kodak Photo-Flo Solution, diluted 1:200) to ensure uniformity, or, if the reducing action is to be slow, the film is immersed directly in the reducer.

Removal of Silver Stains and Dichroic Fog. or print in the tray and swah locally with absorber cotton to hasten removal of surface scum. The action is usually complete in 2 to 5 minutes. Remove the film or print from the tray immediately, if any reduction of shadow detail is noted. Wash thoroughly and dry.

(2) Reduction of Negatives.

Use variation (b), especially if considerable reduction is required. Agitate occasionally, observing the progress of reduction. A guide as to the degree of reduction is given in Table IV for several materials. A reduction of 20 percent will correspond to a change of about 1 grade of printing paper. Wash well following reduction.

(3) Reduction of Prints and Fine-Grain Negative Materials. This reducer is particularly useful for slight overexposures or overdevelopment but strong reduction may result in loss of image quality, particularly with prints. Use variation (a), pre-wet, and remove from the reducer after 1 to 5 minutes. Wash well.

Don't Be A Sphinx, Sell PSA!

By Alfred C. Schwartz, Chairman, N. Y. Convention Membership Committee.

After 5000 years the Sphinx still stands as one of the original Seven Great Wonders, a monument to the fact that creations wellconceived are half-sold. A week behind the Membership Desk at the recent convention convinces one that PSA, like the Sphinx is well-conceived and half-sold. The other half of the selling job is still to be done.

PSA JOURNAL and a small proportion of PSA'ers have carried the load as the task force which has created PSA and constructed a membership of which we may well be proud. However, much of their gospel reaches PSA members. We have not completed the job of piercing the line of ennui and disinterest surrounding that great mass of camerists who are not yet enjoying PSA.

This is an operation that can be successful if all PSA'ers join the attack. To await requests for information on PSA membership is to wage a defensive action. We must go forth and aggressively beard non-members wherever we encounter them and preach PSA. We must be prepared to answer the inevitable question: What do I get out of PSA? We must not stop after telling them about our JOURNAL. We must convey the scope and activities of our organization; our portfolios, contests, criticism services, lecturers, conventions, regional meetings, etc.

We must communicate to all camera enthusiasts the impact and dynamism of our seven great divisions. We must eschew the traditional silence of the Sphinx, As an individual you can talk PSA to camerists and photographic assemblies. You can hand your outdated copies of the Journal to prospective members.

Here is the nub and substance of a plan which has great potentialities. Practically every photographic judge and lecturer is a member of PSA. They represent the finest PSA selling force possible. Let them be armed with literature, application blanks and information, and have them devote only five minutes of each appearance before a camera group, to a discussion of PSA. Thus, repeatedly, camera organizations will hear the story of PSA from reputable and respected people of our world. This is a powerful approach built around the fact that no other means of communication has ever exceeded the personal one.

We of the Convention Membership Committee have tried it, and we believe in its atomic force. Among our pre-convention activities was an arrangement with 20 of the popular judges and lecturers operating in our community, who talked up the PSA Convention and membership before clubs in Connecticut, New Jersey and New York.

It required no special visits. We asked only that they talk PSA for a few minutes whenever they had any occasion to visit a camera group or class. It is simple, costs nothing, and is effective. We need the cooperation of these photographic leaders, who are in the main, loyal PSA'ers.

Let's not be Sphinxes; but let us join the crusade to carry the joys of PSA to every camera club and enthusiast we can reach. If membership is valuable to you, it must be valuable to your brother photographers.

Kodak Citric Acid

All about Great Miniatures

(Including the brand-new Kodak Retinette Camera)

Here's Kodak's newest—the Retinette Camera. Look at it! It has the unmistakable Continental style, plus obviously beautiful workmanship. Heft it! It's heavy enough for steady handheld shots, light enough to ride on a strap over your shoulder all day and make you happy to have it along.

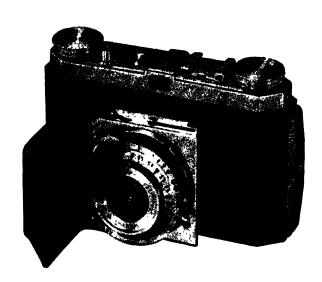

You'll like the fact that the settings are easy to see and adjust . . . controls handily grouped. Good camera for sports

coverage!

A fine Schneider Reomar f/4.5 Lens, a wide range of shutter speeds—from one second to one three-hundredth of a second, including delayed action—add to its picture-taking versatility. It also has accurate built-in synchronization for M and F flash

lamps and electronic flash equipment.

It's a really durable travelling companion. The body of the Retinette is made of die-cast aluminum alloy covered with pin-grain leather. A coupled film advance provides automatic film stop, counter, and double-exposure prevention. Plunger-type body shutter release also adds to picture-taking steadiness. Use Kodak 135 film—20- or 36-exposure magazines—black-and-white or Kodachrome. The price . . . \$59.50.

Kodak Retina IIa Camera. A top-quality precision miniature. Beautiful, too. It gives you a fast Schneider Retina Xenon f/2.0 Lens that doubles your color picture opportunities. It gives you fast action in color or lets you work easily in subdued light.

It gives you a film advance lever for fast action, for sequence shots, or to take advantage of fleeting picture opportunities. A flick of the thumb advances the film and positions it, re-sets the exposure counter, cocks the shutter and the synchronizer, leaves you ready for the next shot.

It gives you a combined range finder and

view finder for greater picture-taking convenience.

It gives you a new 1/500 Synchro-Compur shutter, providing nine speeds from 1 to 1/500 second and with built-in flash synchronization for Class M or F lamps or for electronic flash equipment.

As rugged as they come, the Retina IIa is built of die-cast aluminum alloy with pin-grain leather covering. Closes when not in use so that cover protects lens and shutter. Takes Kodak 135 film—black-and-white or Kodachrome—20-or 36-exposure. Price. \$164.10.

Kodak Signet 35 Camera. Why should camera connoisseurs be so amazed at the Signet's unexcelled performance—the sharpness, brilliance, and quality it delivers? After all, that's what you expect from a Kodak Ektar f/3.5 Lumenized Lens, in a truly superb shutter, on the best focusing mount ever designed.

The amazing thing is not the Signet's topquality performance, but its budget-low price -less than \$100 for a true precision miniature!

Kodak Ektar lenses, as you well know, are unsurpassed. The Signet's Kodak Synchro 300 Shutter lives up to Ektar quality—gives you uniform release rate, a quick opening-closing rate for maximum efficiency, and reliable syn-

chronization for all Class M lamps up to 1/300 second.

And that Signet lens mount! It rides on 50 ball bearings, for exact alignment and perfect smoothness... and the focusing helix is held to a lateral play of .001-inch or less!

That precision of detail is maintained all through the Signet—through the convenient combined range-and-view finder, the film transport that's so smooth you advance film with a flick of the thumb, the other features that make your Signet a joy to use. Accepts No. 135 Kodak black-and-white and Kodachrome Film, 20- or 36-exposure. Only \$92.50.

Kodak Pony 135 Camera. Here's a thrifty teammate for any beginner's photographic ambitions, and an ideal "second camera" for the expert.

You'll like the simplicity of its modern design, matched by its simplicity of operation.

You'll like the sharp, clear pictures—blackand-white or color—provided by the Kodak Anaston f/4.5 Lumenized Lens. You'll also like the Kodak Flash 200 Shutter with built-in synchronization, the body shutter release, simplified exposure settings marked in red, and automatic film stop and counter. Takes Kodak 135 Film, black-and-white or Kodachrome—20-or 36-exposure. Price, \$35.75. Kodak Pony 828 Camera is similar in design; takes 8-exposure Kodak 828 Film, black-and-white, Kodachrome, and Kodacolor. Price, \$31.15.

...and KODAK Flash Equipment

Flexible, Reliable, Handsome, and Economical

KODAK EKTALUX FLASH EQUIPMENT

Here's real professional flash—for single-lamp shots, on the camera, or off... for multiple-lamp set-ups... for long extension flash work... for remote control... for trim compactness and pleasant portability... and, above all, for reliable response every time you press the button!

The Kodak Ektalux Flasholder is a high-energy, battery-condenser unit. One tiny battery, 22½ volts, powers one to three lamps; two batteries, tucked away in that firm "saw-grip" handle, will kick off seven lamps, spread out over 120 feet of extension cable. Batteries last over a year—thousands of flashes—and the dependable Ektalux condenser circuit assures accurate timing right up to the limit of battery life.

The Kodak Ektalux Flasholder works directly with any shutter that has built-in flash contacts; with Standard Bracket and 15-inch payonet-connector cord, it is \$29.75. Kodak Ektalux Extension Units (at left), complete with 20-foot cord, \$12.40. For non-flash shutters, Kodak Ektalux Solenoid, \$15.40, and Kodak Ektalux Synchro-Switch, \$6.20.

KODAK STANDARD FLASHOLDER

Here is dependable flash for any internally synchronized camera at a new low price.

NEW design—Sturdy plastic battery case is designed for holding; shaped to provide a secure comfortable grip, to add a note of smartness. **NEW** bracket of the U-beam type is unusually

strong and well made, tapped for either rightor left-hand use, and adaptable to any camera with a tripod socket. Rubber gripping cushion holds camera securely, prevents marring, is inlaid in bracket and riveted in place.

NEW mounting between flasholder and bracket permits quick and easy removal of flasholder for off-camera lighting. Support on bracket is toothed with matching teeth on flasholder screw attachment so that flasholder can be angled to match any camera or taking distance, and locked securely in place.

NEW rugged socket accepts lamps easily and holds them.

NEW heavy-duty ejector spring kicks out used lamps at a touch of the ejector button.

NEW "self-shorting" extension input . . . no need to bother with "shorting plugs."

NEW low price, \$8.25.

Takes two standard "C" batteries or Kodak B-C Flashpack. Has exposure decal on reflector, keeping all exposure data right where it's most convenient.

Kodak B-C Flashpack converts the Kodak Standard Flasholder—or any flasholder which takes two standard "C" cells—to a modern, high-energy battery-condenser outfit. Peak energy is delivered every time throughout battery life; no gradual weakening, no lagging of ignition

from weak batteries. Provides sufficient power to fire several extension units at the same time. Takes one 22½-volt battery. Complete unit with battery inserted slides into your passent flasholder; no alterations needed. Price, without battery, only \$2.95.

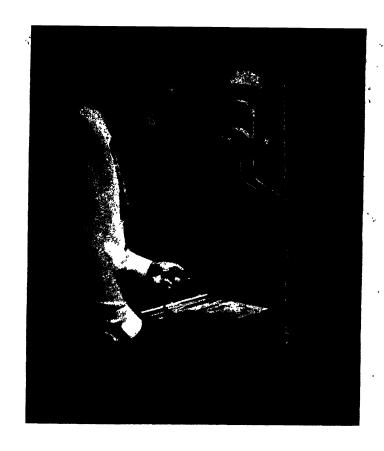

Prices include Federal Tax where applicable and are subject to change without notice.

EASTMAN KODAK COMPANY, Rochester 4, N. Y.

GIVE YOUR DARKROOM A NEW LEASE ON LIFE WITH

Kodak Darkroom Equipment

This is the season when you can really begin to enjoy your darkroom. But this season or any season, you'll heighten that enjoyment with these Kodak Darkroom Aids.

KODAK FLUROLITE ENLARGER

First and foremost on any schedule of darkroom purchases is an enlarger, and the first-choice enlarger on anyone's list should be the Kodak Flurolite Enlarger. For this is the enlarger which, since it was introduced, has set new standards of darkroom performance. Instant starting cold light. Circline fluorescent lamp, in "integrating sphere" lamphouse, provides cool illumination of high actinic quality and excellent visual contrastgives you easy focusing, ample printing speed, and proper printing contrast; minimizes negative grain, dust, and minor scratches, and climinates risk of heat damage to valuable negatives.

Perspective correction, or deliberate distortion, is easy in any plane with the rotating negative carriers and tilting negative platform. High stability and freedom from vibration are assured by the extra-large, rigid steel pillar.

Ample paper storage space is provided in the light-tight all-steel cabinet base, which also provides rigid double support for the enlarger column.

Convenience and speed of operation are enhanced by the two velvet-smooth hand controls which permit simultaneous elevation and focusing.

Versatility is provided by the long bellows draw, permitting use of lenses of various focal lengths and wide choice of negative carriers in seven sizes up to 2½ x 3½ inches. With accessories, enlarger also doubles as a view, copying, slide-making camera, and cine-titler.

Price, with one Kodak Glassless Negative Carrier, lamp, and 2-inch filter holder, without lens or lens board, \$99.50.

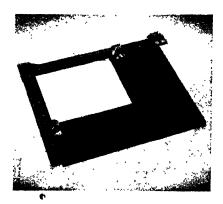

To complete your enlarger set-up you will want an enlarging lens and a masking easel. Kodak offers you a wide choice of Kodak

Enlarging Ektar Lenses and Kodak Enlarging Ektanon Lenses. Matched to your enlarger and to your exact requirements, they are available in 2-inch, 3-inch, and 4-inch focal lengths, priced from \$14.00 to \$49.90. For the very finest work, both in color and in blackand-white, and to bring out the full capabilities of your Flurolite enlarger, you will want the Ektar lenses, the finest ob-

tainable anywhere. Both Ektar and Ektanon lenses are Lumenized.

When you start working with your enlarger, you will want a Kodak Masking Easel, 11 x 14, to hold the paper in position. Actually, the Kodak Masking

Easel does far more than that. For use with any vertical enlarger, it handles papers up to 11 x 14 inches and can be adjusted for from ¼- to ¾-inch margins. Paper insertion is casy, sure, and quick because of the specially designed back guide which holds the paper down while it is positioned against the side guide. Masking arms have wide base with spring clamp handles, giving rapid, sure adjustment; they keep things completely on the square. A stand arm holds the mask off the board while paper is being inserted. Warp-proof base with non-slipping felt bottom. Price, \$9.60.

Light to work by is most conveniently provided by the new Kodak Two-Way Safelight Lamp. Here is a safelight as versatile as they come. Triangular in shape, it is

equipped with a filter on one side and a metal plate on the other. Both can be easily and quickly removed to change filters or to insert filters on both sides for more light. Connect it with an extension cord and set it on a table or bench handy to your work, or insert it directly in a socket in the conventional manner for wall or overhead lighting. An added advantage—the unit can be completely rotated in the socket, to aim the light exactly where you want it, in the concentration you want. Price, \$4.50—complete with one filter and 15-watt lamp.

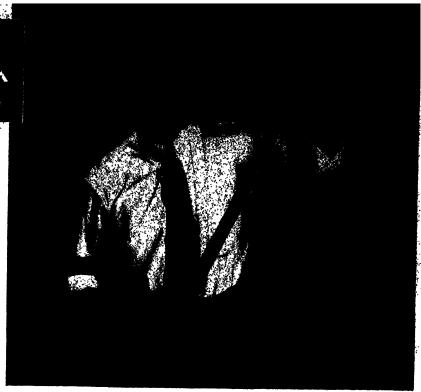

Beginner or professional, you will be interested in the new book, "Bigger and Better, the Book of Enlarging," by Don Nibbelink, FRPS, APSA. Here is an accurate, compre-

hensive, clear, concise, and up-to-date guide on enlarging, from simple print making to advanced control processes.

This book tells everything that goes into the final print—negatives, papers, solutions, the darkroom . . . and you. It helps you analyze your work from artistic and technical viewpoints. It gives detailed step-by-step instructions for making good pictures better. For the first time, it also describes the new control process, monochrome-dye printing. Eighteen chapters with more than 100 illustrations make this the complete book on enlarging. Price, \$2.95.

When planning and equipping your darkroom see your Kodak dealer.

MATCH PAPER AND NEGATIVE PERFECTLY.

with Kodak Medalist Paper

Kodak Medalist Paper is more than a fine exhibition medium. It is a new kind of photographic paper—a unique and winning combination of high speed, uniform speed in all contrast grades, fine tonal quality, broad adaptability to toning, and flexibility in contrast control.

Medalist's flexibility offers a new key to print quality. It enables you to match paper and negative so perfectly that print quality need never be compromised. All Medalist grades, I through 4, can be manipulated up or down the contrast scale to meet adjoining grades . . . giving you, in effect, an infinite series of grades.

Furthermore, merely by adjustment of the exposure-development ratio, you can choose freely between soft, normal, and brilliant prints from the same negative—without risking muddiness, fog, or shifts in image tone.

Medalist on direct development yields rich, clear, warm blacks—just a hint warmer than the true neutral blacks of Kodabromide Paper. In Kodak Brown Toner, Medalist tones to a beautiful warm brown. In Kodak Selenium Toner, it yields rich, deep browns. In Kodak Blue Toner, it acquires gray-blue tones.

Several popular surfaces — including glossy F, fine-grained lustre G, and sparkling high-lustre J—and printing grades Nos. 1 through 4.

And it's a high-speed paper, with the same effective printing speed for all four contrast grades.

In brief, it is the most remarkable photographic paper in many years. If you are seeking a finer medium for your work—if you have not yet discovered what Kodak Medalist Paper can do for you—your Kodak dealer is the man to see. See him today.

Prices include Federal Tax where applicable and are subject to change without notice.

EASTMAN KODAK COMPANY Rochester 4, N. Y.

Pictorial DIGEST Division

Devoted to News of the Pictorial Division of the Photographic Society of America

VIEWS AND REVIEWS

BY THE DIGEST EDITOR

The Convention In Retrospect

The New York Convention is now history—and all who were there agreed that it made pleasant history. The exceptional programs developed for the Pictorial Division by Doris Martha Weber made all of us proud.

As I remember the outstanding parts of this New York Convention—the programs were fine—they always are. There is a stimulation and continued challenge to know a little more this year than you did last year about this fascinating subject of photography.

There were social get-togethers too. Look at the number of photographers who hauled their equipment aboard the boat which took us on that interesting and instructive trip around Manhattan Island. Shutters clicked and movie cameras buzzed all around us. Cameras were compared, flash bulbs put man-made sun in the darker corners. Cameras turned toward Manhattan's towers and chasms—and the lovely curves of the models aboard. And everyone had a good time.

Those attending had a chance to express themselves. A Members' Meeting and audience participation in all programs gave everyone a chance to have his say or to have the experts give him an opinion. And if attendance at some of the programs indicates interest in pictorialism—there is plenty. For several programs overflowed their rooms and the interested audience sat on the floor in the aisles.

And the climax to the meetings came at the annual banquet and presentation of the awards. Those of us who attended had the rare privilege of glimpsing briefly into the future of PSA and seeing revealed there the outline of a project which will permit us—as amateur photographers — to interpret America to the rest of the world.

PSA is on the threshold of becoming more than a group of photographers seeking only photographic knowledge...PSA is entering its maturity as an ambassador of a wider truth—as an interpreter of liberty and freedom—as a vital factor in world peace and understanding.

These may be just so many words to many of you—but remember them—they are a prophecy, for Captain Mackay's talk at the banquet was prophetic of the things that are to come.

And after two or three or four days of being together at our annual convention—there comes the hardest thing—that of bidding goodbye to friends. For the thing that makes our PSA Conventions worth attending isn't the programs nor the social events, although they play a large part. No, the central core, the heart of a PSA Convention is FRIENDSHIP.

For PSA friendship is a heady distillate

The newly elected P-D officers were introduced Friday night. They are, left to right, Ray Miess, APSA, Chairman, Norris Harkness, APSA, President of PSA, Stella Jenks, APSA, Secretary, and Loren Root, APSA, Vice-Chairman. Robert Lauer, Treasurer, was unable to attend.

of love and respect and mutual interests. Those who have tasted the friendship in PSA are forever lost—they must return again and again to drink of it—and the thirst grows stronger the longer they partake.

But it is not a selfish thirst—it reaches out and ennobles all with whom it comes in contact. Through the growing friendships, more and more people know the true delight of convention attendance—know how warm and enduring friendships started there can become.

Leave taking is poignant—among friends it always is. We have been together for several too-short days—and suddenly it is time again to go our separate ways. But the inspiration of the programs—the opportunity to know each other better during these few short days—the deepening of our bonds of friendship—these sustain us in our leave taking. For we know that if the Great Master of us all is willing another year will soon roll by and we can be together again.

Yes, the New York Convention is over and already preparations are being made for next year—and the by-words now are "see you in Los Angeles next year."

---Stella Jenks

C. "JERRY" DERBES, Director

The Salon Workshop is off to a terrific start. A number of groups have already been started, applications are coming in

strong and new groups are being formed right along.

Additional incentive has been provided by two of our Masters, Mr. Wellington Lee, APSA, and Mr. J. M. Endres, APSA. These well known exhibitors have offered their group winners more than the standard reward, that is the autographed Salon Print, for making the best print of their group. Mr. Lee has offered a medal as a first award and four honorable mention ribbons.

Mr. Endres has offered "The Endres Award", a very beautiful plaque made of hammered brass mounted on a mahogany base. He has, in the past, offered this award to members of his camera club who hung their first print in an International Salon. Now he has extended it to the person who makes the best print in his Salon Workshop group.

Participating in the salon workshop is fun for both the Master and the inexperienced worker. Groups of 15 persons each are formed containing people with about the same experience. In the first circuit box is a real salon negative made by a well known salon exhibitor. The box also contains a printed article titled "How to Make a Salon Print". This article, written by one of the foremost Salon Exhibitors of all times, is in itself well worth the service charge. Anyone willing to follow the clear cut rules given in this article should, with a little practice, be able to make prints from their own negatives which will hang in the International Salons.

To begin with you will receive a very fine salon negative from which you will be required to make an 11" x 14" print. You can crop the print in any way you care to. You can tone it or not, depending on how you think it would look better.

Also included in the negative box and the print box is a small notebook in which the Master of your group has given a full account of his photographic background and included a picture of himself. You in turn are to do likewise, giving any information about yourself you care to and each of you will be expected to also include a small picture of yourself. It's fun to meet your fellow members through the notebook.

Later, when the negative has completed the fire round, everyone will receive all of the fifteen prints made by each member of his group, plus a print of like size made by the Master. He will then be able to compare his print with that of the others and the Master's print. Five days time will be allowed each member to inspect these prints. There will be times when the prints will arrive near your camera club meeting date and you might want to take them down to show them to the gals and guys at your meeting. Do not, however, delay the circuit beyond your five days allotted time. Remember, the member next on your list is anxiously awaiting the arrival of the prints and the others down the line are doing likewise.

The cost of mailing both the negative box and the print box is very small since they will weigh very little. The Salon Workshop is operated on a yearly basis and each member will be able to work with at least two negatives from two different Masters in a year's time for the one dollar service charge.

The Salon Workshop is fun for the Master too. The well known Salon Exhibitor who is interested in helping the less experienced worker will derive great pleasure in seeing the results of his effort and how each member interprets his negative and prints from it. If you are a One Star Exhibitor or better and would like to become one of the Masters of a group we would like to hear from you.

Members of the Pictorial Division wishing to join one of the groups are urged to write the Director, whose name and address appears in the mast head, for application blank and detailed information.

A. LYNNE PASCHALL, Associate Editor

The Convention

Many of the directors were at the National Convention in August, and they all look hale and hearty. It is wonderful what a meeting like that can do to a man's morale.

One morning when I went down to the Coffee Shop, Jake Endres gave me the high sign and we had breakfast together. We had a pleasant little chat and one of the first things Jake asked about was a picture that I had laid aside a year or two ago. "It had the makings of a salon print," he said, "I hope you haven't given up on it yet."

I had little to say in self defense because I realized that I had been negligent, but I have often thought since: In what other organization could such an incident have happened? How many men as busy and important as Mr. Endres would have taken time out to pick up a lagging member and give him a push in the right direction?

Camera Club Judging Service

Fred Bauer, the director of this activity, gave me a friendly pat on the shoulder, one evening when we were going up in the elevator at the New Yorker, and I wished that he had been with me at some of the sessions where the judging problem was discussed by camera club officers. It is a subject that worries them all. There is nothing we can say here about PSA Service that would be more convincing than this message from a satisfied customer. We quote from a letter that Fred received recently from the Ashville Photographic Society:

'I would like to add that we feel this Camera Club Judging Service in itself is worth more than the cost of a membership.

"I have long recognized that I have personally been neglecting to take advantage of my membership, mostly for the lack of time; and I have also recognized that the Club has been neglecting its privileges and this proves it." How about you? Has your club been paying for something that you have failed to get for them?

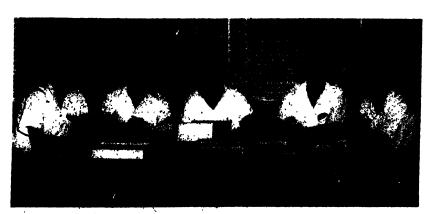

Mr. Bauer says: "We have added a new feature at some of our judging points. Where equipment is available our judges will make tape recordings of their comments on the prints sent in for judging. These records can be played back at the meetings when the prints are returned, and the clubs that have used this method report back most enthusiastically."

Recorded Lectures

A new recorded lecture has been added to the list. This talk is by J. Elwood Armstrong and is based on a hundred pictures selected from the PSA Permanent Print Collection. It will be No. 6 on our reper-

Some of the pictures are quite well known in photographic circles and are the work of people of world renown, such as: Ansel Adams, Cecil Atwater, E. C. Crossett, Adolph Fassbender, Frank Fraprie, Nicholas Haz, John R. Hogan, Yousef Karsh, P. H. Oelman, and Max Thorek, to name only a few.

This talk has been translated into Spanish for Latin American distribution, and in time some of the other talks may be translated, for there is an urgent demand for them.

Getting out applications and routing the first groups of the Salon Workshop are, left to right, PSAers C. L. Anderson, J. M. Endres, APSA, C. "Jerry" Derbes, Director, Walter J. Bone, Jr., and T. G. James, all of Jackson, Mississippi.

ORGANIZATION John R. Hogan, Hon. PSA, YPSA. Direct 1528 Walaut Street, Philadelphia 2, Ponus. Some new lectures are also planned, but it is too early to announce any of them yet.

If your club has access to a tape recorder, write to Philip Maples, Brockport, N. Y. for particulars. Be sure to tell him what dates you have open, as well as the name of the recorded program in which you are interested.

The West Coast distributor is Mrs. Vella L. Finne, 1827 E. Fourth St., Long Beach 12. California.

The distributor for Canada is Mr. Frank L. Pogue, 810 Duplex Ave., Toronto, Ontario. Canada.

I may add that your letter to Phil will likely be answered by his charming wife, Jessie. She was the last person to whom I talked at the PSA Convention and my B & O Coach was called before I could finish the conversation. There wasn't even time to tell her that she misplaced a comma in a letter to me last winter.

American Exhibits

Two new shows are now ready for scheduling. One is an excellent pictorial exhibit from the Omaha Camera Club and the other is an equally fine set from the Syracuse Camera Club. In addition, the Standard Oil Company Documentary Exhibit is again open for scheduling and has some open dates during the fall months.

Other exhibits are pretty well booked up through December so that clubs desiring one or more of them for January or later should write to Fred Fix as soon as possible.

Portfolio of Portfolios

Under the able direction of James T. Johnson, this activity has been a very busy one during the past few months.

As you know, a Portfolio of Portfolios is a collection of prints that have traveled in international portfolios. The individual prints are not large (say 5" x 7" on the average) but the mounts are all of uniform salon size (16" x 20") and each one contains as many pictures as can be conveniently grouped on a card of this size. They make ideal pin-up displays for club meeting rooms.

Nine new sets have recently been added, giving a lot of new material, and the exhibits have all been travelling, some even to far-off Hawaii. More than nine hundred people have viewed them and expressed their satisfaction.

Among the places that have had sets may be listed the following:

Brooks Institute of Photography, Santa Barbara, Calif.
Santa Maria Camera Club, California
Batou Rouge Camera Club, Louisiana
Bayou County Camera Club, Louisiana
Tejon Camera Club, Bakersfield, Calif.
Standard Oil Co. Camera Club, Sant Francisco
Lake Charles Camera Club, Louisiana
Channel City Camera Club, Santa Barbara, Calif.
Oznard Camera Club, California
Kahuiut Camera Club, Hawaii
Seven Hilla Camera Club, California
San Luis Obispo Camera Club, California
San Luis Obispo Camera Club, California
Lahahuj Camera Club, California
Lahahuj Camera Club, Hawaii
Lincoln, Nebraska
Boise, Idabo.

Mr. Johnson will be pleased to hear from any PSA club that is interested. He has recently purchased a new home in Santa Barbara, so be sure to send your correspondence to the new address as shown in the masthead.

Portfolian Clubs

We were very sorry that Sten Anderson, the director of this activity, was unable to be at the New York Convention, but he has been very busy out at Lincoln, Nebraska, and tells us that the Portfolian idea is gaining right along.

Oklahoma reports: "The Bartlesville Portfolian Exhibit is over and our club feels it was a worthwhile project. There were over 45 prints displayed in a public place and they attracted a great deal of attention during the two-weeks period. At the close of the show we photographed each picture in order to have a record for our files. A poster was prepared and displayed along with the exhibit, giving the names of the contributors and where they were from." From Berkeley, California: "Things mov-

From Berkeley, California: "Things moving nicely in the 'Eager Beavers'. Boris Dobro (Sponsor) couldn't get up here for a week of cramming, so we organized a class on The Negative, by Minor White, which has just completed six weekly meetings, with projects or home work. Jim Johnson of Santa Barbara was up here and we had an informal gathering with him."

If you know four or more members of PSA and the Pictorial Division, and wish to form a Portfolian Club, write to Sten Anderson for his latest circular. No fee is charged.

Although Sten couldn't get to the Convention, some of his staunch Portfolian Club members did get there. When we started out from the New Yorker for the boat ride, it was Frank Heller of the Bartlesville, Oklahoma, Club who took charge and got four of us into a cab in short order. I can see why he is so well thought of around the Y. at Springfield, Ohio, where I also have many friends.

Camera Club Print Circuits

Our old stand-by for last minute scheduling is the Print Circuit. There is always a new one in the making.

The prints in these circuits are not made by nation-wide celebrities but are the work of average camera club members like you and me. Such shows are a great help and encouragement to beginners and are enjoyed by the most expert exhibitors. If your club wishes to know how it measures up with other clubs across the country, by all means join a Print Circuit.

Only three prints are required from your club, but there will be a total of twenty-four in the circuit.

After a number of years of faithful work, our old friend, William R. Hutchinson has found it necessary to give up this work, so now address your letters to George J. Munz, whose address appears in the masthead.

Instruction Print Sets

And now we have something for the small PSA clubs, especially those whose geographical location makes it difficult for the members to attend national conventions, to view leading salons, or be present at judgings.

The Instruction Print Sets are intended to bring the highest type of salon work to these clubs. The sets that are sent out are one-man shows and each is accompanied by a discussion such as a panel of judges might make.

. We have had collections of fine pictures before, but had to depend upon the criticicisms of the club's own members, who we all think are prejudiced in their views. With these prints, we have the comments of topranking salon judges. It is interesting to learn what the leading experts think of this picture and that, and such knowledge may enable us to see why our own work doesn't get recognition beyond the local club.

The director of this new activity is Dr. John S. Anderson, First National Bank Building, Grand Island, Nebraska, and we suggest that you write him for further information.

INTERNATIONAL CLUB PRINT COMPETITION

ROBERT J. LAUER, Associate Editor

October 20 is closing date for the first International Club Print Competition of the 1952-53 season. Baltimore CC will handle the judging. Judges for first round are A. Aubrey Bodine, FPSA, Mark Mooney, APSA and Edward L. Bafford, APSA.

Send your club's four top prints right away to Baltimore CC, 601 W. North Ave., Baltimore, Md. Entry blanks and information from Dr. Grant Haist, 166 Valley Crest Rd., Rochester 16, N. Y.

Introducing A New Director

Taking over as new director of the International Club Print Competition is Grant M. Haist of Kodak Camera Club, Rochester, New York. Grant is active in photography, both as a vocation and as a hobby. He finished his education at Michigan State College, receiving his Doctor's degree in Physical Chemistry in 1949. Since then he has been a member of the Photographic Chemistry Department of the Research Laboratories of Eastman Kodak Company.

Active in Club work, Grant has served on the pictorial committees of the Kodak and Rochester International Photographic Exhibitions, and has just completed one year as chairman of the Monochrome Section of the Kodak Camera Club.

AN INVITATION

This is an invitation to every PSA member to participate in the PSA American Portfolios.

Enrollments are now being received in the following specialized groups:

PSA Pictorial Portfolios
PSA Portrait Portfolios
PSA Miniature Portfolios
PSA Control Process Portfolios
PSA Star Exhibitor Portfolios
(For PSA Award of Morit Winners)
PSA Nature Portfolios
PSA Photo-Journalium Portfolios

For information concerning any of the foregoing activities and for enrollment blanks, write to the Director of the PSA American Portfolios, Eldridge R. Christhilf, Hon. PSA, APSA, Suite 406, 800 Davis Street, Evanston, Illinois. When asked to give a thumbnail sketch of his photographic background, Grant said that this was a little tough to do, but with a little probing here is what we were able to find out: As with many serious amateurs his "photographic life" dates from the time he won a 35mm camera in a newspaper contest. He maintains that the exclusive use of color film to take snapshots taught him to carefully consider each exposure before taking it. From there he worked up to a 4 x 5 Super D Graflex for serious black and white work.

Exhibition photography looked interesting and enough acceptances and honor prints in International Exhibitions spurred his efforts in nature, pictorial, and documentary fields. Color slide exhibiting in nature and pictorial round out his photographic efforts. This year the Buffalo Nature group selected Grant M. Haist as one of the color jury for their International Nature Exhibition. He also served as a judge for the PSA Nature print competition.

As a director of this PSA activity Grant will have a good background to take care of all the planning which is necessary for a smooth running operation. From there on out, with a little imagination and with the interest and help of PSA Camera Clubs, the International Club Print Competition, we predict, will continue to grow and prosper.

STANLEY D. SOHL, Associate Editor

International Portfolios

With the New York Convention of 1952 a matter of history and the Los Angeles Convention of 1953 a pleasant anticipation, the International Portfolios found new life and new hope during this summer.

The Portfolio room on the fourth floor of the Hotel New Yorker was not only a meeting ground for the internationalists, but it truly emphasized the friendliness and mutual feeling of warm cooperation that exists among us. Although all phases of the several portfolio activities of Pictorial Division were on display, it was at the International Table where one found Mexico and Canada with their arms around the shoulders of China, discussing the beautiful work presented by the pictorialists of New Zealand and France! Kipling's admonition that "East is East and West is West, and ne'er the two shall meet" again was kicked into a cocked hat—as it usually is when the members of the International Portfolios assemble to discuss their common hobby.

Plans for the betterment of the International Portfolios were discussed and those problems which in the past have been bothersome seemed to vanish into thin air. More and better activity is in store for all internationalists, and encouraging announcements will be released in the very near future.

Our days of stagnation and doldrums are gone—the future is bright! Stay in there punching and watch the interest and activity perk up, but fast!

See you all again in Los Angeles in 53?

Comments Into Spanish

Col. Charles J. Perry, Director of the International Portfolios, has been working hard getting materials together and ready for translation into Spanish for our South American and Mexican members. The latest translation is done by Juan Garcia from Elwood Armstrong's, F.P.S.A., commentary on the One Hundred Pictures of the PSA Permanent Collection. This translation is then recorded on tape to be used by local clubs for their programs. It is now already in use in Mexico. This new service is good publicity for our International program and the PSA. In the near future Philip B. Maples will have some new English originals ready for translation.

Miess In Mexico

Ray Miess, APSA, the newly elected Chairman of the Pictorial Division, spent a week in Mexico City this spring. Actually a delegate to the Rotary International meetings, he was privileged to visit the beautiful Club Fotografico de Mexico as well as many places in the photogenic city.

In preparation for his trip, Ray had studied the Spanish language for over a year, and had succeeded in gaining a vocabulary approximately equal to that of a fourteen year old boy.

He was greeted at the airport by a delegation headed by Francisco Sobrino. In the group was the president of the Club Fotografico de Mexico, Sr. Jose Turu. ex-president, Manuel Ampudio, Arturo Vives, and Mario Sabate. Later he was honored by the Society and he responded with a short talk. During his stay in the capital he attended a number of meetings of various sections of the club.

He left Mexico with Turu and Sabate and he promised to aid the club with forms and circulars, relative to the approaching Salon International de Art Fotografico.

This information came from the "June lssue Bulletin" published by the Club Fotografico de Mexico.

MISS EVELYN ROBBINS, Associate Editor

Chirps From The Robbins

Were YOU at the PSA Convention, just finished, in New York?, I hope so for it was a grand one.

It was my great privilege and honor to spend quite a bit of time in the Portfolio Room, and there meet with a great many Portfolioists that I had not met before and to renew acquaintances with those I had. Of course, that isn't to mention the tremendous

thrill gotten out of talking with these who were quite new to the activity and convincing them that they really were missing semething BIG by not joining in this great organization of ours and becoming a part of italicant is the semething at least I hope I was sufficiently convincing, because if you haven't yet been "bitten" by the Portfolio bug, you just aren't quite in the swing of things.

Overheard conversations covered everything from the various merits and advantages of print finishes, such as varnish vs. wax, etc.; how to apply it and what the results should be to give the very best possible quality-the advantages and disadvantages of Portfolios that used a maximum of 11 x 14 prints—and the same controversy on the ones using exclusively 8 x 10 prints, and the comparison of one against the other in size. Discussions on the different papers, developers, toners, etc. Doesn't that sound familiar? Of course it does! isn't that the usual trend of the notebook entries in the Portfolios themselves? It was only natural, because after all, they were simply carrying on where they had left off in their own particular circles.

During the course of the conversations the following question was put to me, and I wonder now if perhaps there might not be others who have the same problem. "I'd like very much to belong to a Portfolio, but I've always felt that it was impossible because my address is constantly changing—it is one locale in the winter and another in the summer. Would there be any way I could join a Portfolio?"

Of COURSE you may join a Portfolio! Just keep your Portfolio Secretary informed at all times, giving him or her the address to which the Portfolio must be mailed at that particular point in its circuit, allowing ample time for the setting up of the schedule so that you will receive it promptly and at the proper address. There really isn't much of a trick to it, and certainly very little extra work involved. It does work, and works beautifully. I belong to one that works just exactly that way, and so far as I know, from the schedules, that Portfolio has yet to bog down a single time due to a delay on the part of the person who carries a different address in the summer than he does in the winter. If it is held up, it is due to some other reason, you can always place a very sure bet on that.

One point which was brought up in the Portfolio Members' Meeting that I think it might be well to discuss with your fellow Portfolio members was this. It was agreed that it would be an excellent idea to add to the Portfolios a section just for remade prints. The rest of it would remain the same. What do you think of the idea of carefully noting the comments on your print, and then doing it over according to those comments and putting it into the Portfolio again in this particular section, chiefly as a check for those that advised the changes, to see if you DID understand what help they had tried to give you. It's something that might well be discussed with your fellow Portfolio members, and if you agree that it would be good, then I'm sure that just that sort of thing can and will be put into use.

It is my sincere wish that more of you could attend those meetings in the Portfolio Room—truly, they are unbelievably wonderful. I was privileged to introduce

several members of Portfolios that had not met before, and then sit back and watch them. It was but a matter of a couple of minutes until they were chattering away as though they had known each other all their lives. It was nothing unusual to see them from then on at various programs together, either in twos, or even a larger group, if that particular Portfolio happened to have better than average representation present. That those particular Portfolios will really hum from now on would be my guess from experience.

Several met their Commentators for the first time. That is an experience beyond description. Will it suffice if I simply say, "Both wore grins from ear to ear"? And that is actually the story. It never failed to happen that in no time at all the Portfolio members were asking the Commentator's advice and help; and the Commentator would give it without hesitation and no matter how long and detailed an explanation it took. The loyalty to THEIR own particular Portfolio is tremendous, too, because before the conversation was ended the Portfolioist had been urged, and more than urged, to enter the Print of the Month Contest that John Hogan is so ably guiding, with the reminder that THEIR Portfolio just had to win the most points!

Yea, a visit to the Portfolio Room at a PSA Convention is a truly unforgettable event and one that I hope you may all experience soon. You'll find a warm hearty welcome there!

Tape Recorded Portfolios

By ELDRIDGE R. CHRISTHILF, Hon. PSA Director—PSA American Portfolios

The fact that a number of PSA members have tape recorders has brought a suggestion from Sam Levy, Harristown, Illinois, which we feel has considerable merit—Tape Recorded Pictorial Portfolios.

Briefly, and subject to change, the mechanics will be the same as those under which the PSA Pictorial Portfolios are operated, with the exception that all comments, criticisms, etc. will be via tape recordings instead of by writing. Each member will supply his own 5" roll of tape along with his prints, and all comments and criticisms on that particular print will be made on the member's tape, along with his technical data and any other information that he may wish to give about that print. As the Portfolio will contain no writing it will be able to travel by parcel post instead of Railway Express.

Do not send in your enrollments now—but if you do have a tape recorder, and wish to participate in such a Portofolio please let us know at once. Whether we inaugurate such a Portfolio will depend entirely upon the response that we receive to this initial announcement. It is hoped that the response will be sufficient to enable us to start several Circles in the near future.

Address all commounications in reference to this to:

E. R. Christhilf, Director PSA American Portfolios, Rooft 406-800 Davis Street, Evanston, Illininois

Meet Another Portfolio Member

The following was picked up by the alert secretary of Pictorial Portfolio #64, Miss

Susan Sherman, and I wonder just how many of us feel the same way. Let's see if you aren't in agreement. Grant Reed tells us of the three phases through which he passed since starting photography as follows:

"1st: A great awe, bordering on reverence of anyone or anything connected with a darkroom—and a fear that any step I might do wrong would absolutely ruin my whole picture. This I call my 'wonder phase'. Wonder why I ever got out of it?

"2nd: This phase I call my 'hot shot' phase. After a few rolls of film I began to notice that a little more or less, a little hotter or colder, a little lighter or darker, etc. etc. etc., didn't seem to make much difference—I still got an image. Nothing to this photography. Look, I'm a photographer—I make Pitchers!! Well, this phase persisted for quite some time. Then I began to compare my prints to others: 'Boy, what's the matter with you?' I says to myself, 'Why are these shots of yours not so good?' And that word 'why' has helped me no end. Which brings me to:

"3rd: The Renaissance: I 'awoke' to several facts:

- a. Exposure must be right.
- b. Film development must be right (including fixing, washing and drying).
- c. Print development must be right. (Don't stretch development or pull the print too soon.)
- d. Print finishing must be right. Drying, flattening, spotting, varnishing. etc.

"And if you don't believe real care and attention to details will improve the final result, just fill out the attached coupon, and I will send postpaid some prints made a short two years ago—you'll be convinced!"

"STAR DUST"

A monthly column devoted to the "Wit and Wisdom" of the Stars as taken from Note Books in the Star Exhibitor Portfolios.

By ROY E. LINDAHL, Gen. Sec'y Star Exhibitor Portfolios

This month's column is devoted to a letter from another member in Star Three who sets a high standard for his group with the following summary which he entitles CRITICISM.

"I intend this criticism to be constructive, but frankly, I was disappointed in Star Exhibitors Number Three. In fact, I might say that I was even disgusted with the general complexion of the prints in round one. In my opinion, only three prints out of the fifteen submitted are salon material. A fourth one is barely possible.

"On the basis of the 1950 Annual of Photography, I was correct in assuming that completed, technically correct salon prints was what one should expect from this group as that issue of the Annual shows an impressive salon record of twelve members in the last three years, namely an aggregate of 1.696 prints accepted and hung in various recognized salons. If the prints in round one are a sample of what was accepted and hung in those salons I certainly have little respect for the judgment of those juries. Some of these prints possibly can be made into real salon prints, but generally I feel that you will each have to agree that this is a very poor showing for fellows who have had the number of prints accepted and hung that you have. I know you have had prints rejected, as each of us have, and in my opinion this Star Exhibitors Portfolio should show only our best work.

"Most of you have no doubt attended the judging of several salons. You know how the three judges react to 2,000 or 3,000 prints that pass before them in the light box at the rate of one a minute and they vote in, hold or out. If sufficient 'Ins' are voted, your print hangs. If it is held it gets up for a second review, and it may hang or it may be ultimately out. None of us knows what the reaction of the judges will be to our print. We only know the actual result which was either 'In' or 'Out'.

"For this Portfolio I believe that we fifteen comprise a jury. Our vote is not in or out but in the notes on each print we will give our opinion as to why it is in or why it is out and what may be done about the print to make it one that other juries will vote in.

"This portfolio should be one that we can show to and discuss with our friends and before our clubs as an example of what is the best that can be produced. Technically it should be perfect. I showed this first round of fifteen prints to a small club here at the Federal Reserve Bank. The comments on quality and technique on most of these prints was something that I do not care to repeat, and honestly, these kids were right, for as a whole, these prints smell as compared to what should have been submitted in this first round.

"I know you fellows don't like this and would like to tell me where I get off, but what I am aiming at is this: Let's make this Portfolio what it is supposed to be-a reviewing clinic made up of salon exhibitors who know salon prints and who can be helpful to each other in making real constructive suggestions for improvements. Technically, we should all be tops. Our ideas as to what is a pictorial or salon picture may differ. That is to be expected; but, frankly, let's have Star Exhibitor Portfolio number Three made up of prints that sing and that will establish a reputation for this group that will be the envy of the members of the other portfolios."

F. L. PURRINGTON, Wheaton, Illinois

Highlights from the PORTRAIT PORTFOLIOS

FREDERIC CALVERT, Associate Editor

It is with regret, that I announce the resignation of Maurice H. Louis as Assistant Director of Portrait Portfolios. In his place, William H. Turner of Wallingford, Pa. will assume the duties as Assistant Director.

The 1952 Convention was well represented by many Portrait Portfolio members. Those who signed the registration book were: William H. Turner, Wallingford, Pa., Henry C. Radon, New York, Henry C. Sollman, Cobleskill, New York, Edna V. Tucker, Utica, New York, Arnold W. Wise, Albany, New York, Caryl R. Firth, Trappe, Md., Lyle M. Wilson, Roanoke Rapids, N. C., Henry O. Forrest West Englewood, N. J., J. G. Whetson, Youngstown, Ohio, H. L. Garrison, Westfield, N. J., Susan Sherman,

N. Y. C., Carl C. Shutt, Warren, Ohio, Belle McMullin, Lansing, Mich., Rietta Scofield, Waterbury 8, Conn., Stanley Vlattas, N. Y. C., Florence Jordy, Madison, N. J., C. Oliver Proctor, Washington, D. C., George Munz, Bergenfield, N. J., B. Kleban, Wilmington, Del., George Braun, Ridgefield, Conn., Louis Lehman, Trenton, N. J., Maurice H. Louis, N. Y. C., Herbert Jackson, Signal Mt., Tenn., Fernald S. Stickney. West Caldwell, N. J., W. F. Small, Newburgh, N. Y., Alfred Weber, Bridgeton, N. J., Gerald F. Greenridge, Brooklyn, N. Y., Catherine Dorr Whetson, Youngstown, Ohio.

Romance has blossomed in the Portfolios. Miss Catherine E. Dorr of Brooklyn, N. Y. met Mr. J. George Whetson of Youngstown, Ohio at the Baltimore Convention, became engaged at the Detroit Convention and were married in June of this year in time for the convention.

GEORGE GREEN, Associate Editor

I've come to the conclusion that it doesn't pay to plan too for in advance. I'm not diluting my "soup" with tears but I sure had planned on attending the Convention this year. But "Hypo" was ordered back to bed by the medics. So, instead of meeting all you grand PSAers and flapping the humid air with photographic chin-chin, I'm up to my elbows in suds and clothes which three active images can dirty quicker than you can dry a negative.

Although my skill with the skillet can in no manner equal "Hypo's" it nevertheless is nothing to be thrown to the dogs. Nevertheless the kids didn't eat as much nor with the zest that accompanies the better-half's platters. I had the technique but not the presentation! I tossed the food into the plate instead of making it attractive to their eyes so that their little atomachs would want to eat my cookery.

What has all this to do with Pictorialism? Well, like the proof of the cooking is in the cating, the test of the photographer is in the presentation.

Presentation requires technique. Technique calls for knowledge of both the tools and the subject matter.

Knowledge is divided into two categories: book (theory) and practical (working). Although it is best to acquire them in the above order it doesn't matter too greatly UNLESS you have taken on bad habits while attempting to do it first and read about it afterwards. Good, solid knowledge is based upon reading and learning first and then going out to put it to use.

Once you know what you're doing you must go one step further. You must learn how to apply this technique. You must begin to see what impressed you and then you must strive to capture that impression. After you've done that you have to create this impression all over again in order that

those who view your print will in turn see what caught your eye and warranted your taking and making the picture.

Like ham goes with eggs, knowledge goes with technique. You can have one without the other and do alright but it takes the combination of both plus the seasoning of impressions to bring acclaim.

We can't hold the camera for you or help in your darkroom processes but we can be of aid. P. D. is here to serve you. Tell us your problem and show us your prints and we'll carry the development from there,

Award of Merit

The following changes have been made in Star Exhibitor ratings since the last list was published:

New One Star Exhibitors

Nils Lindstrom, Ljungby, Sweden Alice Ingersheimer, Brookline, Mass. Dr. S. N. Sarkar, Calcutta, India Stanley D. Sohl, Lincoln, Nebr. C. Bronson Weed, Hamden, Conn. George J. Munz. Bergenfield, N. J. Claude Vivier, Roubaix, France Emile Descamps, Roubaix, France R. W. Beede, M.D., Youngstown, Ohio

New Two Star Exhibitors

W. Arthur Young, Webster, N. Y. John O. Hay, Cleveland, Ohio

Advanced from One to Two Star
A. E. Woolley, Baton Rouge, La.
Lawrence W. Spaven, Rochester, N. Y.
Howard A. Hartman, Chicago, 111.
Walter F. Wood, Montreal, Canada

New Three Star Exhibitor

Mrs. Ann-Marie Gripman, Gothenburg, Sweden

Advanced from Two to Three Star J. Wallace Galloway, Edmonton, Canada Glenn E. Dahlby, Oak Park, III. Charles N. Chambers, Calcutta, India John F. Barnes, San Jose, Calif. John I. Fish, Rochester, N. Y. Martin W. Lentz, Wichita, Kan. Blanche M. Lentz, Wichita, Kan. P. N. Mehra, Allahabad, India

Advanced from Three to Four Star Harry L. Waddle, APSA, Port Dover, Canada C. F. Luce, Jr., Atlanta, Ga. Newell Green, FPSA, Hartford, Conn.

If you feel you are eligible for the Star Exhibitor ratings, write to Glenn E. Dahlby, Director, for full information about the requirements for the various ratings.

Report of the Personalized Print Analysis Service

J. ELWOOD ARMSTRONG, FPSA Director

The Personalized Print Analysis Service has truly been such to the P.D. members of the P.S.A. Without discussing the fact that it is rendered free to members of the Pictorial Division it evidently is and has been of some value because during the past two years more than 500 prints have been individually analyzed, and a personal letter written by the director to each member sub-

mitting prints with helpful suggestions for the PSAer's guidance. Reproductions from Salon Catalogues have been returned with the analyzed prints to help members see how good photographs could be made with the same material.

A review of this prodigious number of analyzed prints brings two compelling needs to the fore; 1) a better understanding of picturization and composition and 2) a more definite approach to print quality.

Both of these shall be given treatment in the P.D. section of the Journal from time to time. Suffice it to state that the first four ratings of the Analysis are: Subject interest, originality and impact, emphasis on center of interest, and compositional design. Just look at some of your prints and see for yourself whether you have a picture, a print, or a snapshot. How can you tell? Just use the above as your guide. And we'll meet in the Journal sometime soon to see whether you see eye to eye with us.

Evidently, everyone is interested in making good and/or better photographs. How do we know? Hecause out of the vast number of prints received for analysis every state in the Union and distant parts of the world were represented.

Space prohibits publishing all of the letters of appreciation the Service has received. Perhaps this one will enable you to understand why we feel so proud of the work Mr. Armstrong has done and is doing.

W. C. Streib, 94 South St., Somerville, N. J., writes: "Your helpful criticisms of the prints forwarded to you last February were so valuable that one of our members, Mr. Lee Hedges, was able to win "best in show" with a revised print of one which he had submitted to you. Needless to say, both Hedges and I were delighted with the services you so ably and conscientiously gave. Your comments were fair and just and they were accepted with the full understanding that we have a lot to learn."

How about you? Do you have a lot to learn? If you do we offer the free service of the Personalized Print Analysis by J. Elwood Armstrong.

Coming Salons Agreeing to Follow PSA Recommendations

Note: M-monochrome prints, C-color prints, T-color transparencies, SS-stereo alides, L-monochrome alides, A-architectural prints, S-acleutific or nature prints. Entry fee is \$1.00 in each class unless otherwise specified. Recognition: The monochrome portions of salons listed have initial Piotorial Division approval. Check salon list of appropriate division for recognition of other sections. TOKYO (M, T) Exhibited during October and November at Tokyo and Osaka. Data: Katsuo Takakuwa, 1948 Kichijoji, Near Tokyo, Japan.

NEW ZEALAND (M, T) Exhibited beginning Oct. 4 at Art Gallery. Data: H. A. Larnsen, Salon Secy., P. O. Box 324, Hemilton, New Zealand.

IRISH (M) Exhibited Oct. 20 to Nov. 1 at Dawson Hall. Data: Geo. McLean, Exhib. Secy., 11 Hume St., Dublin, Iveland.

HOUSTON (M) Exhibited Oct. 12,26 at Museum of Fine Arts. Data: Katherine Wray, Museum of Fine Arts, Houston 5, Texas.

GHENT (M) Exhibited Oct. 21 to Nov. 9 at club.
Data: Julien Tack, Secy., Nieuwland 37, Ghent,
Belgium.

MISS. VALLEY (M) Exhibited Stix-Baer & Fuller, Oct 5-19. Data: E. A. Tucker, 3625 Carter Ave., St. Louis 7, Mo.

CHICAGO (M) Exhibited Oct. 18 to Nov. 16 at Museum of Science and Industry. Data: Miss Mabel Young, 231 S. LaSaile St. Room 1382, Chicago 4, III.

DOMINICAN REPUBLIC (M, C, T) Closes Oct. 12.

Exhibited Oct. 24-31 at Art Gallery, Data: Juan U. Garcia, Rosa Duarte 29, altos, Ciudad Trujillo, Dominican Republic.

MEXICAN (M, T) Closes Oct. 15, Exhibited Nov. 15 to Dec. 15 at club. Data: Ray Miess, 1800 N. Farwell Ave., Milwaukee 2, Wis. or Club Fotografice de Mexico, San Juan de Latran 80, Mexico 1, D. F., Mexico.

SANTA BARBARA (M. T) Closes Oct. 18. Exhibited Nov. 1-10. Data: Wm. A. McBride, 12221/2 State St., Santa Barbara, California.

HONG KONG (M. C) Closes Oct. 18. Entry form and fee waived. Exhibited Dec. 1-6. Data: Se-Leuk Keen, e/o Hang Shing Co. Ltd., 52 Bonham Strand East, Hong Kong, China.

VICTORIA (M. T) Closes Oct. 18. Entry fee \$1.50 for prints. Exhibited Nov. 16-23 at Empress Hotel. Data: Jas. A. McVic, 2171 Bartlett Ave., Victoria, B. C., Canada.

ARIZONA STATE FAIR (M. T) Closes Oct. 24. Entry fee \$1.50 for prints. Exhibited Nov. 7-16. Data: Miss Agnes Holst, Supt. of Photography, Arizona State Fair, Phoenia, Arix.

SAYTIAGO (M, T) Closes Nov. 4. Exhibited Nov. 20 to Dec. 20. Data: C. A. Yarrington, 50 Church St., N. Y. 7, N. Y. or Foto Club de Chile, Calle Huerfanos 1223, Santiago, Chile.

CUBAN (M. T) Closes Dec. 2. Exhibited Dec. 18 to Jan. 20 at club. Data: Club Fotografico de Cuba, O'Reilly 306, altos, Havana, Cuba.

SPRINGFIELD (M, T) M closes Dec. 3; T Dec. 10. \$2 entry fee for prints. Exhibited Jen. 4-25 at Smith Art Museum. Data: J. E. Phelps. G. W. V. Smith Art Museum, Springfield 5, Mass.

MINNEAPOLIS (M, C) Closes Jan. 13. Entry fee 82.00. Exhibited Feb. 5-22 at American Swedish Institute. Data: Warren Anderson, 123 S. 7th St., Minnespolis, Minn.

ROCHESTER (M. C. T. S. ST, SS) Closes Feb. 12. Exhibited March 6-29 at Art Gallery. Data: Lowell Miller, 99 Parkside Road, Rochester 16, N. Y.

SYRACUSE (M. C. T. S. ST) Clores Apr. 20. Print fee \$1.00 and return postage. Data: Allen Ruch, 1421 Butternut St., Syracuse, N. Y.

PETROPOLIS (M. C., M Press, T) Closes Oct. 30, 1952. No fee. Exhibited in December at Hotel Quintandinha. Data: L. A. Pimental, Sociedade Fluminense de Fotografia, Gaixa Pustal 118, Niterol, State of Rio de Janeiro, Brazil.

LINCOLN (M. A. S. I., T) Closes Nov. 8. Exhibited Dec. 6 to Jan. 4 at club. Data: A. J. Hawkins, Branston, Lincoln, England.

SAN SEBASTIAN (M) Closes Nov. 10. Exhibited Dec. 1952. Data: Club Vasco de Camping, San Marcial 19. San Sebastian, Spain.

JAPAN (M. T) Closes Nov. 15. Exhibited Jan. 15-22 at Galleries of Mitsukosht, Tokyo; later at other Japanese cities. Data: Goro Ueso, The Asahi Shim. bun Bldg., Yurakucho, Tokyo, Japan.

LUCKNOW (M, C, T) Closes Dec. 15. Enhibited Feb. & Mar. Data: S., H. H. Razair, 63 Yahlapur, Allahebad 3, India.

BENGAL (M) Closes Dec. 25. Exhibited Feb. 15 to Mar. 1. Data: B. K. Muckerjee, 24B Hindusthan Park, Calcutta 29, India.

CHARLEROI (M) Closes Feb. 15. Data: R. Populaire, 18 Rue Destree, Charleroi, Belgium.

PSA COLOR DIVISION

Forestry Building, State College, Penna.

The C.D. Hospital Project In Action In the U. S. Army Hospital in Tokyo Japan, American Red Cross Gray Lady Mrs. Edward X Blaschka of Seattle, Washington brings happy memories of the New England countryside to PFC. Daniel Hamel (right) of Brownville, Maine even though Cpl. Andrew J. Barry (left) of Klamath Falls, Oregon seems somewhat skeptical. Color slides donated by PSA members and others, either hand viewed by individuals or projected to larger groups bring great pleasure to thousands of Korean War casualties and other patients in more than 50 U. S. Army, Navy and Veterans Hospitals in the United States, Japan and Korea. Please identify your spares and rejects as to subject matter and/or geographical location and send them to the PSA Hospital Project, 353-31st Ave., San Francisco. Official ARC photo by Mori.

Nine Years of Progress

(Editorial note For a complete report on Color Division work during 1951-1952. See Page 571.)

In the November 1944 annual issue of the PSA JOURNAL, Mr. John S. Rowan, FPSA, in the President's report said, "The Color Division has sprung to life under Mr. H. J. Johnson and put on a bang-up International Color Slide Salon. This Division is now showing results which include many color slide interchanges and the encouragement of several additional color salons throughout the country, including the present one in connection with the PSA Exhibition. Recognizing that color photography is in for a big advance, many interesting plans are being laid so that due consideration and encouragement will be given to all phases of color, I feel that this is going to prove one of the most active Divisions in the Society,"

Mr. Rowan unfortunately did not live long enough to see that his prediction was an understatement of Color Division's potentialities.

In the years prior to 1943, Color Division existed in a state of inactivity. There was no treasury to finance its activities. Yet, without asking anything from PSA, it began to develop an extensive SERVICE program for color photographers. Most of the activities, by efficient organization and by

keeping expenses within receipts, from the very beginning were able to carry their own weight. C. D.'s philosophy always has been that dues should be spent for the benefit of those who pay them, at the same rate they are paid in, subject only to the statistical margin necessary for safety. And so today, your \$1 a year dues entitles you to participate in all of the division's activities without any further charge and to compete for the sterling silver medals and ribbons which are awarded in the various competitions.

A profound tribute to the success of its activities and services is found in the growth of its membership. From only a few hundred in 1943, the division now boasts a membership of almost 3,000. This represents a little over 40% of PSA's total enrollment.

Interest and participation in the various activities has kept pace with the increase in membership. From the very beginning, color exhibitions have been enthusiastically supported by color photographers. A little over 300 persons submitted entries to the first exhibit held in Chicago in December 1943. Just 8 years later, 1,111 persons entered Chicago's 1951 exhibition—the largest all color show ever to be field anywhere in the world.

: Who's Who in Color, which first appeared in the September 1944 issue of the JOURNAL listed the names of 217 persons who were successful in two or more color shows. The

1952 Who's Who contains almost 31/2 times that number (732). In addition, there were a few less than 1,000 persons who were successful in only one exhibition. One of the most important factors in the development of this activity is C.D.'s master mailing list which was used by 29 exhibitions this past year. This list of names and addresses of contributors is made available to each color show which promises to follow the Division's standards and agrees to reciprocate with the names and addresses of its contributors so that the list can be kept up to date. In the past year, five exhibitions were accorded special recognition for efficiency and exceptional service to their entrants.

A glance through the Color Division report for 1951-52, will reveal many new records for service. The bi-monthly slide competition for clubs with 138 clubs catered, is the largest activities of its kind in the world. In addition, 66 clubs enrolled in slide circuits. The exhibition slide set distribution service throughout North America and the International Exchange sets provide world-wide review of the work of our Color photographers. Interest in slide competitions for individuals has expanded so that two classes will be required this year to take care of the demand. The slide study groups, one of the newer services, has grown steadily during the past four years and now over 100 persons are enrolled with special groups for the larger size transparencies.

The slide circuits for individuals which were among the original activities of the Color Division continue in popularity with the 24th circuit completed last June. Since the inception of the Slides-for-Veterans program, approximately 250,000 slides have been distributed to hospitals in the United States, Japan and Korea, Several new services were introduced during the year just ended, including foreign slide circuits, a star-rating plan for Color photography, and a club Color Slide Directory which lists slide sets available for loan to other clubs.

The very first circuits and competitions for stereo workers were conducted under the direction of Color Division. In the January 2002 2004 of the PSA JOURSAL, President Norris Harkness, APSA, who will be highest compliments and commendations to the officers and members of Color Division for a most praiseworthy accomplishment.

"They saw the possibilities in stereo photography as a potent area of photographic interest. With finest forethought, they went to work at a time when few others had any great faith in the rebirth of this old kind of camera work. They laid out a program for both immediate activity and long-range value, and they implemented that program efficiently and well. Today the infant they found on the doorstep and took in as a beloved foundling has reached the point where it can stand alone. Its training, health and its basic and vital strength are firm: thanks to CD it can now begin to make its own way in a world that seems to demand a good start for its new citizens. Accordingly, the Board of Directors have voted to establish a new Stereo Division. . . . When you join Stereo Division . . . Keep in mind . . . all that every PSA member owes to Color for what they have done for photography and PSA in giving our youngest division such a grand start."

As in the past, Color Division will continue to serve its membership by inaugurating new activities, services and benefits which will create further participation in and enjoyment of our hobby—color photography.

The accomplishments of the past nine years are not the results of the efforts of just one individual but those of many persons. To H. J. Johnson, FPSA, who gave Color Division its firm foundation-to those chairmen who succeeded him-wand to all the committee members and volunteer workers whose unselfish devotion to the work of Color Division and PSA has been invaluable, are extended our sincere thanks. The list includes H. J. Johnson, FPSA; George W. Blaha, APSA; Rev. Herman Bielenberg, APSA; Karl A. Baumgaertel, APSA; George F. Johnson, APSA; Frank B. Bayless; Mildred Blaha; Walter Carter; Donald Eaton; Merle S. Ewell, APSA; Vella L.

Charles Greene; Donald B. Grim; Harry Haimes, APSA; R. B. Horner, APSA; Charles Kinsley, APSA; A. C. Klein, APSA; Blanche Kolarik, APSA; Charles B. McKee, APSA; H. G. Mitchell; John Moddejonge, APSA; John Mulder, FPSA; Dennis W. Pett; L. F. Plummer; Frank Proctor.

Finne.

W. K. Raxworthy, APSA; Fred Richter; W. H. Savary, APSA; Harrison S. Sayre; Fenwick G. Small; Emmett E. Smith; Eric Sorensen; Sam Vogan, APSA; and Paul J. Wolf, APSA.

- - MILDRED C. BLAHA

Korean Communication

From the 25th Evacuation Hospital somewhere in Korea comes the following note of thanks for the slides donated through the C. D. Hospital Project.

"We should like to thank all for the assortment of Color Slides which we received this week. We have sorted all of them by States and when we have a slide social in the wards, the servicemen are delighted to see their State projected on the screen. We have the hand viewers that can be checked out to the bed patients and that helps fill the long hours of the day. At every showing there are interested "Shutter Bugs" who comparent on the composition, exposures, and so forth. The patients here at the 25th Evacuation Hospital are most grateful to you for your interest in them. The Staff wishes to thank you also."

Donations of slides received are still running a thousand or more a month short of the quantity needed. Please send any slides you can spare with a simple identification as to subject matter if possible to Karl A. Baumgaertel, 353-31st Avenue, San Francisco, California.

First International Circuit

The first International Slide Circuit has been established by the Color Division. This Circuit is made up of two slides each from 10 American slide makers and will circulate in The Netherlands. A similar collection of slides from that country is now circulating among the circuit members in this country. Each circuit includes hiographies and photographs of the participants, and complete technical data on the slides.

The ten American participants in this new Color Division Service are: Helen Merkel, Philadelphia; Ken Barton, Cornell, Il-

These International Circuits are under the supervision of John C. Moddejonge, 7414 Manhattan Avenue, Cleveland, Ohio.

Star-Rating Plan

Many inquiries are being received about the new Color Division project called the "Star-rating plan."

This plan has been set up by the Division to give a rating for exhibition slide acceptances. A rating certificate will be issued from one to four stars depending upon number of different slides and total acceptances. Applicants send in a list of titles of accepted slides in recognized color exhibitions, listing the names of the exhibitions and the year accepted. For full information, write: Lloyd Robinson, Jr., 1616 West 109th Street, Los Angeles 47, California.

Color at the Convention

Members of the Color Division again gathered in full force for the annual Convention of the PSA in New York to renew old friendships and to enjoy the thrill of becoming personally acquainted with those faces which had heretofore been names only. The intermittent dampness of the weather at no time dampened the enthusiasm of the CD clan for the get-together and the enjoyment of the many excellent programs scheduled for their entertainment. Much credit is due Paul J. Wolf, APSA, for the magnificent ground-work which he as local Chair-man of the CD Program Committee had performed prior to his unexpected departure for the West coast. His duties were graciously assumed by Mrs. Amy Mintel Walker, APSA, who in addition to her responsibilities as Chairman of the International Color Slide Exhibition, handled her job in a highly efficient manner.

The International Color Slide Exhibition had its first showing at the Manhattan Center, adjacent to the New Yorker Hotel, on Wednesday evening. Aug. 13th before an audience of some 2000 people. A total of 1800 slides were submitted by 456 entrants from 33 States, the District of Columbia, the Canal Zone, Hawaii and 12 foreign countries from which the jury accepted 402 slides for exhibition. The slides, shown in

categories, with credits to the makers, and a background of music furnished by Mr. Mannie Lovich, made a show of great beauty which was received by the audience with great enthusiasm. This was the biggest Color Slide show in the history of PSA conventions and a second viewing was equally enjoyed in the Crand Ballroom of the New Yorker on Saturday morning, Aug. 16th.

In the color print section of the exhibition, entries were received from 14 States and 2 foreign countries. The Clerk Maxwell Trophy for the hest color print in the show was awarded to H. Lou Gibson, FPSA, of Rochester, N. Y. The presentation was made by Warren H. Savary, APSA, at the honors banquet.

A program of most unusual interest and excitement was presented by William A. Price on Thursday morning, Aug. 14th. The title of Mr. Price's program was "Native Activities in Japan" and "The Eruption of Mt. Mihara." Mr. Price had spent three years in Japan where his job required extensive travel throughout every section of the country. Since he worked directly with the Japanese he learned a great deal more about Japan than most people are privileged to learn.

"When we can picture what we really see--the poetry or music, the power or tranquility of nature, the struggle or satisfaction of people, the grandeur or minuteness of our subject, we are arriving in color pictorialism," were Helen Manzer's, APSA, opening thoughts in presenting "The Ins and Outs of the Color Shows." Mrs. Manzer further suggested simple compositions with a single interest set in a simple symmetrical arrangement of major and minor elements. Clouds, for instance, can add rhythm and music to a picture or throw disharmony or confusion into it. One gets more "ins" with color shows when we practice framing the principle subject so surrounding material emphasizes the importance of the subject and keeps our interest upon it.

On Thursday evening, Jay T. Fox, APSA. presented a program titled "Nature's Highlights," a 16 mm, full color 1600 foot movie, depicting his specialized technique in close-ups and ultra close-ups. The film, in four sections, covers Botany, Insects, Exotic Fish, and Gemology. The portion on Botany covers flowers in all seasons, and fascinating time-lapse sequences of flowers opening. The gemology portion of the film is a pictorial study of the famous Morgan Gem Collection at the Museum of Natural History in New York City.

Friday morning, Aug. 15th, brought us a program titled "Swordfishing out of Gloucester," presented by Dr. Richard B. Pomeroy, APSA, and which in a matter of minutes depicted what takes place on an eight day trip on a Diesel-engined two-masted, 67-foot schooner which is manned by nine stalwart Portuguese fishermen from Gloucester.

Another Friday morning program was a non-technical discussion on the use of filters for color photography, both indoors and outdoors, by Charles A. Kinsley, APSA. Emphasis was placed upon the need for only a few filters to cover practically all situations. The moze than 100 slides used for illustrations were made expressly for this talk, and showed both outdoor situa-

tions of people, distant scenics, high altitude shots, objects surrounded by water, snow scenes, and sunrises and sunsets. Situations covering artificial light sources, including photofloods, 3200 K lamps, various types of flash lamps and general tungsten illumination were also discussed.

Then came the annual Color Division luncheon which has become a tradition in in PSA convention programs. The luncheon was attended by 125 CD members and their guests in the Grand Ballroom of the New Yorker and was presided over by Bob Goldman, who with his wife, Edna, were hosts for the occasion.

A very unique program was given Friday afternoon by Amy and John Walker as one of the CD's featured programs. The program was in two parts: The first covered the history of modern painting, illustrated by color slides of paintings which were significant in the development of Modern Art. The second part consisted of a showing of slides made by the Walkers in the modern trend which have been successful in International Exhibitions. Other experimental slides were also shown.

The 1952 Color Slide Clinic was conducted on Friday afternoon, again under the supervision of A. C. Klein, APSA. Those serving on the panel which discussed the slides presented for criticism were: Rev. H. Bielenberg, APSA, Robert J. Goldman, Charles Kinsley, APSA, Dr. Frank E. Rice, APSA, Warren Savary, APSA, Mrs. Alice Stark, Mrs. Sandra Thaw, and Leonard A. Thurston. The panel discussed the merits and shortcomings of 100 slides which were selected for criticism out of the rejected slides from the recent judging of the 1952 PSA International Color Slide Exhibition.

"Improving Your Kodachromes" was the title of the program presented Saturday morning, August 16th, by Louis J. Parker, APSA, a discussion of exposure determin-

ing devices with appropriate illustrating slides. The technique of fill-in flash, lowering the lightness scale by means of bounce board reflection, and the camera angle for the purpose of composition comprised the first part of Mr. Parker's program. Close-up techniques and the correct method of computing exposure were discussed together with a demonstration of simple masking procedures for best results in duplication.

Saturday afternoon John W. Doscher, FPSA. FRPS, gave a fascinating demonstration in the technique of making dye transfers. His talk covered the transition from black and white to color printing, the equipment required, the breakdown of transparencies, the use of, market for, and future possibilities of color prints.

The curtain call for the Convention was the Honors Banquet which was held in the Grand Ballroom of the Hotel New Yorker on Saturday night, Aug. 16th. Among those receiving honors, the following are members of the Color Division: Fellowships--II. Clyde Carlton, Dorothy M. Eidlitz, John A. Norling, Orlando E. Romig, Allen G. Stimson and Doris Martha Weber. Associates-Ruth Sage, Richard B. Pomeroy, W. J. Schubert, Merril W. Seymour, Amy Mintel Walker, Jack Breed, George Ehrenfried, Caryl Firth, Louise Agnew, R. B. Horner. Robert L. McIntyre, Walter E. Parker, Pearl Schwartz Rice, Charles A. Howe, Rolland H. Rahe, W. K. Raxworthy, Thomas Limborg, Hailand P. Nasvik, John A. Maurer, Stella Jenks, James P. Thompson, Lynn Fayman and Sam J. Vogan.

The 1952 PSA Convention is over; unlike the political conventions that we all recently had an opportunity to sit in on, we are all loyal to the same initials—P. S. A. For those who missed it, it's too bad—IT WAS GOOD.

ROBERT J. GOLDMAN

PSA NATURE DIVISION

HARRY R. REICH, APSA

286 Schenck St., No. Tonawanda, New York

And A Good Time Was Had By All Another National Convention of the Photographic Society of America has gone into the history of the society and as usual another milestone of progress in photography has been recorded for posterity. What I'm trying to say is that the 1952 National Convention was another of those big successes that we have come to look forward to. The national and the local convention committees are to be congratulated on a real fine job.

Howard E. Foote, APSA was the Nature Division's representative on the local exhibition committee of the convention and certainly did a man-size job in arranging for the judging and exhibition of the nature section of the show. The Nature Division would like to tender him a vote of thanks for his efforts. Warren H. Savary, APSA was the Nature Division's representative for the program and all of you folks who were present know what a wonderful job he came up with. Mr. Savary was probably one

of the busiest men during the convention which was apparent to those of you who attended but what was not apparent were the months of tedious work that he put into the preparation of the program. For his time and effort Mr. Savary has the thanks of the executive committee and the memberbody of the Nature Division.

The Division wishes to express its thanks to those who contributed of their time, effort, and their knowledge to present the marvelous program for N.D. members in attendance. To Mr. J. Donald Sutherland and Mr. Ralph E. Lawrence for their presentation of "Birds of Washington". To Life Magazine, for their "Darkroom Tour". To Dr. B. J. K. Kaston for his "Photography of Spiders", a milestone in nature photography. To Helen C. Manzer, APSA for her "Ins and Outs of the Color Shows". To Jay T. Fox, APSA, for his "Nature's Highlights". To Bruce Force for his "Photography of Miuerals". To Dr. Roman Vishniac, for his "Discovery of Nature". To C. B.

Schaughency, for his Color Motion Picture "New Jersey Birds". To Professor John Starr, for his "Adventures in Underwater Filming". To Ruth F. Sage, APSA, for her very informative how-to-do-it program, "What Makes a Nature Picture" in which she was assisted by H. Lou Gibson, FPSA, Chester Wheeler, Hon. PSA, and Lowell Miller, APSA, with an assist from Eastman Kodak who supplied some of her props. Our thanks also to all the other New York N.D. members who collaborated in making the nature section of the 1952 convention something to remember.

The Nature Division luncheon again was a big success on Saturday noon, about one hundred members of the division breaking bread together. Naturally the Honors Banquet on Saturday night was the big event of the convention with the Nature Division being well represented among the recipients of bonors.

A Follow Up Report

In the last issue of this column the writer held forth a promise of a dozen sanctioned nature exhibitions in 1953. He mentioned the possibility of a nature section to the 1953 Syracuse Salon of Photography, I spoke of a meeting of the salon committee which I intended to attend. Ruth Sage, N.D. secretary and the writer were present at this meeting and were able to be of assistance in the preparatory work for their salon; we also did a job of selling, the success of which is recorded in a letter from the Syracuse salon secretary which the writer received this day, just in time for the inclusion of this report in the column.

I quote from this letter: "We were very glad to meet you last Wednesday night in Rochester. We want to thank you for coming, and for all the helpful advice you gave use. We will definitely have a Nature Section in our salon; your interest and encouragement gave us the necessary incentive to do it".

Information regarding the Tenth Syracuse International Salon is:

Mention was also made in this column last month of a possible nature section in the Cleveland International Exhibition for 1953. The 1952 exhibition in Cleveland was judged last Saturday, August 23, the writer being privileged to serve on the color jury of this exhibition. He was assured that there would be a nature section included in the 1953 show. This means that eleven of the promised dozen nature shows are to be a reality, and we hope soon to have the twelfth accounted for.

It is hoped that this column will be able early in the coming year to publish a calendar of nature shows for the entire year.

Star Ratinas for Nature Workers

Better get out your file of nature catalogues and carefully scan your print and slide files, yes it might be a good idea to start a journal recording your acceptances and rejections in the recognized nature exhibitions. Why? you say. Well, the division is about to launch a Star rating system similar in aspect to that of the Pictorial

Division.

The details have not been worked out as yet (at this writing) by the executive committee of the division but they are being ironed out. Naturally the number of presently recognized nature exhibitions is far below the number of pictorial exhibitions and therefore a fair and equitable division of prints and slides and their acceptances will have to be determined giving consideration to the number of approved exhibitions. As soon as a schedule of rules and regulations governing the number of pictures and the number of acceptances are determined, announcement of same will be made and the rating system will be instituted.

Nature Division Services

About a year and a half ago the Nature Division adopted a criticism service for both prints and slides, available to all members of the division. Our experience since that time reveals that this service has proven very popular with the newer members to the division and to the non-exhibitors but that the older members of the division and the exhibitors do not take advantage of this service. The writer has taken note of this fact and given it some thought. Probably some of the more advanced workers would get a surprise if they were to try it just once.

The prints and slides submitted for criticism are evaluated by some of the top nature workers in the country and an effort is made to distribute the material to different critics so that a person who makes regular use of this service will find that they have the benefit of a variety of opinions and evaluations on their various enorts. So I say the service can be of value to both advanced workers and newer nature enthusiasts.

While speaking of N.D. services this might be a good time to make mention of some of the services that are in the making at this time. Two different tape recordings are in the making now and should be ready for distribution about the first of the year. We are at this time recruiting circle secretaries to handle two new nature portfolios. It might be well to get your names to Ruth Sage, N.D. Sec'y., at once if you care to enroll in one of these. Another feature in its formative stage is a nature color slide circuit for member camera clubs, This should prove popular with the clubs who have N.D. affiliations. Naturally, this activity will have to be confined to about ten clubs to the circuit in order to have it make the rounds in a reasonable time. If, however, we find that sufficient clubs care to participate, a second circuit will be organized.

Too Late To Classify

Comes word from Wan Tho Loke of Singapore, that the Singapore Art Society has definitely decided to include a Nature Section in its Fourth International Exhibition of Photography to be held in the British Council Hall, Stamford Road, Singapore from February 7, through the 15th. The deadline for receiving prints being January 9. This exhibition will be restricted to prints.

The exhibition will be conducted to conform to PSA standards and will therefore be recognized by the society as an approved

show. The judges will be: Viscount Hanworth, FRPS, Dr. C. A. Gibson-Hill ARPS, and Wan The Loke. Medals (Silver and Bronze) and certificates of commendation will be awarded.

Entry forms for this exhibition will be mailed to American Exhibitors. Mr. Loke however advises that for any of us who may not receive these forms instructions are to forward our prints to him personally, without entry forms and they will be entered by him. Mr. Wan Tho Loke, Cathay Building, Singapore.

PHOTO-JOURNALISM

. WILLIAM A. PRICE

78 Elbert St., Ramsey, N. J.

If you did not attend the convention during August at the Hotel New Yorker, read on and see what you missed. If you did attend, read on and receive some pleasant memories, and plan for next year.

First, as National Convention Chairman of the PJ Division and in behalf of my coworkers Dave Eisendrath and Bob Garland, I must begin this with apologies to those people who were required to stand at many of our presentations and to others who were turned away after standing room had also become filled. We knew that we had an outstanding program but we underestimated the popular acceptance which developed from the very first presentation. Again, we're mighty sorry but we will be ready for you next year.

Next, I want through this column to thank many, many people who helped and cooperated with us in making the P J program such a success. There is always so much pick and shovel work to be done for as much as six months in advance and to all of these people, committee chairmen, their committee members, volunteers and everyone, my heartfelt gratitude and thanks. You folks made this convention possible.

Thanks too, to you many fine-spirited people throughout the country who wrote to me and offered to help in any way that you could. Many of you we didn't call upon but it felt so good to know that you were there if we needed you and your moral support made the job easier.

How can I say thanks to those wonderful people who actually put on our programs, who actually were our programs? I hope that they felt our thanks and shared our pride when they saw every seat filled, all standing room taken, hour after hour and day after day. What more can I say?

Now for some highlights of the P J program. We presented fourteen separate sections in our four day program. The total attendance at our programs was 1715 people. Seventy seven new members joined up with the P J Division and there were promises of many more when PSA renewals become duc.

We displayed 75 prints in the exhibition and many of these had been judged as among the best news photos of 1952. There was always a large crowd around this exhibit.

Through the courtesy of Life Magazine, we ran a tour through their new, ultra-modern darkroom on Wednesday afternoon.

It was just another workday for Life so they had to limit us to 100 people, 10 each half hour. Even so, we did disrupt their operations to some extent and we appreciate their fine cooperation in putting up with us. Because so many people wanted to make this tour, we had to limit it to P J members only, and again we apologize to those who applied too late to get in the first 100.

Knowing that a great many of you readers did not attend our convention this year by reason of distance, expense, time, or whatever, let me outline what you missed in the P J programs and perhaps it will encourage you to prepare for the convention next year at Los Angeles.

We started off with a round table discussion on "Everyone is a Photo Journalist". This was presented by David B. Eisendrath, APSA, Robin Garland, APSA, and myself. I won't get it in this issue, but I hope to write a feature on this subject soon because it drew considerable interest at the convention. We signed up several new members as a result of this discussion alone.

We next presented Dante O. Tranquille, Chief Photographer of the Utica Observer Dispatch, who told us about "The Versatile Small Town Newspaper Photographer" And has he had experiences!

The next day Fred Maroon who has produced All American yearhooks, told about "Producing Prize Winning School Annuals." Fred knows how, he produced the country's best in 1950.

This was followed by Morris Gordon of the Western Electric Company and Hal Power of the Shell Oil Company who gave us their knowledge of "Industrial Publications and Industrial Photography". They are among the best in the business.

A feature to a packed house was "Photography Serves in Security and Crime Prevention". Who could better put on a show than Donald J. Parsons of the F.B.1?

Again to a packed house we presented Don Mohler of the General Electric Company in "Light is not Artificial, it's How you use it". Don is called the clown prince of lighting and they are still talking about his program.

The following day Wyatt Brummit of the Eastman Kodak Company presented "How Live is Your Morgue?" which is just what a lot of us needed to know about how to organize our print and negative files.

Harold Blumenfeld of United Press Acme Newspictures next tried to answer this one "Where is the Cash in Press Photography?" We found out where it is all right, and now it's up to us to get it out. We got a lot of good ideas on how to try.

We next found out what happens between the darkroom and the newsstand. Peggy Sargent, negative editor at Life, gave us a very fine talk on the life of a negative from time of receipt until it is published if luck is with you. We never knew that there were so many pitfalls for a negative.

Dave Eisendrath, APSA, and a very successful free lancer, told us the next day about "The Rights and Privileges of the Photographer". Again a lot of pitfalls and Dave knows all the answers. Can you take certain pictures and have you the right to publish them? Dave told us.

This was followed by a talk on "Picture Agencies How they work and how they can work with you". Kurt Safranski of Black Star Pictures and Arthur Brachman of the Free Lance Photographers Guild explained their respective operations which drew a multitude of questions from the audience to the enlightenment of all of us.

Alfred Eisendrath of Life next told us about what it takes and gives to be a magazine photographer. Has he been around And we found out that most of his stuff is 35 mm, even to 1/8 second hand held at times. No

wonder he is good.

We thought that we had our program in bed by this time but by popular demand we held another roundtable similar to our opening presentation. This was not advertised but we still had a full house. Lots of questions and answers in this one.

Now you have an idea of the extent of the PJ program this year and also why we had such a successful convention. If you missed this one, don't miss next year.

PSA STEREO DIVISION

FRANK E. RICE, APSA ...

228 N. LaSalle St., Chicago 1

Stereo Startles Conventioneers

At the 1952 PSA Convention stereo photographers, most of them with their cameras, showed up in large numbers. As to the acceptance of the stereo programs, we will quote the New York Times of August 17, in its report on the convention:

"The new Stereo Division's debut as the society's seventh group was unusually successful, attracting overflow attendance at almost all of its meetings."

There were so many interesting events on the stereo program that no one of them can be called the "highlight." There were discussions to satisfy the most technically-minded as for instance—Samuel Kitrosser on Simplified Calculation of Stereo Interocular Distance, presented in conjunction with the Technical Division, which was anything but "simplified" to stereo photographers who are mainly interested in taking pictures.

Member Paul J. Wolfe's travelogues on "Mexico" and "The Colorful West" were perfectly organized. The slides were tops in pictorial interest.

Dr. Kenneth S. Tydings, author of The Stereo Realist Guide, instructor in photography at Long Beach (N. Y.) People's College, addressed the Section on "Simplified Stereo."

Equipment Clinics

Two periods were devoted to clinics---one on Slide Mounting and the other on Stereo Materials and Equipment, Participants were representatives from Brumberger, David White, Eastman, Holson, Loucks and Norling studios, Morgenthaler and Stereo Graphic Studio. Questions were shot at the panel from the audience about such things as the Realist focusing knob turning too easily, location of the flash gun holders, and how to shoot close-ups. We are advised that for extreme close-ups, it is best to take two shots,-one for hand viewing and one for projection. More distortion is observed in projection; and here it may be especially necessary to narrow the interocular in

Bob Hall demonstrated the new SILVR-SCREEN—metal on plastic base stretched tight. The Holson Binders representative, Mr. Holtzman, corrected the impression that seems to be about:—The plastic used in their binders to cover the transparencies do not disturb the direction of polarized light:

they can be used for projection exactly as slides bound in glass.

Member Victor Ellis, who offers custom built photographic equipment, urged that more attention be given to stereogram transparencies in sizes other than 35mm. Other sizes have advantages,—16mm especially for hand viewing and for economy; and the larger sizes for more obvious stereo at the greater distances. The larger sizes also produce more dramatic effect.

Clinic for Sick Slides

Bart Brooks and Jack Norling two of the judges that selected the show slides, together with Henry Cordes, substituting for Paul Wolf, the third judge, discussed slides as thrown on the screen. For the most part these were stereograms that had been rejected in the show. The judges expressed their views as to wherein the slides were not up to par. Following are some of the points made (not all of which were agreed to by the audience).

"Frozen" water is more objectionable in stereo than in planar. Use slow enough exposure so that a little movement is obvious. The same holds for jumping horses and other fast moving objects.

Pattern is OK for planar but not for stereo unless it is something very unusual.

Avoid strong contrasts, white against dark, as it causes "ghost" in projection. This objection does not hold for hand viewing of course.

Distortion is especially fatal where people and animals are concerned. It is best not to try portaints unless you have a stereo camera built with long focal length lenses and shoot from a distance. (The audience did not agree entirely with this one.)

These judges do not like silhouettes—look like black cardboard cut-outs, they say;—no good for stereo, OK for planar.

One picture of a pile of broken timbers, brought forth the comment that the stereo photographer "cannot glamorize junk" as can often be done in the dark room by the black and white photographer.

Subject Distance and Interocular

In a number of the discussions during the week reference was made to the formula that subject to lens distance should really not be less than 50 times the interocular spread of the lenses on the camera used. This is especially true where the stereograms are to be projected. It was stated that 15 times interocular is not too bad for hand viewing.

When taking closer-up pictures by stereo, the interocular should be narrowed—by the use of a slide board or in some other way. Floyd A. Ramsdell illustrated the use of two cameras and a mirror in front of one, as a means of varying the interocular.

Motion Pictures in Stereo

There were several programs in which the Motion Picture Division joined with the Stereo Division.

The stereo attachments for the Bolex camera and projector were demonstrated by a representative who predicted that in 5 years all movies will be in stereo. He could see no solution to the problem of the audience wearing glasses.

Douglas Winnek, a photographic engineer, who was scheduled to speak on Saturday afternoon on "Stereo Without Viewers or Glasses" was ill and did not show up. So, if he had the solution, we did not hear it. it.

Floyd A. Ramsdell lectured on "Stereo Movies the Professional Way". (See also above). He demonstrated the importance of generally keeping the images back of the screen in projection. At the screen plane, homologous points coincide. In the case of distant images, the points must not be more than 2½ inches apart.

There were some interesting demonstrations of runners coming toward the screen —homologous points coming closer and closer together until they coincide.

Among the important uses for stereo motion pictures mentioned were student teaching, sports technique (golf swing, tennis stroke) and employe training.

Showing of Accepted Slides

One hundred slides, accepted by the judges, entered by 41 photogs, were shown to a large audience. Almost every kind of a picture from landscape to non-objectives were represented. However, there were few, if any, portraits, the judges being "allergic" for the reason above stated.

For the show, as well as in all the projections of stereo slides throughout the week the projector was furnished by David White as was also the projectionist. Most of the time it was Jim Calder himself. The screen also furnished by David White was the new SILVRSCREEN. See above. (We are assured that the entry fee hereafter will not be \$2. Those who entered this time may get \$1 back—that is if the Convention Committee ends up with a surplus.)

Stereo Shooting All Over the Place

In the meetings, at the dinners, in the lobbies and on the sight seeing boat ride arranged by the Convention Committee, stereo cameras were much in evidence. We hope to have a set of slides which can be loaned to clubs, picturing the principal events at the convention.

Great credit goes to Norman Rothschild who was the activator in New York in charge of the stereo grogram, and to some good helpers he had, including Henry Aldrich, Russell Darby, Harry Fisher, Phillip Sternberg and others.

Next year the convention will be in Los

Angeles, early in August. Calling all stereophotogs in that area!— Are you going to give us a good program in keeping with the reputation of the great Golden State? We can help you from here. But mostly it is up to you. Let us hear from you and soon.

Stereo Dinner

Thirty avid stereoists showed up at the rather impromptu dinner, following which there was a lively round table discussion of many and various things. The formation of stereo clubs and the problems involved were well covered.

The question was raised as to whether our Stereo Division is not giving a disproportionate amount of attention to projection and its problems. Are we neglecting those who are perfectly satisfied with hand viewing? What say you, SD members?

David White Award

Making the David White Award "For Important Contributions to the Art of Stereoscopic Photography" to H. C. McKay was a special event on the PSA banquet program. This is to be an annual award made to a person chosen by the Stereo Division. Besides a handsome engraved plaque, struck off by the David White Company, Mr. McKay received a large camera case containing a Realist camera with flash, viewer and all the other trimmings. Do we hear nominations for next year?

Heard at the PSA Convention

LeJaren Hiller, long time professional photographer, in his talk said that from the time of his early photographic career he has concentrated his attention "in front of the camera." His only interest in camera mechanisms is in choosing a camera that will permit him to take pictures without having to divert his mind to its operation

For each 1 inch separation of homologous points on the screen one may figure roughly a 1 mm difference in the slide, -an indication of the precision required in slide mounting for projection.

It is suggested that the term "interpupilary" be used in connection with the eyes;—"interocular" in relation to the camera. There are a couple of other terms sometimes used in these connections—"interaxial" and "stereoscopic spacing." A task committee of the Technical Division is now working on nomenclature.

Whether anyone can see stereo in objects beyond 150 feet was questioned.

The Stereoscopic Society

Affiliated with the Royal Photographic Society of London is the Stereoscopic Society with members in Britain, New Zealand and Australia as well as the U.S.A. The SS was founded in 1893, the American Branch in 1917. Print and transparency folios are circulated among the members. Large sizes as well as 35 mm are included. Each member of the folio circuit adds his comments about all the pictures in the folio as it comes to him. Information about membership may be obtained from the American Branch Secretary, R. W Strong. 450 Russ Building, San Francisco 4. Calif.

On The Way -

Short notes about new developments in photography and related arts.

Kodak unveiled two new ones recently that will have a big impact in business and in the printing field. One is a new paper which reverses itself in the developer to a positive image. To be marketed first, we understand, through Photostat Corp., for business use, it is ideal for the many times a photostatic positive is required and the negative is just surplus. The developer is special.

The other development, of great importance to small magazines is a color printing process for offset lithography. Based on 35mm and Bantam originals, it provides a simplified routine for producing three separations and the three printing plates. Samples we have seen indicate that the fourth or black plate will not be needed. Process based on use of Kromekote paper, an extremely white, high-gloss paper that heretofore has been available coated on one side only, but now can be furnished coated both sides. Since the other side of singlecoated Kromekote was a dingy, matte color, like newsprint, it meant that alternate pages of a publication would have to be type. With the new paper, that last barrier has been removed.

Almost a year ago your Editor posed for a snap outside the research laboratories of Remington Rand. That isn't news, but what followed the shutter click is. We took the holder into the darkroom and with the white ceiling lights burning at full intensity, Bob Wark, the lab director pulled the slide, took out a sheet of paper and handed it to me. "Put it in that tray of D-72", he said. "What, and get a fogged picture?" "Do it". and we did, and up came the picture, positive and without a trace of fog! The new emulsion seems to have the faculty of responding only to the first exposure. Lloyd Varden described it completely in his paper on light-sensitive materials presented as the Brehm Lecture at Rochester this spring. According to Wark, there is no limit to the speed or color sensitivity of the new emulsion. At first it will be available only for office copy use, eliminating the need for a darkroom. Later, who knows?

DARKROOM HINTS

By Francis Ashley Faught, M. D., PSA.

Aids to Making Chemical Solutions

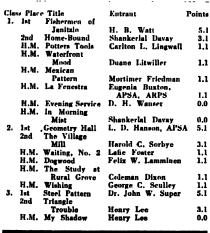

Some salts, such as potassium bichromate, potassium ferri-cyanide, and others, dissolve with difficulty, one may use heat where permissible, but it may not be advisable, or convenient to effect solution by this means. Prompt solution may be accomplished with a mortar (approximately 3" in diameter) and pestle. In this crystals may be rubbed up in a small amount of water until solution is effected; this concentrate may then be diluted as directed in the formula. This is not only a definite time saving procedure, but it also assures complete solution. Hypo may be dissolved quickly by putting it in a funnel with cheesecloth liner, then pouring hot water through. A quart of hot water will dissolve two pounds of hypo rapidly.

REMARKS REMARKS

The first six books of the Picture of the Month were exhibited at the Convention. I hope those of you who saw how valuable this Library is becoming for exhibition purposes will get into the game and send prints, and I do mean the Fellows and Associates of the P.S.A. who so far have been conspinuous for their absence! We are getting some very fine nictures. but we need even more and even fine pirtures, but we need even more and even better. Why let the others have all the fun when maybe you can make pictures as good as theirs? R. HOCAN,

graphiques. He has published extensively in the photographic periodicals over a long period of years.

Ever Try Glycerine?

Most photographers make the acquaintance of glycerine in their own darkrooms. One of the first "tricks of the trade" that every photographer learns is that a little glycerine in the final rinse water provides prints that dry without curling. In addition, by overcoming the tendency of the gelatine layer to harden and crack, glycerine helps to render the prints pliable and easy to handle. If prints are to be ferrotyped, the glycerine treatment improves gloss, combats the tendency to stick to the ferrotype tin and reduces the possibility of pits, dull spots and "oyster shell" markings.

baths varies somewhat with different authorities. The War Department's manual on basic photography had advised that a suitable solution is made by adding one part of glycerine to 10 parts of water. Immediately after the prints have been washed, they are placed in the glycerine bath and allowed to stay there for at least five minutes. If the softening action is not sufficient, the amount of glycerine may be increased or the solu-

90° F. Prints are not rinsed after the glycerine treatment, but are placed immediately on blotters, drying stretchers, or ferrotype plates. A suitable print "flattener" can also be made by adding 4 ounces of glycerine (U.S.P. grade) to one quart of water. This solution may be used on rough or matte prints as well as on glossy prints to be ferrotyped.

The glycerine solution need not be dis-

609

The concentration of glycerine in these tion can be heated to about 80° or carded because it can be used many times.

Wanted---March Journals

Headquarters finds itself completely out of stock of the March, 1952 PSA Journal. Copies are needed to fill special requests. If you no longer have need for your copy, send it to Headquarters. For each copy received by November 1 in good condition, HQ will send a set of three PSA Decals, worth

Two New Handbooks

Two new handbooks in the familiar format have been announced by the Eastman Kodak Co. One is for the industrial photographer, the other for the professional.

The Industrial Handbook contains Data Books on Microfilming, Photography Through the Microscope, Service Pictures and Kodagraph Reproduction Materials. Price is \$4.

The Professional Handbook includes Data Books on Camera Technique, Negative Making, Maintenance and Repair of Professional Equipment and Professional Printing. Price is \$4.

The separate Data Books will be avail-able at 50 cents each.

Membership Directory

Work starts soon on the annual Membership Directory. The last one was printed with the January issue of the PSA JOURNAL. Look at that issue and see if your name is listed properly, that all your Division affiliations are shown, and, if you have honors or are on a committee, that you are properly listed.

If you find an error in your listing or that of a friend, won't you drop a line to "Directory, PSA Headquarters, 2005 Walnut St., Phila. 3, Pa."?

You get <u>more</u> for your camera dollar with the ANSCO SPEEDEX f4.5 SPECIAL!

(Makes 12 popular 21/4 x 21/4" size negatives on 120 roll film)

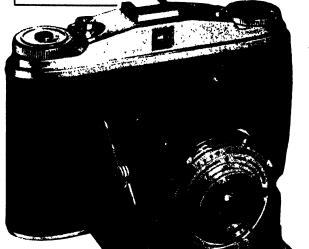

No other quality camera near this price has all these important features!

- 1. Double-exposure prevention with red dot indicator.
- 2. Built-in shutter release button.
- 3. Accessory clip for rangefinder.
- 4. Optical-type eye level viewfinder.
- 5. Convenient depthof-field dial.
- 6. Full-range shutter with accurate speeds from 1 to 1/300 second, T & B.

Only \$48.65

Including Tax

Top-grain cowhide case, only \$6.95

7. Full focusing range from 3 feet to infinity, with easy-to-use zone focusing settings.

8. Hard-coated f4.5
Agfa Apotar Anastigmat
lens, corrected for color
photography.

9. Delayed action shutter release lets photographer get in picture.

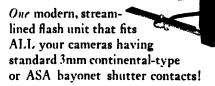

10. Full flash shutter (Prontor S), for all flash-bulbs and electronic flash

PLUS All the fine finish and "feel" of a modern, high-quality camera... Compact, lightweight all-metal body with grained black Robusite covering... Satin finished chrome trim... Swingout film spool carriers for easy loading... Self-erecting front.

Be SURE to see the ANSCO SPEEDEX f4.5 SPECIAL at your photo dealer's! You'll find it one of the most streamlined, compact and competent cameras you've ever held in your hand ... and the quality construction and fine finish suggest a much, much higher price! There's also a standard model Speedex f4.5 camera, with fewer "special" features at \$36.50.

For fine modern folding cameras making album-size 2½x3½, negatives, see the ANSCO VIKING cameras! Viking f6.3, only \$34.95; Viking f4.5, \$48.65; top-grain cowhide case, \$6.95.

The Amazing new ANSCO FLASH UNIT

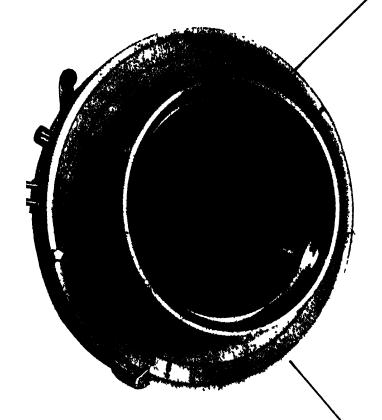

Only \$995

Be sure to see it!

THE PRESENT STATUS OF THE DIRECT NEGATIVE-POSITIVE COLOR PROCESSES IN EUROPE

H. Gordon*

The development of direct color printing methods cannot yet by any means be considered finished. It may be assumed that the technical details of the advances in this field in America up to the present time are familiar to all readers of this publication. It may be of some interest, therefore, to discuss the four different processes which have been developed in Europe during the last about fifteen years.

A certain relationship in image structure exists between the American processes of Kodacolor and Plenacolor on one hand and the following European processes on the other:

Agfacolor Gevacolor Ferraniacolor Telcolor

With any of these processes it is possible to obtain results of high quality if all conditions essential for a satisfactory balance between negative and positive have been fulfilled.

All methods to be described have the following in common: As the first step a color negative is generated in the camera in an integral tripack material. Its colors are essentially complementary to those of the subject. After the negative material has undergone a special development, any number of colored paper pictures of the same subject can be made on a positive material of similar layer structure by a suitable printing and color development procedure.

With regard to the historical development, the following data appear to have been established:

- (1) Already in 1933 the technical possibilities in theory and experiment existed, and these investigations were carried out largely in the plants of Agia.
- (2) The colored paper picture of today has evolved from the procedure for producing motion picture color films, printed from color negatives, with suitably modified details.
- (3) Due to the particular conditions of the war and afterwar years these Agfa methods have been taken over and further developed by other manufacturers.

Prior to the development of the processes described here it was necessary for the making of a colored paper print to start with black-and-white separation negatives and combine the separation positives (derived from them in the three primary colors) during the printing process by special methods so that a paper picture in natural colors

*Swedish Colorphoto Corporation, Stockholm 1, Sweden. Received 9 July 1952. Translated from the original German by G. A. Wiesehahn.

could be obtained as the final result. The best known techniques, still much used today, are:

Carbro Dye-transfer Duzochrome

and their modifications. All these processes are—due to inherent causes of defects—expensive to carry out and therefore suitable for certain special purposes only. There had been therefore much demand for direct methods for the preparation of pictures in natural colors. The methods employing color transparencies and a following color reversal procedure, such as Ansco Printon, offered a certain possibility in this direction. However, there was no corresponding process available in Europe.

The method using a negative in complementary colors has become today the starting point for a generally applicable procedure. Although the American production figures can hardly be attained in Europe, the four makes mentioned above have obtained overall results which are qualitatively as well as quantitatively very favorable. It is our task in the following to discuss the operation of the four processes with respect to both their physical and chemical characteristics and their phototechnical execution.

The negative films which are used as starting material for the paper print processes to be described all have a layer structure which is very similar to that of the tripack reversal films. However, in order to obtain satisfactory print results there must be differences in the gradation as compared with the reversal film. The conventional arrangement is followed in all cases. The uppermost layer is sensitive for blue only. Then follows a yellow filter layer. The second emulsion layer is green sensitive. The third one is sensitive to red.

These three layers contain the corresponding color-forming components. To the blue-sensitive layer there is therefore added a coupler which produces a yellow dye during color development. In the second layer there is the color former for a magenta dye, and in the third one for cyan. The three layers are treated with a common color developer. Whereas in the Kodacolor process the couplers are distributed by physical binding in the form of fine colloidal particles through the emulsion, increase of molecular size by the chemical attachment of long chains has been chosen in all European products to inhibit the diffusion of the couplers in the chromogenic development process. Typical representatives of the many patented color formers for the basic colors yellow, magenta, and cyan (FIAT Final Report #721) are the following:

III. cyan (Agfa F 546)

The developing agent N,N-diethyl p-phenylenediamine, which is also known as p-aminodiethylaniline, is used in most cases. This compound.

$$H_1N \longrightarrow N \xrightarrow{C_1H_1} K_1$$

stains and irritates the skin. For this reason many attempts have been made to achieve improvements by the introduction of substituents. Success has been achieved, among others, by the introduction of a hydroxyl group into one of the ethyl groups of the molecule:

We shall discuss below other components which are present in a typical color negative developer.

The products formed in the negative films during development consist of dyes and it is possible to obtain in this manner, in the printing process, a generally satisfactory color reproduction. Nevertheless in two of the negative processes dealt with here (Ferraniacolor and Telcolor) it has been preferred, in order to improve the quality of the color reproduction and of the gradation, to convert part of the image silver, after completion of the color development and bleaching of the aimularter completion of the color development and bleaching of the simulations of the silver mask. In the other process (Agfacolor and Gevacolor) the image silver formed during the development reaction is completely removed by bleaching and fixation. This should be emphasized because in one of the American can negative processes (Kodacolor) a colored mask is generated during the processing.

Agfacolor Negative Film

The Agfacolor Negative film is commefcially available with a daylight and an artificial light emulsion. The daylight emulsion is sensitized for an average color temperature of 5,800K, the artificial light film for 3,200K. Assuming a normal development, the sensitivity of the daylight film is equivalent to an ASA Exposure Index of 16. The sensitivity of the artificial light film is about ASA 25. It is possible,

sensitivity of the artificial light slim is about ASA 25. It is possible, by prolonging the developing time, to increase the sensitivity considerably at the expense of the gradation. However, an increase of the developer temperature dannot be recommended because of the risk of reticulation at elevated temperatures.

The Agracolor magniful is sold in various sizes: 35mm magazines, foriginally in the length of 36 frames, now with 20 only; Karat magazines for 16 exposures; Roll film sizes 120 and 630. Besides there exists roll film 4.5cm wide. Sheet films are available in all sizes from 2½/4 × 30 cm). $3^{1}/_{4} = 10 \times 12$ inches (24 × 30 cm).

considerable queterities of the seam film type, in the being made in the original film factory called Roscopienka under Russian control. On the different emulsion types was one year aled blowever, it was recently increased to two year lin this consection it may be mentioned the latent image is not very long; so the de film should be carried out within at most of pourse. Otherwise there may be shifts in it three layers which can no longer be consistent. three layers which can no longer be compensated process. That the films should be secret cool as process. That the films should be stored cool and go the effect of chemically active gases is as valid here a reversal films. The keeping quality under tropical condition certain.

Gevacolor Negative Film

The Gevacolor Negative film is available only as daylight simulaion for the 2½, × 3½ inch size on 120 spools. An emulsion for emagnism light has not appeared so far nor a 35mm emulsion in daylight tooling magazines. So far the 35mm film exists only as artificial light emulsion and in lengths required for the taking of motion picture negatives whose popularity is constantly increasing in Europe. The manufacture of sheet films in different sizes is being prepared at the present in the Gevaert plant in Mornel near Antwerp. The development of improvements of these materials is carried out there constantly and intensively rensively

Ferraniacolor Negative Film

The Ferraniacolor film, originating in Turin, Italy, is available so far in the 35mm size for 20 exposures. The $2^1/4 \times 3^1/4$ inch size film is also available. Both sizes are furnished only with daylight sensitization. Nothing is known up to now of sheet films.

Telcolor Negative Film

The firm of Tellko in Fribourg, Switzerland, sells the Telcolor film. This is sensitized as a universal film which permits the taking of exposures on the same material in daylight as well as artificial light. The 35mm films are available in magazines for 20 exposures, the $2^1/4 \times 3^1/4$ inch film in the 120 size for 8 exposures. Sheet film is also available.

The practical speed of Gevacolor daylight film is given as 24° Scheiner corresponding to ASA Exposure Index 16 with standard development. It too can be increased by prolonging the development time. Thus the speed of both Agracolor and Gevacolor negative is higher by one half to one full stop than that of the corresponding color reversal films. The sensitivity of Ferraniacolor and Telcolor, however, is the very same as the usual speed of color reversal films, which are not being produced by these two manufacturers. This somewhat lower speed is related to the mask development of the two film types.

Use of Optical Filters

The use of filters during the exposure is to be avoided with all negative film types, because the resulting color shifts cannot be compensated during the printing process. Only haze filters are permissible. On the basis of the color temperature for the sensitization only blue-colored flashlamps of the same type as for color reversal films are suitable as

flashlamps for daylight type negative film.

Considering the developing procedure proper of the four negative films, and disregarding the necessary rinses shown in Table I, all ma-

terials described above have four steps in common:

- 1. Developer
- Stop bath Bleach bath
- Fixing bath.

The film makes described here can be divided into two groups; those in which the process is carried out as above, and those in which an additional black-ind-white mask is introduced by an additional black-and-white development after the bleach. Agfa and Gevaert films form the first, Perranja and Tellico films the second group.

It is remarkable that the classical processes of this technique even today, still operate without masks, whereas those which arrived later

Table I.

NEGATIVE PROCESSING TIME TABLE

Step	Agfa	Gevaçolor	Ferrania	Telcolor
1. Development 2. Hardening 3. Rinse 4. Stop Bath 5. Rinse 6. Bleach 7. Rinse 8. Fixing 9. Rinse 10. Stabilization 11. Rinse * End of darkroom	6' 18C 2' 10' 3'4 3' 20' 	10' 20C 10" 5' 30' 5' 30' 5' 5' 5' 5' 5'	7' 18C 20' 5'* 10' 5' 20'	6' 18C 15' 5'* 10' 5' 20'

obtain even better color separation by the masking principle. Tellko, for example, leaves the alternative of operating without mask in its directions and gives as the reason that the development of the silver mask is not without certain technical difficulties. A critical second exposure is required which, with the use of the prescribed mask developer, should produce a density of exactly 0.4 measured on the unexposed image edge.

Practical experiments have shown that the color separation in this manner is undoubtedly improved; but it is questionable, whether this improvement is worth the considerably greater amount of work re-

quired.

Processing Agfacolor Film

The following formulas for the development of the Agfacolor films are typical of formulas for color negative films. The formulas have not been published by the manufacturer because of the restrictive policies of this firm.

Developer	
p-aminodiethylaniline hydrochloride	2.1 g
Hydroxylamine hydrochloride Potassium carbonate	1.2 g 75.0 g
Sodium sulfite, anhydrous	2.0 g
Potassium bromide Sodium hexametaphosphate	2.5 g 1.0 g
Water to make	1.01
Hardening Bath

Bleach	
Potassium ferricyanide Potassium bromide	40 g
Potassium bromide Water to make	40 g 30 g
Fixing Hath	
Sodium thiosulfare	300 g
Borax Water to make	5 8
MART IN MUNIC	1 1

The normal developing time of 7 minutes at 18C can be varied between 6 and 9 minutes if known over- or underexposures have to be compensated for. However, underdeveloped color negatives always produce poorer print results than those which are somewhat over-exposed or overdeveloped. With still longer developing times the results become too hard. This is obvious not only in unpleasant image contrast but also in the fact that halation may appear in the paper tripit.

paper print.

The remperature of 18C is very critical for the Agfacolor developer and must not be exceeded by more than 1° without running into the danger of loosening of the layers or of reticulation of the gelatin. The other makes mentioned are less sensitive in this respect. Consequently they do not require a special hardening bath. The density curves are influenced by increasing the temperature as well as by increasing the time in color development the same as in black-and-white development. For uniform results the 18C temperature should be

Table II.

MASK PROCESSING TIME TABLE

	Steps Following the Blesch	Ferraniacolor	Telcolor
1.	Ringe Exposure with 10 lux of white light	10' (from base vide)	10' (from emulsion side)
3.	Exposure with 10 lux of white light Mask development (density of the silver mask 0.4)	3'	3.5'
4.	Rinse .	5'	5'
5.	Fixing Final ringe	5'	š′
6.	Final ringe	20'	20′

maintained =1°. For this type of color developers the rise occurs rather rapidly. This is due to two causes:

1. the high alkali content of the developer

2. the content of hydroxylamine.

The last mentioned substance has proven itself as a development acceler ator as well as antifoggant in all color negative and color paper processes. It may be recalled in this connection that it also is being used in the color developer for Ansco Printon material. The dosage of the hydroxylamine as well as that of the potassium bromide is extremely critical. The following hardening bath—the only one of all the processing baths whose composition has been published by Agfa—is recommended only for soft water but has proven very important in all cases in order to avoid reticulation.

The duration of the following rinse as well as its temperature is of great importance; for the action of the color developer is not immediately stopped in the recommended processing. Instead the film, saturated with solution, continues to develop during the washing. Simultaneously the residual developing agent diffuses out of the layer. The slow diffusion produces a softer result in the negative development which is important for the later printing process in the use of the Agfacolor film. Furthermore the full speed of the film is made use of only

with this washing.

The rinsing must last for at least 10 minutes. With a shorter wash a disturbing color reaction occurs afterward in the bleach bath which stains the negative films making them unsuitable for the production of a neutral color balance in printing. This magenta dye occurs as the oxidation product of the color developing agents with the potassium ferricyanide of the bleach bath and stains the gelatin substantively. It cannot be washed out or destroyed by a chemical aftertreatment. The formation of this fog dye is about proportional to the duration of the intermediate rinse, and after 10 minutes has reached a point where the color fog is practically on a nonmeasurable level.

where the color fog is practically on a nonmeasurable level.

In the following bleach bath the silver, which has been formed during development besides the dye, is converted to silver ferrocyanide and silver bromide. Both are substances which readily dissolve in the subsequent final fixing bath. The duration of the washing following the bleach is only of importance insofar as a somewhat prolonged rinse can extend the use of the fixing baths before renewal becomes necessary. The composition of the bleach bath for films of this type is not very critical, but impurities in the potassium ferricyanide supply may cause variations in the pH value which in such a case should be maintained at 6.0 to 6.3 by a disodium phosphate-sodium bisulfate

The results of the negative development with Agfacolor as well as with the other negative films reveal considerable deviations in the color balance from the theoretical so that the basal character of the emulsion appears sometimes brownish, sometimes greenish, reddish, but only rarely neutral gray. This color tint is noticeable especially in the background fog but extends over all developed colors. The cause is the technical impossibility of manufacturing several emulsion coatings uniformly, conditions which are long familiar with color reversal film.

In the course of several years of manufacture some of the color formers have been replaced by better ones. However, the color tint of the negative emulsions is not of major importance because it always can be corrected by the use of filters in the printing process. One important reservation must be made: the emulsion to be developed must not have passed the date of expiration. If this is the case, the characteristic curves of the three color emulsions foll a developed gray wedge are shifted so that they no longer run parallely to each other. Then a satisfactory neutral reproduction can no longer be expected in the printing process.

printing process.

Besides the dreaded reticulation, due to insufficiently hardened emulsion, dry spots in the form of irregular lime deposits may be mentioned as a defect that may occur. They may be found when the

sodium hexametaphosphate recommended in the above developer formula is left out. In its place Califor can be used. Under no circumstances should chamois or sponges be used in the drying; the danger of scratching the layer is too great and resouching in the print

in many cases is impossible.

There is a considerable difference in the general behavior of the films originating in the Eastern zoile compared with those from the Western zone. In the former the background fog is usually much greater, and the film support is of a different type. It is thicker and consists of nitrate film in contrast to the acetate base of the others. Coating defects, i.e., irregularities in the emulsion, have been observed in both makes and are, in their rare cases of occurrence, obvious mostly as stripes or streaks parallel to the film length.

It may be mentioned that in the first year after the war considerable quantities of Agfacolor perforated 35mm negative motion picture film were put on the market, illegally, in the form of special magazines. The sales agencies offered them as reversal film. The fact is mentioned here to point out that the gradation of color negative films is completely unsuitable for use as reversal film. Only by special processing methods can a less than mediocre transparency result be obtained with

this negative material.

Processing Gevacolor Film

The processing of the Gevacolor Negative films, in principle, follows the formulae just given. Some deviations exist because, due to extra long rinses, the treatment requires more than twice the time. The color developer is very similar to the Agfa formula given above and differs mainly in its content of potassium bromide. The color developing agents can be changed. In any case it is possible to use paminodiethylaniline hydrochloride here too. It is important that the Gevacolor Negative film because of different gradation requires a longer developing time and a higher temperature than Agía film.

A special developing agent, "Gevaminol," produced by the Gevaert company at one time, did not prove itself for the negative process because of fog formation but was well suited for the Gevacolor print

paper. At the present time conversion to a new specially substituted compound, "Gevadiamin," is being carried out.

The hydroxylamine hydrochloride plays an important role in Gevaert's developer also. As alkali, sodium carbonate, is used in place of potassium carbonate. The long washing after the development in case of this negative material is substituted by a short rinse of 10 seconds. Then follows the stop bath which acts simultaneously as fixing and as hardening bath, contrary to the procedure of Agfa which works with a special hardening bath, but without stop bath. The long washing has been postponed to this point after the stop bath, and 30 minutes are considered necessary to avoid the color reaction with the bleach bath. This washing can be carried out in bright light. The bleach bath has a composition similar to the one above, but sodium acetate serves in this case as buffer.

The following rinse (10 minutes) is twice as long as in the Agfacolor Negative process. The subsequent fixing bath is alkaline and contains a small quantity of sodium sulfite which aids in stabilizing the formed dyes. After another rinse of 5 minutes, the stabilizing bath proper follows, which is not required for any of the other negative color film types. It consists of an alkaline formaldehyde solution. For Gevacolor the function of this bath is important. Only by the application of the solution mentioned can the decomposition of the yellow layer

of the film be avoided.

Processing Ferrania Film

The chemical composition of the color developing agent proper has not been defined by the manufacturer. This substance is furnished under the code name "S 41." The chemical properties indicate that it too is a derivative of p-aminodicthylaniline, possibly with a hydroxyl group as additional substituent. According to the exposure conditions of the film a liberal tolerance in the developing time is allowed. It is given as 7 minutes at 18C normally, but can be varied between 5 and 10

given as 7 minutes at 18C normally, but can be varied between 5 and 10 minutes, if tests prove adjustments to be necessary. These extreme variations are intended mainly for negatives on cine film, i.e., for the purposes of the motion accurate industry.

The developer is followed by a rinse of 20 minutes. The directions do not consider a stop or hardening bath. The temperature of all later baths should be at about 15C unless specified otherwise in order to avoid damyging the gelatin. The subsequent bleach bath has the usual composition, potassium ferricyanide and potassium bromide, in a somewhat greater concentration than usual. Afterwards there is another rinse for 10 minutes.

Development of the Silver Mask

Now follows the special process, which distinguishes ! and Telcolor from the two other makes; the development of the and-white mask. Because the silver has largely been conversiver bromide by the preceding bleach bath, it regains in this its, light-sensitivity. This fact can be used to generate a negative, silver image in the film by a controlled significant soft-working Metol developer serves for its developments. the film is exposed for about 5 minutes to a light identity of 100 foot-candles. Then the special Metol developer is entered to the special of the special o until a density of 0.4-0.45 has been produced on the meng edge. About 3 minutes developing time are required. The sition of a suitable Metol developer follows:

Metol Sodium sulfite, anh.	1 g 20 g
Disodium phosphate, cryst.	30 g
Potassium bromide	lg
Water to make	11

Thus only a part of the residual silver bromide is reduced with the mask developer, and it is important that the developed mask is seither too thin not too dense. If the mask is too thin, it is ineffective, if 950 dense, it increases the printing time, shifts the gradation, and leads to halation phenomena. In the final print there occur shifts in the color tone in the dark color areas, e.g., redbrown instead of black. After completion of the mask development there follows a rinse for 5 minutes and then fixation for 5 minutes, using a neutral fixing bath, prior to the final rinse.

Processing Telcolor Film

The negative processing procedure of the firm of Tellko is closely related to the method of Ferrania. It is true that no details as to the composition of the baths have become known, but because the packaged chemicals must be separated in their containers due to their reactivity, conclusions can be drawn as to the quantities of the components. The firm of Tellko also recommends the mask method as the best possible development, but its instruction literature also describes a mask-less standard development, according to the principle of Agfa and Gevaert, because the technical manipulation is simple and the resulting reproduction satisfactory in many cases.

Again the standard developing time amounts to 7 minutes at 18C A rihse of 15 minutes is provided, no hardening or stop bath, and a bleach time of 5 minutes. The composition of the bleach bath resembles that of Ferrania. Exposure for 5 minutes with a light intensity of 100 foot-candles follows and development of the black-and-white mask with a density of 0.4 in 3¹/s minutes. Five minutes rine, 5 minutes in the normal fixing bath, and the usual washing of 20 minutes complete the process. Table I shows the far-reaching parallelism of the various

procedures and their differences in the treatment times.

Some remarks should be made on the light conditions during the processing. The development itself-or in the case of the mask proc ess the first development—should suitably be carried out in complete darkness. If for one reason or another working without any illumination is not feasible, each manufacturer recommends a special darkroom filter. However, it has been established that a darkroom filter suitable for panchromatic materials of highest sensitivity may be used if the customary darkroom rules are observed. The same illumination is necessary for the following washing or all steps preceding the bleach bath. Only after the film has been created for 2 minutes in the bleach can it be exposed to normal room light without damage (but preferably not to daylight because solarization phenomena may occur then).

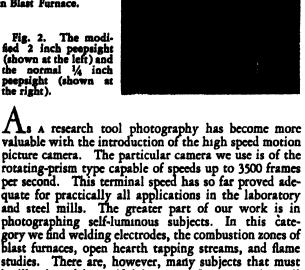

The results obtainable with the four film types reveal a close similarity in their general character if mask development has not been carried out. Bach emulsion type, regardless of the manufacturer, has its characteristic color tint, and it is not always possible to differentiate the various makes by a specific color tint, if they are submitted after development. However the spectral transparency of the formed dyes is very different in the individual makes so that an unfiltered test print during the printing technique (to be described later) reacts immedistely with a strong shift when two identically appearing negatives of different manufacture are examined. Nevertheless the various film types can be printed on color papers of different origin provided that the correct acquired printing filters have been selected.

NOTE. The second part of Dr. Gordon's paper, dealing with European color positive materials and processes for making color prints from color negatives, will be published in the next (December)

FURNACE

Fig. 2. The modified 2 inch peepsight (shown at the left) and the normal ½ inch peepsight (shown at the right).

per second. This terminal speed has so far proved adequate for practically all applications in the laboratory and steel mills. The greater part of our work is in photographing self-luminous subjects. In this category we find welding electrodes, the combustion zones of blast furnaces, open hearth tapping streams, and flame studies. There are, however, many subjects that must be illuminated by artificial means. Impact testing, oil and water quenching, machining of steels, and piercing of seamless tubing are but a few that may be mentioned. One of the most fruitful applications of the high speed camera in the steel industry, however, has been its use in studying the blast furnace. The blast furnace is the most fundamental unit in a steel plant because it is responsible for the reduction of iron ore to metallic iron.

The Blast Furnace

Although the blast furnace has been in use for many hundreds of years, surprisingly little is known of the processes taking place inside the unit. This is largely due to the nature of the furnace and its mode of operation. A modern furnace (see Figure 1) consists essentially of a suitably shaped, steel encased, brick tower about 80' to 100' high with an inside diameter of about 25' at the bottom. Into this tower some 2500 tons of iron ore, 1200 tons of coke and 500 tons of limestone are charged daily and from the bottom liquid iron is withdrawn

PHOTOGRAPHY IN STEEL RESEARCH

R. A. Buchanan*

about every 5 to 6 hours with a total yield of 1000 to 1500 tons per day. The temperature varies from about 300 F at the top to some 3400 F at the bottom. This: latter temperature corresponds to such a bright white heat that the human eye can distinguish little in the furnace without the aid of colored glasses.

In order to withstand these exacting conditions the walls are made of special brick and are up to 3' thick with many metal water coolers built in to increase the life of critical areas.

It is not surprising, therefore, that there have been few attempts to study the inside of the furnace during normal operation, since it is obviously difficult to insert probes and withdraw samples under these conditions. The air required to burn the coke is blown in, under a pressure of 15 to 20 pounds per square inch, near the bottom of the furnace through some 15 to 18 blow pipes or tuyeres which are steel tubes 8 feet long and 6 inches in diameter. It has been found useful to equip these tuyeres with a 1/4 inch sight-hole covered with a blue glass so that the furnace operators can see along the tuyere and into the bottom of the furnace (see Figure 2). In this way particles of coke can be seen moving at such high speed that the eye has difficulty following them. This rather limited vision has been of great aid to the furnace operator and it seemed that a program of study, based on the use of the high speed camera, might prove of value.

It is well known that the preheated air entering the furnace burns the coke which is essentially the only. solid material at this point in the furnace. The combustion results in very high temperatures; 3400 F has been reported.

Preparation for Photography

It was realized that the temperatures involved were high enough so that the subject would be self-luminous but that a special viewing arrangement or peepsight would have to be designed. This consisted essentially of enlarging the viewing window from the normal 1/4 inch to about a 2 inch diameter (see Figure 2). This opening was large enough to prevent interference with the camera lens. In the early design a pyrex glass was used and an arrangement made to cool it by blowing compressed air across the inner face since the temperature of the air in the tuyere itself may be as high as 1000, or even 1200 F. It was found, however, that the cooling air introduced halation effects and a 2 inch flat-ground disc of fused silica was successfully substituted. In this way a view could be obtained of the combustion zone of the furnace through a tube 6 inches it diameter and about 8 feet long (see Figure 3). This gath, an angle of vision of about 3½°. A four inch lens is back on the high speed camera so as to magnify the 6 inch diameter image as much as possible. Kodachsome Type A film is being used throughout the investigation,

Jessey. Presented at the PSA National Convention, New York, N. Y., 13 August 1952, as part of the Technical Division Symposium on Photography in Engineering and Science. Received 25 July 1952.

Light Intensity Fluctuations

In the early work a great percentage of the films were either over or underexposed. It was difficult to understand why the exposures should vary so much, particularly since the same film, camera speed and disphragm opening were used in each exposure. Assuming these factors to be constant, it became evident that the brightness was fluctuating considerable.

ness was fluctuating considerably.

In order to determine how much the light intensity varied a regular photographic exposure meter was used to record the illumination in terms of foot candles. The meter was held in place in front of the two-inch glass opening and a number of readings were made over a period of one hour. The readings ranged from 25 to 250 foot-candles. In one instance, the light intensity changed from 140 to 250 foot-candles in less than one minute.

This simple experiment indicated that an exposure meter of some sort would be required for all future blast furnace work. A standard brand photoelectric cell meter was purchased and calibrated for high speed work. Since this meter has been adopted, virtually all films have been correctly exposed.

Results

When considering the outcome of these photographs it must be stated that they have led to a large and rapidly expanding program of research. Therefore, any detailed discussion is difficult and would probably be of more interest to students of metallurgy than to those whose primary interest is in photographic techniques. However, it is probably of interest to summarize the main results so far obtained. More detail is given in a report by Elliott, Buchanan and Wagstaff. 1

Undoubtedly the most important results have been those obtained indirectly, that is, in answer to questions provided by the movies themselves. The observer looking at the pictures appears to be looking at particles

Fig. 3: "The high speed camers in place to photograph the nombustion zones of a blast furnace. The long red shows in the photograph is part of a water-cooled probe gled to determine the depth of the combustion apies.

PSA JOURNAL SECTION B. GETOBER 1992

Fig. 4. A glass-sided model, representing a variful cross-section of a blast furnace, demonstrates the divculating zone before a tuyere.

moving away from the camera at high speed. That posed two questions: what were the particles, and why were they moving at high speed at the bottom of an 80

ft. tower filled with granular solids?

The answer to the first question was obtained by photographing a furnace under unusual conditions when it was known to contain nothing but coke. It was found that the particles observed at that time were similar to the majority of those normally observed. It was therefore concluded that the majority of the particles in the normal furnace were coke, but that occasionally agglomerates, which were later found to be mixtures of slag, coke, and partially reduced ore, fell into this tuyere zone of the furnace. The movement of the particles was more difficult to explain. It was estimated from the film speed that the particles moved at speeds ranging from 20 to 200 ft/sec and the direction of motion suggested that recirculation of some sort occurred. To explain this a glass-sided model was built to simulate a vertical cross-section of the furnace through the tuyere (see Figure 4).

It is admitted that the model does not precisely represent the combustion zone of a furnace because it is two dimensional rather than three. In addition there is no actual combustion such as takes place in a furnace. There is, however, a great deal of similarity between the high speed pictures taken through the tuyere of a blast furnace and those taken of the model. This similarity makes it appear that circulation of coke about a sizable void must occur before the tuyeres in a blast

furnace

In order to study the thickness of the raceway, smaller models were built. While these studies are still in progress, it can be said that under many conditions the raceways in a blast furnace are approximately spherical. The possible overlap of adjacent raceways has not yet been settled. The direct observation on furnaces is limited at the moment by the fact that the camera has to look along an 8 foot pipe and can only see through an angle of $3^{1}/3^{0}$.

Another and much more direct result of this photographic study was obtained by investigating the size of

the coke particles. It is well known that the operation of the furnace is influenced by the size of coke, but up to the present time investigations had to be limited to measurements on ingoing coke because the bottom of the furnace was at a temperature of 3400 F and some 20 lbs/sq. in. pressure. Withdrawing samples for measurement is unreliable because of the high probability that the lumps would break or burn.

However, having once photographed the lumps it is possible, in theory at least, to project the films on a suitable viewer and measure the lumps one by one. This technique is obviously tedious and in practice was also difficult. A suitable viewer was available with which, by good fortune, the projected image was about life size. Considerable difficulty was experienced because the majority of the particles were nearly at the same temperature and appeared almost identical in brightness and color. It was then difficult to distinguish the outline of any particle when viewing a particular frame. However, by moving the film backwards and forwards it is possible to estimate the size of the particles.

It is too early to give the results of this work, which is still proceeding, but it can be said at this early stage that size gradings can be obtained which are rather different from those expected. Further, the size gradings differ considerably from furnace to furnace.

While it has been stated that the blast furnace program has been the most fruitful application of the high speed camera in steel research there is another use that is worthy of mention here

In the study of welding electrode characteristics the camera was instrumental in answering a number of questions. The high speed films revealed the number of short circuits or arc extinctions per second. The number of extinctions varied according to the type of electrode being used. It was possible to determine

Fig. 5. The continuous flash unit is being used here as the source of artificial illumination in the study of the machineability of a steel specimen.

whether the metal transfer from electrode to plate was globular or spray, depending on what type of electrode was under study.

There is no problem of artificial illumination, the welding are supplying all that is necessary. Daylight type Kodachrome has been used throughout the investigation. A four inch lens plus two 3+ portra attachments are used to produce as large an image of the electrode as possible. With such an optical arrangement the lens-to-subject distance is about five to six inches. The lens is protected from liquid metal spatter by a suitable glass shield. The exposure is determined by making a number of experimental test shots and varying the stop opening. The best exposure, for our work, is 3500 frames per second at f/22.

Artificial Illumination

Lighting is the major problem that confronts the high speed camerman. Workers in this field have utilized everything from #2 Photoflood lamps to huge aircraft searchlights in their efforts to find a suitable source of illumination for their particular type of work.² We have found two sources of illumination which are ideal for the type of work we are called upon to do. The first is the 750 Watt spot which is manufactured for the express purpose of illuminating high speed subjects. A number of these lamps used in banks or as individual sources of light will meet the lighting requirements for a good percentage of our work. The second is the Henry Lester continuous flash unit which has been described more fully in the literature (see Figure These units flash thirty four #31 flashbulbs in one second of time, producing about 3,000,000 lumens of light. With such tremendous light output, small stop openings may be used producing high speed motion pictures with great depth of field. These flash units are particularly well suited for steel mill problems because they are easily portable and require only a 110 volt line for operation.

Today, high speed motion picture photography is an especially important factor in its innumerable applications to arrested-motion analysis in steel research. There has been a tremendous variety of applications for this medium and more are developing each day. The importance of such visual studies can by no means be over-estimated. Research engineers have need for the accurate knowledge of the time, space and force relationships which occur between parts that move too fast for visual observation. The high speed camera is adequately serving this need.

PHOTOGRAPHY IN ROCKET RESEARCH

H. M. Cobb*

L HE WHITE SANDS Proving Ground in New Mexico was activated in 1945 as a base for testing the high altitude and long range missiles which were undergoing development under the auspices of the Department of Defense. The Ballistic Research Laboratories of the Ordnance Corps were assigned the responsibility for the design, development and operation of all instrumentation used to acquire flight data and such other experimental data as might be required by the missile development agencies. Because of the huge cost of the rocket development program and the many complexities of obtaining the required data, all available optical and electronic types of instruments were employed as a means of assuring the most complete and the most accurate information on each missile launched. The data obtained by optical and electronic instruments has been invaluable to the missile development engineers as well as to the flight test engineers.

During the early stages of missile development, detailed studies of flight performance during the launching phase was required. Ignition characteristics, booster performance, stability of the rocket at subsonic and at transonic speeds, effects of different types of launching mechanisms and the effects of meteorological conditions were among the many details studied. Photographic techniques were depended upon to a very large extent during that phase of the program. High speed motion pictures, spectrographic and photometric records showed minute changes in performance as the development engineers tested the missiles under constantly changing conditions.

Fixed motion picture cameras near the launcher were used to observe take-off or launching performance of the missiles. By means of triangulation from a set of two or more of these instruments appropriately placed with respect to the launcher, the position of the missile and the pitch and yaw angles at a given time could be determined with high accuracy. Spectrographs near the launcher produced data on combustion characteristics of various

fuel mixtures and photometric measurements of the jet formation gave an indication of the efficiency of the motor. These observations are still necessary for mis-

siles in the early stages of development.

Following the launching tests the flight performance observations were required, becoming more complicated as the final development stages were reached. Until late 1946 only trajectory data were available since the instruments in use up to that time were tracking theodolite cameras equipped with short focus optics. These instruments record on each frame the azimuth and elevation of the optical axis at the time of exposure as well as a small image of the missile. The position of the

Fig. 2. Photograph of A-4 missile, at a distance of 8 miles, taken with the 4.5 inch tracking telescope with 20 foot focal length. Portions of the 35mm trains not reproduced here contain azimuth, elevation and time records.

missile in the frame is measured to determine the tracking error. Thus the direction of the missile from the station may be determined. By synchronous observations from two or more stations the space position of the missile may be determined. Although theodolite camera observations do not give trajectory data with high accuracy they are capable of producing moderately accurate trajectory in a comparatively short time. Under normal atmospheric conditions observations may be obtained on a V2 missile to an altitude of approxi-

mately forty miles.

To meet the needs of more detailed observations at high altitude, Ballistic Research Laboratories initiated the development of long focus tracking instruments. The first instrument, built as an experimental model (Figure 1), consisted of a 4.5 inch refractor telescope of 60 inches focal length equipped with an amplifying lens near the prime focus to produce an effective focal length of approximately 20 feet. This optical system was mounted on an M45 machine gun turret which served as the tracking mechanism. A standard motion picture camera was used as the recording device. This instrument provided the first definite proof that the V2's were tumbling and spinning at high rates after burnout. This information led to improved flight control techniques by which considerably better missile performance was obtained. (Figure 2).

The successful performance of the 4.5 inch telescope dictated further development along this line. Two 10 inch Newtonian reflectors, a 16 inch Newtonian reflector (Figure 3) and a 10 inch Cassegrain reflector followed in order. Observations obtained by these instruments have given information regarding how missiles performed and often why they performed as they did. Functional failures, separation of booster rockets and ejection of experimental apparatus may be observed. Photometric and spectrographic studies of the jet flame at high altitudes and at high speeds have furnished information regarding fuel burning processes and heat distribution within the jet and have given an indication of aerodynamic flow patterns around the base of the missile. Origination of the missile axis and rate of spin may be

determined from these photographic observations with

a high degree of accuracy.

To meet the requirements for positional measurements of high precision, the Ballistic Research Laboratories have performed studies in photogrammetric techniques utilizing instruments patterned after the so called Ballistic Cameras developed during the early 1940's for use in bomb table observations. Consisting of a set of stationary plate cameras which are calibrated by means of stellar photographs, this system, under good conditions, is capable of giving angular measurements to a precision of about one part in one hundred thousand. Although the cameras in use at the present time are not properly designed for the requirements of the guided missiles program, they have provided the research data necessary to design an adequate photogrammetric instrument system. Such a system is presently being built.

One of the more recent problems imposed by the guided missile program is that of determining the nearest approach of a missile to a moving target at high altitude. This problem has been partially solved by a specially designed tracking telescope with a field of view large enough to cover the space around the target within which a missile would be considered as having scored a hit. Actual positions of the target and missile are not required. Hence the distance of the target from the instrument need be determined only with sufficient percentage accuracy to determine the scale of the photograph with a required accuracy. The instruments track the target and if a hit is scored the missile will appear on the photograph with the target. If the scale of the photograph is known to an accuracy of 1% then the actual distance between the target and missile may be determined to an accuracy of 1%.

Fig. 3. 16 inch tracking telescope on modified 90mm mount, of effective focal length from 40 to 80 feet. The instrument is located 40 miles from the launching sits, at an elevation of 8000 feet.

Fig. 1. Twin 4.5 inch tracking telescope on modified M-45 machine gun mount, showing recording and tracking instruments. The effective focal length may be varied between 15 and 35 feet. Photographs on 35mm film are taken at rates up to 20 exposures per second.

To obtain these observations the Ballistic Research Laboratories designed and built a set of 16 inch reflectors of a modified Newtonian type. These telescopes are mounted on a modified 5 inch Navy Gun Mount and are equipped with cameras operating at 60 frames per second. Instruments are placed at stations at corners of a square so selected that the hit will occur over the approximate center of the square. Thus sufficient observational data is obtained to overcome any difficulties of

reduction due to perspective.

Photographic observations have furnished a great deal of information which could have been obtained by no other instrumentation method. Malfunctions often destroy electronic units which are missile borne causing the loss of telemetry records. In addition certain details of performance can often be studied much more readily by means of photographic records than by other types of observations. Reduction of photographic records are, in general, slow and laborious. Meteorological conditions often make photographic observations impossible and the many problems involved in missile illumination, synchronization of camera operation, anomolous refraction of light waves, tracking mechanisms and mechanical construction of optical instrument mounts provide a field for continuous research and development.

DETERMINING CORRECT EXPOSURES FOR UNUSUAL INDUSTRIAL PHOTOGRAPHS USING A BRIGHTNESS METER

Tom Knowles*

N 1941, Loyd A. Jones and H. R. Condit published a paper entitled, "The Brightness Scale of Exterior Scenes and the Computation of Correct Photographic Exposure." This paper gave a comprehensive treatment of the factors affecting the exposure of exterior scene photographs. The fundamental principles presented by Jones and Condit have been applied to other types of photography. The present author has applied his interpretation of these principles to commercial interior photography,

particularly in the industrial field.

Many an industrial photographic subject has a range of brightness that makes correct exposure determination difficult, if not impossible, using conventional photoelectric exposure mêters. Examples would be an inspection process in subdued light utilizing the fluorescence of materials under ultraviolet light or small, very bright detail of projected images In some cases the exposure must be determined by evaluating from a distance the brightness of important small scene elements. Examples of these may be photographs taken through an inspection window of a laboratory testing chamber or a display sign mounted ar an maccessible height. In the method to be presented an attempt has been made to predetermine the negative densities that will result from exposure to the brightnesses of accurately measured scene elements. By producing negatives with the desired densities, the quality of the final prints will be assured with a minimum of special printing treatment.

A technically correct negative may be considered as one in which the brightness scale of a scene is represented by equally proportional steps of density in the negative. However, flave light adds an over-all density to the negative which may tend to veil the shadow detail. The broken portion of the curve SM, Figure 1, indicates the region most affected by the flare light. For all practical purposes the highlight density can be considered unaffected by flare which, nevertheless, makes it impossible for the scene brightness pattern to be exactly represented by equally proportional steps of density in the negative.

Another unavoidable factor which affects the image illumination in a manner not present in the scene is the

reduced illumination off the lens axis. The writer found, normal angle lenses (56°) to produce negatives having 86 per cent density at the corner compared with 100 per cent density at the center of the negative. Also, the wider the angle of a lens, the less the value of the off-axis illumination. A 90° wide-angle lens produced a density

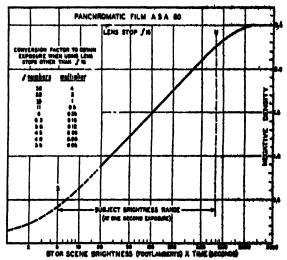

Fig. 1. Characteristic curve of Super XX film, statistically determined and plotted against time-intensity data for exposure determination. The lower scale B T represents scene-element brightness in foot-Lamberts multiplied by exposure time in seconds. B T is plotted against the resulting densities of a negative exposed in a camera at a lens stop of f/16 and developed to gamma 0.80. To obtain exposure time necessary to produce a desired density, divide the required B T by the brightness of the selected scene element. For lens stops other than f/16, use the conversion factor in table, Figure 1. Choosing exposures on the linear, S H, portlos of the curve is not essential but will permit some additional tolerance allowance for unforeseen variables.

only 50 per cent at the corner of the negative as compared with 100 per cent at the center. The technical aspects of flare light and off-axis illumination has been completely covered by Jones and Condit.²

Keeping in mind the following probable variations:.
(1) the disturbing effect of flare and scattered light; (2) the problem of off-axis illumination reduction; (3) the variations to be encountered between successive settings of the same and different shutters and lens stops;

[&]quot;General Electric Company, Lamp Division, Nela Park, Cleveland, Ohio. Presented at the PSA National Convention in Detroit, Michigan, 15 October 1931. Reteived 14 July 1932.

Fig. 2. Luckiesh-Taylor Brightness Meter.

(4) lens transmittance; (5) object to camera distances. Due to small variations in equipment, solutions and sensitive materials, it was decided that some factor of safety should be applied. The author choses to work with exposures as closely on the straight line portion of the D-log E curve as can conveniently be managed.

The method of exposure determination to be described is admittedly subject to some degree of error, due to the factors just described; nevertheless, it has much merit, particularly in the more difficult scenes. This method of exposure determination involves: (1) measuring the brightness of critical subject elements; (2) evaluating the characteristics of negative and printing materials; (3) correlating the range of brightness in the subject with the ranges of the negative and paper; (4) adjusting high brightness-contrasts in the scene, if possible, and; (5) computing the exposure for the desired rendition of the scene.

Measuring Subject Brightness Range

A Luckiesh-Taylor Brightness Meter (Figure 2) may be used for the measurement of subject brightnesses. This meter contains a battery-operated comparison lamp with a rheostat control. The optical system has a viewing angle of one degree. The important elements of the subject to be photographed can be viewed through the meter adjacent to a field illuminated by the comparison lamp. By rotating a continuous-density wedge, the selected scene brightnesses can be matched and measured. The primary range of the instrument is 2 to 50 foot-Lamberts, but this range is greatly extended by the built-in filters which can be inserted on either the scene or the comparison-lamp optical system. These filters extend the range from 0.002 to 50,000 foot-Lamberts. In practice, the brightness of white paper in full moonlight measures about 0.03 foot-Lambert; the brightness of fresh snow in direct sunlight measures from 5,000 to 10,000 foot-Lamberts.

The S.E.I. Exposure Meter (manufactured by the Salford Electrical Instruments Ltd., Manchester, England) serves substantially the same purpose.

Characteristics of Negative and Printing Materials

The film selected, to illustrate the principles discussed, was Super XX Panchromatic. This type of film has a relatively long straight-line portion in its characteristic curve, Figure 1. This curve was obtained statistically from the sensitometric data obtained by the author. Eleven lenses varying in focal length from

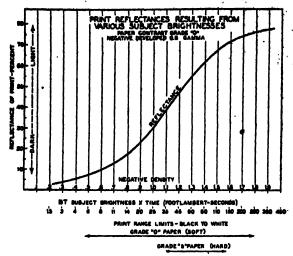

Fig. 3. Estimates of print values are read directly from "Subject-Brightness-Time" scale or the negative-density scale. The values and the relationship between the brightness-time and density are taken from Fig. 2. The curves are typical of those obtained from Azo F contrast grade O paper printed in contact with the negative. Printing exposure is 5 seconds at 70 foot-Lamberts printer brightness.

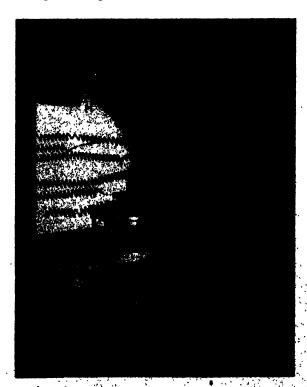

Fig. 5. The highlight area H measured about 10 foot-Lamberts. A floodlight was adjusted to retain some detail of the model, but did not illuminate the screen of the contour projector. The girl's hair was illuminated to 0.5 foot-Lambert or about 10 october heightness. The exposure given was 10 seconds at 115.

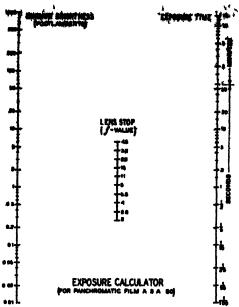

Fig. 4. This nomogram type of "Exposure Calculator" is based on the brightness of a selected shadow area of the scene. A straight line is passed from the minimum-brightness scale on the left through the selected lens-stop in the center scale. The exposure time can be read from the right-hand scale. The resulting shadow density should be about 0.4 when the negative is developed to a gamma of 0.8.

31/2 inches to 12 inches were used. The datum scene area was located 25 degrees off the axis of the lens in order to make some allowance for the reduced illumination at the corners of the negative. The camera lens was kept at a distance greater than fifteen times the focal length of the lens in order to avoid correcting for the bellows factor. The test surface was uniformly illuminated. The average scene may produce more flare light than the conditions under which these data were taken. This would tend to produce somewhat greater densities in the shadow area of the negative than is indicated by broken portion of the curve in Figure 1.

The printing paper used was Azo F glossy. The sensitometric response of this paper is presented in Figure 3.

Correlating Ranges of Scene, Negative and Paper

To determine the photographic exposure for a scene, brightness measurements must first be made of a few important subject elements. Portions of the scene that are to be rendered at the extremes of the print gray-scale, near-white, and near-black, are the critical areas. The measurements of brightness that are usually most essential are those of the critical areas to be reproduced as very dark gray or near-black in the final paper print. In some cases the highlight area is obviously the more important critical detail. Usually, the intermediate brightnesses will reproduce satisfactorily as gray tones.

brightnesses will reproduce satisfactorily as gray tones.

The lower scale, BT, Figure 1, represents the scene element brightness in foot-Lamberts multiplied by exposure time in seconds at a lens stop of f/16. For the sake of bravity the letters BT will represent brightness multiplied by exposure time. The curve SH, Figure 1, shows the relationship between the brightness of scene

Fig. 6. The diffusing white glass If over the lightest part of the picture and manuscript about 200 foot-Lamberts. The hair of the worker is was considered the darkest scene element to be rendered. It measured 6 foot-Lamberts and was relied to 10 by means of a small floodlight. The ratio of shadow to highlight brightnesses was 1 to 20. The exposure was ½ second at 1/16.

elements, exposure time, and negative densities. It is used as the basis of exposure calculation. A conversion-factor is used to obtain exposures for lens-stops other than f/16 (see Table, Figure 1). Assuming the exposure-time to be one second, then the scale reads directly in foot-Lamberts. Conversely, assuming the brightness to be one foot-Lambert, the scale would read in seconds.

For exposures other than unity (one second), divide the BT (foot-Lambert-seconds) required to produce a desired density by the foot-Lambert brightness of a selected portion of the scene. For close-up photographs, those made at a distance less than 10 times the focal length of the lens, some exposure correction must be made. A number of simple calculators are available that are based on the following formula:

Effective f-value = Distance from lens to film X rated f-value

Rated focal length

For practical purposes, we can assume that the reciprocity law is effective over the range of exposures usually encountered. Over this range the same negative density will result from any combination of subject-brightness multiplied by exposure-time, the product of which is constant. For example, I second at 100 foot-Lamberts, 10 seconds at 1 foot-Lamberts, produce approximately the same density.

^{*} Beyond these values correction must be made for reciprocity faithfree.

For the purpose of illustration; vacuing that the highlyese of the critical shadow area, 8, of a scene is 5 took Limberts and the critical highlight area, H, in 1800 foot-Lamberts. This shadow-highlight beightness strip of 5 to 800 is approaching the limit of the straight-line portion of the durve at the points S and H, respectively, Figure 1. The densities produced by 5 and 800 foot-Lambert-seconds at stop f/16 would be 0.4 and 2.24. respectively, Figure 1. Exposures appreciably below and above these values will not produce negative densities in proportion to the brightnesses of the corresponding scene elements. From a subjective viewpoint many fine photographs are made by utilizing the non-linear portions of the negative curve, particularly the toe. It is usually safer to place the exposure for the minimum scenebrightness on the straight-line portion of the curve at about the point S, Figure 1. Using modern emulsions of the type used in this presentation there is little danger of over exposure. This is due to the great scene-brightness range, about 500 or 1000 to one, that can be recorded by these negative materials.

The dark-to-light range of the negative is substantially greater than that which can be reproduced by even the

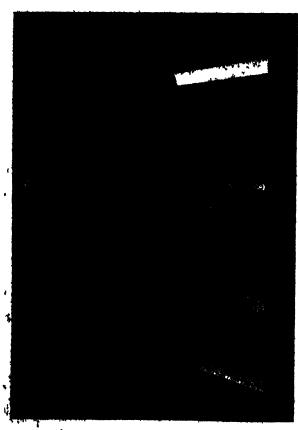

Fig. 7. Beightness readings were made from the charges position directly through the window of this air chardletined test chamber. The selected highlight area A statement 10 hoo-Lamberts. The shadow area 5 makesing 6.75 face-Lambert. The brightness of the lightness tenses was 500 face-Lamberts. Detail of the lightness was chaldled non-assential and it was allowed and polysterial and it was allowed and polysterial and remark white. The shadow-high-light-noise was are remarked to be 1 to 13. The exposure given was 7 milhade at 1/16.

softeneres and arrive of including paper. The linear respective of the acquire material is approximately to 160. The large of active perightenases reproducted by low-consense grade O paper is only about 1 to 40. The define tange, of high-contrast grade 5 paper is only 4 to 1. Figure 3. The density scale of the negative stid the subjective choice of the photographer will determine the most desirable printing-paper contrast.

The reflectance curve in Figure 3 indicates the gray values of a print made on grade O paper, expensed through a negative-density range, and the corresponding subject element exposures (BT) that produced them with a lens-stop of f/16. In the example mentioned, with a negative-density range of 0.4 to 2.24, the resulting print reflectances will be 7 per cent (near-black), and 78 per cent (near-white), respectively. (See Figure 3.) This print will lack shadow and highlight details. If no critical details existed in either the shadow or highlight area, the print may be quite acceptable.

The limits of the reflectance range of white, glossy printing paper (regardless of contrast grade) are about 4 per cent and 78 per cent. This is a reflectance brightness-ratio of about 1 to 20.

If it is desirable to reproduce the brightness-range of the original scene in a glossy paper print, the scene brightness-range should not exceed 1 to 25. Subject elements in which no detail is to be retained obviously may have brightnesses outside of the 1 to 25 range. The resulting negative should print on an #1 or #2 contrast paper.

Adjusting Brightness-Range of Scene

The brightness-range of an industrial inspection bench may be so great that either under-exposure of the low tones or over-exposure of the highlights is unavoidable. If the brightnesses are known, or measurable, an excessive brightness-range may be reduced with supplementary floodlighting.

Assuming the brightnesses of the critical elements of a scene range from 1 to 100, this is about $2^1/2$ times the printing range of zero contrast glossy printing paper. This high-ratio scene can be recorded on the negative, but printing the highlight and the shadow details calls for negative staining or print dodging, etc.

This special printing may be minimized by adjusting the light range of the scene to match a desired contrast printing paper. Obviously many night-time scenes such as lighted streets and other large illuminated outdoor areas must be photographed as they exist, regardless of the contrast range. These scenes are usually printed on very soft contrast papers. To obtain a negative for printing on number 1 or 2 contrast paper, the scene brightness range must be reduced to about 1 to 25. This is done by diffuse floodlighting to raise the brightness of the shadow area to about 4 foot-Lamberts. Where possible, reducing the brightness of the highlight area to 25 foot-Lamberts will have the same effect. In cases where the highlight beightness is produced by a source that can be usually off, such as a lighting fixture, it could be lighted only long enough to produce a brightness that ratio not expecding 25 times that of the shadow area.

Michael Committee and The Committee

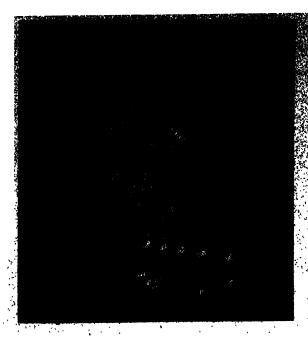

Fig. 8. The brightness of the radial pencils of light measured 5 to 10 foot-Lamberts. The dark area of the model's face measured 0.5 foot-Lambert and was considered the critical shadow area. Exposure - 5 seconds, F/11.

Computing Exposure

The exposure-time can be based on brightness measurements of either the shadow or highlight area. This provides the important product of brightness X time, or BT. The BT, for both the shadow and highlight areas should preferably fall on the straight-line portion of the curve between the points S and H, Figure 1. A typical indoor scene to be photographed could have a shadow brightness of 1 foot-Lambert and a highlight brightness of 25 foot-Lamberts. To determine the exposure for this scene, place the 1 to 25 subject brightness-range on the linear portion of the curve with 1 foot-Lambert at the point S, Figure 1. The scale, BT, for the subject will read 5 BT for the shadow area and 125 BT for the highlight area. The exposure in seconds is computed by dividing BT (to produce the desired density) by the brightness of the scene elements. Computing the exposure-time for the shadow area, 5 BT divided by 1 foot-Lambert (brightness) equals 5 seconds exposure. Based on the highlight area, the same exposure would result from 125 BT divided by 25 foot-Lamberts (brightness) or 5 seconds exposure. This exposure is based on a lens or 5 seconds exposure. This exposure is based on a lens stop of f/16. The table in Figure 1 gives conversionfactors for lens-stops other than f/16. The negative is

developed to a gamma of 0.8.
To simplify the determination of exposure-time, the nomogram, Figure 4, may be used. This calculator is based on the brightness of the critical shadow detail of a strine being photographed. The exposure is read from the right hand scale when a straight line is passed through the minimum critical scene-brightness on the left and the scleeted lens-aperture in the middle. The

contage with the increase of the process of the contage of the con final results are to be paiform,

Summary

Summarizing the steps necessary to detait exposure of unusual scenes by the method design above:

- 1. Measure brightness of the darkest shadow and of the highlight which detail is to be recorded.
- 2. Know the sensitometric characteristics of the negative and par
- 3. Choose the desired negative densities on the setsighteling portion
- of the curve SH, Fig. 1.
 4. If the range of BT (brightness × time) exceeds 1 to 25: 15 mig. reduced by:
 (a) diffusely floodlighting the shadow-aces;

 - (b) reducing the brightness, exposure, or both, of the bightness
 - (c) a combination of (a) and (b).

 Determine the exposure-time by:

 - (a) selecting the exposure-time by:

 (a) selecting the desired negative density on the curve, Figure 1.

 Then divide the required BT by the selected scale beightings in
 measured with the brightness-meter. For lens store, other fine

 f/16 use the conversion table, Figure 1, or

 (b) read exposure-time from calculator (Figure 2) for any insected
 lens f-value. This method is based on the beightness of the
 critical shadow area as measured with the brightness of the

 Course areas further explusion may be accompanied. Of course, some further evaluation may be micross of the photographer's own equipment, expessions, 436.
 When all of these variables have been saken into consider when all or these variables have been taken anto considerable this system of determining exposures, will address the number waste of time and materials caused by taking understated exposures. Time will also be saved by knowing how spector adjust the lighting to produce negatives of preferences of descriptions of preferences of observing the operators of observing the best select another the operators of observing the best select another the operators. of obtaining the best prints possible for any given set of bright ness conditions.

Kinetics of Development of Liquid Photographic Emulsions II. Development by Hydroquinone

L. J. Fortmiller and T. H. James

ABSTRACT

The kinetics of development by hydroquinone of a dispersion of silver halide grains in dilute gelatin solutions were investigated over the pH range of 9-13. The development curve shows a marked induction period. The rate of development is expressed in terms of (1) the reciprocal of the time required to complete 5 or 10 percent of the reaction, and (2) the maximum slope of the density-time of development curve. The rate of development decreases to a minimum as the sulfite-ion concentration increases. The rate is proportional to the concentration of hydroquinone. The pH-dependence of the reaction indicates that the bivalent ion is the effective developing agent in the later stages of the reaction, but the univalent ion may play some part in development in the induction-period region. At high pH, the rate of development does not increase as rapidly as anticipated from its behavior in the lower pH region, probably because of an increase in the charge barrier surrounding the grains resulting from adsorption of hydroxyl ions. The apparent energy of activation is approximately constant over the pH range of 9.3-12.9 when correction is made for the heats of ionization. The activation energy calculated from the time required to complete 5 percent and 10 percent of the reaction is approximately 5 kcal/mole; that calculated from the slope rates is 8 kcal/mole. The activation energy of fog formation calculated from the time required to complete 5 percent and 10 percent of the reaction is 12 kcal/mole; that calculated from the slope rates is 21.5 kcal/mole. The addition of lauryl pyridinium p-toluene sulfonate to the developer markedly increases the rate of development, and quinone catalysis persists in the presence of the quaternary salt

IN A PREVIOUS publication, 1 a method was described for investigating the kinetics of development of dispersions of silver halide grains in dilute gelatin solutions. This method avoids the complications often introduced by diffusion effects in the development of coated emulsions, and is particularly useful as a means of determining the apparent energy of activation of development. The present paper deals with the application of this method to the study of development by hydroquinone in the presence of sulfite.

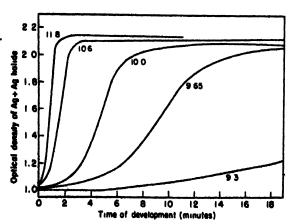

Fig. 1. Development of liquid emulsion by hydroquinone at the average pH levels indicated.

Experimental Procedure

The apparatus and general procedure followed in this work are the same as described in the previous paper.
Emulsion # (previous paper) was employed in preparing

the samples for all o the present tests. In most of the experiments, 90 grams of stock emulsion solution were added to 260 ml of 0.5 percent gelatin solution for each test, and the total reaction solution was made up to 500 ml. All solutions not containing gelatin were deaerated with High Purity Linde nitrogen before adding sulfite or hydroquinone. Nitrogen was kept over the reaction mixture during development. All rate measurements are for 20 C unless otherwise specified.

Experimental Results

The reaction curves in development by derivatives of p-phenylenediamine followed the first-order law over the major part of the reaction course. Development by hydroquinone, on the other hand, exhibits a marked induction period, during which the rate of reaction is

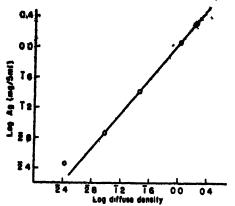

Fig. 2. Relation between developed silver and density.

increasing with increasing time. Typical reaction curves are shown in Figure 1, where the optical density of silver plus silver halide is plotted against the time of reaction at various pH values. Satisfactory "first-order constants" cannot be obtained from such curves. Instead, the rates of development have been expressed in terms of (1) the maximum slope of the reaction curve in terms of ΔD per second (slope-base rates), and (2) the reciprocal of the time in seconds required to complete 5 percent and 10 percent of the total reaction (time-base rates)

The relation between the mass of silver formed during the course of the reaction and the diffuse density of the silver is given in Figure 2 for one experiment. The slope of the log-log curve is about 1.15. This indicates that both the size and the number of silver particles increase as the reaction proceeds, so that the measured rates are a composite of the rates of initiation of development of individual grains and the rates of propa-

gation of development through the grains.

The effect of sodium sulfite upon the rate of development is illustrated in Figure 3. The rate is at a maximum in the absence of sulfite, and decreases rapidly with increasing concentration of sulfite at first. The maximum effect of sulfite, however, is exerted at a concentration of one gram per liter, and not much change in development rate is produced by addition of sulfite in excess of about three grams per liter. Most of the subsequent experiments were carried out with 3.9 grams of sodium sulfite per 500 ml of solution, where the reaction rate is at about the minimum and the sulfite is in sufficient excess to give a comfortable safety factor.

The rate of development is proportional to the concentration of the hydroquinone. This is illustrated in Figure 4 for runs made at pH 9 45 and at two sulfite concentrations. Table I gives numerical results for these runs, together with results for tests made at pH 11.0

The effect of pH upon the rate of development is illustrated by the curves in Figure 1. The pH values given are "average" values, since some change in pH occurred during the course of each reaction. The average values are the averages of the initial pH, determined by measuring the pH of the mixture omitting the stock emulsion, and the final pH determined after reaction is complete. The difference between the initial and final pH values generally amounted to approximately 0.1 pH unit. The pH-dependence of the slope rates and the reciprocal time rates are the same for pH values over 10.0.

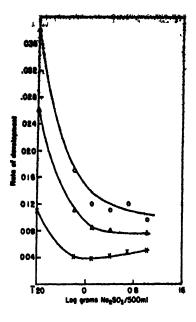

Fig. 3. Dependence of race of christope ment upon sufficient content. OD 1/4 race for 5% development to 1/4 races for 10% development; x x alope races.

Below 10, the reciprocal time rates are somewhat less sensitive to change in pH. The $D_{\rm max}$ obtained for complete development decreases somewhat with decreasing pH. To compensate for this, all slope rates were coprected on a proportional basis to represent a $D_{\rm max}$ of 2.00.

In Figure 5, both rates are plotted as a function of pkl, and are compared with the concentrations of the singly, and doubly ionized hydroquinone present in the solution. These concentrations, plotted as Curves b and c were calculated on the basis of the following dissociation constants for hydroquinone pK₁ = 10.0, pK₂ = 11.8. Ten percent of the hydroquinone is in the singly ionized form at pH 9.0. This increases to a maximum at pH 10.8 and thereafter decreases because of the increase in degree of double ionization. Only one ten-thousandth of the hydroquinone is doubly ionized at pH 9.0, but one-

tenth is doubly ionized at pH 11.0, and ionization is

nearly complete at pH 13.

A single line is drawn through the development rates above pH 10.0 which are plotted in Figure 5. Below this pH, the curves for the slope rates and reciprocal time rates may diverge. The slope rates are proportional to the concentration of doubly ionized hydroquinone below pH 10, and hence the relative rates can be made to coincide with Curve b in Figure 5 by multiplying them by a suitable factor. The reciprocal time rates fall on a curve (broken curve) calculated on the assumption that

T.O. Have proposed to the second seco

Riff. 5. Alace of development compared with the deliver of ignitation of hydroquinone as a function of the Carter b. Easty ionized bydroquinone; Curve c, deliver scaled bydroquinons; A.A. slope rates; O.C. and the state of the control of the cont

singly ionized hydroquinone can act as a developer, but that the doubly ionized hydroquinone is 188 times more effective. Above pH 10, the rate of development is smaller than that predicted by Curve b or by the broken curve. This can be explained on the basis of the charge-barrier effect, as will be shown in the discussion.

The effect of temperature upon the rate of development by hydroquinone was measured over a temperature range of 12-34 C, and at pH values of 9.3, 11.0, and 12.9. The experimental data are given in Figure 6 and in Table II. As indicated by the figure, the maximum density obtained decreases somewhat with decreasing temperature. To compensate for this, the slope rates were corrected on a proportionality basis, as indicated in Table II.

The apparent activation energies were determined from an Arrhenius plot of log rate vs reciprocal of the absolute temperature (see Figure 6). The uncorrected values determined from the slope rates are 19.3, 15.4, and 10.3 kcal/mole for pH 9.3, 11.0, and 12.9, respectively. When these values are corrected on the basis of equal total change in density, they become 18.9, 14.3, and 8.0 kcal/mole. These values, however, are complicated by the heats of ionization of the hydroquinone. The degree of ionization of hydroquinone increases with increasing temperature, and Baxendale, Haidy, and Sutcliffe¹ give the heats of dissociation for the first and second ionizations as 5.3 ± 0.8 and 5.9 ± 0.5 kcal/mole. Using these values, and assuming that the divalent ion is the active species in development, we obtain the following corrected values: 8.5, 8.8, and 7.4 kcal/mole for pH 9.3, 11.0, and 12.9, respectively. The corrected apparent activation energy, thus, is essentially independent of pH. The activation energies calculated from the reciprocal time rates are lower than the values obtained from the slope rates, and average about 5 kcal/mole (see Table II).

The temperature-dependence of fog formation by the hydroquinone developer was determined at phi 12.9 over the same range of temperatures. The temperature coefficients and apparent activation energies are listed in Table II. These activation energies (22 kest/mole for

mich is the this direction of the product of the service of the se 7. The magnitude of the effect is so great that reliable rate measurements could not be made in the presence of the quaternary salt above a pH of 9.0 with the present equipment. The maximum density obtained in the presence of the quaternary salt was greater than than obtained in its absence, and analysis showed that the increase in density was accompanied by an increase in reduced silver. Some experiments carried out at pH 8.8 showed that sulfite still exerts a marked retarding effect upon the rate of development in the presence of the quaternary salt. For example, the addition of 3.9 grams of sulfite per 500 ml of reaction mixture increased the time required to complete 10 percent of the reaction in the presence of 0.001 M quaternary salt from 2 seconds to 10 seconds; it increased the time required to complete 50 percent of the reaction from 5 seconds to 22 seconds.

Discussion of Results

In comparing the results obtained in the present work with those previously obtained with coated film, certain differences are apparent. In the previous work with coated film, 2,5 the exposures were well on the shoulder of the characteristic curve, nearly all of the grains were developable, and the dependence of the photometric equivalent upon the extent of development indicated that the measured rates of development were primarily those of development of the individual grains. This interpretation was supported by the results of microscopic examination of the grains at various stages of development, and by the effect of partial predevelopment upon the bromide-ion sensitivity of the developer. In the present work, the dependence of the photometric equivalent upon the degree of development is much smaller, indicating that the measured rates are much more dependent upon the rate of initiation of development of the individual grains. The fact that the photometric equivalent is not constant shows that some increase in average particle size is occurring as development progresses. The measured rates in the liquid emulsions thus are dependent both upon the rate of initiation of development of the individual grains and the rate of continuation of development of those grains, a situation comparable to that previously found in the development of the toe and lower straight-line portion of the characteristic curve of the coated emulsions. In the present work, the calculated reciprocal time rates may correspond very closely to the rates of initiation of development of the most readily developable individual grains.

The importance of the charge effect in determining the measured rate of development of the liquid emulsions is shown by the marked acceleration obtained by adding the quaternary salt. It proved impossible to obtain reliable kinetic measurements in the presence of the quaternary sale at pH above 9 with the present apparatus because of the limit sadous imposed by the rate of mixing of the sensule. It is possessibly that its pH R is the addition of the quaternary full light nor estimate quintum.

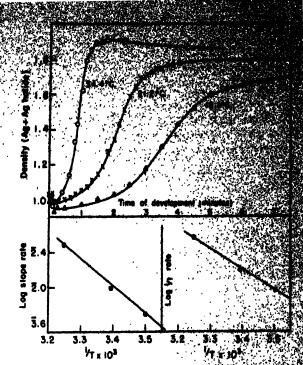

Fig. 6. Upper part: density vs time of decurves at temperatures specified, pH 11.0. L Arrhenius plots of data derived from upper curve

catalysis, and this suggests that something more than the charge effect is involved in this catalysis.

The dependence of the slope rates upon the pH over the pH range, 8.9-9.8, can be accounted for satisfactority pa the assumption that the bivalent ion of the hydrogal-none is the active developing agent. The dependence of the reciprocal time rates suggests that the univalent ion plays some part in the induction period region, but the specific rate of development by the bivalent ion is still much larger. The charge effect might be expected to greatly favor the univalent ion over the bivalent ion in the initiation of development of the individual grains and, hence, the univalent ion would take a relatively more prominent part in determining the reciprocal time rates than in determining the slope rates

The fact that the measured rates cannot be accounted for quantitatively over the entire pH range by any sumed linear combination of univalent and bivalent icu rates suggests that some additional factor is involved The measured rate at pH 12.0 is only about one tent that calculated by extrapolation of the rates measure in the pH range, 8.9-9.8, as shown in Figure 5. A qualitative explanation of this discrepancy can be given on the basis of the charge effect. At pH 12.0 and showed concentration of bivalent ion exceeds that of unitable concentration of bivalent in exceeds that of unitable concentration of bivalent in exceeds that of unitable concentration of bivalent in the case in the case is the concentration of ion and charge effects will be particularly impedetermining the over-all rate. At the lower all the charge on the grain surface is determined. by the bromide ion in the absence of modifications. the quaternary ions. At high pH, however of hydroxyl ion may contribute a stg the net charge. Chromatographic and out by Vanselow and James show clist concentrations as low as 0.001 M (all splaces the merocyanine die 54 (3 eth illiazolylidene) ethylidene 3 methyl 4 s

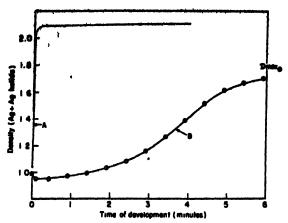

Fig. 7. Effect of lauryl pyridinium p-toluenesulfonste upon development of liquid emulsion by hydroquinone in the presence of sodium sulfite at pH 11. Curve A, 0.001 M lauryl pyridinium parts added; Curve B, no addition.

5-pyrazolone, from the silver bromide surface and, hence, is adsorbed to a significant extent. As the hydroxyl-ion concentration increases from pH 11.0 to 13.0, the amount adsorbed increases and, hence, the rate of development

should be depressed to an increasing extent.

The dependence of the temperature coefficient of development upon the pH of the solution is that to be expected if the specific rate of development by the bivalent ion is much greater than that by the univalent ion. When the apparent activation energies calculated from the temperature coefficients are corrected for the heats of ionization of the bivalent form, the resulting apparent activation energies are essentially independent of pH. The corrected values for the reciprocal time rates vary between 4.2 and 6.2 kcal/mole with an average of 4.9, and can be considered constant within the limits of experimental error. This is roughly the activation energy

expected for a diffusion-controlled process. It may be postulated that the rate-controlling step in the initiation of development of the exposed silver halide grains under the conditions employed is the diffusion of the developer ions through the electric double layer sucrounding the grains. The first-order dependence of rate upon concentration and the marked acceleration produced by the quaternary salt are entirely consistent with this postulate. It is possible, however, that the value 4.9 represents the apparent activation energy of the chemical reaction in which the catalytic action of the latent image is most efficient. The apparent activation energy calculated from the slope rates is 7.4-8.8 kcal/mole, which is high for a diffusion-controlled process, and probably represents the activation energy-required for the development of grains which have smaller or less accessible latent-image centers than the ones represented by the first 5-10 percent of the course of development.

The activation energy calculated for the fogging reaction (reduction of unexposed grains) is 12 kcal/mole for the first 5-10 percent. The value calculated from the slope rates is much higher, i.e., 21.5 kcal/mole. Thus, it appears that the reduction of the most easily fogged grains has a considerably lower energy of activation than the reduction of the grains represented by the later portions of the reaction curve. The "more easily fogged" grains may be those with relatively large sen-

sitivity centers.

REDUCTONE AS A PHOTOGRAPHIC DEVELOPER

Olus J. Stewart*

JULER and Martius isolated glucoreductone in 1933 and established its empirical formula, C₈H₄O₈. They noted its high reducing power, particularly in acid solution. Since no carboxyl group was present, Euler attributed the strongly acidic character to an enolic configuration and assigned the constitutional formula, HO - CH = COH - CHO. In view of the discoveries that both Vitamin C (ascorbic acid)2 and Isovitamin C2 are developers, it now is not surprising to learn that reductione, a closely related compound, also has developing properties. The ability of reductone to develop latent images was still more to be expected after inger's pointed out that reductone, a readily oxidized desponed, should be able to develop exposed sensitive

*Department of Chemistry, University of Kentucky, Lexington, Kantucky. Rechivel 25 August 1952.

material because its atomic configuration conformed to the newly formulated developer rule. About the same time the Wilmanns and Schneider invention proposed to use developers which contained in their molecules the atom grouping - 00 - CHOH - or its tautomeric form - COH = COH -. However, reductone was not among the developers mentioned.

In order to prepare a reductone developer it is necessary, pending the establishment of a commercial supply to synthesize the compound by the method of Euler and Martius, for example, or a modification thereof. Thus one may (a) prepare the chemical and use the purified crystals in the developer formula, of (b) after synthesizing the compound, omit the separation and purification processes, and simply employ the crude reaction mixture in the developer. Both of these procedures will appear in the following developer sarmulas.

PHOTOGRAPHIC SCIENCE AND TECHNIQUE

Reductione developers can be formulated to exhibit the unique property of yielding directly, without toning, warm sone, brown or even reddish prints. Perhaps the 'most practical way to describe these reductone prints in words is so compare them with the well-known warm tone prints which result directly when Kodak Athena paper is developed with Kodak Developer D-52. This project is here put into effect by presenting examples which, sogether with pertinent data, follow each reductone developer formula. It should be stated also that in preparing these examples, all photographic papers used were exposed through the same negative, and in the same contact printer.

REDUCTONE DEVELOPER R-1 FOR PAPERS

Water, about 50C	800 0 ml
Sodrum carbonate, monohydrate	27 0 grams
Sodium hydroxide	6 8 grams
Sodium sulfite, desiccated	15 0 grams
Reductone, crystals	1 0 gram
Potassium bromide	4 0 grams
Water to make	1 0 liter

Example 6. Exposed Kodak Azo E 15 seconds, developed 10 minutes with Reductione Developer R-1 (1:2 water, 20C) The paper stock remained white, the image was brownish and more warm toned than Example

Example 59 Exposed Kodak Athena 15 seconds, developed 20 minutes with Reductione Developer R-1 (1 1, about 20C) The face of the paper stock was slightly tinted, and the image was more warm toned than Example 69

Example 69. Exposed Kodak Athena 15 seconds, developed 2 minutes with Kodak Developer D-52 (1.1, 20C). The print was warm toned, and the paper stock was slightly tinted

Heat 2.5 minutes at 91-93C Cool quickly.

Solution B

Water (about 50C)	400 0 ml
Sodium sulfite, desiccated	45 O grams
Hydroquinoue	12 0 grame
Potassium bromide	4 O grams

Cool, mix with Solution A and dilute to I liter.

When alkali and dextrose are mixed at 91°, a rise of comperature will be observed, indicating an exothermic chemical reaction. The Euler and Martius procedure specified persistent cruises on a parently, however, glocused states. absence of cyanide; with alight million form of a Canningary reaction

Emmple 37. Exposed Kodak And E 24.1 developed 5 minutes with Reductane De (20C) The silver image was warm moved and than Example 69. The paper stock was not tinted

Example 38. Exposed Kodak Athena B 30 arou and developed 6 minutes with Reductone Developer (20C). The print was warm toned, and browner Example 37. The paper stock was tinted.

REDUCTONE DEVELOPER R-4 FOR PAPERS

Reductone Developer R-2 Sodium acetate, desiccated
Acetic acid (28%), add until the solution turns bloc kee Sodium carbonate, monohydrate; add until the solution times pink; litmus paper blue. The pH of the developer will then be about

To use, immerse the exposed paper in the Reductorie Developer R-4 for about 15 minutes, the time and remain perature being relatively unimportant. A suitable container for the developer is an ordinary beaker, and a 4 × 5 paper will require a full 600 ml beaker. The paper then will not float. No image will appear during this time After 15 minutes, remove the paper, drain, and let dry face up The image should begin to appear within one half to one hour, depending on the pli and the degree of exhaustion of the developer. If the image does not begin to reveal itself, add a gram of sodium carbonate, if it appears too soon, add a drop or so of acetic acid (28%). Let the image develop in the air for an hour, or until completely developed. If the paper becomes comparatively dry, and development is incomplete, soak the paper in the developer a second time for a few minutes, and again let it dry. When development is complete, place the print in the thicsulfate solution, avoiding the stop bath.

The developer, with use, tends to become more scidio due to the acidic nature of the oxidation products. This tendency is opposed by the buffer, sodium accuste, and it may be corrected readily by adding small quantities of sodium carbonate from time to time as needed.

Example 73 Exposed Kodak Azo E 15 seconds, and immersed the paper in Reductione Developer R-4 15 minutes (about 27C). On drying, the first indication of an image appeared in 38 minutes. After an additional drying period of 33 minutes, the print was soaked again in the developer for a few minutes, and dried further for one hour and 45 minutes. The image was not merely warm toned; it was entirely brown, or possibly reddish, i brown in color, with no trace whatever of black, the dee shadows being a very dark brown. The paper stock was not tinted, and there was little or no fog.

THE USE OF PROTEOLYTIC ENZYMES FOR THE REMOVAL OF GELATIN FROM FILM BASE

Eugene Gansel*

ABSTRACT

In the reclamation of used film base, the process of separating the emulsion and noncurling gelatin layers from the plastic support must be controlled if the recovered material is to be re-usable. The most common methods of reclaiming film scrap have been evaluated. The use of proteolytic enzymes for the removal of gelatin layers from photographic films has been investigated. Economic use of these new "organic catalysts" and the need for satisfactory evaluation procedures and rigid process controls are discussed.

HE PURPOSE of the present study was to establish a reliable analytical method for the evaluation of commercially available proteolytic enzymes used in the removal of gelatin coatings as well as gelatin silver halide layers from photographic materials. It is only difficultly possible to remove such layers with straightforward chemical means (hot detergents, oxidizing agents, dilute acids, alkalies, salts, etc.). These procedures leave much to be desired.

In the main, film base consisting of cellulose esters is apt to be rather badly deteriorated by those drastic chemical treatments. As the result of the customary chemical treatments for the removal of gelatin, essentially two defects are inflicted on the film base (a) oxidative degradation, (b) hydrolytic decomposition of the cellulose esters. In both instances the reutilization of the reclaimed cellulose ester is jeopardized. The favorable solvent solubility of the original cellulose ester is generally impaired by the formation of carboxyl groups and hydroxyl groups respectively. In the latter case partial de-esterification takes place leading to a type of regenerated cellulose which is highly undesirable in the solvent soluble cellulose acetate dope. Such improperly reclaimed film base evidences itself in slugs, swollen particles, fibers, in a heterogeneous and often badly discolored dope. Experts in cellulose ester technology know how difficult and costly it is to purify such initially poor film dopes. It is therefore important that chemical degradation of the cellulose ester base is held to s minimum.

By the use of enzymes much more favorable, i.e. milder, recovery treatments at moderate temperatures may be afforded. Inadvertently, an improved film base material is recovered from photographic scrap. The use of enzymes has brought about efficient recovery procedures which make oxidation or over-treatment virtually impossible as these conditions would decompose whe enzyme itself and thereby nullify its action.

It seems appropriate to give a brief definition of ensymes in general and of proteolytic enzymes in parcicular. Enzymes are water soluble, colloidal, organic estalysts produced by the living organism. Proteolytic enzymes are those that act on proteins or are specific for according hydrolysis. It would go beyond the intent of

Amon Research Laboratories, Binghamson, New York. Presenced it the Risk Stational Convention in New York, N. Y. 15 August 1952. Received 7 August 1952.

this discussion to dwell upon the hundred year history of enzymes. Suffice it to mention that Pasteur still preached in 1870 that enzyme action was dependent on living cells, until Buechner in 1897 completely disproved Pasteur's vitalistic concept by showing that enzymes can be made to act in fermentation reactions without the presence of cell structures. Today enzymes are grown in chemical plants, just like penicillin molds, isolated and crystallized. Presently, many hundred of enzymes are known; however, only a relatively small number has found its way into industrial processes. 2,4,4,8

Enzyme Action

One of the more important processes to which enzymes have been put to work was the desizing of cottons and synthetic yarns. This was done with amylolytic enzymes, those that specifically work on the digestion and hydrolysis of starches and starch gums into easily soluble sugars. The proteolytic enzymes came later into prominence. The degumming or defibrination of the natural silk fiber, long a process done by soaping and harsh alkali treatments, was ultimately replaced by the superior enzymatic degumming. Many more examples could be cited but the following should serve as illustrations:

Starch	Diastase	Hydrolysis to maltose
Sugar	Invertase	Hydrolysis to dextrose and levulose
Fat	Lipase	Hydrolysis to fatty acids and glycerol
Urea	Ureasc	Hydrolysis to ammonia and CO2
Protein	Protease	Hydrolysis to amino acids
H ₂ O ₂	Catalase	H ₂ O and oxygen
Luciferin (Firefly)	Luciferase	Bioluminescence
Intestinal Worms	Ficin	Protein hydrolyzages.

While the first five examples are drawn from industrial processes, the last three belong to the field of bipchemia try. 43,10

PHOTOGRAPHIC SCHOOL AND TRENCHOUS

Entrying the most remarkable substitutes. To understand their action on music backs summating of their properties. They are amenty colloidal in sauce and are proteins themselves. Thus far they have evaded the tripable chemist. No enzyme has been synthesized as yet. They are dependent on suitable substrates which in former times have been confused with nutrients. Because of this specificity an amyolytic enzyme would be quite ineffective on a protein substrate and vice versa a proteolytic enzyme would not be usable for the hydrolysis of starch. However, the picture is quite complex as it is frequently with nature's products. Many commercially produced enzymes are mixtures of individual enzymes which react on several substrates

Esterification by Proteolytic Enzymes

An enzyme, as a true catalyst, is capable of hydrolysing a suitable substrate into smaller molecular aggregates. Also the reverse is possible. An enzyme is capable of synthesizing a larger molecule from simpler components. In nature, e.g. in the animal organism, such syntheses are carried on regularly. And in the laboratory the formation of ethyl butyrate from ethanol and butyric acid in the presence of lipase, a proteolytic enzyme obtained from the pancreas gland, has been accomplished.

In the present work the confirmatory observation was made. A fruity and pleasant smelling ester was produced when enzyme-gelatin digests were allowed to stand in contact with ethanol at room temperature for several hours. The indication was that we obtained the synthesis of ethyl citrate by proteolytic enzyme catalysis on the liberated citric acid from the citrate buffer and the ethanol present in the mixture whose pH had been allowed to drop on the acid side.

Influence of Substrate

Being concerned with the evaluation of several commercially available proteolytic enzymes, it was logical to think of casein as a suitable substrate. It is a protein obtainable in rather pure form from milk. Also a number of enzyme evaluation studies have been based on casein hydrolysis. Northrup's casein solubilization procedure is probably the best known 2,4,4

The evaluation work started out with casein and compared the effect of enzymatic action with that on gelatin Surprisingly the results were very divergent. Below are listed 6 proteolytic enzymes in their order of rank in regard to activity. They were tested under carefully controlled conditions.

Casein Hydrolysis		Gelatin Hydrolysis			
Enzyme A	90%	Enzyme A	99%		
D	80%	" D	98%		
'' C	. 75%	E	90%		
" D	73%	" C	80%		
" B	62%	" В	70%		
" P	45%	'' F	50%		

The rank order esbalation shows how an erroncous conclusion would be drawn if a certain enzyme were to

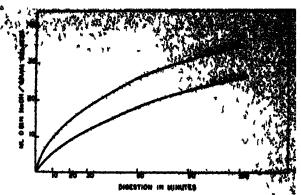

Fig. 1. Reaction velocity of Rhosyme P-11 entymest 40C on 4.3% gelatin solution (pH 8). Detarmined in formol titration.

be tested by the casein hydrolysis method if it is intended to be used for gelatin removal from film base. We set tribute the observed difference in behavior to the different ent chemical composition of the two proteins.

	Cascin		Gelatin	, , ,
Neutral Amino Acids		52 0%		75.0%
Glycine Alanine, Serine Valine, Leucine Proline, Oxyproline Tyrosin & others	0 5% 8 5 22 0 11 0 10 0		24,0% 11.0 6.0 32.0 0.0	
Basic Amino Acids				
Histidine, Arginine, Lysine		15 0%		18 0%
Dicarboxylic Amino Ac	ads			
Aspartic & Glutamie Acids	C	33 0%		9.0%
		100 0%	•	100,0%

Therefore efforts were concentrated on working out a procedure for testing enzymes in their action on gelatin exclusively.

Reaction Velocities

An enzyme, being a catalyst, speeds up the hydrolysis of gelatin tremendously. It was found that the measurement of the initial hydrolysis is more important than to follow the reaction through to an end point or to a maximum which is asymptotically reached. Figure 1 illustrates the point.

In the first 5 minutes of digestion time hydrolysis of the gelatin is more than doubled. At 10 minutes digestion time proportionate conditions prevail, whereas it longer digestion periods proportionality no longer labels. The curves flatten out to reach maximum values where 3 hrs. digestion time. From these curves it is seen that enzymatic attivity rates decrease with time. Only in those cases where enzymes of very low activity where tested did the activity-time relationship approach, a linear function.

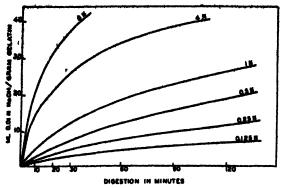

Fig. 2. Effect of enzyme concentration on velocity of gelatin hydrolysis. Data are for Rhozyme P-11 at 40C using 4.3% gelatin solution (pH 8), determined by formol titration.

Enzyme Concentration

With large enzyme concentrations the rate of reaction proved to be almost uncontrollably rapid in the initial stages of the digestion. However, doubling the enzyme concentration does not necessarily double the reaction rate. Figure two shows that in order to attain the same level of hydrolysis (e.g. 40 ml 0.01 N NaOH per g gelatin) enzyme concentrations of 8%, 2%, 1%, 0.5% will require 5 min., 10 min., 75 min., and 135 min. digestion time. This means that the corresponding reciprocal digestion times or reaction velocities will range in the order of 200; 100; 13; 7; for the above concentrations. With other words: To double the reaction rate, the enzyme concentration must be quadrupled.

Substrate Concentration

As most test methods are based on 4 to 5% gelatin concentrations, standard 4.3% gelatin solution was adopted for our tests.

In the literature it has been reported that both low and high substrate concentrations will impair enzyme activity. A somewhat analogous observation was made in one of our experimental series. See Figure 3. Three different gelatin concentrations (0.43%, 1.16%, 4.3% were subjected to the same enzyme concentration (8% based on gelatin content) at the standard digestion conditions at pH 8 and 40C.

At equal acidity levels (e.g. 100 ml 0.01 N NaOH per g gelatin) the three gelatin substrate concentrations show these relative reaction velocities:

	Reciprocal of Digestion Time × 1000
0.43% Gelatin	5
1.16% ''	30
4.30% ''	13

The medium gelatin concentration showed highest enzymatic activity in the experiment.

Influence of pH

Proteolytic enzymes are said to be most active over a wide pH range. Experiments (see Figure four) showed

the very decided preference for pH 8. The curves for the 2% enzyme concentrations illustrate that the same acidity or hydrolysis level of substrate is reached in 12 minutes at pH 8, whereas it takes 55 minutes at pH 5. Similar results were obtained with 1% enzyme concentrations! If expressed in relative reaction velocities (Reciprocal of Digestion Time × 1000) the following figures ensue:

	Relative Read 2% Enzyme	tion Velocity 1% Enzyme		
At pH 8 At pH 5	90 20	3 0		

The data indicate that the reaction velocity is more than 4 times greater at pH 8 than at pH 5.

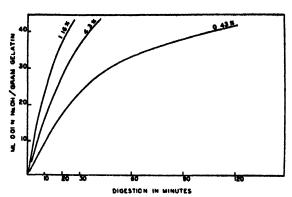

Fig. 3. Effect of gelatin substrate concentration (pH 8) on the velocity of hydrolysis using 8% Rhozyme P-11 at 40C (based on gelatin content). Determined by formol titration.

Influence of Temperature

Reaction rates of enzymatic digestions are materially influenced by temperature. A 10C rise for example, from 40 to 50C, may increase the rate of reaction from 1.5 to 2 times.

Experiments were carried out at 40C, allowing a plus minus deviation of 1C. Realizing that this much temperature variation may influence the activity results as much as 15%, careful temperature control was exercised in the evaluation runs. No attempt was made, however, to determine the temperature optima for all the enzymes which were investigated. To limit the work, 40C was arbitrarily selected with the understanding that the testing was on a rather broad temperature plateau of activity which would be unencumbered by inactivation effects frequently encountered at or near the optimum temperature.

Influence of Hardening Agents

In photographic emulsions various hardening agents are used in order to render the sensitized layers less injurious to mechanical abrasion. These hardeners which are mainly aldehydes render gelatin less soluble or even insoluble. If this hardening action proceeds too far, a leather-like gelatin resin is produced which requires drastic treatments to remove in the film scrap recovery process. How gelatin behaves under the influence of an aldehyde hardener is illustrated in Figure five.

Equal Money Value Compensons

For practical reasons the 6 different entymes invostigated were brought on one and the same economic dememinator, they were tested in concentrations of equal money value equivalents:

32:00% Scrizyme Regular 20:00% Rhozyme PF 11:00% Scrizyme Concentrated 2:16% Takamine #1 2:16% Takamine #2

2.00% Rhozyme P-11

These concentrations were reacted on 4.3% gelatin substrate at pH 8 at 40C. The degree of gelatin hydrolysis was measured as acidity increase by means of the formol titration procedure which will be explained

The results, plotted in Figure six, illustrate the high reaction rates in the early period of the digestion runs. Here the activity differences of the various enzymes show up most decidedly. The data also emphasizes the need to rely on the results of short digestion runs rather than on periods in excess of 1 hour.

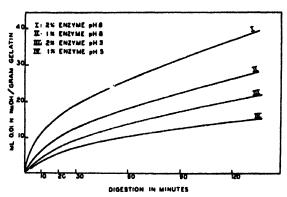

Fig. 4. Influence of pH on velocity of gelatin hydrolysis by Rhozyme P-11 in 1% and 2% concentrations at 40C. Determined by formol titration.

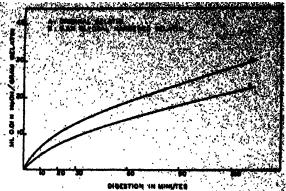

Formol Titration

A modification of the original Socrensen formol titration was worked up in the present study. 6,7 The method is based on measuring the apparent free acidity formed in the hydrolysis of proteins. This is accomplished by arresting further hydrolysis with formaldehyde addition and titrating the acidity with standard alkali. A blank digest is run under the same conditions. The difference of sample from blank acidity is the increased acidity and expressed in terms of ml 0.01 N NaOH per g gelatin. For the theoretical background of the method the original literature must be consulted as it would be outside the scope of the present discussion. 46,6,7,8

The following is a condensed version of the modified formol titration procedure used in these experiments.

Apparatus

A double necked 500 ml flask is clamped to a constant temperature water bath adjusted to 40C. Through one

Influence of gelatin hardening to the velocity of hydrolysis by Rhozyme P-11.

neck of the flask, an electrically driven glass propeller is inserted. Through the other neck a thermometer extends to the bottom of the flask for measuring the temp perature of the digestion mixture. By way of the same neck all charging and withdrawing of solutions is done. The digestion mixture is made up outside the digestion flask. A cut-off recalibrated 50 ml piperte is held in readiness for withdrawing aliquots from the digest at regular time intervals.

Solutions

Buffer Solution (pH 8)

22 g Citric acid monohydrate

13 g Caustic soda pellets

28 g Na₂HPO₄.12H₂O

5 g Boric acid

made up to 1 liter with distilled water and pH adjusted prior to making up to final volume.

Formaldehyde-Phenophthalein Solution

450 ml 40% Formaldehyde (Du Pont) 72 ml 1% Phenolphthalein in ethanol

0.5 N NaOH Solution

1% Enzyme Stock Solution

5 g of the enzyme to be tested are weighed to the nearest 0.01g and transferred to a porcelain mortar; With small amounts of water a paste is ground and transferred with repeated portions of water to a 500 ml volumetric flask. The stock solution is kept refrigerated. Before pipetting an aliquot portion, the contents of the flask are well shaken but not filtered.

Procedure

As substrate a 4.3% (photographic grade) gelatin solution is made up by soaking 15 g in 150 ml distilled water of room temperature for 30 minutes in a 500 mil Erlenmeyer flask. The swollen mass is melted on a steam bath by swirling the flask. The solution is cooled to 45C and transferred into the double necked flask. For rinsing the Erlenmeyer, 150 ml water of 40C is used in several portions. 60 ml pH 8 Buffer Solution are added. Agitation is started and the temperature is adjusted to 40C. The digestion volume is now so adjusted that the volume will be 320 ml. Lastly, a 30 ml aliquot of the 1% enzyme stock solution is pipetted into the digestion fiasi This instant is noted as the digestion start. The final digestion volume should now be 350 ml.

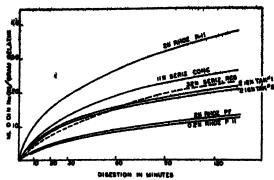

Fig. 6. Hydrolysis rates of different enzymes in concentrations representing equal material cost.

In intervals of 5, 10, 20, 30 and 60 minutes 50 ml withdrawals are made with the cut-off pipette using a vacuum line for quick aspiration. The digest withdrawals are run at once into 250 ml Erlenmeyers, each containing 22 ml of the Formaldehyde-Phenolphthalein solution. The action of formaldehyde stops all digestive action at the instant of pipetting the digest aliquot into the Erlenmeyer flask.

Titration.

The titrations of the 5 Erlenmeyer flasks are conveniently made at the end of the digestion run. Each 50 ml aliquot representing ¹/₇ of the original 15g gelatin present should titrate from 3 to 7 ml 0 5 N NaOH depending upon the degree of hydrolysis.

Blank

In the same described manner a blank run is made in the double necked digestion flask. But instead of adding the 30 ml enzyme aliquot, 30 ml water are used.

Calculation

The titration value of the blank is subtracted from the titration value of the sample. This difference is converted into ml 0.01 N NaOH per g gelatin and plotted on graph paper using 2-inch spacings for each 10 ml 0.01 N NaOH on the ordinate and 1-inch spacings for each 10 minute time interval on the abscissa. In such a large scale graph, the values, particularly those at the lower

part of the thirt, can be satisfactorily read for deter-mining the alope of the curve.

A protectivite entyme giving a formal theiride value of more than 5 ml 0.01 N NaOH per g gelacin in 5 min-utes digestion time is considered an effective enzyme. It shows the following titration and hydrolysis values:

Digestion Time	0.01 N NaOH per g gelatin	Hydrolysis
5 min,	5.5 ml	52.0%
10 "	10 5 "	61.5%
20 ''	17.5 "	73.0%
30 ''	23 5 "	82.5%
60 ''	35 7 ''	97.0%

The hydrolysis values were obtained by Bogue's ethanol precipitation method.

Summary

A procedure is presented for the quantitative evaluation of the activity of commercial proteolytic enzymes. The procedure is based on the formol titration method and is characterized by its relative simplicity. The procedure was tested on enzymes obtained from Rohm & Haas, Takamine Labs. and Wallerstein. The procedure is capable of measuring the activity retarding effect of hardened gelatin as it would be encountered in photographic films.

COLD STORAGE OF PHOTOGRAPHIC FILM

J. M. Calhoun*

IN ABCHNT YEARS there has been an increase in the use of refrigerated storage for unexposed photographic film supplies to avoid or reduce undestrable changes which can occur due to prolonged storage at elevated temperatures. Questions frequently asked are: Must the tempersonne be kept above 32 P? Does moisture condensa-

* Eastman Kodak Company, Rochester, N. Y. Received 7 July 1952.

tion occur inside the package? Can the film be harmed in any way by refrigeration? It is the purpose of this article to attempt to answer these questions, explain the principles involved, and to dispel some commonly held fallacies concerning the cold storage of film.

It is well known that photographic films, regardless of the manufacturer, are perishable. Changes in speed and contrast (usually a decrease) and a gradual growth of

orogeaphic schnes, and then

fog docur mith sign. This is particularly melans with multilayer color films because the charles printing of one layer may change at a different rate than-those of another layer and so upset the color balance of the film.

Adverse storage conditions can cause much greater changes in film properties in a relatively short time than would ordinarily occur during the entire dated life of the film when stored at ordinary room temperatures, for example, not above 75 F. A lowering of the storage temperature definitely retards these changes and, therefore, preserves the characteristics of the film in a more nearly fresh condition. It is for these reasons that the film manufacturer recommends proper storage conditions for his product, and prints an "expiration" date on the package so that the film can be used before it has become too old.

Expiration Dating

The "expiration date" assigned to films by the Eastman Kodak Company, for example, is determined by storage tests made at a variety of temperatures and relative humidities. The dating is ascertained on the basis of the time a given product will withstand average or typical trade storage conditions in the United States, and still yield a satisfactory result. It does not mean that expired film which has been stored at these conditions will produce results identical with fresh film. The time to expiration varies depending on the properties and requirements of the particular product

Protection from Moisture

Moisture and heat are the two factors in film storage which contribute most to deterioration. The moisture content of film as it leaves the factory is very precisely controlled at just the right level to insure the best possible performance. This moisture level, which corresponds to equilibrium with air at a relative humidity varying from 40% to 60% for different types of film, should remain constant during storage. Higher relative humidities accelerate deterioration and cause various physical defects. Lower relative humidities increase the susceptibility of film to static markings, curl, brittleness and so forth. Fortunately, film can be protected from moisture damage by the manufacturer through the use of vapor barrier packaging.

Moisture vapor protection for film has been improved greatly in recent years so that now most films after first being conditioned at the desired humidity are packaged in sealed metal cans or tubes, sealed foil bags, or other suitable vapor barriers. Until such packages are opened, moisture from humid air or damp storage locations, even in tropical climates, cannot penetrate and harm the film. Of course, all films are not completley protected from moisture by perfect vapor barriers and the photographer should know, either by the construction of the package or by the recommendations of the manufacturer, whether his film is completely protected from moisture vapor or not.

Protection from Heat

The protection of film from heat during storage is something over which the film manufacturer has no con-

reight and i this store as a pear that the higher in a practice of the higher representation of the comparations of the store of

For certain special films such as some high special black-and-white films, some color films, etc., or in the where longer storage periods are desired, still letter temperatures are recommended, for example, a period ature of 0 F. In this way maximum quality in even the more critical products can be maintained for longer periods of time, often well beyond the expiration daring of the film.

Refrigeration

Film can be stored safely in any suitable refrigerator, provided that the film is sealed in a vapor-right package or some tassee. Refrigerators are frequently humid, particularly household refrigerators containing foods and liquids, and film stored in unsealed or porous packages will absorb moisture from the air and damage may result. Film which is not factory sealed in vapor-tight packages should be placed in a can or jar which can be closed with an air-tight lid before it is put in the refrigerator.

Household refrigerators usually operate at about 40 F to 50 F and are quite satisfactory for the storage of most films, with the proviso mentioned in the preceding paragraph. For specially sensitive films, or films to be stored for extensive periods, a deep freeze unit of the type available for frozen foods operating at 0 F to -10 F. is recommended.

Does Water in Film Crystallize Below 32 F?

The answer to this question is "no," at least insofar as film at its normal moisture content is concerned. The question is asked frequently because people know that water in food does crystallize and unless food is quickly frozen the ice crystals may be large enough to rupture the cell walls which promotes spoilage. At first glance it might seem that a similar process could occur with film and the sensitive emulsion be damaged.

While the water content of fruit and vegetables is of the order of 90%, the water content of a typical photographic emulsion in equilibrium with air is much less² as indicated below:

Relative Humidity
of Air

20%
50%
80%

Requisibrium Moisture Content
of a Photographic Ramision

5%
5%
5%
15%

This is undoubtedly the reason that ice crystals or damage from ice formation has never been found in photographic film stored at below freezing temperatures. The small amount of moisture normally found in photographic emulsions or in dry gelatin is not present in the form of liquid droplets but is molecularly adsorbed

within the colloid. Furthermore, studies made by Moran³ have shown that gelatin solutions containing less than 34% water cannot freeze at any temperature

down to that of liquid air.

Laboratory experiments have been designed to verify the safety of storing sensitive films at low temperatures. In one experiment made by the Eastman Kodak Company in 1939 several types of film were stored for three weeks completely surrounded with dry ice (solid carbon dioxide) in an insulated container. Thermocouples indicated the film to be at a temperature below -100 F. After removal the film was subjected to microscopic examination and no change in the emulsion structure found. Exhaustive photographic tests, and physical tests made on the film before and after processing, showed no detrimental effect of any kind. Since that time there has been considerable practical experience in the storage of film at low temperatures, in some cases for as long as three years at -10 F. Never has any detrimental effect been found, provided that the film was protected from the penetration of moisture vapor from outside the package. It makes no difference whether the film is cooled slowly or is quickly frozen in dry ice, or how low a temperature is used.

Dry ice has been used by the Eastman Kodak Company to ship various color films to different parts of the United States in hot weather without loss of quality. Dry ice has also been used satisfactorily to protect color motion picture film from heat during air shipment from a production location in Australia to Hollywood for proc-

essing.4

Condensation When the Package Is Opened

Moisture must not be allowed to condense on sensitive photographic film or injury may result. It is well known that moisture from the air condenses in droplets on a cool surface, such as the outside of a glass of cold water. Moisture condenses on a surface when the temperature of the surface is below the dew point of the surrounding air. The dew point of air is determined by its moisture content and may be as low as 10 F inside a heated building in winter, but in summer it may be as high as 75 F in temperate climates and 90 F in tropical climates. Moisture from the air will condense on an object removed from a refrigerator operating at a temperature below the outside dew point.

Moisture condensation on film removed from a refrigerator may be prevented easily by allowing the package to warm up to room temperature before it is opened. The warm-up time depends on the thickness of the package, how well it is insulated, the temperature difference, etc. For film in commercial packages the approximate

warm-up time is as follows:

	Warm-Up Time			
Single rolls of 616, 620, etc. Single 16mm roll Single 25-cheet box of film Single 100-sheet box of film Single bulk 35mm × 100 ft. roll	For a 25 F Rise 20 minutes 1 hour 11/2 hours 3 hours 4 hours	For a 100 F Rise 30 minutes 1½ hours 2 hours 5 hours 6 hours		

Although moisture condensation on glass, metals and other relatively non-porous materials is readily visible as

tiny droplets of water, it is generally not visible on porous materials such as unglazed paper, corrugated cartons, cardboard boxes, etc. This is because in the latter case the moisture is absorbed rapidly by the material and droplets of water do not have time to form. Tests were made with film samples cooled to 0 F then opened quickly in air at 70 F and 70% relative humidity (dew point, 60 F). It was found that moisture droplets were quite visible on film base, only very slightly visible on a gelatin backing on film, and frequently quite invisible on the emulsion surface where rapid absorption occurs. This fact tends to lessen the chance of water spotting gelatin-backed films as a result of moisture condensation, but an increase in moisture content of the film is undesirable even if water droplets do not form.

Condensation Inside the Package

When air is cooled, the relative humidity rises and at the dew point or below moisture condenses on any convenient surface. Because of this fact people have sometimes reasoned that when a package of film is placed in a refrigerator the moisture in the air inside the package will condense on the film and damage it. Film is usually packed in rooms conditioned at about 70 F and 45% to 60% relative humidity. The dew point for these conditions is 48 F to 56 F and if the air is cooled below these temperatures it must give up some of its moisture. Hence, it is argued that film should not be refrigerated.

There is a simple fallacy in this argument. Actually there is so little air present inside the film package, and the quantity of moisture present in this air is so infinitesimal that its effect is negligible. This can be demonstrated

strated readily by a few examples

Example 1.—A box of 4" \times 5" Sheet Felm

Ten sheets of film interleaved with paper are packed between two stiffener boards (cardboard) inside a heat sealed aluminum foil envelope.

Volume of envelope as packed = 110 cc
Volume of film, paper, and cardboard = 80 cc
Volume of air inside envelope = 30 cc

The moisture content of air at 70 F and 50% relative humidity = 4.0 grains per cu. ft.⁵
For 30 cc of air this equals

$$\frac{4 \times 30}{28.320}$$
 = 0.00424 grains = 0 000275 grams of water.

Let us assume that all of this water is condensed out when the package is cooled. The pieces of cardboard on either side of the film weigh 5.6 grams each or 11.2 grams. Moisture equilibrium curves for this material show that it has a water content of 7.75% at 50% relative humidity and 7.9% at 51% relative humidity. Hence,

Amount of water in cardboard at 51% R.H. = 0.885 grams Amount of water in cardboard at 30% R.H. = 0.868 grams Difference for 1% R.H. = 0.017 grams

Since 0.017 grams of water increase the equilibrium relative humidity of the cardboard 1%, 0.000275 grams of water increase the equilibrium relative humidity of the cardboard only by 0.016%.

Even if the film were not protected by the cardboard but only by a single sheet of interleaving paper on each side the result would be similar. The two sheets of

paper weigh 1.762 grams. The moisture content of interleaving paper is 6.75% at 50% relative humidity and 6.9% at 51% relative humidity. Hence,

Amount of water in paper at 51% R.H. = 0.122 grams Amount of water in paper at 50% R.H. = 0 119 grams Difference for 1% R.H. = 0.003 grams

Since 0.003 grams of water increase the equilibrium relative humidity of the paper 1%, 0.000275 grams of water increases the equilibrium relative humidity of the paper only 0.1%.

Example 2.—A 20-exposure roll of 135 film.

This type of film is wound in a magazine and usually packed in a tight aluminum can. A tab of film extends out of the magazine for threading and there is no paper wrapping present. This package represents a relatively high ratio of free air space

Volume of can = 33 cc Volume of magazine = 8 cc Volume of free air space = 25 cc Weight of film tab outside magazine = 0 466 grams

Using the same calculations as in Example 1, we find the water content of the air inside the can at 70 F and

50% relative humidity to be 0 00023 grams.

Let us assume that all of this water condenses on the film tab when the container is cooled and none on the walls of the can. From moisture equilibrium curves we find the films contains 2.8% water at 50% relative humidity and 2.9% at 51% relative humidity. Hence,

Amount of water in film tab at 51% R H = 0 0135 grams Amount of water in film tab at 50% R H = 0 0130 grams Difference for 1% R.H = 0 0005 grams

Since 0 0005 grams of water increase the equilibrium relative humidity of the film tab 1%, the 0.00023 grams of water in the free air space in the can would increase the equilibrium relative humidity of the film only a half of one percent—truly a negligible amount. Furthermore, the tab itself is not used for picture taking.

It cannot be argued that film or paper absorbs less moisture at constant relative humidity at low temperatures since the small effect of temperature on this re-

lationship is in the opposite direction.

The fear of moisture in the air inside a film package condensing on the film when cooled in a refrigerator and causing damage is entirely fallacious from a theoretical standpoint. There is simply not enough water in the small amount of air available. This has been confirmed by adequate laboratory test and practical experience. If a square inch of film were packed in a barrel of air the situation would be different.

It is possible that the false notion that moisture in the air inside the film package would damage the film and, therefore, film should not be refrigerated, arose from a different cause. As pointed out earlier, if the film is not protected by a moisture-vapor-proof package, additional

moisture can penetrate to the fifth from panide thresh age while stored in a humid retrigorable. entirely different problem which can be solved by packaging.

Storage after Refrigeration

The question is often asked whether film stored to some time in a refrigerator and then removed will her any better or worse than film which has never been refrigerated. The answer to this depends primarily on whether the film is protected by its package from pos-sible moisture penetration during the cold storage petion. If such protection did not exist the film might about enough moisture during refrigeration that, even if deterioration had not occurred by the time the package was removed, it would be accelerated at normal or summer temperatures after removal. In such cases the film might be found eventually in poorer condition than if never refrigerated.

On the other hand, tests indicate that films which are stored in a refrigerator in moisture-vapor-tight packages and then removed will change in speed and contrast thereafter along the same rate curves which were interrupted during the cold storage. In this respect the period of refrigeration neither improves nor harms subsequent keeping at normal temperatures. However, some types of films have been observed to develop slightly more fog when kept at elevated temperatures after long periods of refrigeration than could be accounted for by the higher storage temperature alone. Cold storage thus does not completely arrest all changes which may occur in a photographic emulsion. For this reason it is recommended that film which is near its expiration dating be used soon after it is removed from cold storage.

In conclusion it may be said that cold storage is a safe and satisfactory means of prolonging the useful life and safeguarding the quality of sensitized photographic material provided that the precautions mentioned are taken. The photographer need have no fear that the film will be harmed by using the storage temperatures recommended by the manufacturer for the particular

product.

Properties of Developing Agents. II. Paraminophenols*

R. W. Henn

SUMMARY

The nine paraminophenols examined fall into two classes according to the nature of the substituent groups, which may be (a) non-ionic, or (b) sonic, in character. The agents of Group (a) initiated development rapidly with little induction period, their activity increased smoothly over a wide pH range, and the density: log-time curves characteristically had slope values of 1.3 or 2.6.

The substituents of Group (b) included sulfonic and carboxylic acid groups. These agents showed appreciable induction periods, were more dependent on pH changes, and the most characteristic slopes of the density: log-time curves were 2.6 and 3.3. These differences are explained on the basis of the ionic charge theory of development, Group (a) developing (1) without charge, or (2) with a monovalent charge, while Group (b) develops with (1) a monovalent, or (2) a divalent charge.

Oxidation proceeded very differently from development, most of the agents oxidizing at a similar rate in spite of wide differences in developing activity. Loss of activity was accompanied by parallel discoloration. Two of the agents did not oxidize any more rapidly at a pH of 12.8 than at 11.5, although their developing activity increased.

their developing activity increased.

L HE FIRST paper in this series described the photographic properties of a number of hydroquinones. Most of these were found to develop when the pH was increased to about 9, and were then strongly affected by pH changes up to about 11.5, but were almost unaffected by further elevation of pH. Development characteristically proceeded rapidly, but only after a considerable induction period, and was a linear function of the logarithm of the developing time. The slopes of these density: log-time curves were but little affected by changes in pH, or even by the nature of the developing agent, the wide range of activity obtained being pri-marily due to changes in the induction period. The marily due to changes in the induction period. rates of oxidation were measured and the solutions were found to lose activity more rapidly than they discolored.

The present paper considers the photographic properties of nine paraminophenols. A third in the series will consider combinations of the paraminophenols with the

hydroquinones.

The paraminophenols employed are sketched in Table I. They include paraminophenol itself (I), and compounds in which the amino group has been variously substituted: by methyl (II; this is the popular developing agent, Elon't or Metol), by β -hydroxyethyl (III), by β aminoethyl (IV), by sulfomethyl (V) (more precisely named 'sodium p-hydroxyphenylaminomethane sulfonate"), by acetic acid to form the glycine (VI), and by both methyl and acetic acid groups (VII). Compound VIII represents II modified by the substitution of a chlorine atom for a hydrogen in the benzene nucleus, while compound IX contains a nuclear sulfonic acid group. Compounds I, II, and VI represent commercial samples, while the others were synthesized by the Chemical Plant of the Eastman Kodak Company.

The methods of investigation and evaluation were considered in the first paper of this series. They include the use of a simple, positive emulsion, and the employment of density for a fixed exposure as the criterion of the degree of development. The selected exposure is circled in the characteristic curves of Figure 1, where it is seen to lie high on the straight-line portion. Aeration tests were carried out by exposure in unstoppered flasks, while the solubility measurements were made in a special high-salt developer.

The basic developer solution, in which the sensitometric measurements were made, contained 0.02 mole of

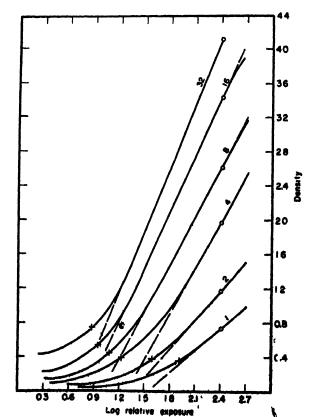

Fig. 1. Typical Group of H. & D. Curves () pH = 10.0). The fourth exposure step is circled, the density of this step which has been used as measure of development throughout this paper, speed point, determined as customary for this matter a density of 0.3 above fog and base is marked w

developing agent, 0 2 mole of sodium sulfite, 0.1 mole of an appropriate buffer, and sodium hydroxide as needed to neutralize the acid salts and phenolic hydrogen. The acidity of the phenol was considerable, the pK, or half-neutralization point being about 10.3 for all of the agents except the chloro-compound, VIII. Like chlorohydroquinone, this had a strongly acidic hydrogen and a pK value of about 8.8.

Experimental Results

1. Developing Activity

The density of the fourth step (see Figure 1) including fog is plotted against, the logarithm of the developing time in Figure 2 for various pH levels. The following

observations appear noteworthy:

(a) The induction period, before the image appears, is characteristically short (I, II, III, IV, VIII) except where a charged ion—carboxy or sulfonic—is present (V, VI, VII, IX). This latter group more closely resembles the hydroquinones in this respect. This is in agreement with James, who has showed that glycine (VI) resembled hydroquinone in ionic charge and induction period.

tion period.

(b) The density:log-time function (a measure of developing rate) is almost entirely linear, with the exception of a short toe portion. However, the slope of these lines is usually 2.6 or 1.35 density units per log-time unit, whereas with the hydroquinones it was 3.3 D/log r. It will be noted that the lower value of alope applies to the values of 8.5 or lower, the steeper slope to pH = 10.0 or higher, while with the most alkaline glycine developers (VI and VII, pH value of 12.8), the steep slope (3.3) of the hydroquinones is attained.

(c) The relative activity of the several agents and the influence of pH on activity are affected by the criterion selected for its measurement. The values of Table II and Figure 3 are based on the time required to reach a density of 2.0, which corresponds to the recommended development of this material (Kodak Fine Grain Positive Film). Agent (II), p-methylaminophenol, is seen to be the most active of the group. It has a readily measurable activity at a pH of 7, and becomes increasingly active as the pH is raised, throughout the entire range investigated.

Paraminophenol itself (I) and the hydroxyethyl-paminophenol (III) produce curves closely approximating those of the methyl compound (II) but displaced by 1.0 or 0.5 pH units, or in terms of developing times, they have one half or two thirds of its activity. Agent (IV), β-aminoethyl-p-aminophenol, shows certain peculiarities, which can be associated with the presence of the aliphatic amino group in its molecule. This accelerates development as the pH is raised but makes it much less selective (Fig. 4). The remaining compounds all contain charged ions and tend to be rather less responsive at high pH, particularly the glycines (VI and VII), which approach the hydroquinones in this respect. The activities of these several agents averaged (Table II) one fourth to one third that of No. II (Elon).

2. Selectivity

The fog produced by these agents at two degrees of development is plotted in Figure 4 as a function of the pH. All developing agents become less selective as the pH is increased, but this decrease in selectivity is not serious except for IV where, as suggested above, the

presence of the primary aliphatic amine becomes important as the developer becomes increasingly alkaline. The p-aminophenols have produced only about one half the fog values found for the hydroquinones and, in general, the lower the activity of the agent, the lower is the fog.

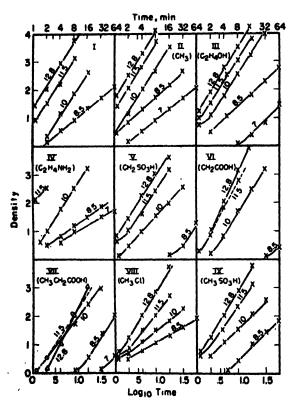

Fig. 2. Density: Log-Time Curves. The density of the fourth step has been plotted against an exponential progression of developing times. Note the "minute" scale at the top and the "log minute" scale at the bottom. The slope and displacement of these curves do much to establish the characteristics of the developer. The point at which the curves cross the density of 2.0 has been used as a measure of the "activity," while the slope of the line establishes the "rate" of development. The numbering of the agents is that of Table I, while the nature of the substituents is also indicated.

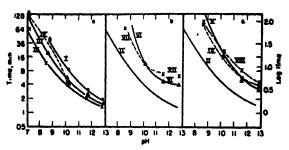

Fig. 3. Activity vs. pH. The time to reach a density of 2.0 has been plotted as a function of the pH. The numbering is as in Table I. Note that the time plot is, as in Fig. 1, again logarithmic.

3. Contrast and Emulsion Speed

As with the hydroquinones, the contrast produced was not primarily a function of the developing agent. The gamma obtained was usually about 2.0, with rather higher values being produced under restrained conditions, that is at low pH or with the addition of bromide. This value is also similar to that obtained for the hydroquinones. The emulsion speeds were also generally close at equal degrees of image density, some loss in speed being noted in the slowly acting pH = 7 developers, where the solvent action of the sulfite becomes important. §

4. Aeration Properties

The loss of developing activity of the p-aminophenol solutions was marked by a corresponding discoloration, the closeness of the two being dependent on the criteria of measurement selected. There was no marked exception to this but it was earlier found that the hydroquinones tended to lose activity completely while discoloring only slightly. Figure 5 directly compares hydroquinone with Elon (II). Note the rapid drop in activity or image density (D), of the hydroquinone as compared with the slow change in hue (H). On the other hand, in the case of Elon, the curves are close together.

The rate of oxidation of the various agents was found to increase with pH (Figure 6) but the change did not parallel the activity-pH curves. For example, Elon (15) and the hydroxyethyl compound (III) oxidized almost as rapidly at pH = 7 as at pH = 8.5 but developed much less rapidly at the lower pH. On the other hand, Elon

PHOTOGRAPHIC SCIENCE AND TECHNIQUE

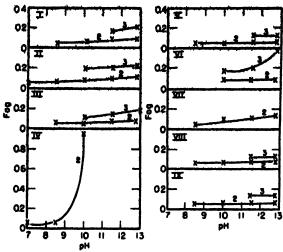

Fig. 4. Selectivity of Development. The fog obtained at constant image development (density = 2.0 or density = 3.0) is plotted as a function of the pH. With most agents the selectivity decreases slightly as the pH is raised. The high fog of No. IV has been attributed to the presence of a primary aliphatic amine in the molecule.

developed only 50 per cent more rapidly at the pH of 12.8 than at 11.5, but oxidized at nearly 4 times the rate. A peculiar inversion was obtained with the hydroxyethyl (III) and sulfomethyl (V) compounds, which actually oxidized somewhat more slowly at 12.8 than at 11.5. This leveling-off, or slight inversion, was obtained for both hue and activity and proved reproducible.

5. Solubility

The solubility of the developing agents in a high-salt solution of moderate alkalinity (pH = 10.0) is given in Table III. Nearly all of these compounds were more soluble than I and II, the conventional agents, and were not precipitated by the addition of hydroquinone, which forms the sparingly-soluble "metoquinone" with II. In spite of good solubility shown here at a pH of 10, the solubility of the agent, VIII, was very modest at pH values of 9 and lower.

Discussion

1. Development and the Ionic Charge Theory

The developing properties of these paraminophenols divides them into two broad classes: Group (a) in which the substituents are non-ionic in character, includes agents I, II, III, IV, and VIII, while Group (b), comprising those substituted by sulfonic and carboxylic acid groups includes Nos. V, VI, VII, and IX. The distinction between these groups is to be explained by assuring that Group (a) acts principally as singly charged ions, while Group (b) develops as doubly charged ions. These differences are seen both in (1) induction period, and (2) the pH response.

Group (a) has, in general, brief induction periods. The surves of Figure 2 may be extrapolated to show that, except for the most restrained pH conditions, development is initiated in the range of 0.25 to 2 minutes. But with Group (b), induction periods of from 4 to 16 minutes are not uncommon, although others are of the order of 1 minute.

These long induction periods are similar to those found, for the hydroquinones which, except in the most alkaline solutions, required from 2 minutes to 2 hours to initiate development. The long induction period of hydroquinone and of glycine (VI) has been explained by James² in terms of the difficulty of the more highly charged ions in penetrating the layer of negatively charged bromide ions surrounding the silver halide grain. He has shown on kinetic basis that the doubly charged ion would need to be present in 18 times as great a concentration as the singly charged ion to initiate development as effectively.

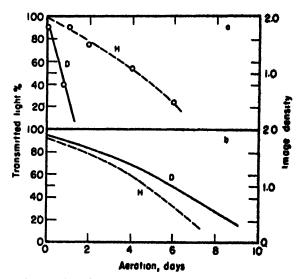

Fig. 5. Aeration Comparison. The seration properties of (a) hydroquinone, and (b) Elon, are compared at a density of 10.0 with regard to image density produced (D) and the hue (H) of the solution following exposure in unstoppered flasks. Note that the hydroquinone loses activity rapidly but discolors only slowly, while the Elon discolors at about the same rate at which it loses activity. The sensitometric strips were developed in the hydroquinone developer for 14 minutes, and in the Elon developer for 4 minutes.

As the alkalinity is increased, the agents of Group (a) increase smoothly in activity over a wide pH range (Figure 3), while those of Group (b) are strongly affected by pH. The pH response of glycine, No. VI, closely resembles that of hydroquinone, only weak development being noted at pH of 8.5, which rapidly increases as the pH is raised to 11.5, but beyond this value the increase in rate is slight.

2. Significance of Slope of Density: Log-Time Curves

The ionic charge theory has been useful in explaining the differences in induction period and in pH response of the various agents. It is also applicable to a study of the slopes of the density: log-time curves of Figure 2. The values of these slopes, or "developing rates" have been entered in Table IV, as an aid to this discussion. It will be seen that the most common value of slope is about 2.6 (2.58 \pm 0.07, average of 17 curves). This appears to characterize development by monovalent paraminophenol, much as the value of 3.3 characterized the hydroquinones. Other slope values obtained were that of 1.35 for the paraminophenols of Group (a) used at pH values of 8.5 and lower, and that of 3.3 for the glycines (VI and VII) used at a pH of 12.8. The lower value might be considered to typify development by the unionized aminophenols, since a pH of 8.5 is far below their pK value (indicated previously as about 10.3), and ionization of only 1 molecule in 500 would be anticipated. The absence of these low slope values in Group (b) agents, which contain ionic substituents, and should not therefore present an un-ionized form, would bear out this hypothesis. It is interesting that the glycines, under the highly alkaline conditions, gave the same slope as the hydroquinones, since they also would be expected to be doubly charged.

In spite of these correlations, there are many examples where the slope value does not appear to correspond to the ionic state anticipated. Agents IV and VII have produced much flatter curves than the 1.35 value, and a number of values intermediate between the 1.35 and 2.6 slopes are evident. These may be merely transitory slopes indicating partial ionization, but more experimental data would be necessary to confirm this. On the contrary, the slopes in many instances are rigidly fixed over a wide range and do not show a change in slope corresponding to ionization.

A particularly interesting p-aminophenol was recently investigated by James, and marked changes in rate related to a change in character from a monovalent to divalent developing ion. Curves obtained for this agent, N-methyl-N-(B-methylsulfonamidoethyl)-p-aminophenol, for the developer formula, emulsion, and condi-

tions of these tests are shown in Figure 7. Note the strong change of slope from 0.8 at pH = 10 to 3.3 density units per log-time unit at pH = 12.8, and the change of induction period, by nearly a factor of 10. This is a particularly clear-cut case of the trends of the agents of Figure 2, but note also the curves of Agent VII, which has certain structural units in common with the sulfon-amidoethyl compound.

3. Selectivity

The selectivity of all of the agents is remarkably good with this positive material, even without bromide, with the exception of the aminoethyl compound already discussed. The lower fogging propensity of the aminophenols as compared with the hydroquinoses is in line with the work of Abribat, Pouradier, and Davids comparing Elon (II) and hydroquinone, but is contrary to the results obtained by Levenson, particularly with negative films, who found hydroquinone to give less fog

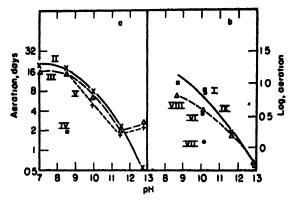

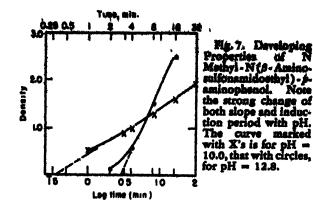

Fig. 6. Aeration Life vs. pH. The life, measured as days before the activity of the developer decreases to the point where one half of the original image density is produced, is plotted in a logarithmic scale to include the wide range of values. Note the resistance of Agents III and V to aeration at high pH. Also compare with the developing-rate curves of Fig. 3.

than Elon. The addition of bromide (0.01 mole per liter) where tested, further increased the selectivity, raising contrast and reducing emulsion speed. When development time was prolonged to match densities, the bromided developers produced about one third more contrast and about half the emulsion speed of the unbromided developers, much as found earlier for the hydroquinones. The various paraminophenol developers were only slightly less sensitive to bromide than the hydroquinone developers of equal activity level.

4. Oxidation

Development may be considered as oxidation of the agent by silver bromide (or other halide), whereas on exposure to air, aerial oxygen is the oxidizing agent. A comparison of Figures 3 and 6 shows how different these mechanisms are. The differences between the pkl response to development and aerial exidation of Agents II and III has already been pointed ont. Thus, oxidation was little increased by raising the pkl from 7 to 8.5, but development was greatly accelerated, and at the high pkl range other discrepancies were evident. It is also

interesting to intercompare the several agents. Thus, III, V, I, and IX oxidized at about the same rate as Blon (II), but the developing rates of these agents differed by a factor of as much as 5 times, and Agents VI, VIII, and especially IV and VII oxidized appreciably more rapidly than II, but developed less actively.

5. Comparison at Equal Activity

The comparisons made so far have already been based on a fixed pH level. Very interesting results are obtained if the basis of comparison is, instead, one of equal activity level. This is done in Table V, where the properties of developers requiring 8 minutes to reach a density of 2.0 are entered. This development is achieved at a pH of 9.0 with Elon (II), the most active of the developers, while with the least active, an elevation to a pH of about 11 is necessary. The fog, contrast, and emulsion speed of these developers are then quite well matched, but the aeration life differs widely, those developers operating at the high pH level showing much shorter lives.

6. Practical Considerations

The commercial importance of Elon (II) appears well justified in these comparisons. It is the most active of any of the agents tested and its activity increases smoothly over a wide pH range. But in spite of its activity, it has equalled or excelled the other agents in resistance to oxidation under normal conditions. However, a number of other agents were more soluble than Elon (see Table III), while III and V were more resistant to oxidation at high pH. Some of the less active agents appear to produce less fog than Elon, but this advantage largely disappears when the pH is adjusted to match developing activity (Table V).

Agent III, the hydroxyethyl-p-aminophenol, is the next most interesting. It is only slightly less active than Elon, (II), while its high solubility offers promise for condentrated developers, and it shows a singular resistanceto oxidation at very high pH. The hydroxyethyl-paminophenol has been the subject of a patent," and has

had some commercial application.

Glycine (VI) finds occasional proponents, but this work would do little to affirm its usefulness as a sign developing agent. It is active only in strongly alkafine solution and is then sensitive to slight changes in sikelinity. At very high pH levels, it loses much of its selentivity, producing dichroic fog and infectious develop-

20

85

Hydrogunone 10 5

Chlorohydroquinone was previously shown to be considerably more active than hydroquinone, particularly at low pH.1 The low activity of the chlorinated N-methyl-p-aminophenol sulfate (VIII) is therefore surprising. Similarly, 2-chloro-4-aminophenol has been found to have but 20 per cent of the activity of paramino-phenol at a pH of 10. These differences are probably subject to explanation in terms of the ionic theory of development. Development is possible with the hydroquinones only as ionization occurs, and chlorination has increased ionization (lowered the pK value), and extended the range of development. But the amingphenois are apparently capable of development without ionization, and the introduction of further ionization has interfered with the normal development mechanism rather than extended it.

USES OF KODALITH FILM IN THE EXAMINATION OF QUESTIONED DOCUMENTS

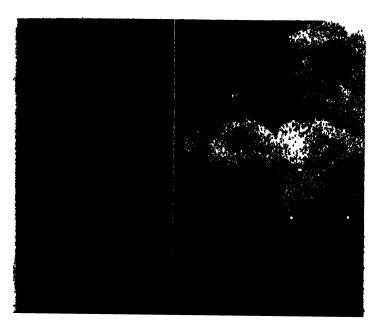

Joseph Tholl*

LODALITH emulsions, which are designed for certain kinds of reproduction work in the graphic arts, have proved to be of value in the examination of questioned documents. The unique effectiveness of Kodalith film in this field is due to its extremely high contrast, its sensitivity restricted to the blue and near ultra-violet parts of the spectrum and its ability, through modified processing, to record and build up intermediate tones which are otherwise flat or indistinguishable. Consequently, Kodalith film emulsions with their fine grain, their spectral sensitivity and selective behaviour bring out many kinds of obscure document evidence with clarity and brilliance.

Kodalith film is not necessarily better nor a good substitute for lower contrast panchromatic emulsions but it does have many unique applications in the document field. Also, it is well suited for reflected ultraviolet photography. In adapting Kodalith film to the photography of questioned documents it was found necessary to use, instead of the high contrast paraformaldehyde developer, a much softer though still energetic type of developer like D-72. The use of D-85 was not practical, with a few exceptions, because the high contrast at the expense of detail eliminates many vital intermediate tones. Given suitable development Kodalith film provides a valuable means for the detection, decipherment and demonstration of many kinds of physical evidence such as faint, obscure and crased written and printed matter; impressions transferred from another sheet; tampered paper surfaces; faded photographs and documents; the differentiation and identification of paper samples (with ultraviolet)

The proportional, intensifying-like action of Kodalith film is illustrated in Figure 1 showing a badly faded, old photograph which has been copied both on a medium

* Examiner of Questioned Documents, 2490 Noble Road, Cleveland 21, Ohio. Presented at the PSA National Convention in New York, N.Y. 16 August, 1952. Received 21 July 1952.

contrast orthochromatic film and on Kodalith film. The overall increase in both contrast and detail by use of the Kodalith negative typifies the behaviour of this material with respect to various kinds of document evidence where tone separation and contrast must be increased in order to effect legibility or decipherment.

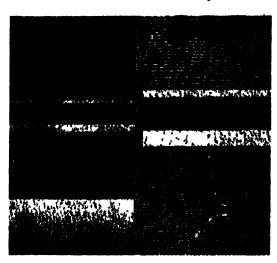

Fig. 2. Enlargement (21/2X) of fine lithographed lines from a panchromatic film on the left compared to 4X enlargement of a Kodalith negative of the same subject.

Enlargements of Kodalith Negatives

Kodalith negatives when critically sharp and correctly developed will retain their wiry character at a considerable degree of enlargement. The respective enlarging qualities of Kodalith film and a medium fine grain panchromatic film are demonstrated by negatives made of the same subject (Figure 2). The fluorescence ultraviolet photograph in Figure 2, made from a panchromatic negative, shows a noticeable loss of definition at two and one-half diameters enlargement while a Kodalith film negative made under the same conditions shows no loss of definition at four diameters. The fine lines of the lithographed form in this case provided a critical test for both recording and enlargement.

The brilliance and wiry quality of Kodalith film enlargements are indispensable requisites for bringing out many forms of document evidence such as meckanical erasures and obscure markings. Figure 3 made from a

Fig. 1. Copy of old, bedly faded pij stograph. The reproduction on the left is from a riedium contrast ortho film negative, fully developed in 14-72. The print on the right is from a Kodalith film negative, also developed in 12-72.

PHOTOGRAPHIC SCIENCE AND TECHNIQUE

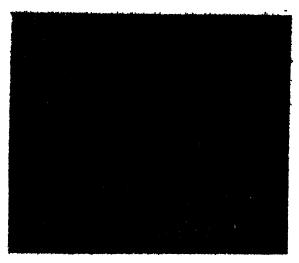

Fig. 3. Erasure and alteration. Enlarged 10× from Kodalith negative.

slightly greater than life size Kodalith negative (1½ X) reveals, even at ten diameters print enlargement, a remarkable degree of depth, textural relief, and definition. Each torn fibre, the paper texture, every depression and projection is brought out with extreme clarity. The ability of the Kodalith film to reproduce paper textures and accentuate evidences of tampering has been demonstrated by many examples of sidelighted photographs of mechanical erasures.

Indentations, and markings transferred from another sheet of paper can be made quite legible through the use of Kodalith film and properly placed sidelights (Figure 4). Because of the high contrast and fine grain qualities of the Kodalith film illustrations it is possible, through this medium, to obtain with the use of ordinary equipment results that compare favorably with those secured from more involved photo-micrography set-ups

Inasmuch as many ink and pencil pigments appear dark or black in the Kodalith photograph it is often possible to decipher mechanical erasures without the use of special infrared and ultraviolet photography. Decipherment in such a case results where the embedded pencil and ink fragments are sharply outlined in black against the fiber-like detail of the paper surface; also, the inden-

Fig. 4. Kodslith film photograph of markings impressed from sue sheet of paper to another sheet.

PSA JOURNAL, SECTION B, OCTOBER 1952

Fig. 5, A lighten print of the segative prod on groduce Fig. 3 shows that a postell was used for changing "3" to as "6."

tations are brought out and made continuous through sharply etched shadows and highlights. Here the high contrast of the Kodalith film picks out the fragments of pigment and outlines the indentations (where they exist) while the selective behavior of this emulsion brings out the vital intermediate tones in the paper.

Reproduction and Decipherment of Pencil Writing

The litho type films are invaluable for the photography and demonstration of questioned documents which are executed in pencil; such writing might be the faint, worn, light writing on wills and anonymous letters and altered portions of receipts and agreements. In all such cases Kodalith film performs many useful functions which include: (1) the building up of essential contrast and density in obscure or erased pencil writing; (2) a selective action which differentiates many pencil pigments; (3) the heavier reproduction of photographically flat pigments without the loss of important paper detail.

In a recent Probate Court matter involving a number of faint, worn, pencil entries Kodalith film proved to be equally effective as Infrared film for increasing the density of the almost illegible writing. In another case, where anonymous pencil writing was made abnormally light as a means of concealment, Kodalith film provided a darker, more legible reproduction which could be more readily identified.

Kodalith film is quite as selective in the case of pencil pigments as infrared film. Even where deep blacks are registered on the print (Figure 3) the negative image may contain considerable detail which can be brought out by lighter printing or softer processing. In Figure 5 a lighter print reveals how the number "3" was altered into an "8" with another pencil.

The Reproduction of Light Carbon Impressions

During a recent investigation a receipt book was found containing several hundred duplicates on which the car-

bon impressions were a very faint blue. This writing, which was the principal evidence in a notorious eriminal prosecution by the State, was found difficult to examine or photograph by reason of its irregularity, color, and lightness. This dilemma was solved by the use of Kodalith film and process development (D-85) which created sufficient contrast and continuity so that the faint, irregular carbon impressions could be enlarged without losing their form. It was then possible to construct comparison charts which established the identity of the questioned writing. These charts, in two successive trials, were bitterly attacked by defense counsel but each time were instrumental in securing a conviction.

Technique

EXPOSURE

It was found, generally, that where developers other than D-85 were used the exposure for Kodalith film was about one-fourth of that used in the case of process development. Some document subjects exposed in as little as two seconds at f/16 with Photoflood lighting. Reflected ultraviolet exposures were surprisingly short

DEVELOPMENT

The Elon-hydroquinone-carbonate type of developer, such as D-72, was found to be more effective than other developers. Contrast was increased or decreased either by changing the proportion of developer ingredients or by dilution. The fine grain of Kodalith film makes the use of special fine grain developers unnecessary. Tests have proven that the more energetic D-72 developer was more effective than DK-20 for use with Kodalith film.

Fig. 6. Bulletind districted photographs of a number of eradicated lake made from Kodalith film (left) and ortho film (right). The latter is detter and shows less deads.

LIGHTING

Just as in other kinds of photographic recording the lighting is manipulated in accordance with the nature; of the subject. Gross lighting is used where texture is not a factor. Cross lighting minimizes distracting textural details and allows tonal values to be recorded. Various degrees of sidelighting bring out texture and depth in evidence such as mechanical erasures and impressed writing. Focussed or concentrated lightings give a maximum of sharpness, depth and relief. It is apparent from the various illustrations used that any lighting will give a more pronounced effect with Kodslith than with other films.

EQUIPMENT

All of the illustrations in this paper were made with ordinary equipment which included a 4 × 5 Speed-Graphic camera with a 127 mm Ektar lens and Photoflood lighting. A cold quartz type lamp was used for the ultraviolet photographs

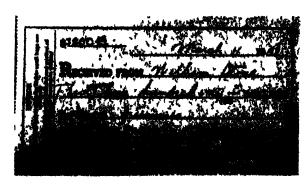

Fig. 7. Reflected ultraviolet photograph made with Kodalith film showing fraudulent interlineations and chemical erasures on a receipt.

Kodalith Ultraviolet Photography

Kodalith film is particularly well suited for ultraviolet photography. The effectiveness of the Kodalith emulsion for ultraviolet recording results from (1) its high contrast which overcomes the flattening effect the ultraviolet radiations have on other film emulsions, (2) its high sensitivity to the near ultraviolet which renders it a selective recording medium; (3) the thin emulsion layer which contains less ultraviolet-opaque gelatin than do the thicker emulsions. As a result of all these factors there is great brilliance, less objectionable fogging of the negative, and a greater latitude of exposure.

Many eradicated permanent inks and washable inks can be more positively deciphered by photographing on Kodalith rather than on commercial films. The excellence of Kodalith film for this purpose is shown in Figure 6 where practically every eradicated specimen of ink writing has been more or less restored photographically. A comparison in Figure 6 of the part made with Kodalith film and the part made with forthochromatic film demonstrates the superior recording possibilities of the former.

PROTOGRAPHIC SCHNCE AND TECHNIQUE

Alterations in a questioned receipt are clearly revealed by reflected ultraviolet photographs on Kodelith film in Figure 7. It can be seen that the ink used for the frapdulent interlineations has a relatively higher absorption of ultraviolet, recording as a dark shade whereas the original ink has a higher relative transmission and registers as a lighter shade.

The exposures for the Kodalith film pictures by ultraviolet from a cold quartz type lamp were quite short. The average exposure was 15 seconds at f/11. Exposures for fluorescence recording took a hundred times longer

exposure.

Special Applications for Kodalith

PHOTOMICROGRAPHS

It has already been demonstrated how the fine grain and brilliant projection qualities of the Kodalith negative make possible unusually sharp, revealing enlargements from negatives of relatively small magnifications $(1^{1}/2 \times$ to 10 X) Kodalith macrophotographs at greater magnification of mechanical erasures, embossures and tampered paper surfaces make effective court exhibits because of their accentuated recording

Bas-Relief Photographs

With certain types of mechanical erasures and impressed markings the illusion of depth may be useful in bringing out hidden or obscure details. Weak, variously processed positives made on Kodalith film and placed in slightly off-set register with a negative-will give a third dimensional effect. In a particularly stubborn case where typewriting had been cleverly erased it was possible by this method to bring out the erased word "all" which had been obliterated and superimposed with the figure "1/2

Test Plates

In the examination and technical presentation of handwriting and typewriting peculiarities the use of trans-

parent measuring and comparison plates may be impuretive. These instruments can be copied to scale on Kodslith film from original drawings or book illustrations.

SHADOWGRAPHS

Wherever there is any transmission of light through a relatively opaque substance such as a heavy envelope it may be possible to secure an impression of the enclosure by placing the unopened envelope in a printing frame in contact with a sheet of Kodalith film. In Figure 8 Kodalith film, developed in D-85, has recorded writing enclosed in six thicknesses of paper. It is also practical by this method to examine suspected letters for evidences of forced opening without cutting open the envelope.

Transmitted Light Photographs

Kodalith film will give sharp, brilliant transmitted light studies of questioned documents which will allow a considerable degree of enlargement. For this type of photograph the document should be placed in the printing frame with the printed or written side adjacent to the emulsion. A 10-watt lamp should be used for lighting and D-72 for development.

Photographic Technique for Professionals

TITLING PHOTOGRAPHIC PRINTS

A letter from a PSA member, published in the July 1952 issue, asked for suggestions for adding captions to 8 × 10 photographic prints. The problem was to provide neat, legible print titles without spending the time needed to prepare a photographic negative of the legends.

The following comments have been received and are published for the interest and information of other photographers who may be confronted with a similar problem.

PHOTOGRAPHIC METHODS ARE USED IN HOLLYWOOD

rundertook a great number of inquiries regarding this problem of placing aries on photographic prints with local people of Hollywood tudio still and publicity departments, as well as representatives in the field of professional photographers. In most infrances it seems that the caption or explanatory lettering is either put on the back of the print or it is glued as a separate item to the lower margin of the print in a folding type arrangement, which permits to pull the portion of the attachment inscribed into place so that the title can be read while the print is being inspected, whereafter the piece can be folded back to become invisible.

Most of the studios, in executing the copyright inscription for sheir photographic prints, use the technique of shooting the secessary wording from a title board onto process panchromatic film, also commercial or litho film. The developed negative is then mounted together with the pictorial negative by cutting out from the pictorial negative a suitable portion from the least objectionable section of the film negative for insertion of the lettering material.

Techniques of optical superimposition are of course also used in title cameras, a method that gives excellent results, but is of very limited use, since few, if anyone, could afford cameras or

equipment of that type.

It is my understanding that integrated captions of prints are more and more abandoned for the very reason that such illustrations are too frequently used for publication in magazines and newspapers, and the unavoidable reduction in size from the original and the degradation in quality present a serious problem of rendering such captions readable.

Herbert Meter Hollywood, Calif

FAST TITLING METHOD USING ELECTRIC TYPEWRITER

In current PS&T there is inquiry about fast captioning of photographic prints. No mention is made as to whether they want black on white or whether white on black will do.

Old time fast trick that we use for fast identifications is this take sheet of thin acetate (clear film will do); use electric typewriter ribbon (black carbons); take out acetate without smudging, slick piece of clear Scotch tape over lettering to prevent smudging; attach to negative or edge of easel and print thru. Of course this gives white letters on black strip—but it's fastest thing I've seen.

Only faster thing is to label all subjects BRORE making picture!

DAVID B. EISENDRATH, Ja Brooklyn, N. Y.

BOSTON UNIVERSITY USES SEVERAL METHODS

The captioning of photographs for technical reports has long been a problem in our laboratory. We have used several methods, and are constantly trying new ones. Unfortunately, just about all of these involve a photographic process in some form.

The oldest, and probably most expensive method, is to produce on high contrast film a negative of the text to be added to the photograph. We have found that in a large number of title jobs Kodabromide F-4 or F-5 paper may be used in place of more expensive Kodalith film. We expose Kodabromide F-4 with a ten inch lens stopped to f/32, for about 45 seconds with the copy illuminated by two f4 Photoflood lamps

The original copy to be thus made into a paper or film negative can be produced in several ways. Ordinary typewriting does not reproduce well; electric typewriters are considerably better. Lettering done with a LeRoy pen copies very well. This may be also used on transparent tape for addition to the photographic negative for contact printing. This is one of the quickest methods, if white letters on a black background can be used.

One of the standard methods for producing copy to be photographed is by pasting up or Scotch-taping special photo-type letters. Negatives produced from these pasted-up lines must usually be carefully retouched to avoid showing lines between

the letters. A simpler and neater method of penducing such copy, although more expinsive at the outset, is by means of the phototype setting machines, such as the Coxhead Headliner. This produces in a few initutes a clean strip of lettering on white opaque 35mm film, or transparent 35mm film. The lettering may be either black on white or white on black. This equipment, with eight different type faces, foot about \$700. For volume production of titles or printed material to be photographed this system probably would pay for itself in time saved.

There are many companies whose business it is to prepare technical reports. If an industrial organisation has occasional demand for such service, or is handicapped by lack of drafting, photographic, or reproduction facilities, these companies offer excellent service. If so desired, these companies can produce masters for use on Multilith, Bruning, Ozalid, Ditto, or what-have-you.

One final thought: possibly Xerography could be used in direct printing on photographic paper. The absorption into the gelatin layer of the special powder might be a problem, but this would be the only good approach other than special typewriters that completely eliminate the wet photographic process.

Typing might be feasible if special inks were developed that would be absorbed readily into the paper gelatin coating. Perhaps this idea has already been exploited. Surface activators might do the trick

Hurson K. Howell Boston, Mass.

KODAK BOOKLETS ON TITLING ARE AVAILABLE

I am wondering whether you are familiar with the recommendations we make in our Data Book "Professional Printing with Kodak Photographic Papers."

You mentioned that you knew no better way than setting captions in type. Most companies that have any activity at all in the preparation of display or sample print material have constant relations with the printer, so the problem of having the type set up and printed offers no great problem. I believe the preference for printing by typeset material goes back to the demand for a neat appearing caption. In some cases, this can be attained by hand lettering but, in my experience, typeset material of this kind has been cheaper than hand lettered material.

A. L. Terlow Rochester. N. Y

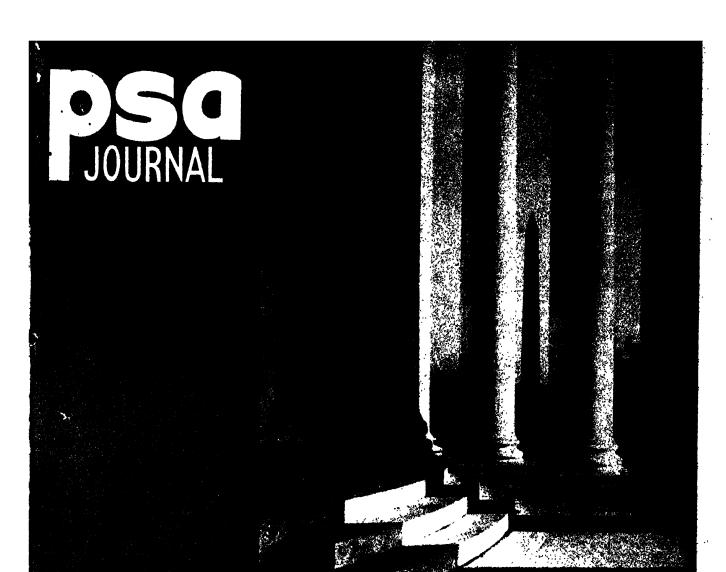

PHOTOGRAPHIC TITLES USED IN PENNSYLVANIA

I wonder if PSA Membea, looking for a means of captioning prints, has tried copying his titles on Kodalith film or similar film made by other companies.

Titles can be printed by hand or typed, then copied to desired size of letters, larger or smaller. In typing titles, the type should be clean to give a clear impression on fair quality letter paper. For best results, I prefer a linetype impression or lettering by hand.

Titles are cut apart with the trimmer and fitted to the plature negative in the usual manner. I know of no other method that can be done more cheaply, neatly, or juickly than this.

Russer, R. Josephov Wyomissing, Penpa.

Picture yourself on Christmas with a POLAROID LAND CAMERA

. It's time to start hinting now for the "60-second muacle" — a Polaroid Land Camera for Christinas Your family will be as excited as you when you take your first picture — and show the finished print on the spot And what a picture it will be!—sharp and crisp in sparkling black and white—as good as the best you've ever taken!

Choose from these two great cameras:

The new all-star POLAROID PATHFINDER Model 110

A fine professional-type camera for fast action shots, brilliant pictures from dim light, superb portraits, flash pictures Uses regular 3½ x 4½" Polaroid Film.

LENS: f/4 5 Raptar, 4-clement, coated, 127 mm focal length

SHUTTER: Nine speed Rapax — 1 to 1/400 second — synchronized for flash and strobe

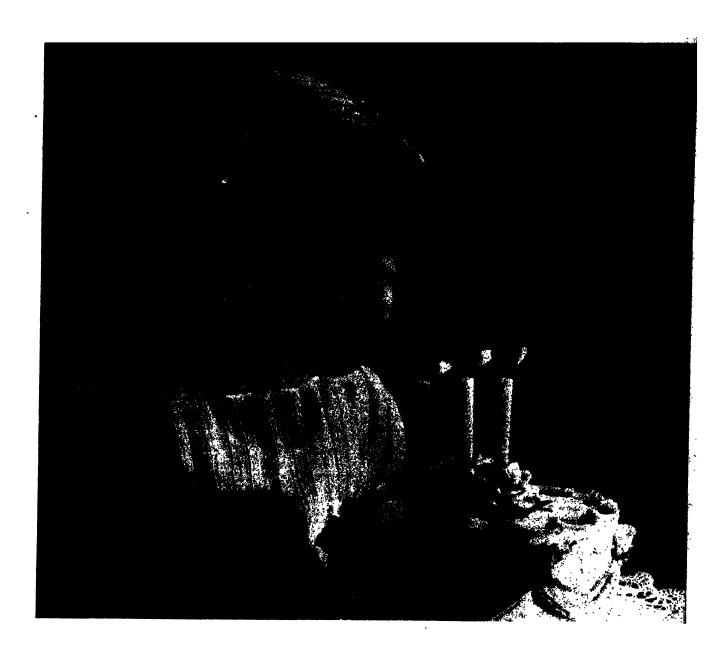

OTHER FEATURES: Coupled Rangefinder; Easy-Sight View-finder, with full parallax adjustment down to 10 inches; built-in depth-of-field scale, exposure computer.

The low-priced, snapshot favorite POLAROID Land CAMERA Model 95

The camera that made 60-second photography famous. Has taken more than 50 million pictures! Easy "drop, in" loading, easy to focus, easy to set the single dial controlling lens opening and shutter speed, easy to remove the 3½ x 4½" black-and-white print. Easy to use with flash attachment, too.

ASK FOR A DEMONSTRATION of "the world's most exciting camera." More than 5000 camera stores carry it—and Polaroid Film. (For the man who already has a Polaroid Camera, you'll find gift suggestions in useful Polaroid accessories.)

FOR FREE BOOKLET about the miracle of 60second photography, write to Polaroid Corp., Dept. PS-13, Cambridge 39, Mass.

You get "big camera" quality from your small camera with Ansco Supreme Film!

Here is why the extreme fine grain and high emulsion speed of Ansco Supreme Film make the combination you need to get "big camera" quality in your enlargements from small negatives.

Supreme's extremely fine grain allows you to make really b-i-g enlargements with superb rendering of delicate texture and fine detail.

Supreme's high emulsion speed lets you use high shutter speeds to redule the camera movement that destroys the sharpness of so many big enlargements.

For practically every kind of a picture situation you meet, you'll find sinsco Supreme is the first-choice film to have in your small camera. Supreme comes in popular size roll film and film packs, and in 35mm magazines. Try Supreme in your camera—soon!

ANSCO, Binghamton, N. Y. A Division of General Aniline & Film Corporation. "From Research to Reality."

PSA HEADQUARTERS: 2005 Walnut St., Philadelphia 3, Pa. Randolph Wright, Jr., Headquarters Manager

Closing date for news is 25th of second preceding month, in Stamford. Trading Post items must be in our hands by 20th of accond preceding month. Urgent and brief news items can be accepted up to the lat of the preceding month. New handled by Division Editors must be in their hands at least two weeks before closing dates. All correspondence regarding editorial matters should be addressed to the Editorial Office in Stamford, Conn.

Change of address notices should be sent to PSA Headquarters in Philadelphia.

The PSA Journal is sent to all member clubs

and affiliated organizations. It is for the use of the entire group and not solely for the individual to whom it is addressed.

whom it is addressed.

PSA Journal does not pay for manuscripts or pictures; all functions of PJA are based on voluntary activity.

Copyright 1952 by The Photographic Society of America, Inc. Reproduction or use of any material contained herein without permission of the Editor is forbidden. Views expressed in the PSA Journal are those of the authors and do not necessarily represent those of the Society.

The Editor Reports-

While the President takes a well-earned vacation in Europe, your Editor fills in hia usual column with some chit chat about this and that.

You'll notice some color in this issue and you'll probably wonder why we don't have more of it, like the big photo mags. There's the little matter of budget. A set of fourcolor plates for one page would exhaust exactly half of our annual cut budget! Only when our friends lend us plates or supply us with reprints can we splurge like this.

In a month or so we'll splurge again. You will find, in an up-coming issue, four pages of color illustrating Ralph Evan's lecture. It is being printed in the new Ektalith process and the story of this cooperative printing venture is almost as interesting as the lecture. It will be in the same issue.

We've added some features we hope you like, and just to make sure, we are running a ballot in this issue so you can vote on them. There are many other features we'd like to run and will as soon as we have enough pages. Advertising has increased enough to permit us to run four extra pages this month in addition to the color insert, 54 pages in all.

Since November is traditionally a voting month, will you turn to the ballot on the next to last page and vote either yes, maybe or no on the features of your magazine. If you need the application blank on the reverse side, fill them both out and send it to Headquarters. As soon as Randy Wright extracts the membership data, he'll pass it on to us to tally your likes and dislikes.

With the task of getting out annual bills, many memberships expiring in October, and also starting work on the Directory, Headquarters is swamped in November and may be slower than usual in answering your letters. With no increase in staff, more than 7,000 names, addresses and Division affiliations must be checked, typed and arranged for the printer. Then galley proofs must be read, pages made up and everything re-checked. It is a tremendous task and leaves little time for routine matters. So . . . if HQ is slow in answering your letter, please bear with them.

We'd like to bring up one editorial matter while we have the floor. Closing dates. At least once a week we get a special delivery, air mail letter describing a camera club or larger activity which is happening that very week. The sponsoring group wants Journal publicity. If it arrives by the 25th of the month, and if far enough in the future, we write a story about it and send it to the printer to be put in type. A week later we get the proof. Then the story is dummied into the magazine. On the 17th of the month the final page proofs are okayed and turned over to the printer. It goes to press, through the bindery and is prepared for mailing. On the 25th (a month later) we turn it over to the tender mercies of the Post Office. From one to two weeks later, you get it.

The moral of this fable is think early. act early, be early and reap the benefits of forethought.-db

TO MEET popular demand for this Introductory Kit of Du Pont "Varigam" variable contrast enlarging paper, photo dealers are again offering it for a limited time. The kit includes everything needed to try "Varigam" in your own darkroom. Get your own kit soon. Your family and your friends will also enjoy receiving this ideal Christmas present.

EASY-TO-USE FILTERS that slip over the lens of your enlarger provide ten different degrees of contrast on *one* grade of paper from any printable negative...soft, normal or hard. This eliminates necessity, bother and expense of stocking several grades of paper for negatives of varying contrast. You save money, time and storage space.

WITHOUT FILTERS, "Varigam" is a nor-

NEW AIDS FOR BETTER PICTURE-MAKING

- By JACOB DESCHIN, FPSA-

On the face of it, the dry battery is going to have the field all to itself in speedlights from now on-or nearly so. "But how can you tell," says Lester Dine, of Speedlight Center, 128 West 32nd Street, New York, "until some time has clapsed so we can judge whether it's going to be wet or dry cell, since the wet cell is more economical, though requiring the bother of recharging?" So he's playing safe with a unique outfit called the Swifty, cousin to the Mighty Midget, but giving the user the choice of any kind of power he wants: wet. dry or AC. Swifty weighs only one pound, costs \$59,95. It has no power of its own. You plug in what you like, a dry or wetcell battery pack or an AC box. The dry pack is \$19.95; the wet-cell with built-in recharger, \$49.95, and the AC box, \$15.95. This unique arrangement gives the user the choice of either one of these or the opportunity of switching from one to another to suit different needs.

With the dry battery pack, which consists of two 225-volt dry batteries in a neat leather case and delivers 3,000 flashes before it has to be replaced, the charge build-up time is three seconds. The wet-cell pack's charging time is under eight seconds; it yields 250 to 300 flashes but can be re-

charged repeatedly for a total output of 10,000 flashes. The AC box permits unlimited shooting by plugging the power cord into the house outlet. All three power sources of the Swifty have a black-and-white guide number of 160 (f/16 at 10 feet); Kodachrome, a guide number of 30 (f/3.5 at 8 feet). The Swifty mounts on the camera by a conventional bracket or on a stand by a bottom tripod screw.

Jen Products Sales Co., 419 West 42nd Street, New York 36, innovators in small-package flash equipment and who introduced the first B-C flashgun, announce a new low-priced B-C flashgun for the Leica IIIf: \$14.95 for battery and carrying case. The new unit is the Jen B-C Pocket Flash, Model SF, an all-aluminum lightweight unit with all the modern design conveniences, Its unique feature is a miniature "pronto" connector, which leaves the finder view free. It mounts in the camera accessory clip and folds into a compact unit for portability.

A new Kodak Standard Flasholder, with a new type of bracket to permit quick removal of the unit for off-the-camera flash photography, is announced by Eastman Kodak. The unit has an improved lamp socket and ejection system and other features, takes midget flash lamps, and may be powered either by two C cells or a Kodak B-C Flashpack. It is wired in series, has an exposure caple on the reflector and lists at \$8.25, including a Kodak Two-way Flashguard.

Cameras

Two new medium-priced 35mm cameras have been introduced on the American market by the Japanese firm, Konishiroku Photo Ind. Co., Ltd., of Tokyo. One is the Konica II, which is equipped with the 5-element 50mm f/2.8 Hexanon lens and Compur-Rapid shutter at \$181.50, and includes single window rangefinder and view-finder, built-in synchronization, cushioned body release, and other features. The other is the Konica I, a modified version of Model II and selling for \$109 equipped with a 4-element 50mm f/3.5 Hexar at \$109 and 50mm f/2.8 Hexanon at \$117. A line of accessories for these cameras is also available.

The company, which has been called the "little Eastman Kodak of Japan" because of the diversity of its products, is that country's largest manufacturer of miscellaneous photographic items, including cameras, color and black-and-white film, papers, chemicals, photographic plates and sheet film. It started business in 1860 and employs 2700 skilled workers in six factories and two laboratories. To promote the sales of its products in this country, the company recently established an American agency, the Konica Camera Company, 76 West Chelten Avenue, Philadelphia.

An improved model of the Bower-X. Model II, German folding rollfilm camera taking 620 film, is announced by Saul Bower, Inc., 114 Liberty Street, New York. The camera is adjustable for two picture sizes, eight 21/4 x31/4 inches or twelve 214x214. and has the Schneider Radionar f/4.5 lens which focuses down to 3 feet. With Vario shutter, speeds to 1/200th second, the camera is \$36.50; with Prontor S. to 1/250th and built-in self-timer. \$43.50: with Prontor SV MX, flash synchronized at all speeds, \$47.50. Important features of the camera include telescopic eve-level optical finder and brilliant waist-level finder; built-in shoe for accessory rangefinder or flash unit; speeds visible above and in front of the camera, and a red dot "zone focusing setting."

Ansco announce the new Viking Readyset cancera, a 19-ounce folding camera with the operating simplicity of a box camera.

Pright and Sparkling, with fine definition developed in PICTONE"

(quoted from an unsolicited letter
from Henry H. Sheldon, noted
animal photographer.) He continues:
"I like it. Pictone gives the
kind of print a publisher enjoys
working with."

This picture has hung in many salons. If you strive for salon quality, you will be pleased with Mallinckrodt PICTONE, the all-purpose negative and paper developer. Its full tonal range — from deep shadows to sparkling highlights — will bring your subject to life in natural texture and delicate detail — as the deer and the window screen prove.

Write for your free copy of data on PICTONE and all other Mallinckrodt developers.

Rather mix your own? Insist on uniformly pure and dependable Mallinckroat photo chemicals for every darkroom process and effect.

Monufacturers of Mediciael, Photographic, Analytical and Industrial Fine Chemicals

The camera takes eight 2½x3½ pictures on 120 film, has two-position focusing control for pictures from 5 feet to infinity, two lens openings, flash-synchronized shutter, and costs \$19.95.

Lenses

A relatively fast wide-angle lens, the Schneider Xenogon 35mm f/2.8, has just been imported by Burleigh Brooks Company, 10 West 46th Street, New York. The \$95.66 coated lens is constructed of six elements and includes click stops down to f/22. The lens is said to have unusually even illumination and good definition at all stops. The same size as standard Leica lenses, the Xenogon is supplied with metal lens caps for front and rear of the lens.

A new Voigtlander lens, the Apo Lenthar f/4.5, a 5-element lens said to be critically corrected for color work and edge-to-edge harpness, is announced by Willoughby's, 110 West 32nd Street, New York, the importers. The new lens is available in two focal lengths, the 6-inch (15cm) to cover

4x5, in Press Compur-X synchronized shutter, at \$98.50; and the 8½-inch (21cm) to cover 5x7, in Compound shutter, at \$169.

The Rodenstock line of lenses are being imported by Alfa Photo Corp., 303 West 42nd Street, New York. Among the lenses now available are the Rodenstock Heligon wide-angle lens for the Leica; the extreme wide-angle Perigon f/12 lens, which covers a field of 85 degrees at full operture, 95 degrees when stopped down; and the Rodenstock Imagon, a portrait lens with grid attachments for controlling the speed of the lens and the degree of definition.

Movies

A low-priced 8mm movie projector that incorporates advanced design features is announced by Bell & Howell Company, Chicago. It is the No. 221, weighs only 12 pounds and costs \$99.95. The 500-watt AC unit has an optical system consisting of a condenser and coated f/1.6 lens. It is self-contained in a gray and maroon case, has a single switch control for lamp, motor

and rewind, and a swing-out film gate for convenient threading. Reel arms, which hold a full 400-foot reel of film, fold out of sight when not in use; the film is held in the film gate by "side tension" clips instead of being pushed against the aperture plate.

A new infrared-sensitive motion picture film, Kodak Spectroscopic I-N Film, which permits moviemaking in the dark with infrared illumination, or in the semi-dark without, is announced by Kodak. The film can be used in any standard 16mm or 35mm motion picture camera using roll film or 16mm magazines.

Darkroom

Eastman Kodak has three processing outfits for three grades of amateurs. For those who want only to print their own pictures, there is the Kodacraft Printing Kit No. 611 at \$4.95; for the slightly more advanced worker who wants to develop film as well as print, the company offers the Kodacraft Photo-Lab Outfit No. 612 at \$8.75; for the serious worker, the Kodacraft Advanced Photo-Lab No. 613 is sold at \$14.10. The latter includes a metal printer as well as other basic items.

FR Short Stop with Color Indicator is the latest item to be added to FR Corporation's line of photographic chemicals. It will be available in half-pint bottles only, at 39 cents a bottle. The solution is normally yellow, turns to bright purple when exhausted. The company also announces Super X-33 Replenisher in an 8-ounce size at 39 cents.

A single-weight paper with the J surface, a fine-grained, high-lustre surface which requires no ferrotyping, has been added to the list of Kodak Medalist Paper surfaces. Other new Medalist surfaces are the double-weight E, fine-grained white stock with moderate lustre, and Y, a fast enlarging paper with a silk lustre finish.

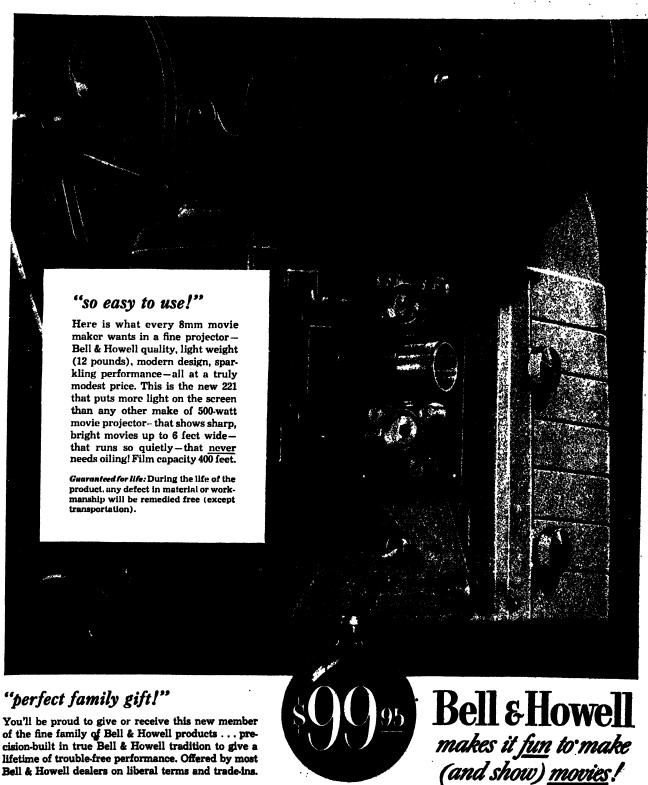

Accessories

A new spotlight, the Sun Ray No. 16, has been placed on the market by the Sun Ray Photo Company, 295 Lafayette Street, New York. Accommodating either 500-watt or 750-watt T-20 or T-24 bi-post projection lamps, the No. 16 is fully adjustable, sprayed inside with a heat resistant paint. finished outside in black wrinkle, operates on AC or DC and costs \$55. The Sun Ray Studio Stand is a three-section unit with a wide-spread triangular base that rides on ball-bearing wheels. By a twist of a thumb lock, the three legs fall automatically into open position and lock in place at the same time. The stand is closed by one upward movement to the center flange. The stand can be adjusted for heights from itfolded length of 40 inches to 81/2 feet. The leg spread is 28 inches Price is \$30.

A copying stand that will accommodate cameras using up to 4x5 film is announced by Spiratone, Inc., 49 West 27th Street, New York. The stand consists of a two-piece 1½-inch diameter post 38 inches high and a 15x18-inch faetal baseboard, and costs \$9.95; a gooseneck light is \$4.95. The company also has imported a Japanese 3-inch f/4-telephoto lens for 16mm cameras

It's the fabulous, new Bell & Howell 8mm home movie projector!

November 1952

Bell & Howell dealers on liberal terms and trade-ins.

When writing advertisers, please mention PSA Journal

with C mounts. The lens has click stops and built-in shade and filter holder, and costs \$29.95. A third item is a remote control release for use with almost any camera. The device uses a solenoid in conjunction with a 20-foot cord, the complete outfit costing \$7.95, the required 4½-volt battery, 70 cents.

Photographic Importing & Distributing Corp., 20 Broad Street, New York, have placed on the market a line of extension tubes for miniature-type cameras; a six-section brass tripod extending to 54 inches, closing to 15 inches, and costing \$7.95, and a line of genuine leather lens cases.

The Combineter, which combines a rangefinder and an extinction-type exposure meter, is offered by S. E. Laszlo, the importer, 25 Lafayette Street, Brooklyn 1, N. Y. The rangefinder is the superimposed image type; the meter has separate scales for indoor, outdoor and overcast sky lighting conditions. With case, the device is \$7.95 in the standard model, \$8.95, the de luxe.

Interstate Photo Supply Corp., 28 West 22nd Street, New York, have imported from Germany an accessory rangefinder and a new photoelectric exposure meter. The rangefinder is the \$4.25 Pollux, a superimposed-image type that fits the standard accessory shoe and focuses from 2 fect to 50 and infinity. The leather-covered device has an adjusting screw for fine adjustment. An accessory case is 75 cents. The meter is the Prix, a \$12.95 unit calibrated in ASA and DIN ratings.

The standard and de luxe models of the Arcadia slide viewer are now available in a Pompeii onyx, a new color, and the case has been improved. The viewers are powered by standard flashlight batteries and cost \$4.95 for the standard, \$5.95 for the de luxe model. The latter has a rectangular viewing lens which permits group viewing. Both viewers are made by Arcadia Manufacturing Co., 2646 West North Ave., Chicago, who will send literature on request.

Enlargement of 2½x2½ Kodacolor negatives up to 8x10-inch Ektacolor Print Film transparencies, is offered in a new service by Authenticolor, Inc., 270 Park Avenue, New York. Michael Lavelle, technical director of the company, says that a new method is used that affords considerable latitude for exposure and color correction. Prices are \$10 for enlargement up to 4x5 inches; \$12 to 5x7. \$15 to 8x10.

A new Graflex booklet, the company's first in three years, is just out and will be mailed free on request simply by writing to Advertising Department, Graflex, Inc., Rochester 8, N. Y. The booklet is in four colors and describes in detail the complete Graflex line of cameras and accessories, which now includes, you will remember, the company's newest acquisition, the Ciroflex line of twin-lens reflex cameras.

Tops at Work

The new "Tops" committee under the chairmanship of Les Mahoney, of Phoenix, Ariz., is proceeding to wrap up a good show for use by clubs and councils. Initial use was the San Diego PSA Town Meeting.

Les has gathered a good group of help-

Les has gathered a good group of helpers. R. B. "Jack" Horner of Chicago has been assembling a slide show of 100 top salon slides made by top color workers. Dr. Harold Lincoln Thompson, APSA, is in charge of the movie part of the show and has contributed his award-winning 1200-foot travelogue in color and sound on Hawaii. Elinore Fields, secretary of the Phoenix CC is helping Mrs. Makoney swing the "hoppe base" jobs.

the "home base" jobs.

If your club or council plans to use "Tops" this year, turn to page 626 for full details.

Accolade

A news letter circulated within the photographic industry by Milton M. Hermanson has this to say in it's October issue:

"Salute to the Photographic Society of America. During the year 1952, a number of shows and conventions, for the public and the trade have been held . . . each one requiring promotion and publicity. By far. the best work along these lines was done by the Photographic Society of America. The publicity program, conducted over a period of about six months, was handled with intelligence, skill and imagination. A constant flow of "news" appeared in the magazine and newspaper press, and on radio and television. And it was all done on a non-paid, voluntary basis. PSA members donated their talent and time to bringing the Convention to the attention of the membership, the trade and the general public, In doing so, they set an example of cooperation and devotion which the photographic industry as a whole should very well note."

Freedoms Foundation Awards

Only a few days remain to get your entries off for the Freedoms Foundation Award in photography. Entries must be mailed before Nov. 11 to Freedoms Foundation, Valley Forge, Pa. Entries are not returned.

Top award is \$1,000 in cash and an Honor Medal. There are also twenty \$100 awards with Honor Medals, ten awards of Honor Medals, and fifteen certificates of merit.

Entry blanks have been mailed to all PSA members.

BOOK REVIEWS

The books reviewed here may be ordered from your regular bookseller, your photo store, or direct from the publishers.

Bigger and Better, the book of enlarging, Don D. Nibbelink, FRPS, APSA, 256 pp, 100 illustrations, \$2.95. Garden City Books, Garden City, N.Y.

If you want to start out right in enlarging, this is your book. It is elementary enough for the beginner, yet contains much that an old hand will find useful. It covers nearly everything that is basic in enlarging. Nearly everything that is basic in enlarging. Nearly everything en cold cathode light sources, for example, only fluorescent and tungsten. On the other hand, there is so much of value that perhaps we are quibbling.

Each chapter ends with a P. S. that is

wisdom in a nutshell. It is easy to see that eight years went into this manuscript, because the author has always had the beginner in mind, provided useful helps for him, yet never writes down to him.

Of interest to almost everyone will be the chapter on Control Processes. Here is the first adequate material on paper negatives for a long time, covering both paper and film intermediates. Also, a new idea in control printing, monochrome-dye, a derivation from the dye transfer color printing process. Sounds like it has possibilities. A good textbook for home study or the club course on enlarging.—db.

The Decisive Moment, Henri Cartier Bresson, with an appended report by Richard Simon, 160 pp, 126 illustrations. Simon and Schuster, New York 20, N.Y. \$12.50.

Ordinarily we would have asked Jackie Judge to review this large picture book because that is her forte. Ordinarily, because we have never been a Cartier-Bresson fan. In fact, we just didn't like any of his work we had seen. When we started through this one, we planned to idly toss a few pages and pass it on for a more understanding mind. We didn't.

As his lab man says, there are two kinds or photographers, those who work for the best possible negative and those who work for the best possible picture. Cartier-Bresson is definitely of the latter group. In fact, there is only one really sharp picture in the whole book and that was made with a 9x12cm camera. All the rest are Leica made, with all the shortcomings of the 35mm negative... softness, grain, and all that ... plus blurs, grab shots out of focus, etc., etc.

The thing that shines through the pictures, negating the technical faults, is LIFE The camera was pointed at people and the ways they live. It told that story. Sometimes the picture was made under severe difficulties, but it was made and you can forgive the faults which pale into minor ones after the impact of the recorded scene.

The book has not converted us into a C-B fan, or even a natural-light fan, but it has given us a sense of respect for the man and his work.—db.

Photography Annual, edited by Bruce Downes, 284 pp, nearly all pictures, (250 and 24 in color). Hard cover edition, published by Crown Publishers, Inc., New York 16, N.Y.

This 1953 Annual, produced by the editors of Photography magazine, has already been on the stands in paper covers. For those who prefer a more permanent binding, this edition is published by Crown.

The book is divided into two parts, Methods and Achievements. Each part is further subdivided under those headings.

What we particularly like is the juxtaposition of pictures that relate either through harmony of idea or disharmony. Often a sly humor dictates the choice.

Many of the pictures are good salon material. Some of them wouldn't get a break in the First Podunk, and some that should wouldn't get it in many. We think you'll like this one, too.—db.

In The Foreign Press

Each month we see many foreign photographic publications. When we find something of general interest we plan to note it in this column. Some of the publications listed are available in libraries, some through photo stores, all by direct subscription. We will gladly furnish the address and subscription rates, when known of any magazine from which we quote. Write your PSA Editor. Language in which publication is printed is indicated by suitable abbreviation following cits of publication.

Leica Fotografie — Frankfurt am Main, (Ger.) July-August, 1952. A new innovation is an inserted pamphlet containing English translation of the text. Concluding their current series on apparatus for close-up photography this issue gives detailed information on using the universal bellows focusing attachment. Previous installments appeared in two preceding issues.

Ferrania—Milan, (1t.) July, 1952. Features a comprehensive analysis of the "Causes of Motion Picture Film Deterioration Due to Projection". The second of two installments, it shows many explanatory diagrams.

Photography—London (Eng.) July, 1952. An interesting study of "Estimating Exposure for Land and Seascape". Another article entitled "Grouse about Exhibition Judges" gives the reader a chance to try his skill at judging six prints—and to compare his score against those of three experts. We quote: "This is a plea to our judges to try and understand one another's outlook. Surely a picture that has received only ten per cent from one judge cannot be worth 90 per cent from another!"

Photo-Technik und Wirtschaft — Cologne, (Ger.) June. 1952. This number salutes the German Kodak Company in Stuttgart on the double celebration of its 25th anniversary and the production of the 500,000th post war Retina camera. Two articles describe plant and the development history of this camera while a third article outlines the new Retina System devised for photomicrography. For those unable to read German a condensed resumé in French, English and Spanish appears in back.

Photo France. Paris, (French) July, 1952. Features the new TE-50 electronic flash lamp of French manufacture in a detailed article by M. Deribéré describing its use and characteristics.

Foto—Doctinchem, (Dutch) June, 1952. In this "official organ of the Dutch Amateur Photographers Association" Mr. J. J. Hens writes in basic detail about perspective as applied to photography. Many diagrams help to clarify the article if your Dutch is rusty.

Mark A. Penick

Mark A. Penick, 57, of Quincy, Illinois, a Life and Cornerstone member of PSA, died in a hospital in his home town in Sept. 13.

He was a lawyer and a graduate of Dartmouth. He was an active member of the Photographic Society of Quincy and of many local organizations.

Surviving are his widow, a daughter and grandson and his father.

1109 Attend San Diego Two-Day PSA Town Meeting of Photography

Models, cameras and fans . . . part of the 1109 who made the San Diego Town Meeting a huge success. All pix by Walter Oshtosh of the Poly Photo Club.

By Vella L. Finne

Camera fans from seventy-five California communities, Arizona, Texas, Wisconsin and New Jersey, even as far away as Canada, Mexico City and Australia attended the P.S.A. Town Meeting of Photography in San Diego, California, September 13th and 14th, 1952. Registration totalled 1109.

This second of these Junior Conventions orginated by photography's best friend, Boris Dobro, last March in Santa Barbara, started off with a bang. By noon the first day four hundred forty nine out-of-town guests had registered and were busy taking pictures in San Diego's famed Zoo and other points in Balboa Park.

At 1:00 P.M. the meeting formally convened in the Conference Building in Balboa Park with more than 600 attending. The Vice-Mayor of the City of San Diego gave the official welcoming speech. Southern California's "photographic greats" such as Fred Archer, Hon FPSA FRPS; Harvey Brown, APSA; Merle Ewell, APSA; Boris Dobro, FPSA, ARPS; Lynn Fayman, APSA; Floyd Evans, APSA; Michael J. Roll APSA; and Leslie J. Mahoney of Phoenix, Arizona—to mention only a few, were introduced.

After the opening ceremonies, the meeting divided into sections, attending programs for Pictorial Division, Color Division and Motion Picture Division, in various buildings grouped about the central plaza in beautiful

Merie Elweil, APSA, opens the color slide clinic with more than 500 in attendance.

Halboa Park. From them on it was a four ring circus, with always a number of cager beavers skipping the programs in search of future masterpieces.

Monochromers particularly enjoyed Boris Dobro's talk on "How I Find My Pictures", and the Camera Club Forum carried on by "big wigs" of the Associations of Camera Clubs in Southern California and by presidents of camera clubs.

While these programs were in session, Al Stewart gave his inspiring demonstration on "Flower Photography With Artificial Light" to over 600 color fans in the Recital Hall, and Lynn Fayman carried the movie group through the mysteries of "Color in Motion", followed by Orval Sprungman's "Water is Life". Later, Robert Barkley demonstrated "Titling Movies".

After dinner, Fred Archer's "Simplified Portrait Lighting" stole the show with an estimated crowd of 1000 attending both the talk and model shoot, held afterwards. The models were photographed under the direction of Fred Archer, Boris Dobro, Harvey Brown and Ernie Wallis.

At 8:00 P.M. Harold Edwards' famed Photochromer's Court gave the lighter touch to Color with Leslie J. Mahoney introducing the Cast of Characters: Hon. Judge. Vella I., Finne; Prosecuting Attorney, Verne I., Sheets; Attorney for Defense, Otto Crader; Bailiff, Harold Edwards; Court Clerk, Alda Van Papallendam; Court Reporter, Meida Hammond.

At 9:00 P.M., there was a "Dutch Treat Jamboree" arranged by Alice Hansen, and at 9:30 a Fashion Show conducted by "Walkers".

. Sunday morning "The House of Pacific Relations" consisting of groups of people, in many cases whole families, from twenty countries, graciously posed in costumes of their former homelands. To add to these, approximately fifteen Calendar Girl models clad in colorful outfits from Bikinis to drum majorette costumes willingly posed.

Boris Dobro, FPSA, ARPS, father of the Town Meeting idea, being presented a medal for his brainchild by Lawrence E. Mayo, President of the Southern California Association of Camera Clubs. Charles Wilson looking on.

After lunch monochromers, en masse, attended the Print Clinic conducted by Harvey Brown with a panel consisting of Fred Archer, Boris Dobro, M. M. Deaderick, Floyd B. Evans, Julian Hiatt, Shirley Hall. Mel Phegley and Bill Wier. To finish their day Michael J. Roll gave an informative talk on "Controls in Photography" and J. E. Wilcox, Jr. spoke on "Strobe, Past, Present and Future", with both meetings attended by 300 to 400 interested shutterbugs.

While monochromers were thus employed, approximately 700 color enthusiasts witnessed a showing of P.S.A. "Tops" color slides with titles of slides and introductions of makers, in absentia, presented by Vella Finne and with comments on each slide by George Brauer.

From 3:00 to 5:00 P.M. the Color Division presented a Slide Clinic presided over by Merle S. Ewell, APSA, with Al Stewart, Les Mahoney, Vella Finne, Fred Bond, APSA, Floyd Norgaard, Henry Greenhood. George Brauer, Glenn Brookins and Lynn Fayman, APSA, as commentators.

For the final gala wind-up of the Movie Division, Dr. Harold L. Thompson. NPSA, ARPS, showed his medal-winning "Tops" movie, the "Invitation to Hawaii".

The Southern California Association of Camera Clubs, especially Charles L. Wilson, Chairman of the Town Meeting, and his Committee, deserve a lusty ovation for their untiring effort in bringing such a completely successful P.S.A. Town Meeting to an enthusiastic group of Camera Fans.

Concensus was that the two days of Town Meeting were over all too soon and those who attended eagerly await the third of the planned series of Town Meetings at Fresno, California, October 25th and 26th, 1952.

Any group interested in conducting one of these meetings may get full information by writing to Boris Dobro, FPSA. ARPS, P.O. Box 1117, Santa Barbara. Calif.. or to Charles L. Wilson, 4136 Iowa Street San Diego 4, Calif.

Zett 35

2 x 2 SLIDE PROJECTOR

COMPACT — PORTABLE

Projects 2 x 2 Color Transparencies

up to 10 ft. widel

The Zett 35 is so tiny it can be carried in an overcoat pocket or the corner of a brief case, yet it will project color transparencies up to 10 feet wide . . . clear and sharp . . . perfectly and evenly illuminated.

The Zett 35 is the world's smallest miniature projector. It is equipped with a fast Voigtlander f2.8 projection lens, and can be set up anywhere . . . instantly ready for use.

It is not only ideal for home use but for many other uses as well. You can set it up in a clubroom. You can take it on a trip. You can carry it to a friend's house. You can use it for a sales meeting.

Tops In Photography

Would your camera club or your friends in your city like to see the finest assembly of photographic work ever put together?

PSA is proud of it, and wants you to have it, enjoy it, profit by viewing it, and the work of years and years of experienced top workers in photography! TOPS consists of the following:

- 1. Top quality black and white pictorials, 16"x20" mounted prints. by star exhibitors. Yes, over 30 of these.
- 2. Top black and white Nature prints of sparkling quality. Over 20 beautiful 16"x20" mounted prints, again by the star workers.
- Technical section prints in black and white, 15 or 20 of the most wonderful subject matter. Palomar astronomical photos, medical studies, color analysis, scientific photography of rare subject matter not ordinarily shown.
- A 1200 foot Kodachrome in sound by Harold Lincoln Thompson,
 M. D., of Los Angeles. A beautiful movie of a wonderful spot entitled,
 "Invitation to Hawaii".
- 5. Slides, slides, "Tops" in salon quality by the PSA's best known names and workers, such as Baumgaertel, Beilbenberg, Manzer and fifty others, all top workers and beautifully composed and exposed slides as only the top salon workers do it.
- 6. Nature in color! Yes, a set of 50—35MM slides of nature subjects captured in full color on film by the top workers in this field.

Sounds good, huh!

- 1. How to get it?
- B. How much does it cost?
- C. When can we have it?

Well, here are the answers:

- (a) Write Les Mahoney, Chairman, Tops in Photography, P. O. Box 1828, Phoenix, Arizona.
- (h) It will cost you nothing, it is free. All you have to do is pay the rail express from the city where it is being exhibited to your city. You exhibit it and ship it on to the next exhibitor or club or city at their expense.
- (c) You can have it as soon as the club or city nearest you close their show. It is well to allow four to six weeks time for handling, exhibiting and re-shipning

How do we put it on?

One camera club talked it over at their meetings several times and decided they would simply "pass the hat" so to speak, at regular meetings and let each member donate whatever he or she wished towards defraying the shipping expense and gallery rental, if any.

Two members more plentifully endowed with wordly goods came forward and said "we will underwrite any deficit (if any)." There wasn't a deficit. Nobody missed the 25 or 50¢ donated. Not a bad stunt!

But who bosses the job? This club appointed a chairman whose task it was to arrange shipping dates, exhibition dates, exhibition places, and have

tickets printed, and the club members

pitched in and cach took on a small task.

Arrangements can be made with a local gallery, a museum, or your public school for hanging space for the prints. It may be necessary to pay a small rental fee. Preferably the location-hould have a modest auditorium for showing the slides and movie. A photo dealer can help out with projectors.

You ask about tickets, what for?

Some clubs prefer to have a club night or showing then a public showing. Also it is discouraging to be invited to a showing and then not have a seat. We suggest printing inexpensive dated and numbered tickets corresponding with the number of seats in the small auditorium, then each ticket holder is assured of a comfortable seat.

OK, where is the best place to have it?

We think nature prints and slides go over best in a Botanical garden gallery, because they are somewhat specialized in their subject matter. Why not have the prints hung in the gallery and if a small auditorium is available, project the slides at the same place, or in the same room.

Technical prints are of wide public interest, because they deal with scientific subjects. The Science department of a college or school, if convenient to the public is a good location. A downtown bank window or brokers office is a good spot and you will be surprised at the interest it will create.

Now booked: Milwaukee Oct. 15, Saranac Lake Nov. 15, Detroit Dec. 15

Write Les Mahoney, P. O. Box 1828, Phoenix, Arizona, for details and suggestions for staging your own TOPS.

P-J Contest Winner

First prize in the P-J Division contest for pictures made at the N. Y. Convention goes to Mortimer Friedman of Washington, D. C. "Head over heels" was made with a Leica on the boat trip. Other winners below.

Winners in the convention photo-reportage contests sponsored by Photography magazine and the Photo-Journalism Division were announced as we go to press. The Photography magazine contest was for series of pictures telling the convention story, and the P-J Division contest was for single prints.

Fred A. Hamel wins the top prize for series, \$200. You saw many of his pictures in the Convention picture story in the September Journal. Ollie Fife was second for \$100, Billie Price was third for \$50 and Eleanor Rost won the fourth prize of \$50.

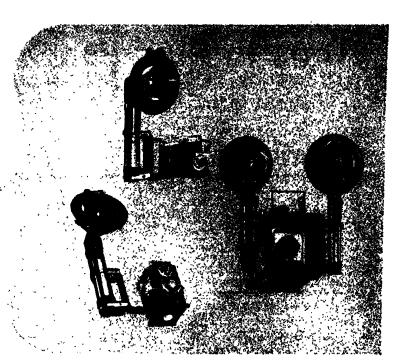

In the P-J Division, Mortimer Friedman copped the top \$50 prize with other awards going to: Eleanor Rost, 2nd, \$25; Miss Billie Price, 3rd, \$15; Fred Hamel, 4th, \$10; Ollie Fife, 1st H.M., \$5; Fred Hamel, 2nd and 3rd H.M., \$5 each. These awards were for single prints.

Arizona Highways

For years we have reveled in the beauties of a little magazine called "Arizona Highways". Before WW II it was freely using color, a rare thing those days with small magazines. Produced by offset, the color is excellent and the articles are always interesting. The October issue contains an article by one of the mag's most popular photographers, Joseph Muench, FPSA, which tells all. His article is worth reading if you want to take pictures of Indians. He has the secret. The Editor, Raymond Carlson, is also a PSA member. Most of the picture captions have the camera data, especially the color pictures. It isn't often we are inclined to plug a "house organ" but this one is exceptional. If you can't find it on your newsstand, send 35 cents for a sample copy to Arizona Highways, Phoenix, Ariz. Subscription is \$3 a year in U. S. A.

Wear Your PSA Insignia It Identifies You

No matter what type of camera you own...

GRAFLITE

answers
every
flash
problem
better!

If you own several cameras, the advantage of Graflite is obvious. But, even if you're a one-camera man, the time is almost sure to come when you'll want to try your skill with another type. So why get stuck with a flash unit that only fits your present camera? Get Graflite and you're flash-equipped once and for all... saving you time, trouble and expense in the future.

What's more, Graflite's amazing versatility extends to its prize-winning performance too! Single or multiple flash, with synchronized or solenoid-operated shutters... no matter what the need, Graflite provides the answer for almost every camera. And remember, only Graflite combines all the following features... multi-purpose circuit controller; "snap-on" vise-like grip; microtype click action switch; multiple outlets with standard household connections; and reversible, heavy-duty clamps. Learn all about the versatile Graflite from your dealer today. It's a sure step to prize-winning pictures every time, every place, in any weather! And it's perfect for color too!

Johnny Appleseed Is Back— Flood of Letters Welcomes Him

What a welcome Johnny received after last month's announcement that he was returning. Offers of help and queries have flooded the mail desk at Headquarters, actually catching us unawares. We thought we were going to have a little time to set up a Directory of Helpers for Johnny but the flood swamped the Directory. Be patient, PSAers, and Johnny will get your answer out just as soon as he can dig down to it.

Helpers who have signed up offer to answer questions on club programming, opcration and use of the Super D Graflex, print toning, graphic arts problems and a host of others. If you have a specialty, may we gently nudge you in the direction of that coupon at the lower right corner of the page? Don't worry that we already have someone, we can use duplicate Johnny's all over the country to speed up the service.

We're printing here some of the answers Johnny has sent his friends. Maybe they'll help you in your problems. Maybe you have a better answer. If so, send it along and if Johnny's expert helpers go along with you, we'll print it. . if they can prove they are smarter, we'll ask them to prove it to you.

So from Johnny's first mailbag, we offer the following items, (condensed):

Wants Another Maine Trip

Using the Journal of June, 1950 as a guide we took that wonderful trip from Kittery to Camden, Me. Now, we would like to have more of those revels in your column and especially we would like to have a trip from Camden up the rest of the coast of Maine so we could take it before vacation. We find it to be ideal to travel for pictures when vacation is over. We did not have the crowds in our way.—I.M.H., Albany, N. Y.

We've also had requests for an article on Nova Canter of the control of the second to have the second to ha

One of my helpers has promised to do it Scotta. One or my neipers has promised to do it up, and we'll see what we can do about his jaunt. We're also working on some "Shorttes", guides to a single picture area. Irma Louise Carter has fed us several, we're going to tackle Charles Albee Howe and maybe Joe Muench will come up with some dope on the Southwest. Sort of a photographers' Bacdaker.

Breaks Rules, But

I have three problems. 1. Does the type of shutter, between the lens or focal plane, affect the exposure or tolerance of exposure, and the fidelity of color film? 2. What is the proper way to apply Fassbender's wax? 3. Is there a standard size of stereo camera that I should purchase?

-H.A.T., Merced, Calif.

You broke our rule about putting more than one question on a sheet. Now we have to copy your letter so it can be split among three of my Helpers. Part I'll answer here, part by mail. Any theoretical difference of exposure between a focal plane and a between the lens shutter is less than the difference between any two shutters of the same type. piece of equipment made has its individualities and each piece must be calibrated by you for the best results. Exposure varations will affect color fidelity. true, but when you change from one camera to another, you must learn that camera. Each of your cameras should be individually calibrated to your exposure meter, determining the right film factor for each camera and each meter you own. Proce-dure is described in the Kodachrome Data Book, but it simply means taking three pictures, one at meter exposure, one a half-stop or stop larger and one the same amount smaller. From inspection of the processed film, choose the right film speed index for your equipment. (You can always get usable pictures by using the equipment as it comes, better pictures by calibrating.)

Your second question has been referred to Mr.

stereo cameras. European models using plates are 45 x 107cm. The Sawyer Viewmaster takes a picture about the size of a 16mm movie frame. Most popular size in U. S. at present is the 23 x 24mm of Stereo Realist, Videon and other cameras. Several cameras makes before a leaves a citature section. eral cameras make a longer picture, namely the Busch Verascope and the Iloca I. Probably more pictures are made in Realist size than any other.

Wants Binders, Index

In the three short months that I have been sember of PSA I have received a great deal of value from the Society, especially from the Journal. I am sure I will want to refer to the Journal again and again, and how will I find an article five or ten years from now? And what if the issue is misplaced? Isn't there a binder I could get to hold my copies? -F.E.D., Hartford, Conn.

We're glad to have such enthusiastic members. And to set your mind at rest, at the end of each year, we publish an index and title page. Some members have the volume bound and in this way they can have a title page for the whole volume, followed by an index of every article which has appeared. The binder problem is not so easily solved. Magazines with million circulation have special binders printed. You can get binders and have them imprinted by your local stationer. Just tell him the

Wants Better Journal

I think the Journal could stand a lot of improve-The news about what individual photographers are doing could be left right out without being missed by me. Some of us do not get to the cond I know there are interes that could be passed on to us. All we get is a short news-type report. Why can't we have more complete coverage of the conventions? We could complete coverage of the conventions? We could stand more articles on where we can take pictures. They don't need to be detailed, but PSA has members who are familiar with their own stamping grounds. I hope more of the papers from the Sym-posium on Science and Industry will be printed. -E.R., Midland, Mich.

This is the kind of brickbats the Journal Editor likes. Constructive. I'll let him defend himself. Johnny.—E.R., the Journal Editor thinks it can stand improving, too. He could use 200 pages every month to meet the demands of all and he has to dub along with 48 pages. The news of Division activities and of people is important to many members. Lots of our readers want more of it. The Convention reporting is another problem. The New York Convention was a seven-ring circus. We would have needed at least ten reporters to cover it adequately, preferably more. Few of the talks were from written material, except in the Technical Division. Five of these were in the PS&T supplement of October, more will be in the December supplement. We know of several talks which were written in advance and were excellent talks, but in cold type they are definitely below par. They are the proposed to the needed the personality of the speaker to make them interesting. We'll try to defend you from that type of material, and we are laying plans to get more adequate coverage of other sections of the Los Anseles Convention in 1953. As for picture possibili-ties, we are working on that as you can see by reading the letters above.

New Member

I would like to learn more about the organization and its history and development. Please send me a copy of the Constitution. How does one become an APSA and a FPSA? How do I locate other PSAers in my city?—L.J.G., Los Angeles, Calif.

This man is going to be a good PSAer. He wants know what makes us tick. He's the type that will know that you get the mostest out of that you put the mostest into. The Journal Editor tells me he is working on a series of short informatells me he is working on a series of short informational items that answer practically all your questions. They will tell you about every PSA and Division service and activity and where you can get the detailed information. This will be run consecutively starting very soon. The 1953 Membership Directory is scheduled for release in February and will contain a geographical cross-index that will make it easy to locate other PSAers in your vicinity. It will also contain the By-Laws.

Why Color?

Would you kindly explain to me the theory that there is no color in an object until light is thrown on it? I have been told that there is color which becomes intensified when light is thrown on it. If this is true, then there must be color somewhere in the object. What about fluorescent paint? This to me is proof that you can see color in the dark. -R.G.H., Toronto.

You sure pick the tough ones! But let me ask you right back, what is light, and what is color? Frankly, a complete explanation requires a whole book and some lab experiments, and you'll find that Ralph Evans' book on color and seeing color has most of the answers. For now, I'll try to give you a brief course that will perhaps clear away your mental blocks and hilp you to see the answer.

Light is energy, a form of vibration related to count and will be observed as the second and trying the second an

sound and radio, but vibrating at a different rate than either of these. In fact, if the whole vibra-ory spectrum were laid out in a straight line about 500 miles long, starting with sub-sonic frequencies and traveling through sonic, supersonic, radio, heat, light, ultra-violet, cosmic, X-Ray and gamma rays

about a sixteenth of an inch just below the middle. Fluorescent materials vibrate under ultraviolet light and usually stay agitated for a while. Thus we can see them glow in the dark. And if fluorescent salts mixed with other salts of visible color, ultraviolet radiation will make the color appear brighter.

HELLUP!

There are a lot of shrinking violets in PSA. I want to ferret them out. Johnny needs a lot of helpers to carry out this new scheme . . . fellas and gals who are real sharp about something. Somewhere in your experience you have encountered problems, the solution of which would also be somebody else's solution. Won't you paste the coupon on a postcard and mail it to me at Headquarters, 2005 Walnut St., Philadelphia 3, Pa., so I can add your name to my growing roster of Johnny's Helpers and refer pleas for help to you? JOHNNY APPLESEED, FPSA

Johnny Appleseed, FPSA 11

Modern Requirements of Photographic Lenses

By Dr. Frank G. Back, FPSA*

It is a well known fact that a simple lens such as a magnifying glass has only a very limited use in photography because of its affliction with so-called aberrations. For some time in the recent past when "artistic softness" was sought, mainly in portrait and figure work but also sometimes in land-scape photography, these simple or monocle lenses, as they are technically called, had a certain limited usefulness. But nowadays the trend is in the opposite direction, and it is therefore the principal task of the lens designer to reduce lens aberrations to achieve as sharp and brilliant an image as possible.

The study of lens aberrations and their elimination is much older than photography itself. As early as the first half of the seventeenth century, the great French philosopher and physicist Descartes devised a method to avoid spherical aberration by using elliptic and hyperbolic lens surfaces. Unfortunately, it was impossible until very recently to manufacture such lenses, so that the so-called Cartesian surfaces remained a scientific curiosity without any practical value.

The only other way to correct lens aberrations consists in combining a number of single lenses of opposite power in such a way that their aberrations cancel each other out as much as possible. Naturally, a complete elimination of all aberrations is impossible to achieve and, at best, only compromise solutions can be found.

Lens progress keeps step

The great progress which photography has made, especially in the last two decades, has greatly increased the demands put on a modern lens. The combination of fine grain with high sensitivity in photographic emulsions has led to a great extent to the discard of the old bulky cameras and their large picture size, and has replaced them with small size and miniature cameras. Another factor which led to this change in negative size is that today projection printing, formerly regarded as a highly skilled art, is as easy as contact printing, thanks to the modern enlargers.

In cinematography, resolution requirements are even greater because a very small image has to be blown up to sizes never dreamt of by the old-time photographer. The modern photographic objective therefore has to have a much higher degree of correction than the old camera lenses because image defects which went unnoticed on a contact print become highly objectionable on an enlargement.

A further factor which puts greater demands on the skill of the lens designer is the necessary speed of the lens. While formerly the photographer was satisfied with a moderate speed of his lens—an f/4.5 lens was regarded as a high speed objective—nowadays such a lens is definitely slow. The mod-

ern photographer wants to take action shots under all kinds of adverse light conditions, and so gradually lenses of f/2, f'1.9, f'1.4 and even faster have been designed. It goes without saying that, in spite of this speed, the photographer still demands the same high resolution from the finished picture which he got from his old and slower lenses.

On the other hand, the task of the lens designer has become easier and, strangely enough, this is only partly due to progress in science and technology. One of the basic rules of classical photography was that the camera axis had to be absolutely horizontal. Converging lines on buildings, etc., were regarded as strictly taboo, and old cameras still have a spirit level to enable the photographer to keep his camera straight.

Distortion no longer a factor

Photography, like many other arts, has freed itself from the bonds of old-fashioned rules. In modern photography, the weirdest angle shots, with their resulting perspective distortion, are no longer objectionable. On the contrary, they are regarded as a means of artistic expression. The lens designer profits by this trend in photography that today a slight amount of distortion in a photographic lens is not objectionable any more so long as this lens is not used for measuring or copying purposes. Since, as has been pointed out already, every lens design is a compromise between the different lens aberrations and since, on the other hand, distortion is the only aberration which does not affect the resolving power of a lens, a higher degree of resolution can be achieved at the expense of a small remainder of distortion.

Needless to say, the lens designer has also profited by technological progress. The modern lens designer has at his disposal a greater variety of optical glass than his colleagues of previous times. Since the selection of glass plays an important role in the art of lens design, it follows that the greater the variety of optical glass, the easier the task of lens correction.

Another newly developed technique which has greatly helped the lens designer is the anti-reflection coating of lensair surfaces. Formerly, he was severely handicapped in the number of elements he could use in his objective. In the precoating era, 8 glass-air surfaces were the maximum permissible in lens design. If this number was increased, not only did severe light losses through internal reflection result, but reflection image known as "lens ghosts" made the lens unusable for photographic purposes. These lens ghosts were not amenable to mathematical treatment and therefore had to be eliminated empirically, a task which became well-nigh impossible if more than 8 reflecting surfaces had to be contended with. The old lens designer, in order to avoid glass-air surfaces, had to cement his lens elements together and therefore

nad to resort, not only to triplets, but to quadruplets and even quintuplets to achieve the required correction. With the advent of lens coating, the lens designer has been freed from these limitations. Within reason, he can use any number of lens-air surfaces without incurring serious transmission losses or risking "lens ghosts." In a recently developed varifocal lens, more than 36 glass-air surfaces are employed without any adverse effect.

Chromatic corrections

Another development which greatly facilitated the work of the lens designer was the advent of the panchromatic emulsion. The old emulsions had their peak sensitivity deep in the ultraviolet, and the old camera lenses therefore had to be corrected not only for the visible spectrum but also for the ultraviolet region. This wide range of chromatic correction usually resulted in a great amount of so-called secondary color because full correction, especially with a small number of elements and a limited choice of glass, can only be achieved for two wavelengths. The farther apart these two wavelengths, the worse the secondary color becomes. This peculiar type of color correction, characteristic of the old lenses, explains also why old cameras lenses cannot be used for modern color photography. The modern photographic emulsion corresponds roughly to the sensitivity range of the human eye, and therefore the modern photographic lens is corrected only for the visible spectrum. It is not necessary for the modern lens designer to pay any attention to the ultraviolet region because on modern film it plays only a negligible role in image formation, and whenever there is a predominance of untraviolet rays, as in haze, these are cut out by haze filters.

Another point which has greatly influenced lens design is the fact that formerly a photographic objective was regarded as an optical instrument in itself. The photographer therefore demanded that he could use the same lens for different kinds of image sizes, alternately as a wide angle lens with a large size plate, as a normal lens to cover a medium image frame, and as a telephoto lens for a small size picture. The lens designer therefore had to correct his lens for as wide a field as possible which, of course, greatly limited the speed as well as the resolution.

Nowadays the lens is regarded as part of a camera. It has to cover a certain predetermined field, neither more nor less; thereby a much higher degree of resolution can be achieved. This is a fact which is not fully understood by many amateurs. Time and again the questions is asked, even by advanced amateurs: "Why can't I use a 1-inch 16mm lens as a telephoto lens for 8mm?" The answer lies in the nature of lens aberrations.

Aberrations

Spherical aberration and longitudinal color cause a loss of resolution equally distributed over the whole image plane, while the other aberrations, namely, coma, astigmatism, field curvature and lateral color are absent in the center of the field and increase with the size of the field. As lens design consists mainly in balancing the different aberrations against each other, each type of lens has a definite number of points it can resolve over the entire image frame. If the lens has a short focal length as compared to the field covered, spherical correction has to be sacrificed to achieve a sufficiently flat field and sufficient freedom from come and astigmatism. If, on the other hand, the lens is designed as a long focal objective and consequently has to cover only a relatively small field, the lens designer does not have to worry about the socalled extra-axial aberrations and can concentrate his efforts on correcting spherical aberration as much as possible. It therefore follows that a 1-inch lens designed for an 8min

motion picture frame achieves a much higher a lomm lens which has been adapted to an disting contest cause the design of the latter had to sacrifice contest toward the outer field which remains unused on the Smin frame.

For the same reason, a great number of high speed lenses stopped down to f/4.5 do not give the same high image quality as lenses originally designed for a maximum speed of f/4.5. The latter are fully corrected for this speed, while the high speed lenses sometimes suffer from zonal aberrations which result in inferior image quality even if the lens is excellent when used wide open. The photographer's belief that the faster the lens the wider its usefullness is therefore only conditionally true.

Summarising

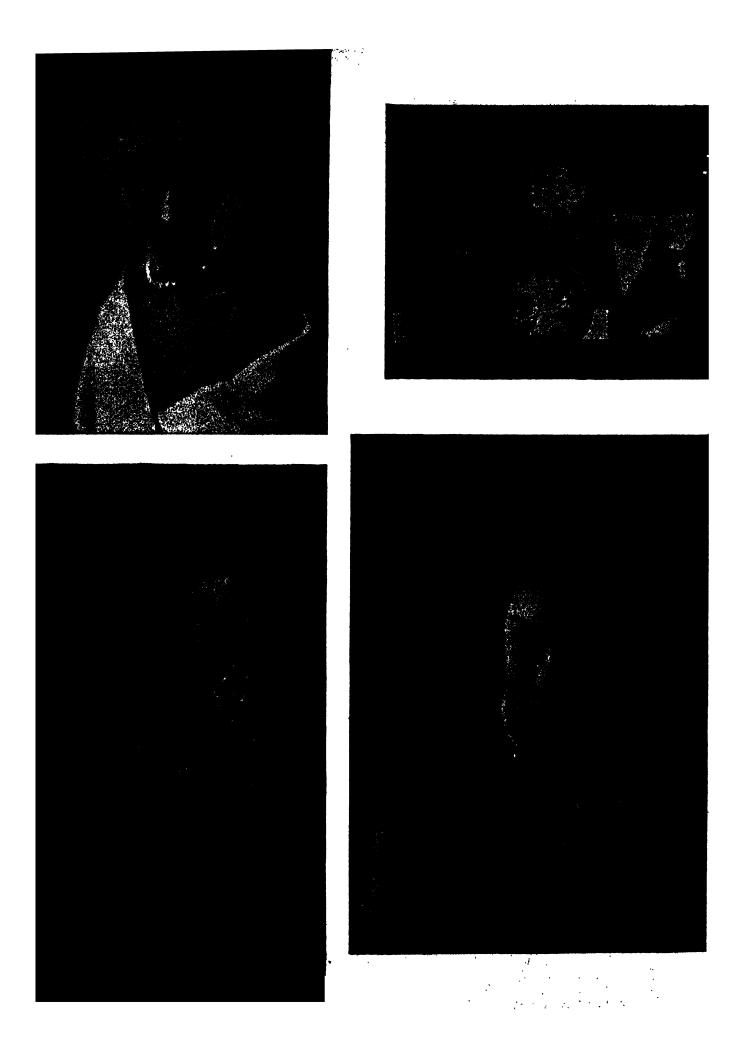

In summing up, it can be said that a good modern lens has to have full color correction for the visible spectrum, and it has to have a resolving power for full aperture which, in the corner, is at least equal to and, in the center, considerably greater than the resolving power of the photographic emulsion. If stopped down, the zonal aberrations and the shift in focus caused thereby should be kept at a minimum.

Most of the modern high class objectives fulfill these requirements. But these achievements do not constitute the ultimate in lens design. One trend goes toward the use of other material besides glass. For instance, recently sapphires and other crystals have been manufactured with sufficient homogeneity to be used as optical material. Another trend combines lenses with mirrors, through this practice is more than 200 years old in telescope design. A further recent development is the commercial production of so-called aspherical surfaces, thereby for the first time using Cartesian lenses.

Finally, the modern high speed electrical computing devices promise to be a great boon to optical designers. The theory of geometrical lens correction was fully developed more than a century ago by the great British physicist Hamilton, although in practical application his theory could only be used as rough approximations for preliminary computations using the methods devised by the German physicist Baron Ludwig von Seidel. Any attempts to develop formulae of greater accuracy from Hamilton's theory led to such complicated equations that they became unusable for practical purposes. The modern large scale computing machines can handle such equations easily and therefore it is highly probable that in the near future Hamilton's ideas will play a greater part in lens design than they have hitherto.

Petsval led the way

In this connection, it should be mentioned that Joseph Petzval, one of the classical masters of lens design, had developed formulae from the Hamilton functions which were usable. In the absence of modern computation aids other than logarithms, the Austrian Government put at his disposal two military engineers well versed in mathematics and computations. Petzvel then withdrew with his human computing machines to the lonely top of a mountain at the outskirts of Vienna and finally produced a leas design far superior to anything known to his contemporaries. As a matter fact, the Petzval type lens still forms the basis of many modern high speed objectives. Unfortunately, burglars who broke into his home expecting to find material riches and treasures, were so disappointed when they found in his safe only sheets covered with mathematical formulae and computations, that they destroyed all his notes. So present day mathematicians have to go through all his work again to develop a usable method for computing machines based on Hamilton's theory.

Quality Color Prints

Produced in the Camera

by John R. Kane*

The color insert illustrating Mr. Kane's article has been furnished through the courtesy of U. S. Camera magazine. An article on this subject appears in the November issue of U. S. Camera. Both articles derive from Mr. Kane's paper delivered at the New York Canvention.

High quality color prints may be easily and quickly produced directly in the camera using standard materials and equipment. These direct color prints, which are considered to be superior in quality to prints printed by standard color printing methods, require only minor changes in existing procedures.

The sensitive material used is Ansco Color** Printon material, which is a multi-layer color printing material on opaque base designed for single exposure production of color prints.

The obvious procedure is to load the Printon material into standard sheet film holders and expose it in the camera in the same manner as film would be exposed and then process it according to standard Printon material processing procedure. This procedure, while basically correct, is not completely satisfactory for the following reasons:

- a) The image is a mirror image
- b) Effective speed is excessively low, being the equivalent of exposure index 1 to 1½
- c) Contrast is too low resulting in mushy appearing prints of unsatisfactory color saturation

The problem then is to overcome the above objections in such a way that existing solutions, equipment and, in most cases, techniques may be retained. We believe that this has been successfully accomplished.

Firstly, the problem of the mirror image is solved by mounting a first surface mirror in front of the camera lens at 45° to the optical axis of the lens. A suitable mirror can be purchased for approximately \$1.50.

DIRECT COLOR photographs, at left, made on Printon. The little boy, lower left, was photographed by the author. Daphne Dorne (top left), Dawn Arden (lower right) and the ceramic objects by Associated Amélican Artists, were photographed by Bernard Einson, well-known New York photographer, in his studio. All of the pictural wave processed in strict accordance with the information set forth in the article.

*Ansco Technical Service Department **Reg. Trademark

A Technical Division Feature

For experimental purposes, a simple cardboard mount can be made. However, for permanent use, a more substantial mount is desirable. Commercially available mirrors were found to have only slight effect on exposure or color balance since most of these reflect over 85% of all visible wavelengths. A prism may be used if available. In the experiments described here, a mirror of 4 x 4 inches was found to be adequate for use with a 12 inch f:4.5 lens used for exposing 8 x 10 inch prints of portrait subjects. Suitable first surface mirrors can be obtained from Evaporated Metal Films Corp., Ithaca, New York, or Semon Bache, 636 Greenwich St., New York 14, New York.

Our second problem, that of increasing the effective speed of the Printon material to a practical level, was solved by increasing the first development time up to double normal time. This increased the effective speed by approximately four (4) stops, or up to an effective exposure index of approximately 16. This, you will notice, is actually faster than most color films. The first development time used to obtain this speed was 26 minutes at 68F. This time can be reduced as much as 50% by high temperature (80F) processing.

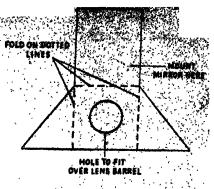

The third problem, that of gradation control, is solved by increasing the color development time. In most cases, an increase of 30% over normal produces satisfactory gradation characteristics. Since normal color development time is on the order of 12 minutes, this means that for direct color print work, we use a time of about 16 minutes. Here again, this time may be reduced by approximately 50% by high temperature (80F) processing.

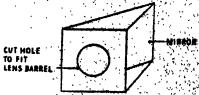

Practical Aspects

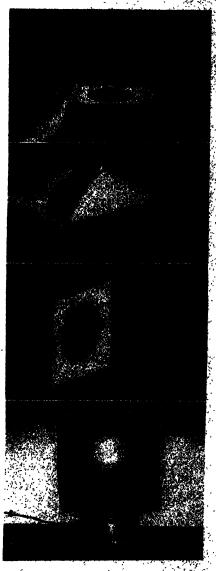

Printon material is balanced to be used with tungsten type illumination, that is, approximately 3200K. If light sources of other color temperatures are used, the appropriate conversion filter or filters must be used. For example, if exposures are made by electronic flash, which we know to be a daylight quality light, a conversion #11 filter should be used on the lens. In addition to a conversion filter, some color compensating filters may be required to "halance out" individual emulsions. It is quite likely that the filtration required will not

(Continued on page 665)

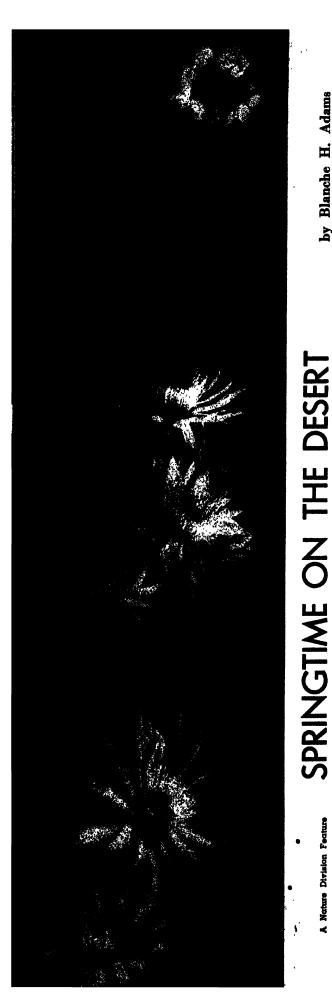

Illumination Tungsten (3200K)	EXPOSURE DATA FOR PRINTON Filter none	Exposure Index 16 Guide No	•

Electronic Flash 100ws	Conv. #11	40	

Score on folding lines, bend to shape; then seel corners with Scatch tape. Mirror can be held if place with rubber coment, Hole should be a push fit on lens barrel. (Keep flagers off front surface of mirror!)

Those who do not understand say that the desert is barren and promiseless. Only he who accepts its challenge by walking difficult trails reaps the rewards. One of these is in evidence in the spring when warm sun rays awaken the cacti which bring forth their delicate blossoms. Their earthly beauty is transitory, but photographic science can preserve it. This, preservation may satisfy a personal desire for an individual collection, or it may, if properly classified and catalogued, become part of a permanent scientific nature collection. In either case, the role of the nature photographer is a worthwhile one.

Those not acquainted with the Southwest are surprised by the desert in the spring. They find it almost incredible that such unostentatious, rugged, cacti produce colorful and exquisite blossoms. Both black and white workers and color enthusiasts find this flora excellent subject matter.

It is not wise to venture forth without some knowledge of the desert, for it is not without its perils. Sturdy shoes are a necessity, for rocks, gravel and brush make desert trails rough. Excessive sun and heat call for drinking water, widebrimmed hats and sun glasses; and long-sleeved shirts, though uncomfortable, will protect one from sunburn.

Rattlesnakes are a potential danger. During the heat of the day they seek the shelter of the shade, and one should exercise care as he goes in search of pictures. Special caution should be taken when one is on the desert during a shower or storm, for coolness and moisture bring the snakes into the open. I have been photographing on the desert for five years, often in dense growth, and have seen rattlesnakes on two occasions, both times after a shower. As a precaution, one should carry a First-Aid Kit for snake bite. The above is not meant to frighten prospective photographers interested in this type of work, but one must realize the necessity of care in this respect.

The flowers are abundant. The hedgehogs are the first to bloom, appearing in early April. They grow in clumps and of all the cacti blossoms, I have found them the most difficult from the point of composition. The Prickly Pear blossoms are unusually delicate, both in form and color; and good composition is easier to find because of the profuse blossoms and buds, and abundance of this plant. They change color during the day, turning from pale to deep yellow with an orange tinge as the day advances. The Chollas are beautiful in their wide range of red, yellow, bronze, green and silver. As they bloom in clusters, it is easy to select good composition for the flowers are numerous. The silver cholla plant, commonly called the "Teddy-bear" because of its resemblance to the little animal, has a greenish-silver blossom tinted with the most delicate touches of pink. The Barrel cactus blooms later in the season; and if one is fortunate, he may find a complete circlet of blossoms. (It is commonly said that a lost desert traveler can quench his thirst from one species of this cactus. Actually, the plants dehydrate in the hot weather and have very little available sap. Even when sap is present in this plant, it is still useless as a source of water, for it is in the form of an acrid mucilage which produces thirst instead of quenching it.) The Mammillaria, or pincushion cactus, likes to grow in the shade of a shrub; and its tiny blossoms form a circle around the top of the little plant giving it the appearance of a birthday cake.

The varieties mentioned, plus the Saguaro, grow in the vicinity of Phoenix, and not too far away one finds the Claret cup which grows in the higher regions and can be found easily by its large crimson patches of small blossoms. The Beavertails, with their rose-pink blossoms, are a joy to photograph. The members of the Rainbow family are of various colors and hues and are borne on a small plant which is almost overpowered by the large blossoms which it bears. During each

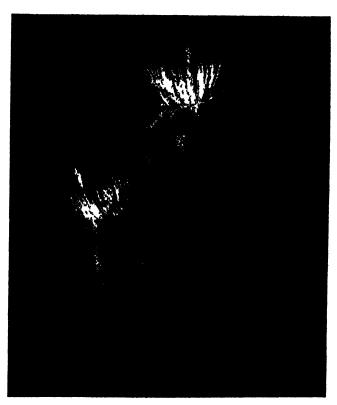

Eriocereus Jusbertii. Center-Peniocereus Greggil, Lower-Cereus onnianut.

season these plants produce a different colored spine which give the effect of colored bands. The flowers of the Coryphanthas bloom in clusters, as does the Johnson cactus. The buds, blossoms and tree structure of the Johna Tree make excellent pictures. The Johna Tree forest is located between Congress Junction and Kingman, Arizôna.

The above is not a comprehensive list but does include the most common varieties found on the desert around Phoenix.

The Desert Botanical Garden Of Arizona, located near Tempe, Arizona, (a few miles from Phoenix) is a source of not only the cacti mentioned above but also numerous varieties not native to the state. Scientists and photographers are welcome, but the latter must secure a photographer's permit from the Director.

Southwestern photography is by no means limited to cacti blossoms. Poppies, lupin, sand verbenas and numerous other desert flowers add color to the landscape. The Palo Verde tree is a mass of yellow when in bloom and the Ironwood tree has delicate lavendar blossoms. The creosote bushes

Nyctocereus serpentinus

bloom a great deal, and the Ocotillo's flaming red flowers brighten the scene.

Heavy equipment becomes a burden in desert photography. It is best to leave it at some accessible spot, well protected from the sun, while one looks for specimens to be photographed. A tripod is necessary for close-up photography, as exposures based on hellows extension are long and necessitate a solid support. Ground glass focusing and composition are also possible when the camera is on a tripod.

Metal foil reflectors serve to throw light on the dark plant area and thus they ease, to a great degree, the problem of the great contrast that one finds when photographing both light blossoms and a dark plant. Mirrors are not as satisfactory for they may produce a glare, yet I have photographed many saguaro blossoms by light reflected from a mirror, for the blossoms were completely in the shade.

The nature photographer may record subject matter in its natural state or in a more formal arrangement. Both approaches, of course, have their place. Because pattern backgrounds lend authenticity, I prefer to use the first approach whenever possible. If that is not feasible and the structure be used as a background, I resort to the sid of artificial backgrounds.

For this purpose I prefer velveteen, for it does not have the glare of cardboards. If folded carefully it does not writtle badly. I also carry a piece of wallboard to which I thumbtack or pin the velveteen, (clothes pins can be used also), and then I place it behind the flower to be photographed. A cloth background has only one disadvantage I believe, and that is that it picks up cactus thorns and dust which must be removed before each exposure.

When photographing a low cactus I place the battspround behind the plant, supporting it with a rock; in the case of a taller one, I hang the wallboard covered with velvesom on a spare, lightweight tripod which I carry for this purpose. This is very easy for I have punched holes in the board (two to hang it vertically, and two so that it can be hung horizontally)

© BHA Saguaro blossoms

and have threaded heavy cord through them. I find this more satisfactory than placing the background immediately behind the plant, because it does not become imbedded with thorns and it can be placed back far enough so that no hard shadow is thrown on it if a light background is used. Many of the thorns are very fine and difficult to remove, and it is well to carry tweezers to remove thorns both from the background,—and the photographer!

For black and white work, I prefer a light gray color because it permits tonal control of the background in the printing process. There are times, however, when I find it necessary to use a dark blue one in order to achieve the desired composition by etching out large areas on the negative. This is easily possible when a dark background has been used.

It was necessary to do this in the pictures of night blooming cereus used to illustrate this article. Saguaro blossoms grow in large clusters or groups and in order to achieve the desired composition in the picture used here, I had to each

out nine buds along with part of the plant. The three bloswoms of the "Queen of the Night" almost overpowered the slender stem on which they were growing, and the stem had to be attached to a stake which could not be removed except by etching. In other varieties, massed stems are a problem. One must realize that a cactus plant cannot be manipulated into good composition. There is much opposition to such a solid dark background, and rightfully so, but one finds it indispensible at such times.

For color work I use a navy blue background most frequently, for it dramatizes the blossoms and does not show a dark visible shadow as cardboards do. I seldom use the bright colors because color harmony is not easy with a limited assortment of colors; and also because they produce a "seed

catalog" effect instead of a pictorial one.

Though the cacti blossoms are numerous, one does not succeed in getting a great number of excellent pictures on one trip. Considering traveling time to and from the desert, the time necessary to find the specimens and the relatively short time during the day that the blossoms are at their best, one can see that it takes many trips and hours of searching to get a large collection. The opening of the blossoms of most varieties depends on the sun; generally they are open about eleven in the morning. As heavy shadows are undesirable, one must avoid the noon hour and wait until the light angle is better. As the flowers begin to close around three o'clock in the afternoon, the day is gone before one realizes it. The chollas, however, open fully in mid-afternoon.

People who have not photographed these blossoms have no conception of the discomfort involved. Much walking with camera equipment is necessary. Insects, particularly gnats, flies and bees can be a decided annoyance. The wind often makes it difficult to make an exposure and causes much delay. At times, the heat is excessive, but photographers loaded down with equipment, a thermos bottle of drinking water. reflectors, tripods, backgrounds, countless supplementary aids,—and perhaps, a lunch too,—do have the courage and undaunted photographic urge to go in search of pictures, not once, not twice, but repeatedly. Often times, one feels amply rewarded; other times, he feels fortunate to have found just one fine shot during an entire day.

Those of us who live in the Southwest where these flowers predominate, can be quite selective in our choice of material. We have the opportunity to photograph the same subjects each season. We know, too, the seasonal aspects of the varieties which grow here and the locations in which they grow. Not all grow together, and in their native habitat, they grow in certain localities. We often drive a hundred miles or more hoping that we will be fortunate enuogh to find the blossoms at their best but when one photographs on week-ends only, this is not easy.

Various species of the night blooming Cereus grow in Arizona, and they can be found in the Arizona Desert Botanical Garden or in private gardens. Their large blossoms open after nightfall and close early in the following morning.

The photography of these blossoms does not differ from

general flower photography by artificial light.

One of the most beautiful is the Peniocereus Greggii, commonly called the "Queen of the Night." It grows from a large tuber which resembles a sweet potato and is very difficult to find on the desert. Its drab stem resembles a dry stick and grows in the shelter of desert shrubs. An inexperienced eye would not recognize it as the potential source of the exquisite fragrant flowers which it bears.

The blossoms of the Saguaro, Arizona's State Flower, open at night also, but stay open sufficiently long in the morning to permit daytime photography. The Saguaros, referred to as the "Sentinels of the Desert" reach a great height and for close-up photography of these blossoms, it is necessary to find a plant which has low "arms" for the blossoms are borne at the tip of each one. Not only is the plant unique in its plant structure and growth, but also in its beautiful waxy flowers and bright red fruit which the Indians consider a delicacy.

Other cacti, along with the Saguaro, bear colorful fruit ranging from a cerise to a scarlet and dark red. Beautiful studies of these can be made, especially of the Prickly Pear.

It is the hope of the writer that this brief introduction will arouse interest in desert photography. The field offers unlimited opportunities as each spring brings with it, in the form of a photographic adventure, a challenge to the camera enthusiast.

Home Movie Stories Are Easy

by Harris B. Tuttle, FPSA

A Motion Picture Division Feature

Nearly everyone who owns a movie camera manages to struggle through the job of exposing his first roll of movie film. The first roll is usually considered a test run-just to prove to one's self that the camera will actually make movies. When this first roll is returned from processing and projected, the initial test is completed. The very important question now is—what is going to be the subject for the next film—and the next-and the next?

First, it should be realized that movie making is a lot different than making still pictures. Each still picture usually does—or, at least, should tell a story. It can be of a subject -snapped while in rapid movement or while in repose. A motion picture is made up of a number of separate scenes of an object or objects in motion or repose, but these scenes, when assembled in proper sequence should be related one to the other and should also tell a story.

While there may not be movement in every scene, there is an over-all movement of progress in the development of the story being told.

The person making snapshots with a still picture camera often does make a story record of an event, merely by making snaps of each related event in the order in which it occurs. Such still pictures usually require considerable explanation in the form of titles.

Motion pictures, on the other hand, merely by tieing together related movements, can tell a story without titles or oral explanation.

The basic difference between a still and a motion picture is that a motion picture should be made of moving objects, or convey an idea of movement.

The motion picture as a means of communication is more powerful than the written word. By following a focal point the motion picture can direct and lead one's thinking into practically any desired channel. The subtle inferences that can be conveyed in a foot or two of movie film would require pages of the written word to explain and then perhaps the subtle inference would be lost. In a motion picture the raising of an eyebrow or the dropping of an arm to the side can

convey more information than a paragraph of written words. The problem of teaching persons who have motion picture

cameras to use them to record movement and tell a story

through related scenes is not an easy one to solve.

Probably ninety per cent of the amateur movie camera users in the world today are snapshooters. Many of them may have owned a still camera before buying a movie camera. In making pictures with the still camera, they would stand the subjects up out in the sun, tell them to hold still-and smile-then they would snap the picture.

A friend of mine did just this in making snapshots of his little daughter's birthday. He made a snap of her blowing out the lighted candles on the birthday cake, and another snap of

her starting to cut the cake.

By her next birthday, he had a movie camera. Now he did exactly as he had with his still camera. He made a few feet of her blowing out the candles and a few feet more of her cutting the first piece of cake. Yes, this time the movements of blowing out the candles and cutting the cake were recorded in motion. Actually these were movie snapshots, but only one step removed from the still snapshots.

Perhaps the difficulty in using a movie camera properly lies in the fact that most of us have never been trained to think in terms of telling a story with a series of motion picture scenes. In view of this, perhaps it is amazing that we, as amateurs, have done as well as we have. However, if we are going to have the most fun and satisfaction and make motion pictures of which we will be proud, we must learn to think in terms of telling a story with a movie camera.

In using the word story, I do not mean the Hollywood-type of story filmed for the theater. I mean the simple story contained in every day events of family life. The birthday party, the wedding-Christmas or New Year's parties-a family picnic or swimming party, or any project around the home.

Each of these events or occasions start somewhere-go , somewhere—and end somewhere.

Let's go back to my friend's birthday party movie of his little daughter. The birthday party idea started way back three weeks before when his wife decided to have a party and invite several of the neighbor children and playmates. Why not start the movie story at this point?

First, there should be a title stating the topic of the movie such as "Nancy's Fifth Birthday—and the date and year." The film should start off with scenes of mother addressing the invitations-and a close-up insert of the invitation so that everyone can read it. This close-up title sets the stage for the scenes to follow. (Such titles can be typed on a typewriter and filmed in a jiffy with the Cine-Kodak Titler).

It says-You are invited to Nancy's Fifth Birthday Party November 9th, 1953 at 2:30 in the afternoon 1220 University Avenue

Now the audience knows what it's all about.

There should be close-ups of Nancy helping mother by sealing the envelopes and affixing the stamps, then a shot of Nancy dropping the invitations in the mailbox. Children are most cooperative and readily enter into the fun of just acting natural in making scenes such as this. Give children opportunity to do things and you'll be surprised at the wonderful related action scenes you can make.

A title can now be used to bridge the gap between the mailing of the invitation and the day of the party. The title could be as follows: "The Big Day Arrives."

The next scene could show mother brushing Nancy's hair and adjusting her dress-then another title reading "In the Meantime-

Then, show Grandma taking the cake from the ovenfrosting it and setting the five candles in the frosting.

The next stene could be of the delivery man with a gallon

of ice cream. Then, a shot of Aunt Mary setting the table with party favors.

Now, let's go back to a shot of Nancy with mother placing a big blue ribbon in her hair.

Now, to a close-up of the clock with hands at 2:29.

Now, show one of the little guests coming up the walk to Nancy's home with a long package in his arms. a package almost as big as he is. Get him going up the steps and then reaching for the bell button. (Make two or three shots from different points of view. One coming toward the camera, one from the rear as he goes up the steps, and close-up as he reaches for the bell button.)

Perhaps he has to stand on his tiptoes to reach it. Make a close-up of his little feet on his tiptoes then flash to a close-up of his little finger on the bell button.

As soon as he pushes the button, something happens now make a close-up of the bell showing the clapper vibrating,just a short shot—make only 6 to 8 inches of film.

When the bell rings, of course Nancy hears it. Now, back to Nancy, showing her jumping with joy as she is alerted by the door bell and get her dashing off to answer the door.

The next scene is a close view of Nancy opening the door and all the little guests are there with presents—they all come in and present Nancy with their gifts.

Now for the movies of the party games. Pin the Tail on the Donkey, blindfolded, London Bridge is Falling Down, and other similar party games. And, of course, movies of Nancy opening all of her gifts.

Then comes the big moment when they are all called to the birthday lunch.

Get the children around the table-get a shot of them passing the ice cream. Perhaps one little fat fellow keeps passing the ice cream on looking for the biggest dish for himself.

Perhaps one of the younger guests may get ice cream all over her face. These are the opportunties for close-ups that make wonderful shots.

Then comes the moment when the candles are lighted, and now for the scene of Nancy blowing out the candles and cutting the cake.

The picture can end with Nancy at the door bidding them all good-bye as they leave.

A film record such as this of Nancy's birthday tells the whole story. It starts somewhere—goes somewhere and ends somewhere. It's a short story—a story of a family incident. It can be filmed with about 200 to 400 feet of 16mm film or 100 to 200 feet of 8mm film, depending upon the number of interesting details filmed.

One can go as far as he wishes in details—scenes of grandma icing the cake and setting the candles. Scenes of Aunt Ruth setting the party table. All such scenes are related and add interest to the film.

It's the type of family record that will become more valuable each year as time goes on. In just a few short years, fifteen, perhaps-Nancy will be a young lady, the other children that were at the party will also be grown to young manhood and womanhood. The only time that complete. records of their childhood can be made is when they're children, not when they are grown. The pictures made of them when they are grown will also be equally valuable in another fifteen or twenty years. These same pictures will be priceless to Nancy when she herself is a grandmother.

The important point, however, is to include the details in movies-pictures of the events as they are planned and as they happen.

One does not need to be a Hollywood cameraman or director to make a motion picture. Anyone that can write a letter or a telegram can learn to convey the same type of message with a movie camera on motion picture film.

It's the filming of the little details that help to tell the story (Continued on page 664)

Who's Who in Pictorial Photography 1951-1952

By C. A. Yarrington

This is the third annual record of exhibitors in all of the accepted Pictorial Photographic Exhibitions in the world, during the 1951-52 photo-year, whose opening date was between July 1st, 1951 and June 30, 1952.

Included in the record are the results from those exhibitions which have, in the opinion of the PD Salon Board, met the Minimum Requirements as published in the June, 1952, Journal. The Board has been very liberal this year, in applying the Requirements, as a courtesy to some salons which were not yet fully informed about them, but which actually followed the main requirements.

This year the Board has stressed the following major considerations rather than a strict compliance with all items. These considerations involved:

- Exhibition open to all with early and adequate publicity, which is necessary if all are to have a chance to send entries.
- Some kind of schedule, listing the dates on which the various specific actions will be taken.
- Three or more judges on the jury, with names of judges stated in the entry blank or catalog.
- Maximum exhibition period of one month, with two additional weeks for each other city where the prints are to be shown.
- Issuance of a catalog within a reasonable time—not over two months from date of opening of salon, and the supply of a catalog to all entrants.
- Return of prints approximately 60 days after the last day for receiving entries, with suitable extension where the exhibition involves two or more cities.

Next year, a more strict compliance with the Minimum Requirements will be expected and Exhibition Committees desiring PSA approval of their shows should make a serious effort to conform to the current rules which have been given worldwide distribution.

The objective of the Salon Board is to establish and keep print exhibitions on a high level, and to be fair to exhibitors, salon committees, and the public. It is not their purpose to foster competition between exhibitors, because there can never be a real meaning to such competitions as there is no yard-stick by which artistic efforts can be truly measured. Hence a numerical listing is not given.

The Salon Board will continue to assist those committees promising adherence to the Minimum Requirements and will urge exhibitors to patronize those shows.

The following 74 exhibitions have been accepted, listed according to the date of opening of the show. This compares with 53 exhibitions listed last year, and indicates an increase in the number of exhibitions conforming to our rules. We have records covering a total of 110 exhibitions held in the world this photo-year. The others, 36 of them, failed in some important particular to follow our Requirements.

The list has been compiled from about 4000 cards, and lists all those who have exhibited in two or more exhibitions during the year. We have tried to correct and eliminate errors which always show up in the catalogs, but if there are any questions about individual listings, you may write to C. A. Yarrington, 50 Church St., New York, who will be glad to reply and explain any discrepancy.

SALONS LISTED

Memphis, 51, Midland, Hartford, San Sebastian, Illinois, Copenhagen, Edinburgh, Vancouver, Truro, Sacramento, Antwerp, Witwatersand, Cleveland, Puyallup, Amsterdam, 11th, West Ontario, Jonkoping, Zaragoza, Brussels, Houston, PSA-Detroit, Bath, Scottish,35th, Evansville, Chicago, Ghent, Zagreb, Mysore, Miss. IN STEREO

By ROBERT J. GOLDHAM 43 Plymouth Rd., Great Neck, L. L., N. Y.

The West Coast was quick in recognizing s good workhorse. Paul J. Wolf (Hew thorne, N. Y.), now residing in San Fran cisco, will judge at the Photochromers for their September contest and is also school uled to judge for Berkeley and California CC in October . Les Mahoney (Phoenia, Aris.) is in the dog-house. His wife, Olga-refers to Les' fancy studio as a "plush lined dog house." . . Dr. Francis Wn Hess Kong) presented a lecture on "Pictoria Photography from the Chinese Viewpoint" for the benefit of the Central Ohio Camera Club Council in Columbus, Ohio, on September 12 . . .

Ezra Parsons (Windsor, Nova Scotia) was shooting all around the PSA convention in New York with the No. 1 Polaroid Land Pathfinder Camera, with Wollensek F4.5 lens in Rapax shutter, loaned for the occasion by the Polaroid Corporation . . . Joe Burges (Dumont, N. J.) delivered the Portfolio to Martha Tarplee (Rochester, N. Y.) at the convention in New York, in personso as to meet the deadline. Martha menaged a free lunch out of the deal . . . A wonderful way to correspond is by tape recording-just put your feet up on the table, sip a cool drink and talk, so say-Phil Maples (Rockport, N. Y.), Gene Chase (St. Louis, Mo.), P. H. Oelman (Cincinnati, Ohio), Spee Wright (Springfield, III.), and Col. Joe Perry (El Pase, Texas), who keeps them all well informed on the progress of his Mission grapes at El Rancho Perry . . .

Isaac Jonathan (Cairo, Egypt), a newly enrolled member at the convention in New York, temporarily residing in Springfield, Mass., ran the Photo Lab for the American Embassy in Cairo and gave a one-man show in that city and in Alexandria of pictures on Egyptian life . . . Ruth Sage (Buffalo, N. Y.), compiler of Who's Who in Nature Photography, is one of the three women photo-engravers in the U. S. specializing in making color plates

Karl Baumgaertel (San Francisco) has turned poet. In telling about Charles G. Phelps (Grand Rapids, Mich.), who some years ago took over as his personal photographic project the making of color slides of the 48 state capitols and in finishing his project much sooner than he expected, was at a loss for something to do, Karl writes-

In Grand Rapids, Charley Phelps feels most unhappily

Wanted slices of all the state capitols and got them too snappily So now all he has left are a couple of

waits

Till Hawaii and Alaska are some day. made states . . .

Once again, we remind PSA follie that this column is aimed at helping them know who is doing what in PSA throughout the country. Please send personal news items such as appear here to Robert J. Goldman, 43 Plymouth Road, Great Nack, N. Y.

Araujo, Artur de.

Comments on Baltimore

Our request for comments on the Baltimore Salon has produced some curious reactions. Two members who have seen the show have reported, also several who didn't but saw the reproductions in either the Journal or in Camera, and one enterprising club which conducted a critique session under the guidance of an artist.

Mark Mooney, who handled the reporting job for Camera and supplied us with our information, in a postscript says that those who saw the show hanging were generally agreed that it was a good show. (Who ever liked every print in any show?—db).

Of all the comments received, we like best the report of the discussion sponsored by the YMCA CC of Springfield, Ohio. Leader was Prof. Raiston Thompson, head of the fine arts department of Wittenberg College. Attending were 55 persons including star exhibitors, salon judges, professionals, advanced amateurs, beginners and artists,

Prof. Thompson started the meeting with an introductory talk on modern composition. Following this examples of photographs and paintings dating from 1870 to the present day, including all the pictures from the Baltimore Salon catalogue, were projected.

Comparisons were made between paintings and photographs to show how one influenced the other. Club members' prints were discussed, not judged by the speaker.

Carlton Bauer, club president, in reporting the event says: "It is too early to get a fair and accurate reaction from the club members. The meeting did cause a fury among the local photographers. They are still banging their fists on the camera store counters. There are many opinions about who should judge the salons. Some want artists, some want photographers and some don't care. The commotion that this meeting caused will vibrate off the club room walls for months to come. Every one seems to have an opinion of his own and doesn't care what the next fellow thinks.

"A large majority think the Baltimore experiment was beneficial and good would come out of it. The club members were astounded at the differences between modern compositional theory and old-style salon pictorialism. Our meeting did not break up until four hours had passed.

"Remarks from photographers present were: 'It gets you out of a rut'. 'It made you stop and think'. 'It renewed interest in photographers who have gotten stale'. 'It's the only thing'. 'It's not a question of should there be more Baltimore Salons, there will be more of them.'"

Later on we'll give you some data on the Baltimore prints, but now we'd like to carry on the mail melee . . . Garth Oler says the whole thing has left him in a fog. He thinks the question of photography as an art was answered years ago and we have art techniques that can stand alone. He would like to see some of she winners circulated in portfolios for comment by Weber, Romig and other master craftsmen.

Garth fears that if amateur photography is to be put to judging like the Baltimore experiment that many serious workers will sit on the sidelines.

Raymond Hanson of Boston "was little impressed by the pictures nor by the fervor of the judges in their eulogistic appraisal of the prize winners."

Perhaps the most important commentary is that of F. G. Southworth of Baltimore. He has some figures to back up his report. About 12% of the entries were hung and he feels that is about average.

A group which included some members of the salon committee had an independent viewing of the show. They classed the prints as "pictorial", "pattern" and "other" Then they divided them by print quality. Of the 28 pictorial subjects, 25 were adjudged as having good quality; of the 36 pattern pictures 17 had good print quality; of the 30 in the "other" group, half were of good quality.

The group felt that of the pictorials, all of good print quality would have hung in most salons. Of the pattern prints, most of the good ones would have hung in a salon where the judges were sympathetic to patterns. But, the group felt that none of the 30 "other" prints would have hung in any regular salon.

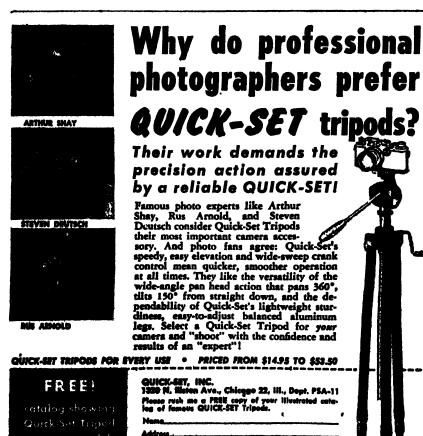

Southworth reports that the jury strongly objected to prints which fall into the usual classification of pictorial. They didn't go for landscapes, seascapes, animals, pretty girls and posed anecdotes. Particularly cited were "vulgarly obvious sailboats" and pictures "displaying mushy prettiness".

Apparently the public did not agree with

Apparerty the public did not agree with the jury since an additional gold medal awarded strictly on a basis of public vote was won, hands down, by a print which, although hung by the jury, was definitely in the jury's category of a "sentimental approach to mushy escapism".

Southworth makes an extremely pertinent comment in pointing out that artists in general, and this jury in particular, earn their living in art, whereas exhibiting photographers are hobbyists and not concerned with the economic perpetuation of art.

It seems to your editor that this argument is going to go on for a long time to come. You'll find as many schools of critical thought as there are photographers. You'll find old-timers who like it, and new comers who can't see it for peanuts.

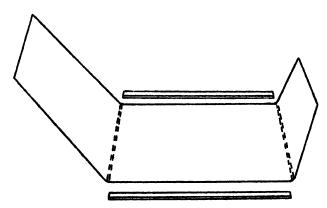

Lightweight Print Mailer

By Harry R. Reich

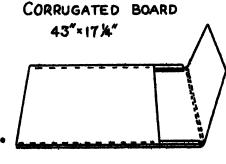

When this writer forwarded the material for the August Nature Column of the Journal he was not aware that he was letting himself in for an added assignment. Don Bennett, in editing that material, was evidently intrigued with the print mailer described in one of the articles but not impressed with the description of it or, I should say with the instructions for its construction, so he very promptly demanded a story with sketches and pix. Well, when the editor demands, the columnist has to produce. So here it is for what it is worth.

There are two ways to procure the material. If you have any connections with a local lumber yard, the wood for the strips may be procured from the scrap pile. This of course will require that you are mechanic enough to fashion it to the proper dimensions. If not you may purchase it so fashioned for a very nominal fee. If you have connections with local department stores you can also obtain the corrugated board from their shipping room floor, if not it may be purchased from some local paper company cut to size.

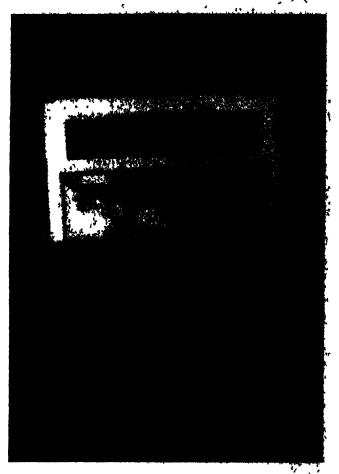

There are several types of corrugated board available and either of these will suit the purpose. Some of it is rather oft and thick while others are harder and considerably thin-

Material --- LIGHT PINE STRIPS 20"x "8" x %"

ASSEMBLED MATERIAL

ner For durability the hard thin board is preferable. The weight of the two is nearly equal. The wood that you use is a factor in the weight of the finished container and should therefore be of a soft light wood such as white pine. An oak strip for instance could weight twice as much as a pine strip. Two such strips could materially affect the finished weight of the mailer.

The balance of the material can be purchased from the local stationer and hardware dealer. It consists of a box of short shanked, brass headed upholstery tacks, and a roll of quicinch scotch tape, a dull kitchen knife, and a tack hammer, plus a minimum amount of mechanical skill.

The top sketch shows the material ready for assembly. The corrugated board has an overall dimension of forty three inches by seventeen and one quarter inches. The board is scored for bending with a straight edge and a very dull knife. The first score mark will be fifteen inches from the end of the board. The second score mark will be just one half fight from the first. This half inch will constitute the thickness of the container. Twenty inches from the second score mark another score mark will be made and one half inch further you will make another, fourth, score mark. It will be necessary that you make these score marks with repeated light strokes of the dull knife so that there will be no danger of cutting through the paper while making it possible to bend it quite readily at these marks. The corrugated board is now ready for assembly.

The pine strips are cut twenty inches long by \$\foata \text{inch mids} by \$\foata \text{inch thick.} As shown in the first sketch the board is placed so that the twenty inch area is down and the strips

(Continued on page 664)

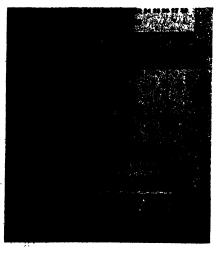

Proof Sheets By Theodore S. Hall

Proofing your negatives is a necessary chore, especially with the smaller negatives, for no matter how fine the strip or individual negatives look, proofing alone will reveal all the features.

When you went out and came back with either one roll or a dozen, it was a time consuming job to proof them all. And what did you do with the proofs after you had made and studied them? (Each one can answer that for himself).

Now, in a few minutes instead of hours, you can make contact prints of the full negative in a form easy to file, as a permanent record for future reference.

Other than an enlarger and print developing trays, the only extra piece of equipment necessary is a printing frame and the most practical size in this case is 8 x 10 inches, larger sizes may be used. This size frame will comfortably hold 30 negatives of 35 MM, one roll of 2½ inches square or four 4 x 5 inch negatives.

Adjust your enlarger so that the light, without a negative in the carrier, amply covers an 8 x 10 inch space on your baseboard or easel. Mark this area in some way so that you will know where to place the print frame when you are ready to print. This will give you an even printing light over the required area and if you make a note of the height, it will be no trick to

Here is an idea the photo-journalists have been using for some time... they often shoot hundreds of negatives on a job and rather than blow them all up to full size, they make proof sheets on glossy paper so the best poses may be selected for enlarging. The practice is so common that you simply ask a professional finisher for "sheets" and no further explanation is needed. Because few anateurs have a contact printer, Ted Hall's idea presented here is a good one... why not try it an your next roll?

Do you have some alich tricks like this ship was the ship was the ship with the ship was the ship wa

next roll?

Do you have some slick tricks like this you have been hiding away? Stop it! Tell your story in pictures, with enough text so even the Editor can understand what you are driving at and send it along. But . . . act like a photographer and make pictures to tell your story.

adjust your enlarger after this whenever you want to make proofs.

Now turn your print frame over, remove the back and place your negatives on the glass, emulsion side up, singly or in strips, having first slipped an old 8 x 10 or larger print, white side up, under the frame, as a guide to placing your negatives. Up to now you can work under regular room or white light. Switch this off and turn on your safelight. Take a normal sheet of 8 x 10 enlarging paper and place it over the negatives, emulsion side down, carefully so as not to push them out of line. Replace the back of the frame carefully and lock it. For proofing I use normal, single weight, glossy paper. You are now ready to make the exposure but if you have any doubt about the time necessary, make a test strip. (Contact paper could be used but long exposures would be needed.)

Once you have found the time necessary for an overall exposure, unless your negatives vary in density considerably, you can always use this same time with the same setup.

By this method of contact proofing it is possible to do a bit of dodging by holding back the thinner negatives and giving the others a few seconds more.

Ordinarily you are supposed to give prints full development and not pull them from the developer before time. However, in this case you are not trying to make prints of salon quality but to produce a reasonably good sheet of proofs of the negatives involved and I have found it quite practical to give a couple of seconds or so more than the average to cover any slight difference in density of some of the negatives and if some of the thinner sections come up rather fast in the developer but before they block up, I pull the sheet, stop and fix it, and have a workable sheet of proofs.

This in brief is the method, but it does not enumerate all of the benefits, altho by now many of you will commence to see them. To mention a few of the benefits:

- (1) Besides saving time, labor and expense, you have a whole sheet of proofs to compare at a glance.
- (2) These sheets can be filed back to back in inexpensive ring binders, by number or by date or whatever system you choose, as a permanent record with appropriate labels on cover and back.
- (3) An index sheet can be placed in each binder to note data on special negatives.

فالأراب سيتنا بالسيادات والمديو

(4) Instead of cramming envelopes, small boxes and big boxes full of old single proofs, hard to refer to and easily lost, you will now have sheets of neatly arranged proofs in compact binders each one of which, for the 2½ inch square negative, should hold approximately 600 negative proofs.

DARKROOM HINTS By Francis Ashley Faught, M.D., PSA.

To Keep Test Strips Flat

Sensitized paper tends to curl, especially in a dry atmosphere. To prevent this while printing, test strips should be covered with glass. It is convenient to have on hand several sizes, i.e. $4\pi 5$ ", $5\pi 7$ " and $8\pi 10$ ". Place the test strip in the area selected, and overlay it with glass of appropriate size. This will not reflect enough light to influence the length of exposure. This simple procedure will not only keep the test strip in place flat, and in sharper focus, but will also prevent it from being disturbed when a cardboard shield is used to make step up test exposures on a single test strip.

Accidental Fogging of Paper

A momentary flash of light caused by a sudden jar will renew electrical contact in a live socket, where the bulb has been backed out a little to extinguish the light. The remedy is to use only key sockets.

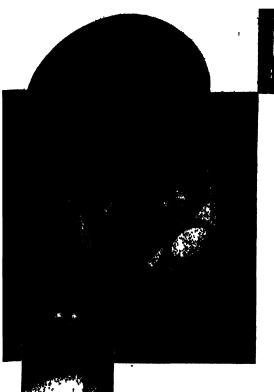

To Secure Sharp Focus

Free and uniform movement of closely fitted moving parts require lubrication. This applies to the rods and guides upon which the enlarger and counter weight slides. A little machine oil occasionally rubbed on, and the excess rubbed off, will secure freedom of motion, and so make it easier to adjust to a sharp focus.

The thickness of heavy weight paper may affect the sharpness of focus when making large enlargements. To avoid this, focus on a piece of paper of the same thickness in the easel, which is then removed, and replaced by the sensitized paper. A sharper focus may also be secured by making the adjustment in total darkness. The type of film carrier which functions without glass may allow closely trimmed film to pull away from one edge and spoil focus. Always check the four edges of the image before printing.

Don't Talk Or Sneeze

Fine droplets of saliva may produce white spots on the finished print, resembling those produced by dust settling on the negative or enlarging paper. Experiment has shown that ordinary speech produces a microscopic spray extending about four feet beyond the speaker, while sneezing and coughing has an even greater range. It is a good rule not to talk when near the easel, and if you must talk, talk with your back to it, Caution your visitor to do likewise. This precaution may greatly reduce the need for spotting.

Kodak

BRING YOUR DARKROOM UP TO DATE...

Amateur photography is a balanced, well-rounded hebby. To those who get the most enjoyment out of it, no one aspect overshadows the others—yet each has its best season."

With nights growing longer, this is the season to rediscover your darkroom—to recapture the pleasures and satisfactions of creative work there. But first—check your darkroom equipment, and be sure it is truly up to date.

UP-TO-DATE **ENLARGING**

Have you, for instance, discovered the pleas-

ure of working with a cold light enlarger? In the Kodak Flurolite Enlarger cold light is provided by a Circline fluorescent lamp housed in an integrating-sphere lamphouse. Your negatives stay cool without any heatinduced tendency to buckle or warp, even on long exposures. The quality of the illumination, too, is a revelation if you have been accustomed to older types of light. All of the light is reflected light evenly distributed throughout the negative area. Visual contrast is excellent, for easy focusing; and the excellent actinic contrast assures superior print quality.

Every photographer will recognize instantly the advantages of the Flurolite's two-hand control in focusing. The focusing and elevating knobs are so placed that elevation may be controlled with one hand while simultaneous focusing is done with the other.

Big Storage Base

The Flurolite eliminates groping for paper. Its base is a big lighttight storage compartment for paper up to 14" x 17", making the enlarger almost a darkroom work center in itself. The double support provided by this base construction and the extra-large heavy column helps insure the Flurolite's "rock-steady" performance.

A rotating and tilting negative carrier lets you correct distortion in almost any plane, effortlessly and easily. The rotating negative carrier, combined with the swinging head, also permits centering any portion of the negative at the center of the easel.

Add all of these advantages to the fact that you can also use the Flurolite enlarger

(with accessories) as a view camera, for copying, for close-ups, for photomicrography, microfilming, clinical photography, and for cine-titling and slide making and you'll agree that this modern equipment does add appeal to the darkroom. The price, without lens, is \$99.50.

In selecting your lens, you will also discover that recent years have added something. Both Kodak Enlarging Ektanon and Kodak Enlarging Ektar Lenses have been specifically designed for enlarging, to work from one flat surface to another flat surface, with maximum definition throughout the area they cover. Either Ektanon or Ektar Enlarging Lenses are available in 2-, 3-, and 4-inch focal lengths, priced from \$14.00 to \$49.90. The Kodak Enlarging Ektar Lenses, the finest that Kodak makes. are particularly recommended if you plan to do color work.

Automatic Control

Incidentally, if you are planning to make your own Christmas cards this year, one of the neatest time savers you can get is the Kodak Electric Time Control. Plug it into the power supply, then insert the enlarger or printer plug into the socket on the Time Control. Just set the printing time for the negative you are using, from one to 57 seconds, then for each exposure just press the lever. Each exposure will be precisely timed, and the lamp automatically turned off after the exposure. The price, \$13.50.

You need both hands free while you are dodging prints in your enlarger or working at a contact printer; and this pleasant experience can be yours, either with the Electric Time Control or the Kodak Utility Footswitch. The Footswitch lets you turn the current to any of your darkroom equipment on and off with your foot. A safe, lowintensity neon light in the foot pedal helps

you find it in the dark. The price, \$10.00.

If you have never worked under a safelight that puts the light you want exactly where you want it, you will appreciate the versatile new Kodak 2-Way Safelamp. It's triangular in shape, one side containing a filter, the other a removable metal plate for which an additional filter can be substituted for wider distribution of the light. With an extension cord you can place it on the bench, or you can insert it in a wall or ceiling socket . . . and, it can be completely rotated in the socket to direct the light where desired. Price, with one filter and 15-watt lamp, \$4.50.

Kodak

Prices include Federal Tax and are subject to change without notice.

EASTMAN KODAK COMPANY, Rochoster 4, N. Y.

Experts' Choices For Fine Prints

No. 7 of an informative series...how leading exhibitors choose papers to fit their salon aims

ELMORE C. ADAMS' "The Brush-Burner" has appeared in more than forty important exhibitions. He writes:

"My choice of Kodak Opal Paper for 'The Brush-Burner,' as well as for most other pictorial prints, was based upon my experience with its ability to give maximum scope to tonal range of the negative, and to render these tones to the fullest degree in the finished print.

"Its ability to give prolonged projection time and the fullest development time, without fogging or loss of print quality, is exceptional The dark-

room worker has sufficient time for dodging, printing-in, or other manipulative processes.

"Choice of Kodak Opal Paper G for this picture was further determined by its fine pebblegrained lustrous surface that permits full rendition of detail without loss of pictorial quality. In my experience. Kodak Opal Paper's superiority in giving the fullest scope and control over the various toning effects, either to enhance its own natural warm tone or to give the beautiful bluegrays sought by many pictorialists, makes it an even more desirable paper to use "

 $\mathbf{l}_{ extsf{N}}$ "The Brush-Burner," Adams sought to recreate the warmth and atmospheric mood of autumn. Kodak Opal's brown-black image tone fitted perfectly. For "Pattern Motif 283," Axel Bahnsen desired a crisp, objective design quality, with maximum image texture and detail. Kodabromide Paper F, with its pure white stock, cool neutral blacks, and glossy surface, fitted perfectly. Had he desired a slightly warmer interpretation, Bahnsen would naturally have turned to Kodak Medalist F or high-lustre Medalist J. This fine warm-black paper comes in a range of surface choices and contrast grades, and has two special advantages—great flexibility in contrast control, plus the same speed in all four contrast grades.

CHOOSE THE PAPER THAT FITS THE PICTURE—AND THE PURPOSE

These are the papers for fine exhibition enlargements, gift prints, home decoration, and specialized applications—in a range of types to fit your every need:

For fast printing, fine warm-black tones, and great flexibility in manipulation—Kodak Medalist Paper.

For rich neutral blacks in a top-speed paper-Kedabromide Paper, Five evenly spaced grades and nine combinations of sheen, texture, tint, and weight.

For rich warm blacks in a moderate-speed, paper-Kedak Platine Paper. Three printing grades.

For widest choice of tist and surface in a low-speed paper of utmost topal quality and adaptability to toning brown-black Kodek Opel Paper. One printing grade.

For Opel quality with twice the speed of Opel-Kadah Bhtslure Paper G.

For Opal quality in a special fine-grained surface suited equally to exhibition and reproduction—Kedak Illustrators' Special.

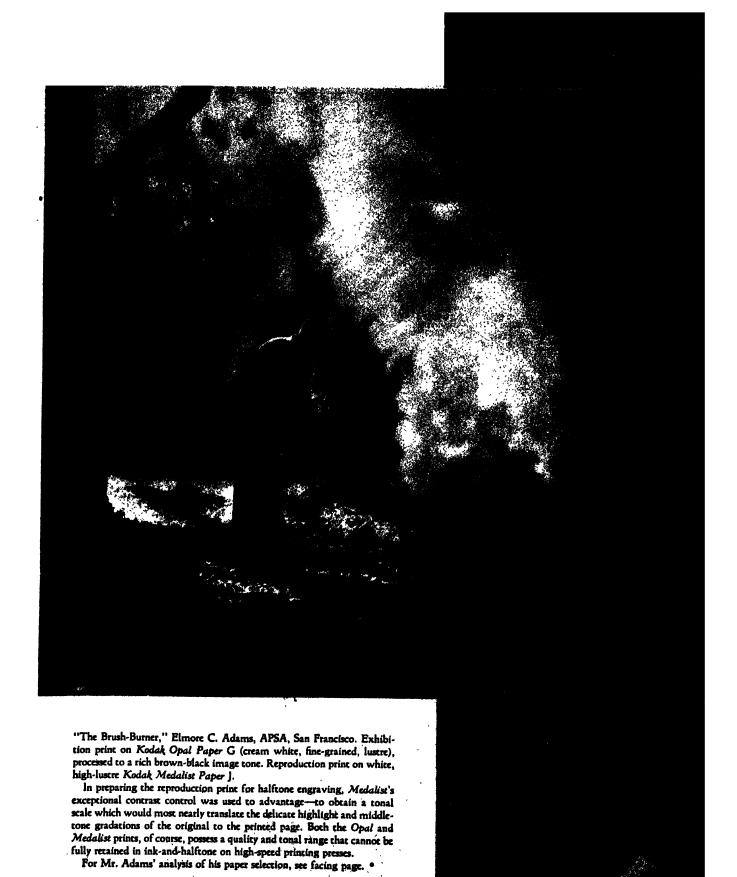

For photomurals-Kodak Mural R.

For transilluminated prints-Kodak Opalure Print

Film and Kodak Translite Paper.
For extra-fast printing and processing—Kodak Resiste Rapid N. It's as fast as Kodabromide; and its special base allows washing and drying in ten minutes.

And for contact prints-Kedak Aze, Velex, Resiste N, and others. Each Kodak enlarging paper has a contactpaper counterpart, equivalent in type and quality.

For full details on these fine Kodak papers-tints, surfaces, weights, processing—consult the Data Book on Kodak Papers, and your Kodak dealer.

Kottak

Pictorial DIGEST Division

Devoted to News of the Pictorial Division of the Photographic Society of America

C. "JERRY" DERBES, Director

I recently received a very interesting letter from Mr. Walter Fiske, Jr., of the Jefferson Portfolian Club (Louisville), which I would like to quote:

"At a recent meeting of the Jefferson Portfolian Club, I read the Salon Workshop article to the members. The response was wonderful and nine members would like to have applications to get into this deal. This includes me, of course. Will you send me about twelve applications?

"Our Club was formed about nine months ago and has grown from six wide eyed rank amateurs to fourteen very interested workers. On the average, the work of all of us has improved considerably. They jumped on your activity with glee and want to get into it."

As director of this new activity it has been interesting to nurture the idea from its infancy and watch it grow to young boyhood, which is just about where this idea of the Salon Workshop is at present.

The young boy has growing pains. The idea of being able not only to see but to actually print from a well known salon exhibitors negative, is catching on. (If you did not read the opening announcement, may I urge you to look up your August issue on page 494 and read it now).

There are still a lot of well known salon exhibitors who are willing and anxious not only to loan us one of their valuable salon negatives but are also willing to furnish us with a 11 x 14 print to travel in the second circuit. In addition, the Master will give us an actual Salon Print to award to the person in his group who makes the best print and will comment on each print individually and point out the good points as well as the bad.

What a golden opportunity for each of you inexperienced workers to improve your print quality by actually seeing how the Masters print their pictures as against how you and the other fourteen members in your group print from the same negative. It will be fun to watch the different cropping, toning, spotting, etc., each member chooses to use and then compare it with how the Master made his print.
Do you need interesting programs for

your camera club? Why not display the sixteen prints and read the comments by the Master about each of them?

I suggest each camera club officer who reads this column take the August issue and read the opening announcement of the Salon Workshop to the members of your club at your next meeting. It should be interesting to each of them and no doubt many of the members would like to get in on this activity.

Application blanks for joining the Salon Workshop may be secured by writing the Director, whose name and address appears in the mast head.

INTERNATIONAL CLUB PRINT COMPETITION

DR. GRANT M. HAIST, Associate Editor

As a result of a series of conferences at the recent PSA Convention in New York, a number of changes in the procedures of the Competition have been made which will make this activity of even greater value to every camera club. A consistent, high level of print judging and an improved scoring system will be two of the immediate benefits of the new innovations.

The first four of the five contests for the coming season will be held at the Baltimore Camera Club, the fifth at the 1953 PSA Convention in Los Angeles. This last contest will be a part of the convention program of the Pictorial Division and the actual print judging will be open to the general public. It is planned to make the presentation of awards to the winning clubs at the Convention.

The well-staffed Baltimore club has ample facilities, and can call upon a large number of qualified judges to insure the success of the new plans. The first contest, held in October, featured three outstanding judges: Edward L. Bafford, APSA; A. Aubrey Bodine, FPSA; and Mark Mooney, APSA. Robert V. George, print director of the Baltimore club, will supervise the details of the print judging while the president of the club, Vernon N. Kisling, will handle an improved publicity program. In order to permit the ultimate in service to be given to all participating camera clubs, the Baltimore Camera Club will not compete this year in the Competition.

The revised scoring system allows each judge a maximum of 12 points per print instead of the previous high of 10 points. Besides rewarding the finer prints with greater point scores, the increased value will permit each judge to indicate a rating of 1 to 4 points under each of three categories: (1) Composition, (2) Interest value, and (3) Technical quality. In addition, each judge will indicate specific written comment for print improvement on scoring sheets which will be returned to the print maker.

The details of this more efficient judging system were worked out in conferences at

the New York Convention with A. Aubrey Bodine, Robert George, and Vernon Kis-ling of the Baltimore club and "Gene" Chase and Ray Miess of the Pictorial Division. The final plans also incorporate improvements in the judging system introduced by Robert J. Lauer, Director of last season's Competition.

For further particulars concerning any of the new features of the judgings or how your club can enter the International Club Print Competition, write Grant M. Haist. Director of this activity.

MISS EVELYN ROBBINS, Associate Editor

Chirps From The Robbins

This month in our "Comments by Commentators" you will find an article by Dave Darvas, APSA, Commentator for Portfolio #24. This article was quite lengthy, but in order to bring all of it-and there is an excellent message there for you-I've put in the first portion this month and will follow it up next month. Don't miss it!

Comments By Commentators

During the past few years as Commentator to Portfolio #24. I have gained a great deal of knowledge that has influenced certain contentions concerning print quality, technique, and other factors that enter into our desire to produce a good picture. Through the contacts with the members of #24, listening to the voices through their words, I have felt intimacies that would have been impossible otherwise. Their comments on the other members efforts, as well as all the criticisms as a whole, help to establish an inkling of human behaviorism among those of us in the Portfolio who have desired to express a message through photography.

As I see it, the major purposes of Portfolio activity are a concerted effort to teach each other as well as be taught. Portfolios are somewhat like itinerant classrooms with Commentators acting as teachers and advisors. I believe that this fact must not be overlooked. Too many of us are willing to try anything once, in the hope that through partial activity only, we will find the help we need in ten easy lessons. Portfolios can only become successful through the constant patience and consistent effort on the part of all, including the Commentator.

Knowledge is gained slowly. That Port-

folios have helped a great many to find themselves in photography is true, but there are many who have failed to achieve similar results. The elements of ability and experience have contributed to success, and the majority having had their share of ability can achieve that success if only they will allow themselves the time for the experience.

I must say that Portfolio #24 has been very consistent and very enthusiastic through all these years, and the membership has been intact except for a very few cases where the resignations were warranted. I feel proud of #24 and its members and am honored by the willingness on their part to suffer through much of my vitriolic criticisms, yet I feel sure that they liked it. Otherwise, they wouldn't have remained. I hope that in the future I can point to the names and say that over 90% of the membership has been with me from the very start. By that time, too, I will be able to point out those that have achieved success in picture making.

There shall be many problems to overcome before that time arrives. Improvements in a person's work progress imperceptibly, and only by comparisons made between his earlier work and the present can noticeable changes become obvious; yet the differences of quality between a first effort and a last may be very slight indeed. Those slight differences mark the tempo of his evolutionary progress. If practice and experience is held to a minimum, the tempo will be slow and the progress slow as well.

Of course, it is s'uple to expound doctrines and broad statements. What we wish is specific information; accurate and positive statements regarding the answers to our questions.

Let's take the word "experience". When I refer to experience, I mean many things. I mean the sum total of knowledge gained through the practice of the incidentals of our craft; I also mean the experience gained through the fusing of our mental attitudes, thoughts and philosophies with our technique.

I believe that we cannot sever one particle of our mental consciousness from the pure technical requisites. The sum total of knowledge gained must be made up of minute segments of subjective thoughts and subjective technical applications in order that we may solve our objective problems.

This may be difficult to realize until we actually attempt to analyze and adapt an apparently simple fact to a photographic conclusion. Among the many problems within our Portfolio membership, as well as in others, is our feeble attempts to answer our own questions through material methods without first considering the possibilities of the mental approach.

In the early experiences with the problem of print quality, we are a bit confused about one particular and obvious photographic result, namely that from a simple and commonplace sheet of sensitive paper a tremendous number of tonal combinations are possible in the form of a picture where each and every picture is just as appealing as the other.

appealing as the other.

Why is it possible to appreciate this or that photograph as compared with another when both are handled differently and have

a tonal range entirely unlike chek other. We look at a picture handled in the law key and marvel at the tonal range and fog its general handling of all factors. We are next attracted to a print in high key, and that key has equal carrying power as the one in low key. What is that essence of print quality that allows an apparent flexibility of tone distribution in opposite directions without devaluating the influence that we call "carrying power"?

I'm quite sure that when we try to make a low key print our general result is very muddy. When we try something in high key our result gets chalky. Authoritative instruction defines print quality as the resolution of a complete tone range within the limitations of the photographic process. We have achieved this during our test printing. We have proven to ourselves that we can print for a black and a white and all the tones in between, but just as soon as we attempt to confine those tones into a photographic image we get anything or everything other than the objectives we had in mind.

(Continued next month)

"STAR DUST"

A monthly column devoted to the "Wit and Wisdom" of the Stars as taken from Note Books in the Star Exhibitor Portfolios.

By Roy E. LINDAHL, Gen. Sec'y Star Exhibitor Portfolios

Material for this column has been a little scarce of late and this presents an opportunity to pass along a few things that might be of interest to those who are members of other than the Star Portfolios. I find response from those in the regular American Portfolios indicating that we have an active following there as well, and this is as it should be for they represent our future Star Members.

We might well direct our attention first to those readers who have not yet had the pleasure of belonging to a Portfolio by saying that if you are a serious amateur photographer with a real desire to improve your pictures, you should by all means take advantage of this opportunity presented by your Society. It will give you added incentive to improve your work by comparing it with that of others like yourself, by exchanging ideas and through the suggestions and help you will receive from the Commentator.

To those who have enrolled in one of the various Portfolios and subsequently dropped out because of loss of interest may I suggest that you follow this column for the next few issues and perhaps you will find where the cause for your loss of interest lies.

First of all let me point out that, in a community activity of this kind, the success or failure of the operation depends on the active and consistent participation of each member of the circle. We will get out of our Portfolio exactly in proportion to that which we are willing to put into it. One factor of extreme importance in the success of any Portfolio is the full participation by all members in the Notebook. Just as it is important that you put forth your best effort on the pictures you submit it is equally important that you have

What is a Pictorial picture anyway?

Perhaps this can be cleared up a little and in the column for next month we will try to show how you can help your commentator help you find the answer to this perplexing question.

Highlights from the PORTRAIT PORTFOLIOS

FREDERIC CALVERT, Associate Editor

Something New To Be Added

I have asked some of the Commentators, top notch amateurs and professionals in our Portrait Portfolios to send me some prints so that I can make up some books of good portraits.

These books in time, will be sent by Parcel Post to each member of all Portrait Portfolios. They will have lighting diagrams and some technical data. There will be prints by Edith Royky, APSA, Charles Tipple, Everett Saggus and Lionel Heymann to mention only a few. Each book will have several prints of each maker.

The idea is to stimulate more interest and desire to make better pictures of the family, friends or get portraits into the salons.

If you know of any friends interested in portraiture better advise them to jump on the Band Wagon and join a Portrait Portfolio where they will learn a lot more about portraiture, be in a nice group of new friends all interested in the same hobby.

It has been suggested I start a Portfolio just for the very first beginners in portrait work. I will be glad to do so if I have enough members join. Also to start another advanced folio and another hand oil color folio. The folios are for your learning and enjoyment. Send for the rules and application blank today, address: Frederic Calvert, Director 28 E. 4th St., Chester, Pa.

STANLEY D. SOHL, Associate Editor

South Africa for You?

Word has just been received that the South African Portfolios have received a burst of new life and are back on a schedule of real activity. Number 2 portfolio is on the read toward South Africa with number, I starting on its way before this

even gets into print, South Africa has a new and third group of workers gathering their prints to form a still newer portfolio. We here in the U. S. are going to have to hurry up just to keep up.

The pictures that these friends of ours sent us are most interesting. They approach photography from a different angle which is both educational and very beneficial to sell who take advantage of their style through these exchanges. They like to take pictures of the country, the mountains, the seascapes; the extreme contrast of the dark and light in portraits and many mood pictures. Their cameras are predominately Rollies, but their techniques are varied and many.

Or Costa Rica?

We will soon need some new state side members to help match the new P.S.A.'ers active in Costa Rica.

The newspaper, El Diatio of Costa Rica, sponsored a photographic competition. The exhibition, through the support of the National Press, was displayed in the Press building for many hundreds to see and enjoy. The first prize winner was "Dolor de Madre" (Sorrow of the Mother) by Mario Madrigal, second prize, "El Problema" (The Problem) by Abelardo Bonilla, and third prize was Yunta (Oxen) by Oscar Powan.

The Jurors were Leslie de Paos, Jorge Aubert, and Dr. Esteban A. de Varona, APSA.

Over two hundred and forty prints were submitted and ten Honorable Mention prints were selected.

The newspaper, by way of its celebration, reproduced the first three winners' prints in a full front page spread, in three colors.

It's good to see that our PSA Members are the leaders in their respective countries. All of these men are members of the Caribbean-American Portfolios.

New General Secretary For New Zealand-Australia

The new diplomat for our international program "down-under" is Mr. Russell Cooper. He will have as his right-hand General Secretary, on the U.S. side, Miss Edith Royky, APSA, of Sioux City, Iowa. These following secretaries will work with the two general secretaries in their specific circles. Mr. Harold Carpenter, of Sandy, Utah, is the new secretary for Circle #1, with Mr. Lem Casbolt from "down-under". Mr. C. A. Sweet of Green Bay, Wisc., and T. R. Patterson from Hamilton, N. Z. for Circle #2. Mr. Maurice Louis of New York City is the secretary for the U. S. side, with a new secretary for the other half of Circle #3 to be appointed from the Australasian counterpart.

These three circles are in operation now with two mote, #4 and #5, to be filled any time. Here again is a chance to get in on the ground floor on two fine portfolios.

Mr. Russell Cooper says in part that he is going to be hard on any alacker from "down-under" and as he expresses it that we will "get them, (the portfolios), across smartly".

Good luck to all you workers and the many PSA members from so far away.

We have a good organization so don't lot the secretaries down.

V. E. SHIMANSKI, Associate Editor

Some years ago I developed the habit of taking a brief "time-out" period each day,—just a few minutes to relax and sort of day-dream.

During one of these day-dreams I got to wondering as to who had the best job in this world of ours. I had about concluded that a golf pro had the best racket, for he was paid to do what I considered a pleasant recreation. Then I thought of Maurice Louis, He is now traveling throughout this scenic country of ours, talking about photography, and getting paid for it.

Then I became curious as to the least desirable job in this world, and had about decided that I'd rather do anything but be a coal miner, when I suddenly remembered the poor program director of a small town camera club.

The program director must come up with no less than eighteen original, entertaining, instructive and all-interesting programs during the camera club season. He is expected to put on a three-ring circus at every meeting. Now in a small town this is no simple task.

Serving my fourth consecutive term as program director I speak from experience, and I wish to pass on a friendly tip to you program chairmen. Schedule one or two of the International Print Exhibits as program material.

If your club has never viewed an International Exhibit you can give the members a real treat. You will be amazed, impressed and inspired by the variety and quality of work produced by our fellow photographers from across the seas. Such a program will be like a spring tonic.

We have print exhibits from Australia, China, Italy and other countries available to camera clubs. Merely drop a note to the Director of International Exhibits and we will make arrangements for one or more of these shows for your club.

A. LYNNE PARCHALL, Associate Editor

November is a month when many outdoor photographers lay their cameras on the shulf and turn their attention to indoor artificialities.

It is true that long spells of dark, rainy weather do sometimes descend upon us at this season of the year, but the month does not deserve the bad rating that is commonly given it. Every season has beauties of its own if we will only look for them. What is levelier than a still, frosty morning in November? Gray skies maybe, but atmospheric effects that can be caught at no other time. Stark black trees, clustered factory chimneys from which the smoke rises straight and vertical, perhaps an occasional plume of white steam against the dull background, roof planes that are invisible at other times of the year, everything that is needed to make a picture except your own creative imagination.

Come on, let's get up early some morning and try it this year!

Pictures, pictures, and more pictures are needed to keep the club going. If the members become interested and there are indications of prints in the making, then you have nothing to worry about, but if there are signs of a let-up, you may have to call upon PSA for help, so better act quickly.

American Exhibits

Fred Fix still had a few open dates for several of the American Exhibits when we heard from him last, but we suggest that you write him for an up-to-date list of the shows now available.

Instruction Print Sets

Among the new helps now being offered by the Pictorial Division is the Instruction Print Sets. There are one-man shows that are accompanied by the comments of experts. Members of small and isolated camera clubs soon become fed up with the stereotyped criticisms of their fellow members and would like to hear what a qualified salon judge has to say about the pictures. This is what these sets offer. The director of the activity is Dr. John S. Anderson; write him for further particulats.

Portfolian Clubs

Some members of every PSA club are in Portfolio circuits and someone should keep track of their schedules. Many a meeting has been saved from cancellation by the timely arrival of a Portfolio.

If four or five members are engaged in such activities, perhaps they would be interested in organizing a "Portfolian Club" to supplement the regular club activities. Sten Anderson is the man to consult in that event.

Sten reports that the latest club to qualify for a sponsor is the Orlando Portfolian Club, and Thomas Limborg, APSA, of Minneapolis has been appointed to the job

Portfolio of Portfolios

Would you like to have a display of pictures to hang in your club room on a social night, or display to the public in a show window? See whether James T. Johnson has a Portfolio or Portfolios for you. These are collections of prints that have traveled in International Portfolios, and many of them have become famous.

The prints are of smaller size and several are grouped together en each card. The cards are all 16" x 20" and there are fifteen, or twenty cards to a set.

Comera Club Print Circuits '

William Hutchinson has left us for other work in PSA and the new director is George I. Munz. George and I. sat together in a meeting at the New York Convention in August, and had a nice visit, talking over plans for the future. George says:

"As I get further into the running of PSA Camera Club Print Circuits, I notice that a club gets the henefit of having three activities from one participation, first, they can have a competition to see which three prints will be entered, second, they have the program when the Circuit arrives for viewing and commenting, and then third, when the prints and all comments are finally returned to them. This takes a lot of worries off the program chairman, and I personally feel that the more prints that you view and hear comments on, the better photographer you will be.

"I also think the clubs that participate in this activity should have the print makers remake their prints according to the comments received. This is the only way to really learn and correct the mistakes that others see."

Ask George for an application blank, and before sending it in be sure that you already have the three prints required of your club.

Judging Service

When does your club have the big Print of the Year contest and display! If it comes in January, it is time now to make plans for judging. If it comes in May or June, you have several more months in which to think it over, but do not delay too long.

Consult Fred Bauer Jr. if you need help in finding some good out-of-town judges.

VIEWS AND REVIEWS

BY THE DIGEST EDITOR

WHO'S WHO

The long listing of those who have had prints accepted in two or more photographic exhibitions during the past year, which appears in this issue, is some indication that neither the exhibitions nor the exhibitors are quite as decadent as some people might like to believe.

These exhibitors have found acceptance for their work in competition with other photographers all over the world.

No one who understands exhibitions or exhibition judging will deny that many meritorious prints were not accepted for exhibition. But for the most part, the prints which were displayed were not only technically excellent, but partrayed some facet of our life today which the maker felt was important.

The leading exhibitions and the leading judges of exhibitions are becoming more and more critical of what they choose as representing the best in photography. The best will always survive, and photography will have taken a forward step toward its rightful place as one of the Fine Arts.

PSA COLOR DIVISION

MRS. BLANCHE KOLARIK, APSA 2824 S. Central Park Ave., Chicago 23

Korean Communique

In a previous item we mentioned that the Color Division Hospital Project was functioning close to the front lines in Korea. Just how close is now disclosed in a letter written by Miss Mary Jane White, an American Red Cross Assistant Field Director in

Korea. We quote:

"A few days ago I received the color slides which your group sent to the hospital here. I am so pleased to have them and I know we will use them a great deal. This is a mobile surgical hospital and many of our patients are very ill. After a few days they are interested in some quiet activity and this is where the slides will help. The hospital personnel joins me in thanking you for this contribution. Because this hospital is fairly isolated there have not been many recreational facilities here so everything is appreciated.

"As you probably know, the mobile surgical units are hospitals set up in tents. They are the first hospital patients reach The men are usually here for about five days and then evacuated to the rear. Our hospital which is typical is situated in a small valley and is surprisingly comfortable.

"Once again, thank you for the slides. They are already in use and are a pleasure to have."

In forwarding the above to us the American Red Cross Field Directors Office in Tokyo, Japan adds the following:

"As always, we can't tell you enough how much your splendid work means to us. Without your very wonderful contribution, a great lack would be felt most strongly by the men in the hospitals".

While the American Red Cross has been expanding its service to take in additional hospitals our part of the project has slowed down due to a drop in the number of slides received. We need at least 4000 slides a month for hospitals in Japan and Korea and at least 2000 slides a month for U. S. Army, Navy and Veterans hospitals in this country. The need is desperate. Send whatever you can, no matter how few or how many, identified as to subject matter if possible, to Karl A. Baumgaertel, A.P.S.A., 353 31st Avenue, San Francisco 21, Calif.

Convention Note

Since closing day of the New York Convention, much has been heard of the splendid Color Division Show and the innovation introduced by its chairman, Mrs. Amy Mintel Walker, APSA, and co-chairman John Walker, of showing the slides grouped into several classifications, such as Still Life, Genre, Pastoral, Marine, etc., each group accompanied by appropriate musical background.

This arrangement afforded fine opportunity of comparison of the various subject matter for the audience, and created considerable feeling of smoothness in the presentation.—Carl Sanchez, Jr.

Some Aspects of Color Perception In Viewing Color Prints

Editor's Note: The number of color print makers is gradually increasing, and the following article by Color Division's Technical Adviser is chiefly for their information. However, much of uts material on color applies also to tronsparencies.

The second portion of the article will appear next month.

We have always lived in a world of color. and the present high level of success achieved by modern color processes allows us to reproduce pictures in color with a realism so great as to almost create the illusion of the real thing. To many, this has already become a distinct handicap which limits their individual means of expression, and accordingly, methods have now been devised to remove this limitation and thus extend the possibilities well into the realms of color abstraction.

When photographing colored objects in monochrome, the primary objective is to correctly reproduce the luminosity of the objects and thus retain the relative tone values. Luminosity is the term used to characterize the depth of that neutral gray which appears to the eye to match in "lightness" the given color. Despite frequent and deliberate deviations from this primary objective for reasons of emphasis or of individual artistic preference, we seldom feel the necessity to question the correctness of the reproduction. Perhaps we feel that the missing colors themselves can be supplied through a mental conversion of monochromatic values into whatever color values appear to suit the occasion.

A monochrome print can accordingly deviate almost without bounds from correct reproduction, and this quality will seldom be challenged. We feel that if the picture satisfies the requirements of composition and expresses a mood appropriate to the occasion, whatever overt liberties were taken to emphasize and perhaps enhance the reproduction, only served to demonstrate the artistic facets and technical ability of the maker.

When viewing a color photograph, however, especially a reflection color print, an entirely different set of circumstances seem to apply. Here, the necessity for a mental assignment of color to monochromatic values no longer exists, and the hypothetical boundaries of almost infinite limitation which formerly applied have now been reduced to the rather narrow limits of the print area itself. We can now no longer assign a color of our imagination to an area, but are obliged to view the photograph in full color as a realistic reproduction. To many, this sort of confinement appears to be a distinct disadvantage, and accordingly they attempt to evaluate the reproduction colorwise, not necessarily in

terms of what they see, but too frequently in terms of how they think the subject should have appeared, even though they may never have seen it under any circumstances. Such attempts, more frequently than not, distort the facts and result in considerable confusion.

Since the interpretation of color involves both physical and psychological factors, it may be of more than passing interest to consider it rather briefly in the general field of psychophysics in an effort to account for the more important factors which affect the visual mechanism.

Because light is the medium by means of which the sensation of color is produced, we can conveniently start by examining the nature of light, and later, consider its effect upon the visual mechanism.

The Nature of Light

As one of several known forms of radiant energy, light is presumed to travel with wave motions. The speed with which these waves travel in air is approximately 186,300 miles per second, and as matters now stand, this is the absolute speed limit of the universe. The waves of light differ in length, this being defined as the distance from the crest of one to that of the next. They also differ in frequency, which is the number of waves passing a given point in I second. The product of wave length by the frequency is the speed, and this is constant for any given medium. The speed varies, however, with different media.

The various forms of radiant energy result in a continuous series of wavelengths. each differing from the next by an infinitesimal amount. Such a series is known as the electromagnetic spectrum. Toward one end of this spectrum are the almost infinitely short gamma rays emitted by some of the radioactive materials. Following the gamma rays are the X rays, and these gradually merge into the ultraviolet region. Farther along toward the center of this tremendous array of energy, we reach a series of wavelength which is able to stimulate our visual mechanism and cause the visual sensations. This is the region of light, which starts at approximately 400 millimicrons and extends to about 700 millimicrons. A millimicron is one millionth of a millimeter or about one twenty-five-millionths of an inch.

Beyond the visible region of light is the infrared region, followed by the radar, television, and radio waves, some of which are miles in length. For comparative purposes, if we consider only the region from the short gamma rays to the long radio waves, this can be represented by an imaginary straight line approximately 6 miles long. Toward the center of this line is a space about one-sixteenth of an inch in length. Within this relatively small linear dimension is confined most of the energy which stimulates our visual mechanism and causes the sensation of sight; but it is a powerful stimulant.

Light is scientifically defined as the aspect of radiant energy of which a human observer is aware through the visual sensations which arise from the stimulation of the retina of the eve. Since this definition includes both radiant energy, which is purely physical, and the visual sensation, which is psychological in character, the entire process extends into two realms and is therefore expressed in psychophysical terms which interrelate both phenomena. The Visual Response

There is nothing in the physical nature of light which decrees that human beings shall respond to it, and the energy comprising this very narrow band is quite similar to that of adjoining areas. Nevertheless. it supplies the medium by means of which we observe the world of color about us, and why we respond to this particular energy band has never been elucidated. We can consider the visual response to light only in terms of human beings, and because we vary in our physiological as well as in our psychological responses, the visual process cannot be defined in terms of a particular individual, but rather it must be considered in terms of an imaginary person called a standard observer representing an average "normal" visual response. Colorwise on this hasis, it has been possible for the International Commission on Illumination to prepare a set of three response curves representing the average response characteristics of this hypothetical individual to the energy which constitutes the visible spectrum. The Spectrum

We are all familiar with the spectrum as presented by the rainbow, when the sunshine falling upon the curved surface of raindrops is dispersed into a majestic array of color. A similar situation can be achieved analytically in the laboratory by passing a beam of white light through a glass priam. The resulting continuous bands of colored light are known as the visible spectrum, and it is customary to recognize the seven colors—violet, indigo, blue, green, yellow, orange, and red.

For reference purposes it is necessary to have some recognized method for identifying any desired portion of the spectrum. Such a method is fulfilled by the Fraunhofer lines which are narrow dark bands traversing the spectrum at fixed points, and they form a convenient means of designation for any part of the spectrum.

White Light
When all of the wave lengths between 400 and 700 millimicrons are presented collectively to the eye, the sensation of "white" is produced. Because an absolute basis for white does not exist, the term cannot be precisely defined except by visual comparison to such arbitrary standards as a block of pure magnesium oxide illuminated by light of specified intensity and spectral charactegistics.

Our conception of white under ordinary circumstances is therefore a matter of some conjecture and considerable variation, since The G. D. Hospital Project in Agitton

PFC. Charles Rogers (center) of Greenville, South Caroline tries to convince Cpl. Domingo H. Garcia (left) of Cotulia, Texas and PFC. Jose A. Rivers (right) of New York City, with the aid of color slides donated by PSA members and others, that South Carolina scenery is more pictorial than that of Texas or New York. This picture, of a friendly discussion among Korean War casualties in the U. S. Army Hospital in Tokyo, Japan, shows only one of the many ways in which color slides are used in more than fifty U. S. Army, Navy and Veterans Hospitals in the United States, Japan and Korea. Please identify your spares or rejects as to subject matter and/or geographical location and send them to the PSA Hospital Project, 353—31st Avenue, San Francisco, California. They will be greatly appreciated. Official American Red Cross photo by Mori.

the visual mechanism is able to adjust over a wide range of changing conditions. Most tungsten sources will accordingly appear colorless until they are compared directly with daylight or with other artificial sources of daylight quality.

The role which colors play in light is quite similar to that which pure musical notes play in sound, but the physiological effect is entirely different. Two superimposed musical sounds can easily be recognized as two distinct pitches by most of us, and a trained musician can differentiate and identify the separate notes in a harmony, including the overtones present in the notes from a single instrument.

Unlike musical sound, however, as few as two spectrum colors comprising a mixture are incapable of such separation. If, for example, spectral red is mixed with spectral green, the psychological effect of yellow is produced which cannot be distinguished from that which might be produced by a single spectral yellow. In similar fashion, the admixture of any number of spectral colors gives rise to a single color sensation which cannot be analyzed into its constituent parts by vision alone.

Several theories of color vision have been proposed, but all of them seem inadequate to satisfactorily explain some important aspect of the manner in which we see color. One of the most widely accepted theories propounds the existence of color sensitive

elements in the retina of the eye. There are three sets of such elements, each group acting as a separate receptor s stem for one of the primary colors, red, green, and blue. Heretofore, these receptors were presumed to be arranged in a somewhat orderly manner, but recent evidence from England appears to indicate that they are scattered about somewhat haphazardly in the manner of the colored starch grains in an Autochrome plate.

Since there appears to be no way of isolating one of these mechanisms to study its response as a function of wave length, there is still considerable uncertainty as to the exact manner in which it operates.

These response centers are connected to the brain by an extensive communication system of nerve fibers. When light reaching the eye is focused on the retina, the respective stimulations are carried to the brain where they are converted to sensations. The psychological factors involved in this process are indeed complex, and it is therefore no more surprising to find variations in color interpretation among normal individuals than it would be to expect differences of opinion among them.

Additive Color Mixture

The principles of additive color mixture were demonstrated in 1861 by James Clerk Maxwell. A similar result can be most conveniently achieved by using three projectors, each beam of which is screened by a red, green, and blue filter, respectively.

If the circular areas of color are made to overlap, somewhat in a pattern resembling a three leaf clover, the sensation of yellow will be produced in the area of overlap between the red and green direles. Likewise, the mixture of red and blue will create the sensation of magents, and that of the blue and green will cause the sensation of bluegreen or eyan. In the central area where all three colors are superimposed, the sensasion of white will be produced. Hence, Maxwell demonstrated that for all practical purposes, white light can be thought of as a mixture of red, green, and blue light in the proper ratio. This principle was later applied to the development of the additive process of color photography, and its success was demonstrated by such processes as Autochrome, Agfa Color, and Dufaycolor. Subtractive Color Mixture

By way of comparison to additive mixture. there is a second method of color synthesis which employs colors complementary to those used by Maxwell. This scheme, called the subtractive process, utilizes cyan, magenta, and yellow, and they are accordinaly identified as the subtractive printing primaries. Unlike the corresponding additive primary colors which exist only in their respective energy bands, the subtractive primaries exist in two wave bands. Thus, the evan is composed of both green and blue, the magenta, of red and blue, and the vellow, of red and green. If the subtractive primaries are projected on a white screen. using the pattern previously described, the sensation of red, green, and blue will be created in the regions of overlap between the magenta and yellow, cyan and yellow, and magenta and evan, respectively. In the central area where all three colors are superimposed, black will be produced.

This principle is used in all of the modern subtractive color processes, although the materials employed are somewhat different, according to circumstances. For color transparencies, dyes are used, and for reflection prints, either dyes or pigments may be employed.

It may be of interest to note that the subtractive principle used in modern color photography follows the method used by painters. They start with a white canvas which scatters light of all colors, and they apply a bit of pigment to an area. The function of the pigment is to remove or subtract white light from the area over which it is applied, and thus substitute its own unique characteristics. If the pigment has the quality of absorbing the blue component from white light and reflecting the red and green, the sensation of yellow is created. Thus, modern subtractive color processes are not concerned with any attempt to duplicate the spectral colors themselves, but instead, to create the corresponding color sensations. and when this is accomplished with reasonable accuracy, the effect upon the visual mechanism will be practically identical to that produced by viewing the isolated spectral colors .- W. K. RAXWORTHY, APSA

The Service Folder

If you are a member of the Color Division, you have received the 1952-58 edition of the Division's Service Folder.

This folder carries the details on 14 specific projects of which you (if an in-

dividual member) or your Club (if a CD member) can take advantage to improve your color photography and to reap additional thrills from such effort. The folder also explains 16 related services which should be of interest and value to all CD members.

Our advice is to study the folder carefully, and follow through on one or more of the services offered. By all means, file the folder in a convenient place so you can refer to it frequently. You may be very much interested in some project tomorrow which holds little interest for you today.

The folder carries the names and addresses of the Color Division officers for 1952-54. If you have special problems or questions not answered in the folder, write to your Division Chairman, other officers, or supervisors listed. Suggestions for improving Color Division projects and services are always welcome.

Color at San Diego

Over one-thousand camera fans, preponderantly color enthusiasts, had themselves a real field-day at the P.S.A. Town Meeting of Photography in San Diego, California on September 13th and 14th. From early until late they swarmed over beautiful Balboa Park and the water front, cameras in hand, taking advantage of cooperative weather and models.

For those who were after future masterpieces there were calendar girls, and drum majorettes, topped by a shooting session supervised by name photographers with none other than "Miss San Diego" herself as model. On Sunday almost a hundred persons including whole families from twenty different countries, members of San Diego's House of Pacific Relations, graciously posed hour after hour in their native costumes.

On the more formal programs, outstanding photographers gave willingly and unstintingly of their knowledge. Al Stewart opened the Color Division with a command performance of his masterful and inspiring demonstration of "Flower Photography Under Artificial Light."

Lynn Fayman, who can always be counted upon for new emotional experiences in "Color", took his audience thru a realm of "Color in Motion" never before exhibited in color photography. Both his films and color prints left one breathless.

Harold Edwards' famous Photochromers Court provided a lighter touch to put all in a mood for the Dutch Treat Jamboree held on the Roof Garden of Hotel San Diego Saturday night, where a dazzling style show with more beautiful models provided additional incentive for snap-happy photographers.

For those who seriously wanted to learn about "Color", Fred Bond, APSA, and noted authority. lectured on "Color Harmony and Composition", on Sunday.

"P.S.A. Tops in Photography, Color Slides" were indeed—TOPS—with Vella Finne introducing each slide, and its maker in absentia, with George Brauer commenting.

A two-hour Slide Clinic closed the Color Division program with Merle Ewell, APSA, conducting, and Al Stewart, Les Mehoney, Vella Finne, Fred Bond, APSA, Floyd Norgaard, Henry Greenhood, Charles Norona, George Brauer, Glenn Brockins and Lynn Fayman, APSA, commentators.

To the Southern California Association of Camera Clubs, especially Charles L. Wilson and his able committee, we give a lusty ovation for a wonderful two days that ended all too soon.

—Vella L. Finne

TECHNICAL DIVISION

TD Executive Committee

The Annual Meeting of the Executive Committee of the Technical Division was held on Sept. 27 at Lake George, N. Y. Installation of newly elected division officers and the appointment of committees were prime order of business, along with plans for the future activities of the division.

This annual get-together is the social event of the year for TD and committee members bring along their families. New York, Rochester, Binghamton and Boston Sections were represented. Bill Swann, retiring division Chairman presided until he tunned the reins over to Dr. E. P. Wightman, the new Chairman. W. E. Fritz is Vice-Chairman and Herbert MacDonough is Secretary-Treasurer.

Canoe Island Lodge on Lake George is the meeting place and as the gang started to arrive on Friday night, the large dining room was turned into a projection room. Clyde Carlton brought two stereo viewers and showed his slides of the PSA Convention and also of the Lake George 1951 meeting. Gene Wightman had color slides of both meetings and Herb MacDonough threw some of his into the pile.

On Saturday night Host Bill Busch showed movies he had taken on a ski trip to Austria and Switzerland, giving your reporter additional reasons why he should never take up skiing. Bill never misses a good shot, especially when it is blonde, and one of the blondes in Switzerland proved to be Renee, waitress in the dining room, who was always coming around to see if we wanted "anuzzer" cup of coffee.

Then Bill showed some very dramatic productions made this past summer by guests, including a slightly condensed version of "World In His Arms". Al Sheldon of Ansco showed some of the color slides he uses in his camera club lecture program, ranging from high-magnification nature subjects to the geological glories of the Southwest.

It looked as if everybody present had a camera; several stereos, Leicas, a brand new 2½x2½ under test, and Sam Kitrosser was trying out Polaroid Pathfinder No. 1. (The Pathfinder we had at the Convention turns out to be No. Zero).—adb.

Boston Section

Hy Schwartz of Kalart was speaker at the first meeting of the Fall season. He spoke on B-C Flash Photography. Next meeting is scheduled for Nov. 20, subject not yet announced. Sam Kitroseer of Polaroid is Chairman.

PSA STEREO DIVISION

FRANK RICE, APSA

228 N. LaSalle St., Chicago 1

Personalized Slide Analysis

Max W. Sorensen, 1119 E. Andrewa, Fresno 4, Calif. and Paul J. Wolfe, APSA, 124 E. Jefferson St., Butler, Pa., have agreed to recrive stereo alides from any individual who cares to submit them for analysis and comments. This is a new service, free to members of the Stereo Division.

In this case the analysis will be based on the appearance of the slide in the hand viewer. It appears there are many stereo photographers who are interested in making good pictures for hand viewing, and do not immediately care about projecting them. Secondly, we have long thought that a personalized slide analysis would appeal to some members who do not care to enter the competitions or circuits, but would like to know, now and then, what a more experienced photographer would have to say about their pictures.

Messrs. Wolfe and Sorensen are capable photographers in other fields as well as stereo. They have had extensive experience as photo critics.

You may send slides to either of these men (Note that one is in the eastern area, the other far west.) Or, you may send the same slide, first to one and then to the other—for double checking—if you like,

Be sure to include enough postage for the return of your slides first class mail since the package will contain their comments. Also send along a self-addressed sticker for convenience in returning the package. The slides do not need to be bound in glass. It would be helpful if the slides are titled; titles help give the analyst an idea of what the photographer had in mind when he took the picture. Also it would be well to give him the exposure data if you remember it, the kind of weather, location of the scene, whether you used a tripod and other such data.

At the present time we will not set a limit to the number of sildes that may be sent. However it is just good sense to send a typical slide out of a lot of slides about which you have some question, rather than to send the whole lot. You can always send a second selection of slides after you see what the analysts have to say about the first

Siereo Larger Than 35 mm.

Wheeler W. Jennings, 7549 S. Clyde Ave., Chicago 49, Ill., will serve as an information clearing house for stereo photographers interested in making stereograms of the larger sizes. He has followed the progress of stereo photography for many years in Europe as well as U.S.A. He has a large collection of slides, cameras and viewers of all sizes.

He will be glad to have reports from others who are working with the larger pictures.

Would you be interested in a large-slide circuit? Do you care to exchange information about equipment? De you wish to buy or sell? Write Mr. Jennings.

Eastman Charge for Stereo Mounting Called Excessive

The Stereo View, publication of the Stereo CC of the East Bay (Alameda, Calif.) and the Stereo Group News of the Jackson Park CC (Chicago) call the new Eastman stereo slide mounting service unreasonably high in cost. The price of the Kl35 films in sizes 20 and 36 include the cost of mounting as 2x2's. The question is asked—why should not the stereo camera owner get a break in one way or the other when he uses the film? Either the cost of the film should be less when he mounts his own, or if Eastman mounts as stereo, the cost should be little, if any, greater than for the 2x2 mounting service.

Photographers and Magnetized Watches

This photographer's watch was in trouble repeatedly because of magnetization. Where it came from was a mystery to several jewelers. Finally one asked -"Are you a photographer? -Then, keep your watch away from your light meter." Light meter had been carried on belt; watch in pants watch pocket directly underneath. F.E.R.

Four-Way Vision for Projectionists

I nless all slides are mounted in projection mounts or are otherwise compensated in the mount so that the right and left images of the most distant objects automatically fall on the screen with 2½" separation, projector adjusting will need to be done during the show. To do this well, the projectionist needs to examine the projected pictures four ways:

- l. In stereo.
- 2. Out of stereo (no polarizing spectacles).
- 3, Left-eye image only.
- 4. Right-eye image only.

Some projectionists wear their spectacles down on their noses so they can sight over tle top to check the horizontal and vertical alignment of the images. Others cut off the bottom third so they can peer underneath. For checking focus, they must squint through the left spectacle, then the right, cover the lenses alternately, or switch the lamps off alternately.

A viewing device is suggested which is constructed on the visor or bill of a base-ball cap. The visor is extended so that sheet polarizing material may be suspended from the visor about 6" in front of the eyes. Two horizontal filters are used, each 1\\(\frac{1}{2}\)"x5\\(\frac{1}{2}\)". Of course, the angle of polarization of each filter must match that of the commercial spectacle.

By looking straight through the filters the screen can be viewed in stereo. (The 1½" height of the filters would be sufficient to cover the screen area completely when viewed from the projector location.) By tilting the head back, the filters are lifted out of the line of sight. By turning the head and sighting with both eyes through the

left filter, the left serven hauge may be seen. By turning the head in the opposite direction the right image only may be exceeded.

The Stereo Optical Co., 3539 N. Kanton. Chicago 41, can furnish two 114"2514" filters properly out for the shore upon receipt of \$1.50. Cash with the order, please. They also have a limited number: of the following item which you can have for 60¢ cash.

The Polaroid Vecto-viewer consists of two oblong filters mounted in a cardboard mount 5"x5½". This can be manipulated to give the four-way vision described but takes one hand to do the manipulating.—EARL KRAUSE.

Old-Timers Only

You fellows who stuck with stereo through its dark ages are the ones we can depend on for help with technical problems. You've forgotten more about stereo than most of us new-comers will ever know—but please go easy on us, will you?

Stereo really has two sides. One involves optics and mechanics, things that lend themselves to precise measurement and calculation. Problems in this field can be answered positively, and you old-timers have the background to do it.

The other side of stereo is in the mind. We don't know nearly as much about it, and it doesn't submit to mathematical formulas. Often an answer that holds true for one stereo user won't necessarily work out for another. Here we'd like to have you leave us a little freedom to have some fun.

For example, you can tell us precisely the distance at which the atereo window will appear when we use a given camera and mounting technique, and we'll be grateful. But please don't go on and tell us we should never let anything protrude through that window, or that anything we shoot at a closer distance will be hopelessly distorted.

Questions like these get us into the workings of the mind, into that field of stereo where there aren't as many definite answers. Mathematics won't prove anything here, and one man's opinion is as good as another's.

An old-timer whose mind is well schooled in the finer points of stereo may find objectionable distortion in six-foot pictures taken with 2½-inch interocular. He's entitled to his opinion—but it isn't law. If we all recognize that some picture qualities aren't fixed and measurable, we can all have more fun and can keep stereo from slipping back into the straight-jacket of rules that kept it stagnant for so many years. It's a swell hobby. Let's enjoy it.—Rosert L. McIntyre

Ed. Note: Amer!

How One Stereo Group Does It

Here is the pattern for activities of one stereo group. Meetings are held once a month with a members-competition every other month. Members enter 3 slides in the competition. Three judges are selected. They are often guests, since members entering slides should not judge. One of them is the analyst whose name was announced in the club bulletin and in publicity releases to the newspapers.

This club uses an electric voting machine which shows each judge's decision as either

a red or green light. After the vote, the analyst comments on the picture, touching on composition, subject matter interest, and atcreo technique. When all members slides have been voted on, the judges talk over the top scoring slides and pick out 3 honor awards and 2 to 4 honorable mentions. As these are projected for the last time, the titles and makers names are announced.

Guests are invited to bring 2 slides each and these are projected with comments by

the analyst-no judging.

The stereo programs on the other six meetings during the year consist of travelogs, technical demonstrations and discussions, manufacturers and dealers demonstrations, traveling folios from other PSA clubs, etc.

At the end of the club year the Annual Exhibit and Banquet is held with stereo. print, and color slide committees of the club cooperating. A catalogue is published.

If you wish your community had a stereo club, refer to the club manuals published by the David White Co. and in the PSA Journal. Then talk to other stereo photographers, camera store employes, and directors of existing camera clubs. For meeting quarters contact art institutes, camera clubs, park or YMCA officials, community house directors, or restaurants with private dining rooms.

There is interest in stereo all over this country. To get more satisfaction from this interest, participation in local clubs is to be encouraged. Try to line up a real stereo attraction for the first meeting and don't forget newspaper publicity on it.--EARL KRAUSE.

Is It Exaggeration? Distortion?

The sense of sight is so arranged, that when we look at a large scene, nothing is distinct. When we try to grasp the view in its entirety, it is out of focus and we only have a general idea of what we are looking at. Then when there is something in the picture that particularly attracts our attention, we focus our eyes on that. This smaller area, we can now see clearly.

It is astonishing, how small a part we really closely examine at one time. Our vision is practically brought to a point. The attention covers less than one square inch, at a distance ten feet away. This scanning action also takes place, front to back. We can only see clearly one plane at the time, at the distance eyes are focused.

At the Stereo Salon in New York the picture of a girl was projected on the screen large sire. Head and shoulders wershown. Talk about distortion ensued. Of course the distance from the girl's shoulders to her nose was somewhat exaggerated, but the fact that our eyes cannot focus at two different distances at one time makes talk about distortion of less significance.—Victor Ellis

One Question and Five Answers

Question: Would like to hear from others as to their experiences with different kinds of film and different kinds of filters.

Answer No. 1. Where color film is used, color correction filters should be used with great care, because of over correction of colors. It takes some one very skilled in the art of color balance to be successful. The user may like his finished product, but others may think he has poor taste in color

iense.

Answer No. 2. So would all photographers everywhere. Wondering about the other brand or technique is part of the fun of photography.—Robert L. Howard

Answer No. 3. Ansec color and other color processes that incorporate part of the color-formers in the emulsion are much too grainy to be enjoyable in stereo. The David White flash filter seems to be too warm with Kodachrome A and No. 25 bulbs. And the same combination of film and bulb without the filter is too cold. I get best results with SM bulbs, no filter, and type A Kodachrome.—Bob Munns

Answer No. 4. I use and recommend Kodachrome A with Realist filters.—Geo. W. Mack

Answer No. 5. Stereo is no different from any other form of photography in the end result. Films, filters, double exposures, vignetting, and what have you, can be experimented with, with the same fascinating results as planar photography. -- Bruno Menin

Follow the Crowd

Don't let a rear place in a crowd keep you from getting shots of that parade, or whatever else it is the crowd is watching. Addition to your accessories of a unipod (one-legged "tripod") and a time release for your shutter will turn the trick. Set the time release after attaching camera to unipod. Hold unipod aloft with two hands and base against waist or chest to steady it, with camera pointed at parade over heads of crowd. When self timer goes off, you've got your picture.—L. B. Dunnigan

Tune Out That Static

Static electricity, the stuff that grabs dust from the air and slaps it onto your film just as you're trying to enclose it in glass is today's worst offender when binding slides. You can pull the dust particles off the film with a hard rubber comb that has been rubbed with a piece of silk. This rubbing sets up strong static electricity in the comb, and the dust will give the film the cold shoulder for the hair-parter. And if you prefer blowing the dust off the film, use a bulb syringe rather than your breath, which is chock full of moisture.—L. B. Dunnigan

Flash That Baby Smile

Ever notice when taking those baby pictures how the tyke so often watches you serious-faced until you shoot, then breaks into a grin after the flash goes off? Capture that smile on film with an extra flash gun attached and use a cable release if you have one. Stand a bit to one side with the extra gun, to get baby's eyes off the lenses, and shoot the extra gun. When baby grins, snap the picture. It costs an extra bulb, but it's a good investment.—L. B. Dunnigan

PSA NATURE DIVISION

HARRY R. REICH, APSA

286 Schenck St., No. Tonawanda, New York

September Nature Color Slide Contest

The judging of the September Color Slide Contest of the Nature Division was held at the home of the Co-chairman, Willard H. Farr on September 19. The judges were: John Millar, Deputy Director of the Chicago Natural History Museum, Arthur W. Papke, Past President of Chicago Nature Camera Club, and Julius Wolf, President of Chicago Nature Club.

Sixty two contestants, representing seventeen states, Canada, and Hawaii, submitted over 240 slides, which is an increase of twenty five percent over the figures for the last contest. The awards were as follows:

MEDAL WINNERS

Irma Louise Carter, Manhattan Beach, Cal. "Rice Shocks, Java". Al Suter, Chicago, Illinois. "Dunes". Paul Wolf. APSA, San Francisco, California. "Apple Blossoms".

HONORABLE MENTIONS

Flovd E. Brickel, University Heights, Ohio. "Joe Pye Weed". Dr. M. A. Chantler, New Toronto, Canada. "Prickly Fungi".

Thomas J. Fisher, Staten Island, N. Y. "Peach Blossoms".

H. W. Greenwood, Hollywood, Cal. "Volcano in Miniature".

Irene M. Hefiner APSA, Albany, N. Y. "Autumn Lane".

Ludwig Kramer, Pleasantville, N. Y.
"Hickory Horned Devil".
Paul L. Miller, Seattle, Washington.

Paul L. Miller, Seattle, Washington, "Desert Storm".

Myrtle R. Walgreen APSA, Chicago, Illinois. "Acorns".

The Nature Color Slide Contests will be conducted in 1953 again, in April and September. The deadline being the fifteenth of each month. Let's make them bigger and better than ever.

Nature Adventure Series .

Ever since the PSA National Convention in Detroit in 1951 the writer has been receiving requests for information as to how some of the members of the Nature Division might obtain the services of Robert C. Hermes for their camera clubs. Mr. Hermes, as you who were present in Detroit will recall, presented his marvelous color film "Exploring Canadian Bird Islands." Mr. Hermes is a regular staff lecturer of the Audubon Society and it is very difficult for him to arrange dates to make many commitments for camera club engagements which is cause for regret on the part of Mr. Hermes. A member of PSA and the Nature Division, Mr. Hermes has been more then willing to fill such engagements when his schedule permitted but unfor unately his engagements were confined to the area near his home, where the trip would be a short one.

Take it easy

WITH STEREO-REALIST

CHECK THESE Realist FEATURES

- World's most complete system of stereo photography
- Microscopically matched, coated 35 mm f:3.5 lenses perfect alignment assured
- Direct vision, centered viewfinder — completely eliminates parallax
- Synchronized for flash
- Hingad lens cover with hyperfecal table.
- Electronically time-tested shutters for perfect color photography
- Wide base, split image range finder for more accurate focusing
- Easy to operate fewer picture failures
- Economical—29 stereo pairs from 36 exposure rell, 16 from 20 exposure rell
- Full year warrantee against mechanical failure

SANTA may be getting the full treatment — but you can literally "take it easy" with your Stereo-REALIST. The breath-taking depth and full natural color of REALIST pictures simply can't be beat for life-like realism. Children are so real you feel as if you could reach out and touch them ... you can almost smell the fragrance of flowers ... scenic views are startling in all of their natural splendor.

It's easy to take these beautiful, three-dimensional pictures. The REALIST takes all of the hard work out of photography, because it duplicates exactly what you see with your eyes. A few easy-to-remember adjustments and you have taken a picture you'll treasure forever.

You'll want a REALIST for yourself — and so will those "special" names at the top of your Christmas list. It's the finest, most everlasting gift money can buy.

If you haven't had the thrill of seeing Realist pictures, visit your camera dealer soon. He'll be glad to show some to you. DAVID WHITE COMPANY, 387 West Court Street, Milwaukee 12, Wisconsin.

On a recent visit to Mr. Hermes' home to arrange for his appearance at a camera club I learned that his schedule on the Audubon lecture platform was full from November to April of 1953. As his itinerary covers territory where N.D. membership is heavily concentrated we thought it a good idea to publish his itinerary so that N.D. members could take advantage of the opportunity to hear Bob and see his wonderful films.

This schedule covers the period from Nov. 10 to Feb. 23. Two subjects are shown, "Bonaventure Diary" and "The Grass Forest" which we are abbreviating to Diary and Forest.

November dates are: 10, Salt Lake City, Diary; 11, Santa Anna, Calif.; 12, Oceanside; 13, San Diego; 14, Pasadena, all Diary. 15, Eagle Rock, Forest and Los Angeles, Diary. 17, Montebello, Diary and 18, Forest. 18, Los Angeles: 19, San Bernardino: Santa Monica; 21, Berkeley; 22, Lodi; 24, Concord; 25, Modesto; 26, Carmel; 28, Whittier; 30, Fresno and Dec. 1, Stockton, all Diary.

Dec. 2, Sacramento, Forest afternoon, Diary evening. 3, Marysville; 4, San Francisco, Diary. 5, San Jose, Forest, aft., Diary, eve. Same for Redwood City 5th, Portland, Ore. 8th. Seattle Wash., 9th, Vancouver, B. C. 10th and 11th, Diary.

Dec. 12, Victoria, B. C., Forest aft., Diary, eve. 15, Edmonton, Diary; 18, Port Arthur, Ont. Forest (aft.); and Ft. William, Diary, (eve.).

January 6, Huntsville, Ont.; 7, North Bay: 8, Timmins; Kapuskasing; 10, Kirkland Lake; 12, Burlington; 13, Guelph; 14, St. Thomas; 15, Chatham; 16, Grosse Pointe, Mich., all Diary and the evening of the 16th in Grosse Pointe, Forest. 17, Bay City, Mich.; Belleville, Oat.; 20, Cobourg, Ont., Diary.

February 12, Binghamton, N. Y., Diary. 14, Rochester, Forest. 16, Sewickley, Pa.; 17 Indiana, Ps. and 18, Cumberland, Md., Diary, 19, Millersville, Pa.; 20, Williamsport. Pa.; 21, St. James, Md., Forest. 23, St. Albans, D. C., Diary.

Repercussion

In a recent article in this column the writer makes a plea for lighter weight mailers to be used in submitting slides and prints to exhibitions in order that exhibition expenses might be reduced to a minimum, enabling those exhibitions that chose to retain lower entry fees to come somewhere near breaking even.

Since that article appeared, the writer has heard from some exhibitors who had in the past tried to adhere to that practice, but had experienced some sad results to some of their choicest color slides due to energetic use of the cancellation stamp by some postal employee.

It occurs to the writer that maybe it would have been wise to include a word to the salon committees of some of the exhibitions as well as the exhibitors in order to produce the desired results, namely, reducing exhibition costs. It stands to reason that if a hand cancellation stamp is used on a package of slides by some postal clerk who might have had a bad night the night before, the results might be fatal to some of the slides in that container. The fault in that case would rest with the salon committee.

That is why a word to the salon committees should have been included in that article. If the exhibitors will accept my apology I'll pass it on to the exhibitions herewith. I sincerely hope that it will be read by the sponsors of all of the nature exhibitions. I think that the folks who are responsible for the return of slides should consult with the postal authorities in the post office to which they take the slides for mailing and request the use of precancelled stamps on all the slide packages. This will preclude the necessity of the use of a hand stamp for the purpose and I believe will insure the safe return of all slides. How about it?

A Call for Help

In the last issue of the Journal it was announced that there were many new activities for the Nature Division in the making. These added activities mean that there will be a need for more active workers who might have time and the inclination to take a more active part in the conduct of the Nature Division and who would be willing to serve in the capacities required by these activities.

There will be a need for circle secretaries for the Nature Portfolios. A committee to work on the Star Ratings of the nature workers. Folks to handle the color circuits of the division, and also the distribution of the tape recordings and for that matter we will require the services of any members of the division who are capable of preparing a tape recording for distribution.

If you have the time and feel that you would like to help in these various activities and in doing so help to promote the interests of the nature division, and stimulate an hiterest in hature photography please drop a line, either to the writer or the secretary of the division. Ruth Sage, and let us know of it. If you have any choice of activities in which you would care to take an active part please specify.

PHOTO-JOURNALISM

WILLIAM A. PRICE

78 Elbert St., Ramsey, N. J.

We are getting a nice response to Dave Eisendrath's Sept. 5th letter from many P-J members and there are some mighty good ideas coming in to us. If YOU haven't written us yet, get going because it is the ideas of all of you that we are going to use to put and keep the P-J Division right up in front all of the time.

One of our proposed activities should be just what you have been looking fortegional get-togethers where P-J members in local areas can get together at luncheon or dinners and talk it out, get acquainted present problems, and enjoy good company. Meeting places and dates are to be arranged locally and meals, if any, would be "dutch".

The P-J membership list is being arranged for us by areas so that it will be simple to contact regional members. We here at national HQ are going to work up half a dozen or more programs in skeleton form that can be used at the regional meetings. Bob Garland, our fireball from Graflex, continually travels the country over and he is already making contacts and helping to get local programs started.

In order to hold these regional meetings it will be necessary that there be someone in each area who is willing to spark the activity. The meeting places and dates must be arranged and some contact maintained with P.J members nearby. We will help all that we can from here by supplying membership lists, furnishing or suggesting programs, answering questions and problems, etc. If we can obtain «chedules far enough in advance, we will run them in the Journal. A meeting every couple months wouldn't be too much trouble and could be a lot of fun for the person (it doesn't have to be a man!) who is willing to volunteer for the good of the P-J Division and its members. How about it, can we have some volunteers? Let's hear from every State, P-J is starting to roll!

You non-P-J members who also read this column, get on the band wagon. Join P-J!

A letter just received from Mr. Marshall Harry of Ft. Wayne, Ind., states that he is interested in a question and answer box as part of or supplementing this column. He points to the trials and tribulations of the amateur in breaking into the Photo-Journalism field and also his thought that there is a sort of taboo on the part of the press in using 35m/m work.

He did not ask any questions but as I wrote to him, there is "meat" in his letter and some information along these lines should answer a few questions that our readers may have. We will try to run something on this by a real authority later on.

In the meanwhile, if you have any questions regarding photo-journalism that could be answered in this column, please send them in and we will print answers by people who really know the score.

P-J Winners en Page 626

CAMERA CLUBS

PSA Fourth International Club Bulletin Competition

With entries from U. S., Canada, Canal Zone, India, New Zealand, Mexico, and South Africa, and representing leading clubs, this year's winners may be sure that their bulletins are "Tops" in camera club publications. There has been continued improvement in bulletins and we believe that the suggestions offered by the judges in these competitions have been important in this direction.

Judges this year were Rita Connolly (camera club editor of CAMERA MAGAZINE), Frank Fenner (former editor of PHOTOGRAPHY), and R. B. Horner (editor of Chicago Color CC's "Projector", which has been a medal winner in all previous competitions.)

Club plaque winners were Science Museum. Photographic Club for its "Fotomic Facts" and Detroit Photographic Guild for its "Bulletin". The two editors, Walter VanBuren and Audrey Gingrich, also received the first place medals.

In the "printed" class, editor Vernon Kr-ling (Baltimore CC's "Focal Point") received the second place medal, with third place medal going to editor Dorothea Ward (Memphis CC's "Southerner").

In the "Other" class, two editors with tied scores each received a second prize medal. They are C. V. Niman (Hawthorne CC's "News") and Lewis Sharrard (Springfield Photographic Society's "Exposures").

Editors of the following received special award gold ribbons for "Editorial Contents": Longbeach "Spotlight", Jackson Park "Jackson Parker", Oakland "Panotam", Polyphoto "Chatter Box", Waikato (N. Zealand) "Snaushots".

Gold special award ribbons for "Typographic Excellence" went to editors of these: Mexico "Boletin", Chatham "Out of Focus", Focus "Rangefinder", Ford "Tripod", New Haven "Bulletin", New Westminster "Reflector", New York Color Slide "Rainbow", San Francisco Photochromers "Color News", Utica "Newsbulletin".

Editors of the following won red award ribbons for various content components: Mexico "Boletin", Mysore (India) "Viewfinder", Ridgewood "Focal Plane", Washington Cinematographers "Newsbulletin", Atlantic (C. Z.) "Focus", Diablo (C. Z.) "Light 'n Lens", Dyckman "Dynamo", Focus "Rangefinder", Ford "Triped", Great Neck Color "Color Wheel", Johannesburg (S. Afr.) "Bulletin", Los Angeles Cinema "Bulletin", New Westminster "Reflector", New York Color Slide "Rainbow", Rockefeller Center "Exposure", Rotorura (N. Zealand) "Shutterbug".

And editors of the following won corresponding ribbons for typographical components: Long Beach "Spotlight", Ridgewood "Focal Plane", Mysore "Viewfinder", Washington Cinematographers "Newsbulletin", Diablo "Light n Lens", Denver G. & E. "Local Focal News", Roteruru "Shutterbug".—H. J. JOHNSON, FPSA.

CHAPTER V (cont.)

- 7. Monthly awards: Selection by elimination from entries receiving highest scores (3 "in" votes), or if insufficient number in this class, then highest scores are awards and the next class (2 "in" votes) are reviewed for the additionals. Total to be 10%, non-ranked, in each class, plus HM's equal to 10% of the entries. Awards receive ribbons plus 2 points towards cumulative scores. HM's receive different color ribbons plus 1 point toward cumulative season scores.
- 8. Season awards: One cup each season for most points earned in club competition in slides plus 1 point for each slide accepted in recognized exhibitions. One cup each season for most points earned in club competition in prints plus 1 point for each print accepted in recognized exhibitions.
- 9. Records: The contest director shall keep a record showing the judges each month (and any comments on their qualifications). He shall also keep a record of prize winners and makers. Each month's results shall be published in the club bulletin. At the end of his term, the contest director shall turn over to successor the complete list of judges (for all previous years) and also a copy of this instruction, with any changes made and approved by the club during his term.

CHAPTER VI

CAMERA CLUB PUBLICATIONS

As a camera club increases in size, a club publication of some sort becomes more and more a necessity. Even some of the more progressive smaller clubs realize the value of a bulletin.

For most clubs, lacking in experienced or competent publicity chairmen, a bulletin is an efficient medium for publicity. Copies sent to newspapers and magazines permit editors of these to select items which they consider of most interest for possible publication. The bulletins informally but effectively stimulate interest in prospective members. Copies sent to other clubs make them aware of the publishing club.

Club publications are more efficient than minutes of business meetings for preserving club history. Some clubs keep no minutes; when they are kept, they are not generally available to members, and of course, do not contain much that is of importance, such as field trip experiences, member and club achievements, etc. As a club becomes older, its history becomes of more interest and value.

Members like to know the background of coming speakers, they want to know competition standings, details of planned field trips, etc., and a club bulletin is the most convenient method for publicizing these to members.

Finally, a properly edited bulletin is very effective in stimulating participation and interest in club affairs.

It is evident from the foregoing that a club bulletin is recommended, especially where there are more than 30 or 40 members.

This Camera Clab Menual is a revision of the original manual prepared in 18th by Victor H. Scales. It will be reprinted when publication is complete and distributed to member clubs.

Methods for reproduction of a club publication

In smaller clubs, a bulletin can be managed at practically no cost other than postage. Someone can type the material with a hectograph carbon which will produce about 75 legible copies. Two or three such pages, stapled together, make a neat, economical bulletin.

For a larger club, mimeographing is recommended, and though it is sometimes possible to find a member who can cut stencils and may have access to a mimeograph machine, it is better to have the job done commercially, since the cost is moderate. This cost should be included in the club budget.

Planographing, offset printing. and printing (letter press) are progressively more expensive. Offset printing is recommended for large clubs with good treasuries; it can be as neat as printing and photographs reproduce well.

The great majority of camera club publications are reproduced by the mimeograph process.

Size

The size of the bulletin will depend chiefly on finances and the number of members. For a small club, a single mimeographed sheet makes a good start. As the club grows, additional pages may be added, with four pages usually considered sufficient even for quite large clubs.

Page size should be standard $8\frac{1}{2} \times 11$ for greatest convenience. Occasionally the legal size page is used but this is an awkward size and is not recommended.

A name for the paper

The most appropriate and unpretentious title for a club publication is simply "Bulietin", preceded by the club name.

If a different name is wanted, avoid the temptation to find one that is "clever" because to outsiders it may appear labored or affected.

National magazines make every effort to find a single word title. For the same reasons of convenience, a club should avoid titles requiring three or four words.

Financing

Most clubs which have bulletins include in their budgets the costs for the publication. These costs should be rather specific in order to prevent an ambitious editor from sp.urging at the expense of the treasury.

Depending on the size of the club, the effectiveness of its publication, and the method of reproduction, the percentage of the treasury which may be budgeted may vary from 10% to 25%. It should be remembered that even where there is no bulletin, part of this expense would be necessary anyway to cover notices of meetings.

Since subscriptions are practically out of the question, the only other source of outside finances is in advertising. In terms of reading public, the club paper is neither effective nor economical in comparison with standard advertising mediums; therefore most clubs do not solicit advertising. However some clubs seek advertisers and find them, perhaps chiefly on a "good will" basis.

The editor

If professional experience or a master's degree in English

were required to edit a club paper, few clubs would be able to obtain an editor.

Any member with a reasonable proficiency in writing is a likely prospect as an editor, even though he occasionally may split an infinitive. If he has imagination (sometimes he will have to "create" material for the paper), initiativeness (to go after information when necessary instead of waiting for it to be presented to him), and enthusiasm, he will make a good editor.

A few clubs have used a system of rotating editors during the season as a way to lighten the editorial work. Another way is to keep an editor but rotate his assistants.

Samples for study

A big help to a new editor is the opportunity to study an assortment of bulletins from other clubs in order to obtain ideas as to appearance, size, text material, etc. Such an assortment can be obtained from the P.S.A. without cost other than postage.

Importance of identification

A common mistake in new bulletins is the omission of necessary identification. It is important that at least the editor's name and address be included because those outside the club who receive the bulletin may want to write for information as prospective members, or an editor of some other publication may want to quote part of the text.

Officers' names and addresses, meeting place and dates are helpful to outsiders and also to members if the club is large.

Distribution of copies

The mailing list obviously will include all members. It also should include editors of camera magazines and newspaper columns who might be able to help the club in the way of publicity.

In order to see how other club editors handle layout and selection and presentation of material, it is recommended that exchange subscriptions be arranged with ten or twelve other club bulletins. Their editors' names therefore would be included in the mailing list. (These exchange copies are also valuable to program chairmen as sources of tips on program material.)

From time to time, a number of copies may be left in camera stores for distribution to interested customers.

Club speakers should receive copies of the bulletins in which they are mentioned.

Bulletin competition

An extremely important aid to camera club editors is the P.S.A. annual club bulletin competition. In this competition, editors have opportunities to win medals and ribbons for themselves and plaques for their clubs, but the greatest value is in the score sheets for each bulletin. These contain numerical analyses of content and typography by three judges scoring independently of each other. The editor receives these sheets along with written comments and suggestions by the judges.

The following factors are evaluated: interest and news-worthiness (editorial style, proportioning of gossip to other material, selection of material, etc.); stimulation to participation in club activities (by exciting enthusiasm, building esprit de corps, etc.; service or usefulness to the club (calendars of events, "build-up" reports for speakers, reports of meetings, standings of contestants, etc.); layout (arrangement of text illustrations, ads); and typography (neatness, legibility, accuracy).

Contents

The more certain a new editor as to what should be included in the bulletin, the easier his job will be. One item necessary to include is a calendar of coming events: speakers, contest subjects, field office, etc. flow far the calendar should extend into the future is a problem of judgment for each editor; but at least two meetings in advance should be included. This information should be provided by the program chairman.

Related to the calendar but sufficiently important for a separate item is the "buildup" for the next apeaker; his background and special qualifications, his subject and its value to members, etc. Properly written, these "buildupa" greatly increase attendance.

Reports of immediately past meetings need not be extensive but it is worthwhile to have at least a brief reference to the speaker's chief points, or methods of procedure in case of demonstrations. Some clubs report lectures at considerable length, but if the bulletin is average size, lengthy reports may take up space which could be used more profitably for something else.

Competition standings should be included. Perhaps a monthly listing is not necessary but the frequency should be sufficient to enable members to have a fair idea of their relative positions so that they may increase their efforts if they want to climb higher in the standings. The information should be furnished to the editor by the contest chairman.

"Personals" are an important part of club publications and provision should be made to include these (though perhaps no more than a column in four pages). They should chiefly concern some angle of photography, as a common denominator: prizes won, contests judged, vacations, etc. However, a part of the material can be more trivial in nature if the ratio is kept well controlled. The "who was seen with who" type of gossip can quickly become "trivia." Special effort must be made to see that the majority of members occasionally find their names in the "personal" column; constant repetition of the same names is not the purpose of such columns. The wise editor will obtain a club roster and check-mark each name as it is used; later he will assign someone to obtain some sort of "news bit" about each member whose name has not been used. (There is no such thing as a member who in the course of a year is a complete blank.)

In larger clubs, short biographical sketches of members are always worthwhile, chiefly of officers and committee members but also including all members in the course of time.

Many editors may be tempted to include "feature" articles. This is a temptation to be resisted because few club papers are large enough to allow space for long articles ("long" in comparison with the total available space). Informative or expository articles of real value may approach a column in length, but rarely can more space be allotted. Short articles of the "tips" type are more desirable.

Elections, business meeting decisions, short accounts of field trips, etc., obviously should be included.

"President's Message" columns are of doubtful value; they too often are "olympian" or too general.

The general tone of the club paper should be one of informality. This is a compromise between "breezy" and "stuffy" (though the "light" touch is preferable to a "heavy" one.)

Layout and Typography

The first problem is whether to run lines across the full page, or to use columns. The latter are recommended because though they require a bit more effort in spacing, they are easier to read.

"Justifying" the right hand margin of typewritten text increases nearness but the effort necessary is out of proportion to the result for most papers.

The most acceptable color for the paper stock is white. Orange, green, or gray are more likely to cheapen the appearance of a paper than to brighten it, though some shades.

Your first efforts to put story telling action into your movies may not be 100 per cent successful. However, you will note improvement with each effort. Start with simple uncomplicated family stories first and as you gain experience, you will be gratified to see it reflected in your movie results.

Print Mailer—from p. 644

are placed at the outer edges of the board. It is advisable to place a few prints in position between the strips in order to make sure that when the container is assembled and tacked that there will be sufficient room between the strips to accept the prints. When the strips are in position fold the lower fifteen inch flap upward as shown in the second sketch. You will then tack the fifteen inch portion to the strips as indicated by the dashed line. Then turning the container over, tack the outer edges of the twenty inch portion of the board to the strips leaving the upper short flap of the board free as shown in the second sketch. An idea for the spacing of the tacks can be gathered from the photograph of the case.

The scotch tape is used to protect the edges of the board. to prevent them from fraying. It is folded over the upper edge of the fifteen inch flap, and over the three outer edges of the top smaller flap. When prints are placed into the container and the top flap folded down in position the upper flap will overlap the lower one by two inches. When shipping a stout cord is bound around the case in both vertical and horizontal positions and the prints are ready for mailing.

In viewing the photograph of the print case with prints in partial position you may think the guy might have used a newer case to photograph or at least he might have retouched his print before submitting it to the editor for reproduction. I assure you this print was prepared as shown for a purpose. The case illustrated is one that has seen two years service and was used to illustrate the fact that the cases are servicable and still make a presentable appearance after two years of use.

Camera Club Manual—from p. 663

with properly matched inks may be satisfactory.

Clean stencils, cut with an even touch, are necessary if a mimeographed paper is to be neat. Better to pay for a stencil than to get it free if it is sloppy in appearance.

If text is "solid", without paragraphs or other variations, it is likely to be unread by most. Therefore paragraphs should

Although readers of a club paper may not expect typographical perfection, too numerous errors will lead to loss of esteem. Therefore "copy", should be carefully proofread.

Misspelling, with its complication of ignorance, must be carefully avoided. With a dictionary at hand, the editor should check the spelling of any word for which he has the least doubt as to the correct spelling.

"Layout", the arrangement of material on the page, is the editor's equivalent of the photographer's "composition". For example, a well composed page will "balance" almost as well as a picture. Long articles are interspersed with short ones, spaces between articles do not match across two columns, occasionally a two or three line item is "boxed" for emphasis, etc.

(To be continued)

PSA JOURNAL

Louis Licks Opposition

Maurice H. Louis, APSA, is well along on his lecture tour that will carry him all the way to California. Local committees have been doing good promotion for his talks. In Wheeling, W. Va., he was interviewed on the radio for ten minutes and newspaper publicity has been excellent.

The Cleveland Guild with a membership of 55 turned out 140 to hear the talk. Opposing attractions the same night included Fred Waring's orchestra, an insurance convention, the Walcott fight, Nixon on the radio explaining his expense account, and Eisenhower in Cleveland for a talk. And still Louis pulled 140 to the Guild lecture! The power of photography.

Color Prints—from page 633

be the same as that recommended on the box, since we are now using Printon material under non-standard conditions.

As a guide to those who wish to expose Printon material in a camera, the table provides some typical data from my experiments. These data should be used as a starting point for tests to be made under your conditions.

Processing Procedure

Standard Printon Kit solutions and procedure should be used with the exception of the developing times in First and Color Develop: 1.

Following is a typical procedure for processing direct color prints at 68F:

		F		
1.	First Developer		2 6	minute
2.	Short Stop		2	99
3.	Rinse		2	99
4.	Second Exposure		2	99
5.	Color Developer		16	99
6.	Short Stop		1	**
7	Rinse		5	19
8.	Bleach -		5	99
9.	Riner		3	19
10.	Fixer		4	**
11.	Wach		10	**

The above development times are based on portrait subjects lighted by electronic flash illumination. Other types of subject matter exposed by other types of illumination may require different exposure-development relationship to produce optimum results. The above times, however, may be used a- a guide in making your own tests.

FLASH FLASH FLASH FLASH FLASH

Your prints in the Picture of the Month books at the Convention created something of a sensation, and things began developing, but fast!

A number of Camera Club Presidents who were present were called to a special meeting where they were asked, "What can PSA do for your Clubs that is not already being done?"

One answer: "WE WANT THE PICTURE OF THE MONTH PRINTS TO SHOW OUR MEMBERS!"

You were promised that your point-winning pictures would be circulated where they would do the most good for your fellow members, and here is how the promise is being fulfilled:

The books already completed and, a new one each

the promise is being fulfilled:

The books already completed and, a new one each month, are being shipped to Phil Maples, Director of the Recorded Lecture Program. The prints will be discussed by the top Commentors of the United States, recorded on tape, and the complete package, a book and the recorded commentary, will he sent as a Program to PSA affillated Camera Clubs in the United States and Canada.

United States and Canada.

Maybe your own Club will want one or more of these Programs, but be patient, folks, to do a really bang-up job of recording takes time, and there will be things your Club must do to get them. Watch the PSA Journal for full information from Phil Maples when the Programs are resdy to be circulated.

In the meantime, all of us have things to do.

In the meantime, all of us have things to do.

The books must be better and better from month to month, and the only way in which this can be accomplished is for more and more of you to send better and better pictures. This is your Activity, a way in which you can help other people enjoy good pictures, and it is up to you to get behind things and push. Send us your own prints, bring pressure on the Commentator of your Portfolio to show you by his own example that he is worthy of being your Commentator, and give the best photographers in your Club a few gentle bints with a baseball bat to send in some of their best. Then, and only then, the PSA will be able to produce Programs for your Camera Club that will be tope in quality and value. Come on folks, let's go!

Camera \$99.50 Flash \$10.00 Case \$7.50

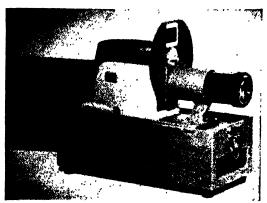

America's most distinguished 35mm camera argus c-four

No other camera combines such amazing ease of operation with this exclusive array of precision features!

Ultra-fast f:2.8 Cintar coated lens—a truly great lens—to give you beautifully defined pictures in color and black-and-white—even in failing light!

Combined rangefinder and viewfinder—to give you an in-focus "picture-window" view—even if you wear glasses!

Superaccurate shutter...1/10 to 1/200 second—perfect complement to the critically sharp lens. Built-in flash synchronizer. See the versatile Argus C4 at your dealer's!

© 1952 Argus Cameras, Inc. Ann Arbor, Mich. All prices include Federal Excise Tax where applicable, and are subject to change without notice.

America's Favorite way to look at color slides—Argus 200 Watt blower-cooled projector. See your highly-prized color slides in true, brilliant color. The "right-side-up" rotary slide carrier prevents upside-down pictures. Silent power blower protects valuable slides. It's the perfect companion for any 35 mm camera! An unmatched value at \$49.50.

MOSL METCOME

You Needn't Be Big - Except in Spirit . . .

There have been replaced escetings and Town Mactings sponsored by councils and other large groups, but here is a meeting sponsored by a comerc club, a Regional Field Day, to "heleg closer together the PSA members of the replan and the camera clube". Sponsored by The Datles, (Ore...) CG; committee headed by Laffe Fester, with Walter Wellington, Ray McGuire and Deretty Welss. Sign displayed in rightentum hearby attracted touring PSAers found Mactena and Taxes. Attendence was chippet, 180; same of whom are seen in top pictors.

The Dalles (Celio Falls) is famous as spot where Indians fish with dip nets, a scene soon to disappear as new dam will soon submerge this very scenic location. Trippers had chance to shoot this as well as Indian families in full regalia. Colorful costumes and natural beauties of The Dalles made it a field day to be remembered. Pix by Foster.

Journal 1952 Index

The contributor and article index of the PSA Jaurnal is usually published in the Documbur issue each year. This year it has been prepared in the familiar format but is adiated separately for distribution to institutional subscribes.

With the reduced number of pages available for each issue of the Journal, inclusion of the Index would mean leaving out one of the Index would mean leaving out one of the Journal the Index consistency with the number of pages available for distilling never. By printing the Index oppositely, we have been able to keep one mean feature article in the book.

there feethers article in the book.

The Index, with title page for those who bind their copies will be sent postpaid on request to: Editor, PSA Journal, 28 Leonard St., Stantford, Cons. After Fab. 1, it will be trainful from Heldquarters.

Aprile At Halfway Point

Spinkling to pressy-live sensors clubs in inspiration estates, Materice II, Louis, APSA, approximatify consisting that first half of his material flow landing beautiful. In capital in the Sagaton, Managing 19th. Louis will remain in Southern California until Dec. 26th when he will begin his return trip through the southern states.

Five lectures have been scheduled in Texas. They are Jan. 2, El Paso CC; Jan. 5, Convair CC, Fort Worth; Jan. 7, San Antonio CC; Jan. 8, Baytown CC; and Jan. 12, Port Arthur CC.

Camera clubs in California and some of the southern states may still make arrangements to hear Louis' lecture on child portraiture. Until Dec. 24th he may be contacted care of Alan L. Harris, 1111 Alta Loma Rd., Los Angeles 46, or through Mrs. Barbara Green, 30 Willow St., Brooklyn 9, N. Y.

PSAers Judge News Contest

Dr. Glenn Adams, APSA, George R. Hoxie, APSA, and Frank H. Richterkessing, APSA, were judges for the newspaper anapatot contest conducted by the Louisville Courier-Journal. Sunday magazine section, in amouncing the awards, gave a nice write-up to PSA in the story about the judges. Two weeks later, Thomas V. Miller, Jr., Camera Editor, devoted his column to a full stary on the PSA Convention, in New York.

Language in which publication is pranted it indicated by suitable, abbreviation following city of publication.

Photo-Technik und Wirtschaft—Berlin (Ger. w/ Eng. summary.) Sept. 1952. The German trade-mark problem still not clarified since war. This article tells of buyers throughout the world being confused by illegal and haphazard trade-mark practices on the part of manufacturers and exporters. Another item calls attention to the recuperation of the photo industry in West Berlin. If you are interested in German movie projectors (silent and sound) a directory of these may be found in the July issue.

Photo-Magazin—Munich (Ger.) Aug. 1952. Press photography for the small newspaper by Frans R. Falkson who uses only a Retina II with Heligon F 2 lens. Several examples and many suggestions as to sources and methods are offered which should prove helpful in any country.

Photography—London (Eng.) Sept. 1952. The first of a new series of articles on print quality by Ian Chipman, brilliant instructor. He says in part: "It might be a motto for us all, put where we can see it at least once a day, on the bedroom wall or underneath our favourite quart glass. It is this:—"The effect of everything that goes into the making of a photograph shows in the print". Only the best of everything, therefore, will give the best print".

Photo France—Paris (French) A current series titled "Architecture and Gardens" show French chateaux and formal gardens taken by different photographers. A concise history of each is given. The series began with the June 1952 issue.

Focus—Bloemendaal (Dutch) Aug. 1952. Smaller-than-miniature cameras. A serious analysis of various increasingly popular subminiature cameras including samples of obtainable results.

Photo Guide Magazine—London (Eng.) Aug. 1952 mentions an article in British Journal of Photography which describes a patented device for self-portrature. Through a multiple periscope reaching from the camera viewfinder to the subject the sitter can see himself as the camera sees him. He pushes the periscope away before releasing the shutter.

Japan Photography—Tokyo (Jap.) Sept. 1952. Loaded with interesting pictures well worth a second look. As for the articles—our Japanese is inadequate—so sorry, please.

TSA: JOURNAL

NOW.

LESS CORROSIVE TO STAINLESS STEEL TANKS!

SHELF LIFE INCREASED FROM 10 TO 24 MONTHS!

for more reasons than ever before.

DON'T FIX 'EM - JIFFIX 'EM

In laboratory tests, improved JIFFIX produced only nominal corrosion on type 302 stainless steel. In this respect it was superior to the older JIFFIX formulation and to ordinary acid-hardening hypo. Corrosion on type 316 stainless steel was negligible.

Also the improved JIFFIX now has a 140% longer shelf life. Yet, it is just as fast, effective and economical as ever. No weighing or mixing of chemicals...just dilute with water and use. JIFFIX is 3 to 4 times faster than hypo on pan and ortho film ...twice as fast on process film. It fixes from 1½ to 2 times more film per gallon than ordinary fixer.

JIFFIX is even more economical when used for fixing films for engraving and lithography. It gives excellent results diluted up to 11 times!

Hardener is bottled separately for your convenience in "tailoring" film hardness.

Critics Get Critical in Picking Critica Awards

When you got right down to it, the only way to pick a winner from a big bunch of prints is to pur them on the floor and get critical!

That is what Jackie Judge (Modern Photography), Bruce Downes (Photography), Jacob Deschin (N. Y. Times) and Ed Hannigan (U. S. Camera) are doing here picking the winners of the First Ananal Critics' Awards sponsored by the Metropolitan Camera Club Council.

The awards were presented at the annual awards dinner of the Council on Nov. 10. Four equal awards were made to: William Berriel, Hypo Hounds, for "Silhouette"; Leo Lerch, Manhattan CC, for an untitled picture; Levon Roubian, P.P.A., for his print "March Northwester" and Harry Sheridan, Fresh Meadows CC for his "Sunday Stroll".

Deschin (Con.)

Kodak news that Kodachrome Film, Type A, 335, in the stereo loading, is now available along with the daylight time previously announced. Steree-Kodachrome, as it is generally known, is the new \$4.75 package that includes processing of the twenty stereo pairs it produces as well as steree mounting, so that when you new receive your color stereos, they come in mounts ready to be viewed. The new film is for use in stereo cameras making 23x24mm stereo pairs with standard spacing between pictures.

At a recent trade show, DuPont departed radically from usual procedure by showing eight products by other manufacturers, all related to the processing of this company's Varigam paper. These included the Aristo \$32.50 "Vari" lamp head for 4x5 enlargers; the Aristo Grad-a-con lamp for 4x5 and 5x7 enlargers and the Aristo Time-O-Lite printer. Other items were the Belleraft Varigram Filter Wheel at \$9.75, a device that contains five filters and a clear hole, and is operated by click stops; the Broun & Mosby Striated Filter; the Omega Filter Turret at \$26.75; and the Urban Striated Filter Unit and photofinishing unit.

Morse Instrument Company, Hudson, Ohio, has a small contact printer with ten individually controlled argon lamps and inflated platen for contact-printing up to 8x10-inch negatives. Franklin M. Morgan. Inc., 303 West 42nd Street, New York, nas introduced an \$80 Printmanager for fixing baths and other solutions requiring constant agitation. This company also offers eight models of a new-type darkroom sink, the Plastank, which is made of plastic-

bonded waterproof wood.

A new line of tripods has been placed on the Market by 'Arrow Metal Products, 108 North Jefferson Street, Chicago, Ill. These are known as Bowman "Lift" models, featuring the popular elevating feature. They are available in three and two sections. Arrow's Archer models, which have a panhead but no lift, cost less. An inexpensive model is the Archer 53, with a junior type of panhead. Prices of all Arrow tripods range from \$14.75 to \$36.95. Write the company for descriptive literature.

Reader Survey

As this issue of the Journal goes to press, first ballots are starting to come in, your votes on the Journal contents. If you have not sent yours in yet will you please refer back to page 667 of the November issue and check off your preferences?

The first scattered returns from the nearby precincts do not indicate any definite trends. (We're writing just a day after the national elections and can't get all the jargon out of our head!) The results will not be clear in any direction before the end of the month, and with our foreign members, for several months.

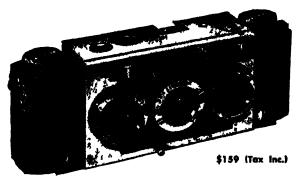

We hope that by next month we can run a preliminary tabulation without analysis and a month or so later an analytical report. In any case the contents of the Journal will in the near future be aligned with the wishes of the majority as indicated by your ballots.

stereo Realist

America's foremost stereo camera line

FINE stereo photography demands that the entire stereo-photographic system — camera, mounting, viewing, projection — be closely integrated to simplify stereo and to give the stereo fan maximum enjoyment. Compare the Stereo-Realist line with any other and see why only the Realist can give you this completely matched, engineered equipment of the finest quality, broadest

range, and greatest economy of operation. Your camera dealer will be glad to show you this complete line of equipment and accessories and/or provide you with an up-to-date catalog and price list or for complete information write: DAVID WHITE COMPANY, 387 W. Court St., Milwaukee 12, Wis.

"Tops" Booked Year Ahead; Second Being Readled

The traveling "Tops In Photography" Show announced in October has been booked solid until September, 1953. Les Mahoney, Chairman of Tops, has announced he has his committee at work on a second collection so new bookings can be made for those now on the waiting list, and new applications.

The schedule as released in early November, and subject to change, is as follows:

Lake Placid, N. Y. Saranac Lake Camera Club Nov. 15 to Dec. 15 Detroit, Michigan Detroit Lutheran Camera Club Dec. 15 to Jan. 15 Pittsfield, Mass. Berkshire Museum Club Jan. 15 to Feb. 15 Quincy, Ill. Photographic Society of Quincy Feb. 15 to Apr. 1 Salt Lake City, Utah Apr. 1 to May 10 Photochrome Club Prescott, Ariz. May 10 to June 15 Prescott Camera Club Madison, Wis. Community Center Photographic June 15 to July 31 Club

Salisbury, Md. Salisbury Camera Club Aug 1 to Sept. 15

Requests are on hand for shows in Toronto, Sandy, Utah, Merced, Calif., Bromerton, Wash., Kalamazoo, Mich., Wichita, Kan., Reading, Ohio and Maryville, Tenn. Add your club to the list by sending an air mail letter to Les Mahoney Chairman, Tops in Photography, Box 1828, Phoenix, Aris.

What is "Tops"?

"Topa" packages contain everything you need to put on a top-flight photographic show except for the place, the tickets and the audience. There are B&W prints by outstanding photographers, color slides by top exhibitors, a group of nature slides of superb quality, a movie that is really tops that is the basic kit. As we add kits there will be variety; sets of technical prints, perhaps a medical or biological show, eplor prints by various processes but whatever the combination you get might be, you can be sure of one thing—it will be "Tops In Photography".

HOW DO WE GET IT?

Any PSA club can sponsor a Tops above. Make your application to Les Mahoney at once so you won't have to wait for it. If there are several clubs, or a council, it might be better to have the group work together, because it is a hig joh.

WHAT MUST WE BO?

You must provide a suitable place to have the alone and a place to project the slides, and aportes. An art missessie, a large public library, an industrible of institution, or a entrable half. The slides should have about two projection to less days, with at least two projection to the implication, there are best two projection, and the implication, there are the slides, good for a large with all the residuals.

or may be used simply to control the attendance.

There are two additional things you can do

You can combine the "Tops" show with a public show promoting photography, with talks at the beginner level, clinics and demonstrations. Or.

You can build a field day around it, as has been done in Phoenix, Montgomery and other places.

In either of these cases you should call on the local photo dealers for help in operating and in underwriting the modest cost of such a show.

WHAT DOES IT COST?

The show itself is free, except for the shipping charges from the last point. You ship it on collect. The only other costs are local; rental of space, printing, etc. Some clubs underwrite the whole show, some ask the dealers to help, some make a small charge for tickets.

WHEN CAN WE GET IT?

Get in line, folks. File your application right away with Les Mahoney at the address given above. He will notify you well in advance of the probable dates a kit will be available to you, in ample time to pin down arrangements for a hall, start publicity and expand your committee to work ing size. Remember this . . . it's more fam think & dalon, and less work.

Camera Specialty Co., 50 West 29th Street, New York. The Wingia Expospy, Meter, measuring about 1 inch long, a little more than 1/2 inch wide, is the visual extinction type and costs \$2.25. As folding cover pretects the meter when not in use. The Preston Midget Panhead, which measures 8 inches long and is made of aluminum and steel, works on a rotating control shaped like a barrel and providing for horizontal panning and vertical tilting through 360 degrees Red dots on each half of the barrel are matched when a level position is desired. The price is \$2.95. The new Caspeo Dimensional Viewer for 2x2 alides, an 8-ounce all-aluminum device, takes card, glass or metal mounts, and costs \$2.95.

The Kodak Flexiclamp, a pocket tripod substitute for supporting a camera or flash extension on flat or tubular surfaces up to 2 inches thick, is offered by Eastman Kodak. The \$4.25 device, a C bracket padded with felt and rubber, has two swivel connections with wing nuts, triple-threaded screw for tightening and a standard tripod screw.

Clingtite Letters, a titling kit for movie-makers, are plastic, non-adhesive letters that adhere on contact to glass, metal, or porcelain or other non-porous surface. A \$2.95 kit consists of more than 150 1-inch ied plastic letters, numerals and figures, and two plastic coated 8x10-inch titling loards

Kodak offers a \$1.25 tile box for 2x2 slides. It's the Kodaslide Flexo File, which holds 360 card-mounted slides, 124 glass

alides or 160 Kodak Stereo slides. It contains four sections and twelve removable septums for titling up to 16 groups of slides.

The Capri Rangefinder, which has three adjustable screws for vertical and horizontal alignment, is a recent import of the Interstate Photo Supply Corp., 28 West 22nd Street, New York. The finder fits the standard camera accessory shoe, measures from 2 to 50 feet and infinity, is leather covered and costs \$4.95. A leather case is 75 cents.

The complete line of Astro (Berlin) telephoto lenses in focal lengths ranging up to 40 inches and supplied in mounts to fit most 35mm and 2½x2½ single-lens reflex cameras and 16mm and 35mm motion picture cameras, is offered by Ercona Camera Corp., 527 Fifth Avenue, New York, who will send descriptive literature on request.

Enteco Industries, Inc., 610 Koscinako Street, Brooklyn 21, N. Y., announce screwin adapter rings to fit lenses recently added to the market. Write them for brochure. The company also has polarising filters in all sizes and mounted in duraluminum. The price, depending on size, ranges from \$3.50 to \$14.

Stereo fear will be interested in the

THE PROPERTY.

frame for adding bellows in front of or behind the camera; a universal leahind-the-lens shutter with internal synchronization, with batteries housed in the monoral tube of the camera; a, special remote control mechanism, and lots more. The camera is \$259. A 5x7 model will be evallable later.

Speedlights

In the electronic flush field the Synctron 200 is offered by Dormitser Electric and Manufacturing Co., 5 Hadley St., Cambridge, Mass. Fosture of this new unit is its dual light output control: 200 wattseconds or 100-watt seconds as desired. Flash duration is 1/1250th, recycling time 15 to 20 seconds. It operates from wet-cell storage batteries or 115-volt AC, weighs nine pounds, measures 3%x91/x91/2 inches. Guide numbers for black-and-white, are 400 and 250, for 200 and 100-watt-seconds, respectively; for daylight Ektachrome, 60 and 40, respectively.

Two dry battery units have appeared. The Johnson Ventlite Co. has Rocket 100watt-second and 200-watt-second models, at \$115 and \$175, respectively, and the Photogenic Machine Co., a 100-watt-second \$120 Little Giant, The Rocket uses five 90-volt B batteries. gives black-and-white guide numbers of 375-500 at 100 watt-seconds, 500-550 at 200; color guide numbers of 40-50 and 75-95 for 100 and 200 watt-seconds, respectively. Each unit is provided with two out-

lets for light extensions.

The Little Giant, which uses 225-volt dry batteries, incorporates a high-low switch to permit operation interchangeably at 50 and 100 watt-seconds, thus providing a lighting control for low and high-intensity needs. Two types of reflectors are inter-changeable on the Little Giant, the conventional 60-degree flood and a narrow beam long-range reflector. The number of flashes the Rocket and the Little Grant will yield varies from about 3,000 at 50 watt-seconds to 1.000 at 200.

Accessories

The Bertram Chrostar Exposure Meter, an improved model of the Bertram Chronos photoelectric unit, has been placed on the market by Willoughby's, 110 West 32nd Street, New York. The \$24.95 (with lapel chain) device has a highly sensitive cell, is designed for direct readings with still or movie cameras, provides for ASA and Weston systems, covers exposures from 1/1600th second to four minutes and diaphragm stops from f/1.5 to f/22 and movie speeds from 8 to 64 frames per second. The meter measures 2% inches across by 1 inch thick, and weighs only 3 ounces. Shaped like a watch, it fits in the hand and

may be carried in pocket or handbag.

Davis & Sanford Co., 553 Fifth Avenue, New York, has a studio-type tripod with a center post that operates by spring action, eliminating conventional cranking. Made of lightweight aluminum alloy, with 2-inch diameter center post, the tripod falls down to 26 inches, extends to 41/2 feet. The tripod head may be tilted in any direction. There are two models, at \$75 and \$99, and accessories that include a side arm extension for shooting at low levels, and an extension section to raise the triped 2 feet higher.

NEW AIDS FOR BETTER PICTURE-MAKING

_By JACOB DESCRIPT, FPSA.

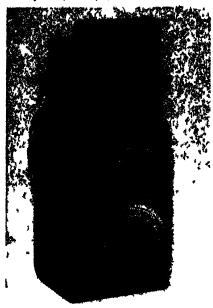

A new stereo camera and the first 8mm Bound projector appear to have made the most stir in the current batch of product announcements.

The new stereo is the Revere 33, which uses regular 35mm er Steree-Kodachrome essettes, and signalines the Revere Camera Company's entry into a new field. Until now they have been preoccupied chiefly with the making of smateur movie cameras, projectors and tape recorders. Although the camera does not introduce any major new developments in the stereo field, it appears to be well designed and constructed, and has come attractive features. Equipped with 35mm f/3.5 coated Wollensak Amaton anastigmat lenses which stop down to 1/22. and the Wollensak Rapax shutters with speeds from 1/2 second to 1/200th, time and bulb, the camera is \$174.50. Features of the new camera include coupled 1.2x magnification superimposed image rangefinder and viewfinder in camera top; conventional miniature film loading; removable back; automatic film transport and shutter setting (but double exposure when desired); parallax adjustment; level gauge visible at bottom of viewfinder; flash-synchronized; provision for exposing single frames; filter retaining rings in lens barrels, and recessed lenses that obviate the need for lens hoods. A focusing stereo viewer, with interocular adjustment, built-in light source and threecolor plastic body, is \$18.50. A saddle leather case is \$12.50 Incidentally, the instruction manual that comes with the camera is one of the easiest to follow we have ever read.

The 8mm sound-on-film projector is the Movie Sound 8, made by Movie Mite Corporation, of Kansas City, Mo., and distributed nationally by O. W. Ray Corp., of New York City. The projector is a complete single-case recording as well as projection unit with a six-inch speaker and a microphone. The total cost is \$398.50. A very narrow magnetic sound stripe is added to the edge of a silent film in a service offered at present only by Reeves Soundcraft Corp. and available through dealers The film is then projected as usual, at 16 or 24 frames per second, preferably the latter speed, and the recording is made by speaking or playing music into the microphone. When the film is run through again the recording is played back. The cost of sound striping the film is \$1.75 for a 50-foot reel of 8mm film. The projector can show 1,600 feet at one time, can be used as a public address system without recording, and weights 34 pounds.

Cameras

The Grafies "22", an improved version of the Circ-Sex 24x24-inch twin-lens reflex countries recently acquired by Grafiex, Inc., Stochaster, has been placed on the market in 1855. The Sham 1/3.5 Grafiex control line and Gentury shutter with built-in flush spicelylightships are both made by Wellesgales, The Juddy, long to 1/3.2. Shutter

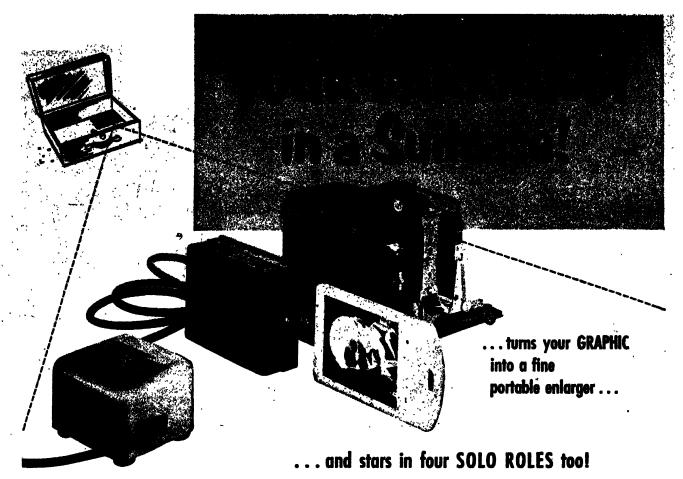

speeds are 1/10, 1/25, 1/50, 1/100 and 1/200, plus bulb and time settings. The speeds are color-coded to indicate which are to be used with X electronic flash lamps or F or M regular flash lamps. Other features include a built in field lens for brighter ground-glass focusing, a 3x built in magnifier, eye levs sportsfinder, simple film loading, spring loaded red window, and metal construction A leather carrying case is \$8.50.

A new model Praktica FX, single-lens 35mm single lens reflex camera with pre-set diaphragm is announced by the importer, the Kine Camera Co, 11 West 20th Street, New York. The camera has built-in flash, focal plane shutter speeds to 1/500 second, and is available at \$139 50 when equipped with the f/1.9 Meyer Primoplan or f/3.5 Zenss Tessar; \$169.50 with f/2 8 Tessar; \$199 50 with f/2 Biotar An eveready case is \$10.95

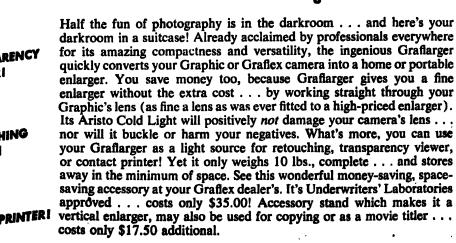

Camera Specialty Co., 50 West 29th Street, announces importation of the new Tennar Folding Camera, which takes No. 620 film for eight 2½x3¼ inch pictures and costs \$16.75. The camera has built-in flash, direct sports-type viewfinder and a universal focus lens. Accessories include a \$4.95 flashgun and a \$4.75 holster-type case.

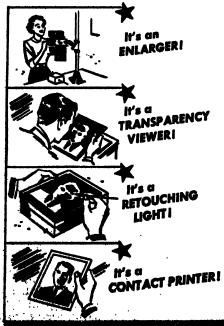

The Sinar, a 4x5 view camers made in Switzerland and imported by Karl Heitz, Inc., 150 West 54th Street, New York, now available in a new model, appears to be capable of doing a remarkable number and variety of technical handsprings. For instance (it says right here) it will take wide-angle lenses with focal lengths dawn to only 2 inches, using a special wide angle ballows. By adding one or mere bellows, it will also take telephoto lenses of any focal length. The camera piny he tilted in any desired direction, and has a mushbar of hivel-subtenessed inchesion, and has a mushbar of

The President Report

Thirteen weeks seems like a ergue with fig bugs, but that is wh been going on since before the Co The only reason for bringing it up to explain why so many letters been answered as promptly as we'd bot and why I missed the desiline last a

A lot has happened in those weeks. San Diego, with Charles Wilson as chairman of a hig PSA Town Meeting, saw a two-day show of true PSA importance. So did Freeno under Nell Longtin's leadership. Those were tangible, valuable performances by PSA'ers for photography and for their communities. Equally important, though less immediately exciting, is the progress in a number of directions that will show later: things like the Gene Chase Regional Activity program and Phil Maples' Recorded Lectures. You will soon hear more about both of these and a lot of others.

¥.

Y.

hio

ш

But since this is your report, here is some of what happened on the trip I hoped would both get rid of the bugs and bring back some of the much-needed pep. Lunch with London photography's Grand Old Man, the revered J. Dudley Johnston who gets younger each year: dinner with Percy Harris, ex-President of the Royal and long-time good friend of many of us over here; a short visit with R.P.S. President Dennis Wratten: tea with Mrs. Rosie Maingot who lectured here a few years ago. Missed Secretary Hallett of the R P.S. who was in France at a convention, but learned enough of what is happening to assure you that closer cooperation between PSA and R.P.S. cannot fail to benefit both of us.

In France, had a thrilling and fabulous dinner with another of photography's splendid seniors, L. P. Clerc and Mrs. Clerc. You know his authoritative books it is too bad that you cannot meet him. Also in Paris. a dinner with our new Honorary Representative to France, Mr. Edouard Belin, President of the French Photographic Society. M. Belin is the inventor of wire-photo which he demonstrated in this country many years ago for Pulitzer's New York World and St. Louis Post-Dispatch, and he also has many television patents dating back to 1911. I hope that he will some day honor us by attending one of our Conventions.

At M. Belin's invitation, Mrs. H. and I attended a meeting of the Society at which Beaumont Newhall gave an excellent lecture on Eastman House in French. To address the Society in their own tongue must have been terrifying beforehand, but Beaumont did a fine job and made many friends for America.

As a last word on the trip, September and October are most definitely NOT the time to try to make a serious movie in France: go in the spring they sing about!

Back trying to work, you will be glad to know that the new Journal setup is running very satisfactorily close to the figures in the budget. Membership jumped by a net of 126 in October. Approximately minety of the best PSA'ers sent in the Volunteer forms that have appeared in fecent J. nals: there are interesting John for about which they will beet more

How to give 60 EXCITING SECONDS ON CHRISTMAS MORNING ... and a lifetime of picture-taking pleasure

When a man discovers a Polaroid Land Camera among his gifts, all other presents wait! He takes it from its box, examines it with mounting excitement. He snaps the shutter... and 60 seconds later shows the family a finished picture — a Christmas picture for all to enjoy on Christmas morning.

That's only the beginning of a lifetime of picture-making pleasure. He'll use his Polaroid Camera constantly for travel pictures, party snaps, family celebrations, portraits, pictures for his business or profession. He'll take better pictures, because seeing results on the spot helps him get the picture just right. No disappointments, no waiting and wondering "how it will come out." The picture is big, too — 3½"x 4½" in brilliant black and white. A whisk of the print coater (packed with every picture roll) gives it lasting lustre and protection.

The Polaroid Camera is the gift for that very special name on your Christmas list. See it at your photo dealer's now, to make sure of delivery before Christmas.

NOW! TWO FINE POLAROID CAMERAS

The Model 95 is designed for those who want an easy-to-operate, inexpensive camera for perfect snapshots indoors or out. More than 50,000,000 pictures have been taken with it. For those who like the greater versatility of a deluxe camera, there's the sensational new Pathfinder model with fast f/4.5 lens, high-speed shutter, coupled range-finder and many other refinements. Ideal for pictures in poor light...for fast-action shots. See them both—at your dealer's.

If you would like this thrill for yourself...start hinting now

OFFICIAL PUBLICATION

OF THE PHOTOGRAPHIC SOCIETY

TO AMORE A

statute said the picture. I hoped he would selecting that path through which he would travel. But Don, he refused to do that, in fact I could not make him trace anything.

I could not draw with him because he could not go in a straight line either horizontally or vertically and when I wanted to trace a curve with him he came up with a zigzag. He did not behave as a good little cataract fly should, but he proved to me that that eye travel dope is just a dish of tapioca.

Now the fly is new but the eye is old; it has done plenty of picture making through half a century. If such an eye cannot travel on self-beaten paths how will an inexperienced eye "travel"?

The line-composition is where your mind says it is. You design the line of the picture in your head as a musician designs his melody line,—provided of course that you can design.

The Image That Must Be Supported

Many critics think that many images must be "supported". This used to puzzle me. Why should a little silver, paint or ink be supported when it sticks to the picture plane as ticks stick to a dog? Then it became clear: the critic mistakes the image for its subject. Imagine a movie critic advocating that Humphrey Bogart be punished for the misdeeds of the gangster he represents.

The still picture critic feels that if you show the foliage of a tree without the tree trunk, or the tree trunk without its foot on the ground the tree won't stand up; it may crash on some innocent by-stander and hurt him. So he says you must show the tree trunk and even the foot of the tree . . . or else your picture is no good.

Don't laugh Don: in art in which little images can "walk out of the picture", (a still picture, at that), or in which a 200 pound onlooker can be "thrown right out of the picture", anything can happen.

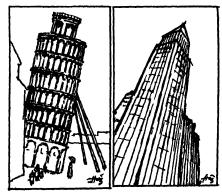

out of the picture", enything can heppen.
If you have the courage to trim ruthlessly, mitting off a whole lot of some of
the images, you may draw fite from come
critic who/her not enough imagination to

continue the images beyond the limits of the picture. Occasionally he is right, as when he nails you with an inept case of trimming; when you make an image appear to be that of a cripple, or you stick images of far away objects to the frame of your picture. But too often the critic is not criticising you; he is merely showing his ignorance or lack of imagination.

The Case of the Leaning Towers

Some analysts think that when you photograph a leaning object the image of it should be propped up. The citizens of Pisa are proud of their leaning tower and for a good reason. Unique and isolated objects are as attractive as unique and isolated images. Anyone can have a tower, but owning the only leaning tower on

earth is another story. How would they feel Don, if they would find the tower propped up one day? And do you suppose that they would approve of pictures, in which the photographer would prop up the image of the tower?

Nevertheless the "you-must-support-thatimage" school of criticism goes on forever.

The Leaning Towers of Great Britain

The problem of leaning images is a big one in Great Britain, where photographers argue leatily about an upright building's chance of appearing aloping in its picture. The traditionalists say "it must be vertical", the progressives say "it may seem leaning". The traditionalists say that since all painters of the past have pictured vertical build-

this day maint do Months, ar a pictures are not good.

The progressives say that this is into seventeenth Century when pictures which made by brushes and paint on converte for rich and mighty patrons; today we work with cameras for everyons who can look at pictures. Therefore we don't have to obey a patron's directions but we many work as we please. Since vertical buildings do appear leaning when photographed from an oblique point of view, why should they not be photographed that way?

The traditionalists say that we cannot see them that way. The progressives say that we can too. So the one party goes on objecting and the other party goes on making them any way they please.

But at any rate no one demands that the leaning images should be supported. Halleluyah.

Oddly Trimmed Images May Suggest That the Subject is Crippled

Some people trim across the images so that they appear to represent mutilated bodies, or the images seem to merge with the frame of the picture. These mergers should be avoided if possible, and no one should cut across images of joints of kuman extremities in trimming his pictures. It is "dangerous" to cut leg and arm images at right angles to their axes, because then the remainder of the image looks like a surgical stump and the onlooker can be pardoned for assuming that that was all the surgeon left to the subject.

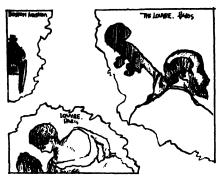

If a picture is trimmed properly a bright onlooker should easily guess from the part image what the entire object was like.

Less than one hundred years ago, when photography was still young, some brillient French painters started to experiment with this new mode of picture making and developed a novel way of trimming, (or "cropping" as some people say). Edgar Degas was the most brilliant of the let. He sometimes took a ballet dancer-image, trimmed off the hody and left the head in the picture. This gave fits to some long whiskered academicians who were used to confusing the images with their subjects.

That did not deter Degas from continuing with his courageous innovations in picture trimming. Some of these were quite startling and did not survive. He would, for instance, split an upright full-length image of a person vertically and gut one half into the picture, the other half he left out of it. It seems that such a system

metrically divided image would stick to the frame, so even he himself did not repeat this often.

He was greatly disliked by the traditionalists of his day who were the judges and jurors of the salons and ditched the work of their betters, even as it is done today. I remember having seen big piles of rejected pictures of famous salons, that contained very much better pictures than those exhibited. And the worst pictures of the salons are usually the work of the judges---themselves.

That was the case also in Degas' time. His judges are now gone and forgotten but Degas' pictures are frequently seen in the art museums of the world. Some of the academicians were probably forgotten while still alive and painting. Many painters and photographers are like Zombies. All you have to do to become a Zombie is to make plenty of old fashioned pictures after the fashions have changed. Keep on wandering on traditional paths when new traditions are being formed. Be a descendant not an ancestor; repeat what others have done millions of times before you. That will do it; you may hear people saying about you, "Is he still alive?" while you are still working.

Pictures Must Have Bases

Do you know the fellow who demands bases in all pictures? He thinks that pictures must have them as do houses, bridges and other structures. But pictures aren't built on the ground; they hang on walls or lie flat in books, albums and magazines.

Anyway what is a base in a picture? After some search I found that some critics think that the lower part of all pictures should be dark. They think that dark tones are heavy and will keep the print upright, as ballast keeps an empty ship on an even keel. I have heard a base-lover say that he would be glad if his printing paper could be pre-fogged in the factory since he has such difficulties in fogging that lower edge. Another fellow remarked that that would be a good idea also for pictures that must be fogged on all four edges to turn them into exhibition pictures. They were probably joking. They probably had fun doing their "flashing" and did not mind a few under or over flashed ones.

But the demand for a base made me visit some art galleries and look around for bases in pictures. I found that dark pictures had dark edges and light ones had light edges. Once if a while I found one that was light with a darkened lower edge and some dark ones with light lower edges.

According to the rule these should have been floating in space, or fallen on their sides. But they were hanging steadily and were valued paintings of fine collections.

To darken the lower edge of a high-key picture could ruin the picture. I mean a real high key picture, like an English Silver Point Drawing that has no dark spots in it. If you put a "base" into such a one you have a dark lower edge with a picture attached to it; the dark "base" will dominate the picture.

The Man That Walks Out of the Picture

The "image that-walks-out-of-the picture" is a major fault in pictures according to some critics. It is just an ordinary image of a full length figure that faces the picture's edge not far from it. This is a compositional tabu, it seems. I disagree; why should he not walk out? Perhaps he does not like it in the picture? Better still, perhaps he would do a favor to the picture maker by walking out, the picture being often better without any figure. But no such luck, no matter how glad one would be to see such a walker walk out of a still picture he will be there forever.

The research about this rule discloses that no great painter of lyric, romantic and heroic landscapes ever put a full length figure of the staffage near to an edge. facing outward. Painters like Corot, Claude Lorrain, Constable, Ruysdeal and Hobbema always kept their figures not very far from the center of the picture and if there were any figures near the edge they were facing inward.

So because painters of the distant past. of hundreds of years ago, did a thing, therefore photographers of 1951-2 and thereafter also must do it. At least that is what some critics expect them to do.

This, Don, reminds me of an anecdote that is worth retelling again and again. It happened that in old Europe the commanding officer of a small garrison was transferred to another garrison town. When he looked around in his new post he found that a 24 hour watch was kept over a field about a mile from town. The guard was changed four times a day and stuck to the place in rain, snow and ice, day and night. He asked the subordinate officer what the guard was guarding? What was the idea? The subordinate did not know. He himself had arrived many years ago, he said, and found the guard watching that spot then as he watches it now.

So the commanding officer looked up the records and found that 230 years ago there had been a powder tower on that spot. It blew up, was never replaced, but no one ever stopped the watch.

Many of our composition rules have a similar history.

You Must Give the Man Space To Jump Into

Perhaps you have heard of the rule that commands the picture maker to provide space for a moving image to jump, run or to walk into-"in a still picture. Don't let him smash himself into the frame or mat" is the admonishment. Well Don, if this rule is valid then that full length figure jumping through an upper corner of a picture by Tabard and published on your front cover not so very long ago is now dead or badly crippled. That figure was right in the corner, facing outward, smashing not himself but a lot of rules, and was not he a dandy?

Now I understand that Tabard is lecturing on Dynamic Symmetry, and is a very well known man anyway, so he cannot be accused of being ignorant. He busted that rule in the snoot on purpose, more power to him.

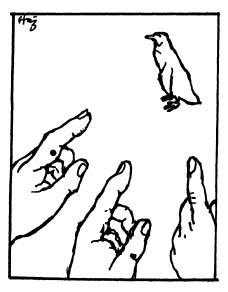

The Young Man's Future Is Behind Him

Another generally observed rule of spacing is this: Leave more space in front of a profile than behind it. This is supposed to be absolute; you do it with the portrait. of an old decrepit hobo the same as with the likeness of a young and hopeful hero.

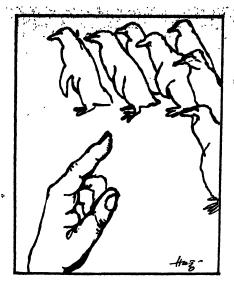

Now the best picture-makers observe this rule with images of young and hopeful subjects, but with portraits of old wrecks they reverse it. Somehow or other the space left around portrait heads becomes symbolic of the subject's age and life expectation. If there is a lot of space in front of the image that means a long life for him; if the space is behind him then it means that he has no future, only a past; there soon will be a funeral. It is a witty way to express your opinion about your subject, there is nothing wrong with it. Except that if you put a long and happy future in front of the image of an old tramp, you are either too optimistic for him or else you don't know how to use this spacing rule correctly.

The "Leading Line" Leads in Two Directions

Another cute rule is that about the leading line. Many people are dead sure that a line leads only in one direction. They therefore use it to lend emphasis to some image. They say: the line leads to it lend-

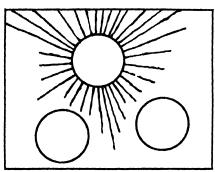

ing it emphasis and dominance. They go even further; they think that if something points in a given direction, (and this pointing can be done by beaks of birds) then whatever they are pointing at will become the "center of interest". This rule is all

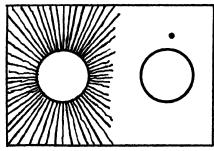

wrong, completely mistaken, it does not hold as much water as a torn sieve.

When I brought out my EMPHASIS IN PICTURES an aggressive critic accused me of overlooking the most important factor of emphasis or dominance: The Leading Line. He furnished an illustration to prove it. He said that the circle

with the lines leading to it was more emphatic than the other two that stood alone. He was right but he was playing (or trying to play) a trick on us Of course one image of a sort is dominant in a picture that includes two images of another sort.

To make the contest equal only two images can be used in a picture—the one with, the other without leading lines. If

you show them that way, you will find that the circle crowded in by the leading lines is much less emphatic than the one that stands alone and isolated. Every line Don, leads in two directions: to and fro. The lines that run into the circle also run out of it. The rays of the sun come more from the sun than go to it. There

Who Will Be Mr. P. S. A. of 1953 i

By Sewell P. Wright, APSA Chairman, Membership Committee

Right off the bat, let's make it clear that "Mr. P. S. A.", might turn out to be "Mrs. P. S. A." or "Miss P. S. A." We're going to talk about "Mr. P. S. A.", and use the masculine pronoun, knowing all the time that some smart gal may win this unique distinction, and all that goes with it.

What's the distinction? Well, Mr. P. S. A.

What's the distinction? Well, Mr. P. S. A. will probably be the most publicized person at the '53 PSA Convention in L. A. He'll sit at the head table at the Annual Banquet, and rub elbows with the biggest wheels in the Society, if you don't mind a nicely mixed metaphor. And he'll be presented, at the banquet, with an impressive plaque setting forth his achievement.

So much for glory—and you might as well omit that "pooh pooh" routine, because we all like a spot of glory, when we deserve it.

But Mr. P. S. A. gets a lot more than glory. He gets—and hold onto your hat, now!—a free trip from anywhere in the U. S. to L. A., and a swell room at the convention hotel for the entire duration of the Convention.

You'd like to be Mr. P. S. A.? Well, confidentially, so would we. Show us a PSAer who wouldn't! All those honors, and a free trip to the convention next year? Wow!

And now the cat comes out of the bag. To be Mr. P. S. A. of 1953, you have to do just one thing: get more new members than anyone else. It's as simple as that: just get more new members than anyone else.

Oh, of course there are a few little rules. Only fully paid memberships count. A member is a "new" member if a previous membership in the Society has expired one year or more prior to the date of the new membership application.

Well, now you know ALL. You have the WORD. We suggest that you start NOW to work toward this BIGGEST OF ALL PSA rewards. The race will be hard and tight later on; we have no doubt of that. Don't wait until next Spring to make YOUR start; if you do, the going may be pretty rugged, no matter how hard you work, simply because others will have started when we are recommending that YOU start: right now!

What happens to the "also rans"? Well, the Society will not leave them out in the cold, by any means. In addition to Mr. P. S. A., there'll be nine others, the nine closest runners-up, who will have a table of their own at the Banquet, who will be

Unofficially, Boris Dobro was Mr. P.S.A. of 1952, by virtue of having brought in the largest number of members this year.

Since the idea of having an official Mr.

Since the idea of having an official Mr. P.S.A. of 1953 originated at the convention in New York, all the nice things that will happen to Mr. P.S.A. of 1953 did NOT happen to Boris, but he was still the top man in new-member-getting, and all honor is due him.

introduced at the Banquet, and who will be awarded scrolls setting forth their achievements.

As soon as the ball starts rolling well, we'll publish a list of the current "Top Ten in each issue of the Journal. First such list will probably appear in the February issue. The name of the actual Mr. P. S. A. probably will be one of the big "secrets" of the 1953 Convention, but he—or she!—will know because as soon as the results are tallied and double-checked, immediately after July 1st, 1953, someone is going to get a wire from President Norris Harkness; a wire which will read something like this:

CONGRATULATIONS TO YOU, MR. P. S. A. of 19531 THE SOCIETY IS MICHTY PROUD OF YOU AND MOST APPRECIATIVE OF THE TREMENDOUS CONTRIBUTION YOU HAVE MADE TO THE GROWTH AND PRESTIGE OF PSA. THE SOCIETY INVITES YOU TO COME TO LOS ANGELES AT THE SOCIETY'S EXPENSE; A LOVELY ROOM HAS BEEN RESERVED FOR YOU, AND I SHALL BE PROUD TO HAVE YOU SEATED AT THE SPEAKERS TABLE AT THE ANNUAL BANQUET.

NORRIS HARKNESS

fore the leading line, as also the pointing beak, finger or roadsign are invalid as makers of dominance, unless the image they are pointing to is unique and isolated in the first place. If there is a single image pointing to many images, the pointing image is the dominant one.

There are many more rules of pictorial picture composition that could stand a little revision, correction and even elimination. I don't expect that this revamping and killing off of bad rules will ever happen.

Not that it matters. Picture making is everyones play or business. It does not make much difference whether you follow rules or break them, make master pieces or just snapshoot and doodle, you'll always find someone to admire your work or to thresh it into the dust. The main thing is that you should like your own work while you are doing it, having lots of fun at the same time.

Cordially yours, Nicholas Haz

Winter in Central Park

Dr. D. J. RUZICKA

Hon. FPSA, Hon. FRPS

By Boris Dobro, FPSA

AYBE CHEAT PHOTOGRAPHERS ARE BORN WITH ALL THE capacities which show up later in life. Maybe one can develop the outstanding qualities that make a great artist through hard work and training. Or maybe the real artist has the perseverance and iron will to work hard in order to bring out his inborn talents.

Dr. Ruzicka must have had an abundance of all artistic qualities in born and certainly succeeded in developing them to the highest degree.

He was born in a Bohemian village not far from Prague in 1870. His ancestors participated in religious wars, centuries ago, and the legend tells that although sparks flew when an axe hit one of those heads, hardly any damage was done to the hard skulls.

The Doctor must have inherited some of the qualities of those peasants, because he went after every goal he set for himself energetically and never took "no" for an answer when he wanted to achieve his aim. At the age of 6, Dr. Ruzicka was brought by his parents to a farm in Nebraska. There he used to go to the little white school and to work in the fields. At the age of 12 he left for New York where he studied pharmacy. After graduation he worked for several years in a pharmacy. It was at a time when pharmacist had to sleep behind the counter and answer the night emergency calls, even if the "emergency" consisted only of a nickel's worth of castor oil. Dr. Ruzicka managed to continue his studies and was graduated as M.D. in 1891.

He returned to Nebraska and took up the practice of a country doctor. Several years later he went back to New York and started practicing as obstetrician and pediatrician. He was one of the first doctors who used X-rays. Fascinated by the appearance of an image on developing his X-ray plates he was ready at this time to be lured by photography. It was not long until he owned a camera.

Two years later he was awarded a prize in a Camera Club and this was the first of the endless number of recognitions he received the world over. The first camera was a 5x7 Corona with a rapid rectilinear lens, then came the soft focus Pinkham & Smith semi-achromatic lens. It was this lens that he used to make the negatives for his splended platinum prints.

A few years later he used 6½x8½ and 8x10 cameras. The latter proved to be too heavy, too big, so he changed to a 4x5 Century camera. His first enlarger was a horizontal job, made in Chicago.

In 1911 the first 11x14's were made and exhibited. It was at this time (1908-1914) when Stieglitz was editing his Photo Era, with articles and illustrations which were very instructive and influenced the photographers of that time. Dr. Ruzicka was no exception.

His acquaintance with Stieglitz and Clarence White helped his development as a pictorial photographer in the best possible way. The publications of the distinguished German

A Dish of Fruit

photographer Heinrich Kuehne, were a great inspiration for the Doctor. He met Kuehne later during a trip to Europe where he came together with the famous group of "fathers" of photography like Zuchy, Holbber, Professor Kopitz and others in Vienna—this contact was another stimulant. Being used to the disciplines of science Dr. Ruzicka applied them to photography too. He studied systematically the effects of light and development upon a plate in order to obtain the negative that would yield a print of desired quality.

There were no reliable light meters at this time, so the Doctor started studying the actinity of light. He observed how long it takes a P.O.P.* to attain a certain tint in the bright sun, in the shade, early in the morning, late afternoon, or when the sky is overcast as well as during a rain or even during a blizzard. The knowledge of the comparative actinity of light helped to figure the right exposures and the evaluation of the reflectance range of the given scene made it easy for him to control the contrast of his negatives by shorter or longer development. He trained his eyes to evaluate exactly not only light but also the character of lighting.

He realized that the good old sun is not a constant source of light, not in strength and especially not in quality, and when this light is filtered through the hazy atmosphere it has to be evaluated in the right way in order to use it advantageous for striking effects in photography. All these difficulties were mastered by the Doctor almost in the beginning. This explains, partially at least, his rapid rise as a world famous pictorialist.

ever our younger readers, P.O.P. is printing-out paper, similar to today's proof paper.

Self Portrait

Raving overcome the technical difficulties in such an effective, thorough and logical way, Dr. Ruzicka was able to concentrate on the artistic aspects of his picture making—this is more than many photographers of the younger generation have achieved.

Those systematic observations gave the Doctor such an extraordinary feeling for lighting, and he learned his lesson so well, that he never started using a light meter, not even for color, and his color slides are as perfect as can be. However, we do not recommend this procedure for general use by all photographers.

He even destroys the myth of the short brightness range of a scene a modern color film can register. His views of lower Manhattan and Grand Canyon taken against light are unbelievably rich in shadow details, and the highlights hold beautifully. His sensitivity for light values is so great that he uses the extremes to which the given photographic material is capable with the greatest of ease.

There is no fuss about these things either when he gives his sincere explanations: "can't you see, you have to learn to use your material right and you can't help getting good results." He sincerely believes it's just as simple as that. It must be easy for him because he had the will-power to work hard until he mastered the medium, he has the gift of observation, and the capacity of logical thinking as well as the supersensitivity of a great artist.

Knowing the way Dr. Ruzicka goes about his work, I am sure he studied most of his aubjects until he found out, not only what hour of the day and what day of the year the desired effect was present but also how to capture it for the final result, how to render it with the minimum of losses on the photographic paper.

the photographic paper.

One of the Doctor's "secrets" in photography is early rising. Most of his famous pictures of Wall Street, Downtown Manhattan and Central Park were taken in the early hours of the day when the average city dweller is still sound a sleep. For some of the pictures, which not only made the tour around the world and were instrumental in establishing the great reputation of the artist, astronomical calculations were necessary. As an example, Dr. Ruzicka figured out that the sun will be in the right position for his Pennsylvania Station pictures at a certain hour on March 16th of that year, and he was right.

For those shots the Doctor used one of his "latest" cameras, a 21/4 x 31/4 folding camera with a shorter than normal lenof some unknown make which seems to be some kind of forerunner of the modern wide field lens. This camera is very thin, fits in the coat pocket without bulging it, there is no rangefinder, it has a home made paper scale instead, and an old "Kodak" type of viewfinder that has to be shielded with the hand when in use. Many of us would be lost if we would have to use this camera for an important shot, one has to get used to it, I guess. Anyway it is a priceless instrument in the hands of the master. He is working so unobtrusively with his unpretentious "Kodak" that hardly anybody is paying attention to this "ordinary"

photographer and there are never people staring at you out of his pictures, and that is exactly what he wants.

The great art of picture evaluation, the extraordinary sensitivity and capacity of evaluation of light and atmosphere enables him to take his pictures precisely at the most appropriate, fleeting moment when the desired effect can be captured at its best; an effect that will never occur again.

Last year I was privileged to observe Dr. Ruzicka at work. At a given moment, despite his 81 years, he ran down a slope covered with slippery ice plants, sure footed like a mountain lion, just to shoot a close-up of one of those California oaks he likes so much. As answers to our admonition to be careful there was one of his charming smiles that will disarm anybody. and the simple remark, "Can't you see, I could not afford to miss such a beautiful tree like this one--there are not many of them, and did you see the sunray just on the tip of it, it's gone now?" Well, we had not seen the sunray, we were only worried stiff about his taking a had spill. He just would not miss anything that will make a picture he wants, if he can help it.

To stabilize his camera he presses it against his face-he does not need to look in the viewfinder, so well does he know the acceptance angle of his lens. His sight is slightly impaired lately but his photographic vision is just as keen, just as refined as ever. Most of his black-and-white shots are taken at 1/100 or 1/50 sec. without a tripod, and the Kodachromes at a 1,25 and even 1/10 sec. without a tripod, tanding like a rock and holding his camera with an iron grip, despite a couple of missing joints on his fingers. Those had to be amputated as a result of his previous work with X-rays when the danger of burns was not known and the protective means of today had not yet been discovered.

A correction at this point is necessary, I said "without tripod", there is a substitute the Doctor uses. He has a string about six feet long in his pocket with a noose on one end of it, which is put around the camera. He steps on the other end of it and pulls during the exposure—this stabilizes the camera considerably. This string (famous by now) serves also as a "range finder" of a sort, because there are knots one foot apart and it is a very handy measuring tape for close-ups. Needless to say, the clever Doctor may occasionally use the same string to tie the little package containing his lunch when he goes along for a long hike.

This inimitable urge for self-expression keeps this outstanding man alert and young to this day and his latest pictures are just as outstanding today as they always were; there are no longer platinum prints or bromoil prints—they are chloro-bromides and Kodachromes.

Dr. Ruzicka is considered by all who know his work as "THE" pictorial photographer, one of the greatest pictorial photographers of all times. He is a man of highest artistic perceptions, an immaculate taste and great versatility. From the long forgotten Orthonon plates developed in the most modern photographic materials including Kodachromes the highest quality of Dr.

Runicka's work has not changed. His platinum prints, his bromells or gold-toned pictures on chloro-bromide paper have all the beauty, the "stamp" of the great artistic personality and talented vision of unique intensity.

Like in every case when we see highest achievement in any human endeavor there is inherent talent combined with a zest for hard work, love for the medium and endless patience. There is nothing hurried about Dr. Ruzicka's work. Every subject is studied with great thoroughness, interest, ability and love.

A good example is his "Manhattan Bridge" over which he wanted a certain kind of cloud in certain position, in combination with a certain kind of lighting. He went there every time he saw the right clouds in the sky but they just did not come in the right position, or the right arrangement. However, one day the conditions were right and his fine picture of the Manhattan Bridge was taken. What does it matter today that it took 7 years of waiting, a masterpiece is certainly worth it.

That is a typical example that shows how this master mind works, it proves his extraordinary imagination that sees the finished picture in advance a long, long time before it is actually being caught on the film and transferred to the paper. All his achievements Dr. Ruzicka has attained without having a single "secret" formula or a magic developer, his only secrets are an immense talent, vision, greatness of thought, imagination, love for photography combined with lots of patience. Dr. Ruzicka has set his standards high, yet he is capable of holding to them despite the demands created by his extraordinary versatility.

His technique is so excellent that he can render any lighting effect, any mood he is after, in the most striking way. His subjects are always not only well lit, they are surrounded with light, detached from the background. The highlights are rich and the shadows hold enough transparency to satisfy the most curious human eye.

Regardless what his subject is, little girls on the beach, boys on the pond, the mighty Manhattan Bridge or the interior of Penn Station, there is always the same warm human approach, the slight warm smile that is felt in every one of his pictures. You can feel the warmth of the sun or the chill of his snow, you can feel the great love for photography and the great hand of the artist in every piece of work he has done. His pictures have been hung all over the world wherever photographic exhibitions are held. It is hardly necessary to mention that Dr. Ruzicka has received all honors the Photographic Societies all over the world have to give.

He is the recognized Dean of Salon judges, but all the honors are only a token of the great appreciation and admiration for the great photographer who gave so much to photography and who inspired so many photographers. Lucky are those who have met this fine gentleman and artist, luckier are those who were honored by his friendship. His always kind words and his inimitable smile are like a benediction.

We all who are his friends, we all who love photography wish him many, many more happy years of picture making.

Speed The Parting Guest Speaker

By Dick Bird, FPSA

A Motion Picture Division Feature

Through the disarray of recently vacated chairs, the Guest Speaker threads his way, hastily collapsed projection screen under his arm. He steers an erratic course through the scattered chairs towards the projection table in the centre of the room.

As if to speed his departure, a mantle of darkness settles on his shoulders as the hall lights are flicked off behind him by an unseen hand.

He fumbles his projectors, films, slides and extension cords into cases; grabs up his screen, brief case, overnight bag, hat and coat, and heads for the exit.

In the vestibule, one hand on the light switch, the other held in front of his face, has eyes focused on his wrist watch, is the last member of the club to leave the hall. He has evidently been "joed" to close up the place and see that all the lights are out and the doors locked.

The G. S. plus impedimenta, maneuvers through the front door and out into the cool night. The door slams behind him and the portal tender speeds past. "Gotta catch that last bus y'know.... goo-nite." and vanishes into the darkness. The lecturer cases his six pieces of equipment down to the sidewalk and considers the situation and his immediate problem.

The meeting had been successful. The audience had shown a keen interest in his subject and its presentation. This was evident by the attention given his discourse and from the fact that so many had gathered around him after the meeting to tell him so. This informal discussion had been a pleasant exchange of enquiries, answers and comments, freely indulged in by lecturer and audience until the Club President, who had taken no part in the "post mortem" interrupted to remark; "Sorry I can't stay any longer old chap but you know how it is. Don't forget to send us your bill for your expenses," and was gone.

The departure of the officer seemed to imply that this ended the evening's activities and although several of the group appeared reluctant to "break it up" the President's attitude plainly indicated that his exit closed the discussion. The group dissolved, leaving the speaker to pack up his gear and find his way to a hotel for the night.

The visitor had spent five weary hours in a dusty day coach to attend this meeting at the invitation of the local club. He considered the unpleasant prospect of the return journey at 6:10 the next morning. No one had suggested a good hotel although club officials must have realised he could not get back to his own city before the morrow.

He buttons up his overcoat to protect himself from the drizzle of rain, gathers together his paraphernalia and moves slowly to what might be a main thoroughfare and a telephone.

Any lecturer, whether he is doing the Guest Speaker stint as a profession or be-

cause he is "hipped" on his subject and has a sincere desire to share his experience and knowledge of it with others, and is making these appearances "for free," has had such experiences as this. He thanks his gods that such thoughtless behaviour of club officers is not the rule.

The speaker whose experience is related above, tries to forget the dismal night spent in the hotel lobby, huddled among his equipment. No reservation had been made for him although he had requested this in his acceptance of the invitation to speak. He still remembers the 6:10 departure before daylight and the tiring train ride and the balance of the busy day on arrival at his own office.

With pleasure he recalls the meeting of the previous week at another nearby town. Here, he had been met at the train by a friendly club member, and, with his equipment, been whisked into a car and away to a room reserved for him at a comfortable hotel. A pleasant dinner with three other club members. The introduction before the meeting and friendly chat with officers and members. The attentive and appreciative audience. The intormal "chin-chin" afterwards and the subsequent adjournment to a nearby coffee shack to continue discussion of subjects of mutual interest, far into the night.

Everything had been thoughtfully planned to make his visit a pleasant interlude.

Writing as one who has done his share of club appearances, a Guest Speaker does not expect his club hosts to roll out the purple carpet but he does have the right to anticipate a courteous reception and some indication that his time and efforts are appreciated.

Every member of an audience is aware of the impression left with the club by their guest speakers. Do they give much thought to the opinion of the club carried away by their platform guests?

Many lecturers remember communities, not altogether by name but from the reception given them by clubs and societies previously visited.

How do Camera Clubs measure up in the esteem of their visiting speakers?

Every lecturer's memory retains vivid recollections of clubs, a return visit to which, evokes little enthusiasm. About September, he scans the itinerary for his platform season ahead.

"Let's see" he muses. "Blumphville. Return engagement. How did it go last year? Hummm, nice audience, splendid reaction. More than the usual number of people came up afterwards to tell me how they enjoyed the program. But, isn't this the place where the Program Director met me at the door of the hall and said; "Hello, you're the speaker sh? Well, they usually run the projector from up there." cocked a thumb upwards to the balcony and ambled away."

"Spent a half hour watching the audience

file in. Many curious and friendly glances as I sat alone at the projector but nobody spoke to me. Program Director introduced me to the audience. Went over nicely. Crowd faded away. Janitor closed the half clour behind me. Although the President of the Club occupied the platform with me and opened the meeting, he and I were never introduced. Often wonder who he was!"

"Pfiftown. Oh yea, Pfiftown and that lost weekend. Arrived Saturday as there was no train connection Monday. Telephoned the Club President to relieve his mind about Monday's appearance. Voice at the other end of the wire; "Oh, yeah, you're the feller who talks to us on Monday. Glad to hear you got here on time." and rang off.

Weekend activities. Saturday night, window shopped on Main Street. To keep warm, went to the picture show although I'd seen the feature before. Back to hotel and bed. Sunday, strolled around residential district. Picture show same as yesterday so returned to hotel and with blankets wrapped round me for comfort, read the daylight hours away. Note, make sure I never weekend in Pfiftown again."

He brightens up as his eyes travel down the list of engagements. "Rochesport! Good-oh! Happy to know they liked our material last season. What a nice crowd. Always have fun at Rochesport. Friendly audience, considerate hosts. Certainly make their speakers welcome. It's a pleasure to accept an invitation from that club."

Not infrequently, a speaker arrives before the time scheduled for his appearance. Oftimes, a day ahead. Some club officials let him sit all day around his hotel without giving him an opportunity to meet club members or someone in town who may have the same hobby or professional interests. Whatever his interests are, there is someone in your community who shares them. For instance, several Camera Clubs of our acquaintance, knowing our interest in nature, thoughtfully arrange for us to meet local naturalists while we are in their communities. A considerate action we much appreciate.

Those of us who appear on public platforms in North America are happy that the majority of clubs we visit, do practice the common courtesies and the happy that so characteristic of Americans and Canadians.

These words are not directed towards those gracious hosts, who, to quote a recent song hit, "do what comes naturally." Our own platform pathways across America are paved with valued friendships, made and cemented during the course of our leo ture itineraries.

There are, however, too many club officials, and in my experience it is not the club membership that is to be consured but those members who assume responsibilities that they are not fitted by temperament or experience, to perform graciously. To these individuals I direct the following questions, hoping the answers will suggest a more thoughtful attitude towards those to whom your club has extended invitations to mount your platform.

Does your clab appoint someone to welcome your guest, either at the railroad station or at his hotel to let him know his

visit is appreciated?

Is it your custom to greet the speaker on his entrance to your meeting place, offer him any assistance he needs to set up his equipment, if he uses any, introduce him to club officers and generally assure him he is among friends before he steps before your audience!

After your guest is seated on the platform, do you bring up petty club affairs liable to promote heated discussion and acrimonious debate among members? Ex-"What stain-fingered so-an-so, slopped hypo all over the club darkroom floor and failed to mop it up?" a subject always good for a half hour slanging match. often entertaining to the stranger if he didn't have to worry about cutting his lecture sequences to allow for the encroachment on the time alloted to him.

Do you delay your speaker's appearance by ringing in extra business matters, (now we've got such a good turnout, let's give 'em the works about delinquent club dues, etc.) or the introduction of other visitors, (we'd just like to take a minute to introduce old Joe Biff from the Ooffa club, everybody know's old Joe who'd like to say a few words, etc.) thus cutting in to your lecturer's time. (There is no such thing as "just a few words!")

Is the speaker introduced to your audience with dignity and courtesy? A chairman may be courteous and not stuffy. Dignified and friendly without being pompous. Humorous without being rude.

Is the person making the introduction informed beforehand of the background of the speaker? Who he is, where he comes from, what he does, his honors if any and why he is considered an authority on his subject. Or, as one recent introduction went; "Ladies and Gentlemen. I'm only pinch hitting for Joe Blow the secretary who couldn't make it tonight. Hadda take his missus to the Capitol. I gotta do the inerduction of this feller here on the platform. He says his name's Bird. I only met him a coupla minutes ago so I don't know anything about him. Guess I'll let him blow his own horn. It's all yours mister."

Are your local Guest Speakers extended the same courtesy and consideration given your out of town speakers? Even if they are well known to everyone in the club they are entitled to it, you know.

Do you allow your local speaker to creep unnoticed into the rear of the audience and sit there until the time comes for him to speak, then ca-ually announce; "Well, our old friend Bill Metol is going to give us a talk. Is Bill here? If he is, will he come to the front and give?"

Do you arrange for some qualified individual to propose a vote of thanks to the speaker following his lecture? Paid speakers do not expect this but if your lecturer is giving of his time without remuneration, this expression of appreciation from the club and its membership is his due.

Is your speaker afforded the opportunity

to meet as many of your members as he wishes? This widens his acquaintance with those who are interested in his subject and gives your members a chance to discuss it with him.

Is a note of thanks sent your guest a few days after his appearance on your platform? This gesture costs little but your speakers will appreciate it and remember your club more kindly.

If your speaker is furnished by or is a member of the staff of a Manufacturer or Distributor of Photographic materials, is he treated as considerately as your "name" speakers? I've heard of a club's officers who always chisel a dinner from one company's lecturer simply because they use his sponsor's products!

Your Guest Speaker does not expect or desire to be received like a visiting potentate. At the same time, he should not be required, among other chores, (and what lecturer hasn't?) to sweep up the debris in the hall from the last meeting; straighten the chairs, darken the windows, take tickets at the door, introduce himself from the platform, buy a dinner for the club President, or, as actually happened to the writer in one town where he had accepted an invitation to lecture, (gratis) pay the hall rent to the waiting owner of the building!

Courtesy and hospitality are as American as baseball and Senate investigations and when extended to the Speaker of the Evening, before, during and after he has been a guest of your club, will make the visitor anxious to return to give of his time and talents, and always, to recall his visit with you -his considerate host as a particularly delightful experience.

Open Letter From Johnny Appleseed

Sure was glad to learn, from the big flock of letters which came my way, that 'you folks were glad old Johnny Appleseed was back on the job.

My original job, you'll remember, was to do some pieces on photography at what the politicians call the grass-roots level. I don't mean just elementary stuff, for tyros, either; I mean articles that even a beginner could understand and profit by, yet which had enough stuff in them to act as darned good refreshers for some of those big shots in each of the Divisions.

Well, I still have that job, and I'm working right now on some pieces I think you'll like; material dealing with subjects you've written in about, You'll be seeing some of these articles right soon, now.

What I'm most anxous to talk about at this time, though, is this second job I've taken on; the job of acting as a kind of clearing house for all sorts of questions, gripes, and constructive ideas.

Why hand that job to Johnny Appleaced? Well, it's like this. I'm an old-timer in PSA. If you have a question, I'm likely to know who in PSA can give you the REST answer, no matter what your problem may be. If you have a gripe, chances are I'll know who should be told about it. and who can DO something about it. Same.

way with constructive ideas: PSA needs them, and wants them, and I can funnel them right where they'll do the most good.

Of course, if you were all old-timers in PSA, like myself, and knew your way around as I do, there wouldn't be any necessity for my taking over this job. As things stand, though, most of you are going to find it mighty handy to just drop a line to old Johnny Appleseed, and know when

you lick the stamp that you're going to get results-because I'll see to it that you do!

I don't want to boast, but I would like to say that as soon as that announcement appeared in the October Journal, I got a flock of letters, and started some action on several things that you'll hear about before long . . . BIG things that maybe wouldn't have been brought up at all if I hadn't taken on this job and made it so doggone easy for any PSAcr to make his voice heard, or get a question answered.

So, less me repeat what they said about me last month: I'm just your handy-man at lleadquarters; the symbol of PSA in action. Some people will tell you there isn't any real Johnny Appleseed, just as some people will tell you there's no such person as Uncle Sam, but remember that if there's no Uncle Sam, there's no you, and there's no me. Uncle is a symbol of all the people in this great country of ours, and Johnny Appleseed is the symbol of all the people, little and big, old and young, experienced and inexperienced, in this big and active Society of ours.

There isn't really any Johnny Appleseed? Drop me a line, if you have something on your mind, and find out.

Yours Johnny

Choose Your Paper Wisely

By John D. Fish*

Much has been written concerning methods of changing the tones of the warmer papers through the addition of various chemicals to the developer. Additional warmth is often advocated through the use of quatities of potassium bromide in the developer solution. In effect, potasium bromide acts as a restrainer and slows the effective paper speed so that with its use it is necessary to increase the exposure until development time becomes normal for the developer used. Contrary to popular belief, the warmth advantage gained by this method is slight and hardly worth the extra effort required. In fact, experimentation along this line will usually produce inconsistent results that may not be reproducible and might well cause excessive waste of developer.

The directions, either enclosed in the packages of paper or published in data books, include the developers and other processing formulas recommended by the manufacturer for the particular type of paper. Two developer formulas are usually included, the preferred, and an alternative for either warmer or colder image tones. Inasmuch as the clumps of silver grainwhich form the image are greatly influenced by development, growing larger (and colder in tone) as development proceeds, it is a good idea to insure consistently uniform result- by standardizing on these recommendations which have been thoroughly tested and approved by the paper manufacturer for his product. Slight differences in image tone may be accentuated by later chemical toning which involves conversion of the black-and-white silver image to another form having the desired color.

Image tone, paper tint

Image tone can be greatly influenced by several other factors as well as development. One of the most important of these is the tint of the paper stock. Gream-white papers appear to have greater warmth of image tone than white papers of the same emulsion type, and ivory-colored papers are extremely warm, even to the point of appearing yellow. The influence of stock on image tone is particularly noticeable when the photograph is of relatively high key with low density areas and high-lights for the stock tint (color) to show through.

Let us incorporate a word of caution at this point concerning a factor that can, and in the actual practice very often does, upset the image tone applecant. High temperatures during drying and mounting are apt to cause a phenomenon known as "plumming". In essence, high temperatures, particularly if the print is wet, cause the image tone of many papers to shift to-

Rochester Skyline

One of the colder toned papers with a white stock would be an appropriate choice for a brilliant night view of this type. Select either a glossy paper or one with a high-lustre surface, such as, Kodak's new Medalist J. It has the advantage of a relatively high gloss without the necessity of ferrotyping, and is capable of reproducing a tonal range that will give maximum detail in the shadows.

ward a colder--rather purple-blue (plum colored) - tone. Serious plumming can be avoided if drying temperatures are no higher than 150 F and mounting press and flatiron temperatures are maintained in the range of 180 to 200 F. You can observe this effect in a rather graphic demonstration. Take one of your scrap prints that has been air dried at room temperature. Cut it into five strips; keep one for a comparison, and place each of the other strips in water at 150, 180, 200, and 212 F. Blot them dry and make your own comparison!

Fixing time

Another factor too o'ten neglected is fixing time. Your prints should only be fixed for the recommended time; prolonged fixation only causes bleaching of the highlight and low density areas and robs the photograph of its warm tone. Five to ten minutes is a maximum for the warmer toned papers!

Remembering that your goal is improved print quality, and recognizing that *the appropriate tone on your photograph helps to re-create the atmosphere of the original scene, it follows that some subjects are better rendered with the blue-black papers while others are shown to best advantage on the warmer types. Choose your paper

wisely! Impersonal objects and cold subjects—such as abstract designs, glass, ice formations, snow scenes, stone, and night views—invite the neutral and blue-black papers. Many of these subjects you may wish to tone blue to enhance the feeling and emphasize the mood; but give them a try on a neutral-black paper, such as Kodabromide, and you may be convinced that the natural black-and-white tones of many of your prints give such a truthful rendering of the subject matter that chemical toning is unnecessary.

Warm-toned papers such as Kodak Opal and Ektalure C render the warmth of fleah tones so successfully that they are frequently used for portraits without additional chemical toning. In fact, Opal P with its old ivory colored stock and warm image tone can provide a truly genuine feeling of warmth and sunniness for any sunlit view. It imparts a particularly friendly atmosphere for portraits of older people. Try such a subject on it and compare it to your present paper; you may be pleasantly surprised!

Paper speeds

A discussion of paper speeds is complicated by many factors: speeds are greatly influenced by the type of enlarger or printer and by the nature of the light source used. Because paper speeds have no direct effect on the appearance of the final photograph, they have not been included within the scope of this article.

Degree of gloss

Photographic papers can be grouped into three general classifications according to their degree of gloss (sheen): (1) glossy and high-lustre, (2) lustre or semi-matte, (3) matte. The following table illustrates some of the principal combinations of surface texture and stock tint available in the various degrees of gloss:

Degree of Gloss	Surface Texture	Stock Tint
Clossy	Smooth	White
High-lustre	Smooth	White
	Fine grained	Cream-white
Semi-mette Smooth	Smooth	White and cream-white
	Fine-grained	White, cream- white, ivory
	Rough	Cream-white and ivory
Matte	Smooth	Cream-white
	Fine-grained	Cream-white
	Rough	Cream-white

Print quality

Print Quality is an important factor to consider when making a photograph, yet, it is often treated too casually. It is frequently the basis for either the success or failure of the entire photographic endeavor. In analyzing the subject, it be-

Winter Fontasy

An overall atmospheric effect has been created in "A Winter Fantasy" by subordinating all fine detail through the use of Kodak Mural Paper. The photograph conveys the mood as it existed in the original scene when the shutter was tripped. For subjects of this type, a paper with a rough textured surface, cold image tone, and a white stock provides excellent rendering.

comes evident that technical excellence and the artistic application of the "tools of the trade" are the chief contributing factors affecting print quality. A thorough understanding of the "tools" offered by photographic papers is an absolute necessity when you make your own photographic prints. Assuming a good negative—a beautiful composition or an interesting subject will be unsuccessful and lack eye appeal if presented in the wrong degree of contrast, or with insufficient attention given to the details of paper surface, stock tint, and image tone.

The purpose, then, of this article is twofold: (1) To acquaint the print maker with the wealth of sensitized photographic paper available for his use; (2) To assist him in achieving print perfection through the wise selection of photographic paper complimentary to his particular negative.

Most of us are mighty pleased when through our own skill (or luck!) we produce a negative with unusual potentialities. Due credit is usually given to our camera and quite possibly to the film—but, unfortunately, there are many photographers who fail to realize the important part photographic paper can play in the final presentation of their efforts.

Many print makers standardize their technique so completely that they use only two different surfaces of one type of photographic paper for the presentation of all subjects. Perhaps early in their photographic experience they were introduced to a paper with a glossy surface on single weight stock and a semi-matte surface on double weight stock. These may have been recommended by a fellow photographic enthusiast, or perhaps suggested by a photographic dealer, or possibly adopted as an

easy way out of what appeared to be, at this early stage, a maze of paper types.

The novice often feels that the majority of photographic papers must have been manufactured for someone else, but not for him, and so, he turns to standardization. The regrettable part of his move is that he may become complacently satisfied and remain oblivious to the wealth of material—or "tools"—available to help him achieve superior print quality.

Now, let us study the negative you wish to print and give due consideration to the final effect you wish to achieve in your photograph. First, make a mental image of how the finished picture should look in order to re-create the original scene and completely capture its atmosphere and mood. Only by doing this, and keeping that mental image before you is it possible to choose a paper that will raise your print to the outstanding class.

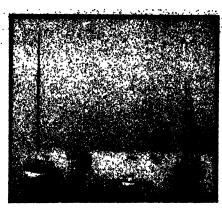

Select correct grade

Perhaps the most important factor affecting print quality is the selection of the correct grade (or contrast) of paper for each negative. Most everyone knows that a soft paper (grade 0 or 1) is used for hard or contrasty negatives; a hard paper (grade 3, 4, or 5) for flat or low contrast negatives. However, for the ultimate in print quality it is necessary to select the proper grade of paper with a great degree of accuracy. The ability to make such a selection comes as a matter of experience, usually gained through use of the trial-anderror method. It is possible to determine the exact contrast of your negative and the paper grade best suited to it through the use of a photometer or a densitometer. The techniques are somewhat involved and since few people own instruments of this type a more practical suggestion might be to consult a paper data book and review the suggested methods of determining contrast offered by the manufacturer.

Alms

Kodak Opal Paper C with its brown-black image tone was selected for this informal portrait of an ancient beggar woman. In contrast to the cold starkness of the reproduction, the subdued contrast and rich blacks of matter paper strengthens her character, while the smooth surface and creem-white stock faithfully record the weathered masonry to complete the mood of the photograph.

Out of the Mist

The cold image tone of Kodabromide G is a "natural" for this damp, foggy harbor scene. Its fine-grained texture tends to minimize the unwanted detail and produces the desired, slightly diffuse, ethereal effect. The semimatte lustre produces a luminosity in print that is almost as natural as that of the original scene.

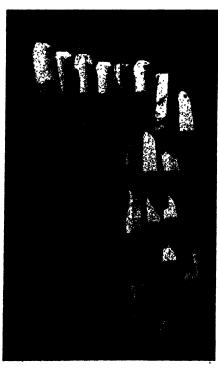

Uniform development of the negative to a normal contrast will solve many of the problems of paper grade selection, but even this procedure is not fool-proof unless the photography is done under studio conditions. The brightness range (difference between the darkest and lightest area) of any scene will vary depending upon the subjects being photographed and will affect the final paper choice. Systematic trial and careful observation remain the most practical way of determining correct paper grade.

Unfortunately, a print made on the wrong grade of paper may seem passable to the less experienced worker, until a direct comparison is made with a print on the correct grade. His contrast problem may be so subtle that the print neither appears muddy nor harsh and only by being extremely analytical in his judgment can he hope to find the flaw and correct it. It may seem to look satisfactory, but would it be improved by printing slightly darker? Or should it be lighter? Is there sufficient detail in the highlights, yet, no muddiness? Are the shadows as rich as they might be? if there is any doubt concerning this phase of your print making-Experiment Further! Only by so doing can you develop the experienced eye of an expert.

Image tone

The selection of a paper with an image tone that will compliment your subject is another very important step toward achieving fine print quality. Print tone governs the mood of the photograph to a considerable degree. It cannot be ignored, for an unwise choice of tone may create a deleterious impression in the eyes of those whom you wish to please. In speaking of image tone I am referring to the color of the silver deposit that composes the visible image on photographic paper after development. These normal or inherent image tones of the different types of photographic papers range in color from brown-black (warm) to blue-black (cold) and are largely dependent upon the size of the silver grain forming the image.

It has been reported that the average brightness range of typical outdoor scenes is about 1-to 160 and in some extreme cases exceeds a range of 1 to 1000. Now. with the matte papers capable of reproducing a tonal range of only 1 to 15 or 20, while the glossy and high-lustre papers have a range of 1 to 30, or slightly better, it is easy to see that considerable compression of tones is necessary when the print is made. It is understandable why many photographers take advantage of glossy's increased density range and use it for the majority of their work. But, the high surface sheen and great reflectivity that are responsible for the unique, quality of glossy are the chief reasons why its use should be carefully restricted to appropriate subjects. for example, it may not be desirable to use glossy papers when rendering certain types of portraits or scenes where broad or atmospheric effects are important. Brilliant subjects, such as glass, plastic, ice, snow, or those particularly rich in texture and detail that we wish to record, are best printed on smooth, glossy papers, such as Medalist F or Kodabromide F. Medalist J paper is a smooth, high-lustre material with no surface pattern to interfere with the rendition of fine detail. It gives adequately high gloss without the necessity of ferrotyping. Most people use papers of these types for pictures to be reproduced in magazines. Their white stocks

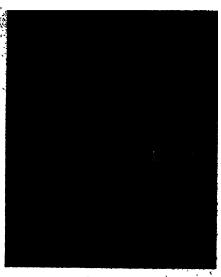

Fisherman's Window

In this pattern study of floats on a fisherman's shack the accent is on detail and texture, with a definite need for maximum tone range to hold shadow detail in the window. Pictures of this type are best presented on a glossy paper, such as Kodak Medalist F or Kodabromide F. Their smooth stocks have no surface pattern to interfere with the rendition of the fine detail. also make them ideally suited for photographs of snow and similar infillient subjects and for prints that will be toned blue.

In a large print, such as a 16 x 20, that will be viewed at some distance, subjects can be pictured on a fine-grained surface that will subdue negative grain without much loss of definition and still show as much detail as a closely viewed 8 x 10 glossy. Particularly good in this respect and for rendering somewhat warmer subjects is Kodak's Opal K. It has a creamwhite stock tint to complement its brownblack image tone and a high-lustre surface that records the shadow detail that is so often lost with the more matte papers. An increase in tone range and maximum density can be achieved to some extent on the semi-matte papers by coating the print with Kodak Print Lustre or various types of paste wax, but these results are seldom as satisfactory as those obtained by using a paper with "built in" gloss. A good point to remember is that high-key photographs usually appear to their best quality advantage on fairly smooth, high-lustre papers. Try Opal K for your high-key portrait and see if you don't agree that its brilliance and nature image warmth complements your subject.

Lustre or semi-matte surfaces have a shorter tone range than glossy, but because of their lack of harshness are considered richer and more pleasing for most subjects. The wide general acceptance of these papers is perhaps the reason why the majority of the many different types of photographic papers are manufactured with semi-matte surfaces. In the case of special papers such as Kodak Opal you will be able to find an almost unlimited choice of textures (surface roughness) having lustre or semi-matte sheen.

Cold-toned papers, such as Kodabromide and the somewhat warmer Kodak Mural R and Medalist, will help convey the feeling of coolness that exists with subjects like snow, fog, and marble. With these facts in mind, you must decide upon the specific texture and sheen that will best represent your subject. If fine detail is all important, then the choice should be glossy. If, however, the subject is a damp, foggy harbor scene, the wisest choice would be a finegrained or rough lustre surface that will tend to minimize fine detail and produce the desired slightly diffuse, ethereal effect. With emphasis on a very broad, warm, atmospheric effect-a scene of trees with distant mountains and sunlight breaking through low hanging clouds—the selection of a warm-toned, rough textured paper, such as Opal R, will best present the atmospheric effect while virtually eliminating unwanted fine detail. If a greater feeling of warmth and sunniness is desired, then Opal S with its rough textured surface and old ivory colored stock should be used. Both Opal R and Opal S are semi-matte papers that will impart a natural brillianee and warmth to any scene while tending to subordinate negative defects and fine detail. The semimatte papers are more easily spotted than the glossy papers and are less apt to catch unwanted specular reflections. Choose one of the smooth or fine-grained, semi-matte papers for your portraits of children and pretty girls and see if you don't agree

Spring Song

In this photograph the emphasis was placed on the broad effect, through the use of a rough textured paper, in an attempt to cause the observer to exclaim, "Spring is here!" Kodak Opal Paper S was selected for its rough texture and ability to subordinate fine detail, while its ivory stock increases the overall warmth of the print to impart a definite sunniness to the flowers.

that they impart a feeling that enhances the quality of your print.

Matte surfaces

Matte surfaces have a very short tone scale and tend to appear softer by subduing the over-all contrast of the print. Their surfaces are usually somewhat more delicate than the semi-matte or glossy surfaces and care must be exercised to prevent damage. The dead matte surfaces can be viewed or hung in any location without fear of annoying specular reflections. Opal W, a paper of this type, appears to strengthen the image and if properly handled, possesses a richness that will give your photograph greater impact. Its old ivory stock color, combined with image warmth and a suede surface, makes it a "natural" for portraits of older people. Its surface softens the wrinkles that come with advancing years and gives a subject of this type additional strength and dignity.

Volumes have been written by others about the subject of print quality and controversies have continued to rage over the elements upon which it is dependent. I have, in this article, added my bit in the hope that some may be convinced that the wise selection of a paper to fit the subject is important to the over-all picture of print quality. Admittedly, the correct paper will not -make a poor photograph good, but it will, most assuredly, raise a good print to the outstanding class!

Samples of photographic papers, which illustrate combinations of practically all available surfaces, image tones, and stock tints, can be seen in sample books at photographic stores. A thorough inspection of these samples, keeping your negative in mind, is a necessary supplement to the information contained herein.

Kodak Gifts The

Here, on these four pages, is something for every photographer on your Christmas list cluding you. Select your gifts at leisure, then visit your Kodak dealer...and watch Christmas take its place in everyone's album as the best ever.

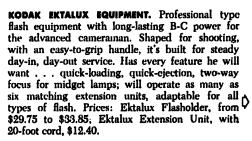

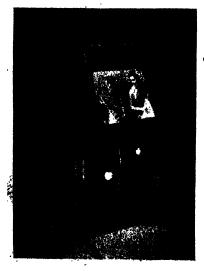

KODACRAFT PHOTO-LAB OUTFITS. A complete-inone-package gift that will open a whole new world of fun for someone you know. Kodacraft Advanced Photo-Lab (illustrated) contains everything needed for developing film and making contact prints . . . a Kodacraft Roll Film Tank with aprons, a Kodacraft Metal Printer, trays, film clips, chemicals, paper, graduate, safelight, thermometer, and instruction manual. \$14.10. Kodacraft Photo-Lab Outfit with printing frame and mask set instead of metal printer and without safelight, \$8.75.

KODAK HOBBYIST ENLARGER. Basic for a darkroom that will keep on giving for many Christmases to come. Has the most modern features for straight enlarging at a thrifty price. Circline fluorescent lamp with integrating sphere lamphouse gives cool, evenly distributed light. Positive, smooth controls; 1.4 to 7 times enlargement on baseboard. Supplied with Kodak Enlarging Ektanon Lens f/6.3, 89mm., and one negative carrier. Takes negatives to 21/4 x 31/4. Price, \$44.00.

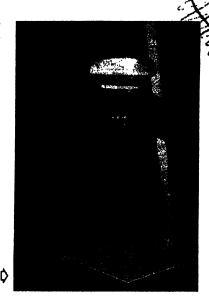

KODACRAFT PRINTING KIT. With this outfit there's no need for a darkroom for a son or daughter to start printing his or her own snapshots. Has 25 sheets Kodak Velite Paper, printing frame and mask set, 3 Tenite Rocker Trays, a graduate, a Kodak Darkroom Thermometer, a glass stirring rod, chemicals, and an instruction booklet. \$4.95.

() KODASLIDE TABLE VIEWER 4X. If there is someone on your list who makes Kodachrome slides . . . or someone who will start this Christmas . . . here is the gift. Perfect for showing 4-times enlarged slides to a small group, day or night. Does not require darkened room. Projector and Kodak Day-View Screen combined in one unit. Price, \$49.50. Carrying case, \$15.50.

KODASLIDE PROJECTORS. New Highlux III-300watt; quiet, efficient blower cooling; special slide ventilation; Lumenized double condenser and f/3,5 projection lenses; carrying case. \$56.50. Thrifty Highlux II-200-watt; f/3.5 lens. Converts readily to 300-watt, blower-cooled unit. \$36.50. Budgetpriced Kodaslide Merit Projector-150-watt-with #3.5 lens, \$26.10.

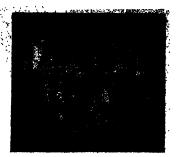

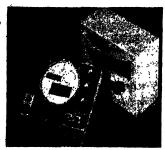

KOOSK BUAPLEX PLASH OUT-FIT. Has everything to start shooting Christmas festivities ... Kodak Duafiex II Camera with Kodet Lens, Flasholder with 2-way Flashguard, photofiash lamps, batteries, film, and instructions. Price, \$22.50. In the DeLuxe Outfit, camera has focusing Kodar f/8 lens. Also includes sturdy Field Case. Price, \$33.45. ROBAN SIGNAT 25 CAMPA.

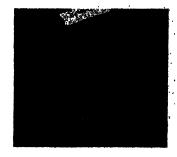

A precision miniature for one who wants the ultimate in fine color work—or black-and-white. Features the famed Kodak Ektar Lens 1/3.5 in a precision setting that insures needle-sharp pictures. Coupled range finder combined with view finder for rapid focusing and framing. Accurate 1/300 shutter. Price. \$92.50.

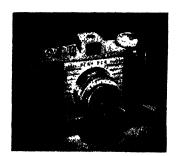

BROWNIE HAWKEYE FLASH OUTFIT. A thrifty gift for a beginner. Includes an easy-touse Brownie Hawkeye Camera, Flash Model; Flasholder with Kodak 2-Way Flashguard; 8 photoflash lamps; batteries; 2 rolls of Kodak Verichrome Film; and instructions. Price, \$13.50.

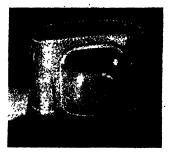

KODAK REFLEX CAMERA
ADAPTER KIT. There are a lot
of Kodak Reflex Cameras in
use. Certainly someone on
your Christmas list has one,
and would like this adapter
kit, which will permit him to
enjoy 828 Kodachrome, Kodacolor, or black-and-white film.
\$4.59.

KODAK PONY 828 CAMERA. A value-packed miniature at a moderate price. Takes black-and-white, Kodacolor, or Kodachrome Film. Has fast f/4.5 lens, and a 1/200 shutter, synchronized for flash. Focuses to 2½ feet. Brilliant view finder. Price, \$31.15. Kodak Pony 135 Camera, \$35.75.

KODAK FIELD CASES. A fine camera deserves a fine case to protect it from scuffs, from damaging blows. Each Kodak Field Case is designed for the camera it is to carry. Made of top grain cowhide, double stitched, reinforced, and perfectly finished. Prices, \$7.00 to \$11.25.

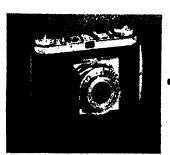

KODAK TOURIST II CAMERAS. Four Tourist cameras give you a wide choice of lenses and shutter speeds... but all give you the Tourist's big 2½ x 3½ pictures and rugged, folding Kodak construction. Both f/4.5 models feature the long-base Scopesight finder. Prices, \$26.25 to \$97.40.

KODAK TOURIST ADAPTER KIT. For someone who owns a Tourist II f/4.5, or Tourist I f/4.5 or f/6.3 Camera, a more appreciated gift would be hard to find. It converts his camera to the use of 828 films including the use of 828 films on the use of 828 films including the use of 828 films of the use of 828 films including the use of 828 films of the use of 828 films including the use of 828 films of 828 films of the use of 828 films of 82

KODAK RETINETTE CAMERA. Same styling as the Retina IIa but with a Schneider Reomar f/4.5 lens. Direct view finder. Shutter speeds from 1 second to 1/300 second. Coupled film advance, automatic stop, double exposure preyention. Nonjarring body shutter release. Takes 135 film. \$59.50.

KODAK MASTER PHOTOGUIDE. Every camera owner wants this wallet-size guide to better pictures. Includes fast-action computers for outdoor-indoor pictures... contrast-viewing filters... data on flash, close-ups, filters... and much other information that's wanted every day. \$1.75.

KODAK RETINA He CAMERA. Smart, continental styling combined with an ultrafast f/2 lens and 9-speed Synchro-Compur Shutter, for someone who takes pride in his pictures and his equipment. Combined range-and-view finder, mapid film advance, automatic stop. \$164.10.

EASTMAN KODAK COMPANY

Rochester 4, N. Y.

Prices include Federal Tax where applicable and are subject to change without notice.

kedak munik

Kodak Gifts are Perfect

KODAK FLUROLITE ENLARGER. A gift that will thrill any photographer. Cold light; rotating negative carrier and tilting platform for distortion control; big, lightight paper storage space in base. With accessories, doubles as view, copying, slide-making camera. Price, without lens, \$99.50.

KODAK MASKING EASEL. 11 x 14. Provides adjustable margins from 1/4 to 3/4 inches. Specially designed back-guide for easy, accurate insertion of paper. Masking arms designed for rapid, sure adjustment. Stand arm for convenient paper insertion. \$9.60.

KODAK ENLARGING LENSES. For someone who is satisfied with only the best in his color work or black-and-white, it will be a Kodak Enlarging Ektar Lense Both Kodak Enlarging Ektar Lenses and Kodak Enlarging Ektanon Lenses are available in 2-, 3-, and 4-inch focal lengths. \$14.00 to \$49.90.

KODAK 2-WAY SAFELAMP. Brand new in design and appropriate for any darkroom enthusiast. For bench, wall, or overhead mounting. Rotate it for light direction. Insert filters in one or two sides. Comes complete with bulb and one filter. \$4.50.

KODAK ADJUSTABLE SAPELIGHT LAMP. Professional in appearance, and puts ample safe light wherever you want it most. Has double-swiveled shank and bracket. Easily attached to wall, shelf, or bench. Comes with one 5½" diameter safelight filter. \$7.40.

KODAK CHEMICAL SCALES. With its Tenite housing and corrosion-resistant Tenite pans, here is a gift item that is both practical and smart for a darkroom worker. Obtainable with weights for either avoirdupois or metric systems. Capacity, 4 oz. 66 gr. or 130 grams. \$9.90.

KODAK ELECTRIC TIME CONTROL. For someone who makes many prints. Permits control of printing time automatically from 1 to 57 seconds. Printer or enlarger plugs into control. Turns off automatically after a preset interval. Remains on when desired for focusing. \$13.50.

RODAK TIMER. For precision timing of darkroom work up to 60 minutes. Minute and second hands; both can be quickly re-set to zero. Start-stop switch permits topping without re-setting. Swivel support permits adjustment to any easy-to-see angle. Price, \$7.20.

RODAK UTILITY FOOTSWITCH.
Permits turning the current to any darkroom equipment on or off with a touch of the foot. Pedal incorporates a safe, low-intensity neon light so that it can be easily found in the dark without fumbling. \$10.00.

KODACRAFT ROLL-FILM TANK. Comes with aprons that eliminate threading, permit easy insertion of film, wet or dry. Comes with three aprons for 620-120, 616-116, and 127 films. \$2.53. Kodacraft Miniature Roll-Film Tank has two aprons for 828 and 20- or 36-exposure 35mm. film. \$2.53.

RODAK AUTOMATIC TRAY SI-PHON. Converts an ordinary tray into an efficient print washer. Fresh water flows in at top, used water is siphoned from bottom. Designed to provide adequate circulation. Molded of gray Tenite, with no moving parts to wear out. \$4.50.

KODAK PROJECTION PRINT SCALE. A paper-saver that will be welcomed by any owner of an enlarger. Just make one exposure through the graduated scale, then read the correct printing time from the developed print. Saves time, prevents mistakes. \$1.15.

KODAK COLOR DENSITOMETER. If he is a serious darkroom worker, this is the gift for him. He'll make better black-and-white prints, without failure, and if he makes color prints, he can measure the density range of his transparencies and check his color-separation negatives easily. \$52.00.

KODAK PHOTO BLOTTER ROLL. For drying prints without curling. Prints are placed between a fine white photo blotter and a linenbacked blotter and rolled with a corrugated separator that permits full air circulation and rapid drying. Takes 60 average contact prints. \$2.88.

KODAK DARKROOM APRON.
Here is an apron that's specifically designed for darkroom use. Black plastic material keeps splashed chemicals away from clothes. Full cut for utmost protection. Has big pocket. Drip cuff at bottom catches any drops. Medium size, \$2.25; large, \$3.00.

KODAK THERMOMETERS. Accurate control of processing temperatures is one secret of successful negatives and prints. In most processes, it is critical. That is why a good, reliable darkroom thermometer is always a welcome gift to any photographer. Prices, \$.42 and up.

...and here is how to shop from your easy chair

KODAK DOUSLE PRINT ROLLER.

An inexpensive extra gift that will get lots of use. Used in ferrotyping prints, the double rollers remove the maximum amount of water. Durable metal frame forms the handle and supports the two 6-inch rubber rollers. Price, \$2.55.

KODAK FLEXICLAMP. Low-cost insurance for sharp, clear pictures unmarred by camera movement. Rugged C-clamp base attaches to fence rail, chair back or car fender. Head screws into any camera tripod socket. Double-swivel action permits adjusting camera to any angle. \$4.25.

KODAK VARI-BEAM CLAMPLIGHT. Adds immeasurably to indoor picture-taking pleasure. Padded clamp attaches to any square or tubular object. Dial adjustment on back permits full light control, from spot to floodlight. Clamplight, \$10.50. Standlight, \$16.00.

KODAK AUTO RELEASE. Just the thing to top off a photographer's stockingful of surprises. Can be used on any camera that can be equipped with a cable release; automatically trips the shutter ten seconds after it is set. Permits the photographer to get in his own pictures. \$3.86.

KODAK STANDARD FLASHOLDER. A dependable flash unit for any internally synchronized camera. New design of case is shaped for easy band holding. Incorporates new U-beam bracket with inlaid, marproof rubber grip, self-shorting extension input, heavy-duty ejector. \$8.25.

KODAK 8-C FLASHPACK. Converts Kodak Standard Flasholder (or any other unit taking 2 standard C cells) to a modern, high-energy battery-condenser outfit. Uses long-lived 22½-volt battery. Inserts into present flasholder in place of batteries. Price, without battery, \$2.95.

KODAK RIVIERA PROTECTO AL-BUM. A gift for the whole family, to keep a record of their trips, of the children's lives. Handsomely bound and protected. An upright, library-type loose-leaf volume. 12 Kodapak folders and 12 leaves. In blue, brown, or red. \$8.50.

RODASLIDE FLEXO FILE. A new and inexpensive file for color slides. Ruggedly made of fiberboard, handsomely covered 4n gray with brass catch. Holds 360 slides in Kodak Ready-Mounts, 124 2x2 glass slides, or 160 Kodak Stereo Ready-Mounts. Conveniently compartmented. \$1.25.

RODALIDE COMPARTMENT FULL. For anyone who makes frequent showings of his slides. It not only gives the slides the protection of metal, but groups them in twelve swing-out compartments for easy use. Indexed. Holds 240 Kodak Ready-Mounts or 96 2x2 glass slides. Price, \$3.94.

KODASLIDE FILE BOX. Give one or give a dozen. They'll be equally appreciated. The convenient way to store color slides in building up a library. One file holds an average showing, making for easy cataloging . . . 140 Kodak Ready-Mounts or 55 2x2 glass slides. Price, \$1.57.

KODAK COMBINATION FILTER CASE. Belongs in every kit. Of fine, durable leather, lined with felt. Holds a Kodak Adapter Ring, filter, and Kodak Lens Hood in one compartment, three filters in the other. For Series V Filters, \$4.25; Series VI, \$4.95.

KODAK POLA-SCREIN FILTER. A gift that will be enjoyed by any photographer, particularly in color work. Cuts down surface reflections; can be set to increase contrast of clouds and sky without affecting rest of picture. Series IV size, \$6.75; Series V, \$7.80; Series VI, \$8.80. Viewer, \$6.75.

kodak portra lines. Every photographer enjoys making close-up pictures of people, of flowers, of table-top set-ups... and it's so easy, and economical, with these lenses. Slip on over camera lens. Price each, 1+, 2+, or 3+, Series V, \$2.91; Series VI, \$3.46.

"THIS IS PHOTOGRAPHY." A new and revised edition of one of the most famous books on photography. Handsomely illustrated. Covers every phase of photography, from "seeing" the picture and composing it, to the mounting of the final print. Price, \$2.75.

KODAK COLOR HANDSOOK. For the man who takes his color seriously and wants to know all there is to know about it. This book gives the complete story with detailed information on all Kodak Color Films and how to use them for best results. Price. \$4.00.

EASTMAN KODAK COMPANY Rochester 4, N. Y.

Prices include Federal Tax where applicable and are subject to change without notice.

Pictorial DIGEST Division

Devoted to News of the Pictorial Division of the Photographic Society of America

Time Is The Future

As we come to the end of another year, we take time to look backward and evaluate our successes and failures, and to look forward and plan toward what we hope will be our new achievements.

All of us can look back over the year just past and see that we have gained certain goals. All of us have done things of which we are proud—have made progress toward some of the things we want.

For those who refuse to be satisfied with themselves—who achieve one goal only to set another one more difficult of accomplishment—the year ahead will provide over eight thousand hours of promise—over eight thousand hours cach of us may use to achieve the things we want for ourselves.

It is true that all men are equal in many respects. All of us are given the same amount of that precious commodity—time. And often it is the way we use or spend the time that is given us that determines whether we succed or whether we fail.

It is not always the casy tasks that take our time. Often the hard and challenging tasks are attempted first, while the easy ones are neglected.

We will always find time for the things we sincerely want to do. How many times has the closing date of a particular exhibition or the impending arrival of a portfolio spurred you on to work in your darkroom and produce pictures of which you are proud? Knowledge that work cannot be put off is always a spur toward achievement.

What can you do toward furthering your goals in 1953?

First you must choose. No one can decide which way you want to go but yourself. You must choose the goals you want to achieve. Write them down—they are easier to stick to if you do.

Then you must work. The only goals you really appreciate are the ones you really work for. And any worthwhile goal means work—hard work. Plan your time and make it work for you.

And so again we come to the end of one year and the beginning of another. It is a time of looking back and evaluating our accomplishments, and a time of planning for the future. What you do with your future is up to you.

And at the end of this year, I would offer a prayer for the future of all of you who read my words:

That your friends are many and strong and true.

That your goals are worthy of the best in you;

That your knowledge increases every week, That success is yours in all you seek;

That happiness always stays where you are— And that your, whole life shines as a guiding star.

> -STELLA JENKS, APSA Digast Editor

INTERNATIONAL CLUB PRINT COMPETITION

Dr. Grant M. Haist, Associate Editor
After your camera club's print chairman
has selected and hopefully mailed the club's
entry to the designated judging point, you
have only to wait impatently for the arrival
of the judge's decisions. But the chairman
of the print judging has to supervise the
medium-sized photographic exhibition that
is needed to handle the prints when they
arrive.

As a guide, the Director furnishes this beleaguered individual, with a detailed standardized procedure of handling the judging. However, the Chairman still has the responsibility, and all the work that goes with it, from the selection of the judges to the dispatch of the last print case. And this seldom-praised individual is the one who must accept quick condemnation when one of his overworked helpers totals a score inaccurately.

The selection of three qualified judges acceptable to all the entrants is the first problem that besets the one in charge of the judging. If the scoring sheets should show that the judges differed in their opinions, then the lack of judging uniformity will become a point of contention with print makers everywhere. And if the judges should agree completely on the majority of the entries, the suspicion will arise that the jury was dominated by one of the jury members.

The procedures for the judging chairman state simply, "You select three qualified judges. They cannot be members of any camera club actively competing in either class of the Competition. The judges selected should be qualified to judge a photographic competition, having had previous print judging experience, if possible." The judging chairman must then select the judges that he feels best meet these qualifications. The requirement that the judges have a knowledge of the photographic process is necessary since the technical quality of the prints is one of the points of consideration in the scoring of the entries.

After the prints reach the judging point, they are handled in much the same manner as prints submitted to international photographic exhibitions. No differentiation is made between Class A and Class B prints. Both groups are mixed and judged as if only one class existed. Prize winners and honorable mentions are selected without regard to any camera club classification. In fact, the prints are usually only identified by a print number, so even the print handlers don't know the print maker's camera club affiliation.

Only after the judging is over, the results are tabulated, and the separation is then made into the Class A and Class B groups. The print winning first prize has been judged to be the best print of the entire

Second International Club Print Competition

Closing date for the second International Club Print Competition is December 20. Four prints from your club may be sent to Mr. Robert V. George, Baltimore Camera Club, 7320 Yorktowne Drive, Towson 4, Maryland.

Entry forms for your club may be secured from Dr. Grant M. Haist, Director of this activity, whose address appears in the masthead of this section.

250 prints submitted.

The judging session must be held within 7 days after the deadline for the entries. Usually, this session is a regular meeting for the host camera club members and open to all others who might be interested. It begins early—about 6:30—and lasts late—at least 11:30. The judges not only have to score each print but also have to indicate possible print improvements.

Some host clubs have had the judges indicate their suggestions on scoring sheets at the time of judging while other clubs have tape recorded the comments, then transcribe the remarks to the scoring sheets. In either case, this procedure repeated for 250 times means a full and tiring evening for all concerned. But everyone present has benefitted by observing the best prints made by camera clubs throughout the world.

Next month there will be a report on the October judging held at the Baltimore Camera Club under the supervision of Judging Chairman, Robert V. "Bob" George. Bob has also promised to send along a complete description of the efficient judging procedure that will be used for the first four competitions.

A. LYNNE PASCHALL, Associate Editor

This is the month that Edgar Allen Poe referred to as "the bleak December". He was feeling mighty blue at that time and uttered a slander against a season of the year that is often bright and sunny. But let's give him credit for one thing; he set down his mood so vividly that it has lived on through the ages. Would that a few of us amateur photographers could do as well!

And while we are on the subject of Poe, I have a confession to make. When the

P. S. A. Convention was held in Baltimore a few years ago, I learned that the famous post was buried just a few blocks from the Lord Baltimore Hotel, and hastened down there with my camera to take a picture. Can you imagine anything dumber than that? Trying to record the greatness of a man by photographing his tombstone! A senseless lump of granite cut to form by an artist of another craft, and something that the Poet never even saw! It would have been a far greater tribute had I put "The Bleak December" into a photograph, but I haven't succeeded in doing that to my satisfaction as yet and the best I have to offer is a little parody on the immortal poem that I penned about that time and give you here.

THE RAVING

Once upon a midnight dreary,
While I pondered, weak and weary,
Over many a strange and earie
Bottle of concocted dope,
Suddenly—without a warning—
From a shelf there fluttered downward,
A priceless print, just made that morning,
On a breeze, to blast my hope.
And while my brain was almost bursting
With a surge of silent wrath,
This errant picture gently settled
In a tray of fixing bath.

Croaked the Raven in his tones both sad and sour:

"You must wash that print again, another hour!"

When December rolls around, it matters little what the weather turns out to be. Fair or foul, chill or temperate, it's bound to be a busy time. What with Christmas cards, and Christmas parties, and special decorations, a body scarcely has time to make that print promised Aunt Louise, let alone prepare a program for the Camera Club. So if that duty is yours, you will need help and right away!

American Exhibits

We haven't heard from Fred Fix lately and that probably means that the American Exhibits are all booked up for some time ahead, but it might pay to write him anyway, for you can never tell and there is no easier way of getting a program ready made.

Print Instruction Sets

Another feature that makes its own program is the Instruction Set. This is something new which may be of interest to your club. Each set is a one-man show and many of the prints have exhibition records. With the set are comments by recognized salon judges.

Write to Dr. John R. Anderson about the prospects of getting one of these.

Portfolio of Portfolios

These are collections made up from composite copies of many of the American and International Portfolios that have traveled in the United States and abroad. In them may be found the work of many of the world's great photographers.

If your club would like to have a set, all you have to do is send your request to James T. Johnson, Director of this activity, and he will see that you are put on a schedule at the earliest possible date. There are four sets traveling over the United States at this time and one of them can be routed

to you.

Jim adds, "A lot of new material has been added to the sets and I have a promise of one of the STAR EXHIBITORS portfolios to be added, and also one of Fred Calvert's PORTRAIT PORTFOLIOS. These are to be routed to me in the near future."

Camera Club Print Circuits

A print circuit will make a nice program for an early spring meeting. Members have a way of bringing in their best work early in the season and you should have no trouble now in finding the three prints required of your club.

George Munz writes that the latest circuit to take the road represents the follow-

ing clubs:

Camera Club of Atlantic City, Atlantic City, N. J.; Central Florida (PSA) Camera Club, St. Petersburg, Fla.; Jackson Photographic Society, Jackson, Miss.; Sante Fe Camera Club, Sante Fe, N. M.; Hollywood Camera Club, Hollywood, Calif.; Snake River Camera Club, Gooding, Idaho; San Luis Valley Camera Club Monte Vista, Colo.; Camera Art Club, Grand Rapids, Mich.

The commentator for this circuit is Dr. William F. Small of Newburgh, N. Y.

Judging Service

Any club wishing Print Judging Service can get full details and prompt attention by writing to Fred Bauer.

We quote the following from a letter recrived by Mr. Bauer from the Marietta Photographic Society:

"Just a note to let you know how our exhibit came out and how we appreciated the judging service. The entire service is very helpful to any photographer and all clubs belonging to PSA should certainly take advantage of this judging service that the Pictorial Division is offering."

Portfolian Clubs

The Portfolian Club idea has been spreading over the country and makes an interesting side activity for a large club. In small places where no camera club now exists but there are a number of PSA members it offers an excellent way of getting a club organized.

Sten Anderson will have some literature on the subject for you.

GEORGE GREEN, Associate Editor

Award of Merit

Those who have become Star Exhibitors since our last listing, and those who have advanced in their Star Exhibitor Ratings are as follows:

New One Star Exhibitors
Susan Sherman, Brooklyn, New York
Manuel Ampudia, Mexico, D. F., Mexico
N. P. Ochotta, Edmonton, Alberta, Canada
New Two Star Exhibitor

Advanced from Two to Three Star Robert V. George, Towson, Maryland Advanced from Three to Four Star Jose Oiticica Filho, APSA, Rio de Janeiro, Brazil.

The requirements for the various degrees of this award are:

One Star: 6 print 30 total acceptances. Two Star: 16 prints 80 total acceptances Three Star: 32 prints-160 total acceptances Four Star: 64 prints-320 total acceptances Five Star: 128 prints -640 total acceptances

These awards are retroactive and are available to those who submit proof of their accomplishments to Glenn E. Dahlby. Director of this activity.

Salon Labels

PICTORIAL DIVISION

THE PHOFOGRAPHIC WALLEY OF AMERICA

Reprinted above is a reduced copy of the label available to Pictorial Division members for use on their exhibition prints. These 44" x 51/2" labels are available from Miss Stella Jenks, APSA, 1846 Kenny Road, Columbus 12, Ohio. A three-cent stamp will bring you fifteen of these labels. Send for your supply now.

V. E. SHIMANSKI, Associate Editor

International Exhibits for November During my grade school days I found geography a very fascinating subject. I remember distinctly that it was a large book, and proved to be an excellent shield when one wished to hide from the teacher's

searching eye.

I also remember that the maps were nicely colored in yellow, green and pink. Australia was a beautiful shade of pink, and my geography said that it was a flat, barren country devoted mainly to the raising of sheep.

Well that is what I thought until I saw the Australian Print exhibits. The country may be a bit barren and flat, but you should see what the pictorialists have done with it. Their landscape prints are beautiful.

So if you feel that your particular locale is without pictorial possibility, may we suggest that you write us for one of the Australian Print Exhibits, and see what can be done with a really tough subject matter.

We are also happy to announce that through the courtesy and effort of Mr. Paul Linwood Gittings we are now able to present to the PSA affiliate camera clubs an outstanding print exhibit by Mr. George J. Hughes, FRPS, of Scotland.

Mr. Gittings gives an excellent description of this exhibit in his letter and we shall take the liberty to quote his words.

"I was so impressed with this collection that I asked Mr. Hughes whether he would be interested in having me send it to the P. S. A.—This man is versatile and has an extremely interesting one-man collection. While he is primarily a portrait photographer, most of the works are pictorial, genre and landscapes, with some extremely interesting reproductions of art galleries and various statuary. I am sure this show would be well received by P. S. A. clubs.

Since we are permitted to retain this show for only eight months we are anxious to book it in a well planned manner, so that it may be enjoyed by as many clubs as possible. We suggest, therefore, that you write us at once giving us three or four acceptable dates. When writing please advise whether the show is to be used for exhibition to the public or mainly for a brief showing to the club membership,

C. "JERRY" DERBES, Director

Here is a beautiful picture by Mr. Wellington Lee, APSA, titled "Beauty in Spring". The negative is 5" x 7" in eize and a special group of the first 15 applicants whose enlargers will accommodate this size negative will be formed to print from it.

Mr. Lee, who will act as Master of the Group, will also award a medal in addition to the beautiful salon print from this negative to the person making the best print. In addition, he will award four Honorable Mention ribbors.

The Salon Workshop has many fine negatives from which the Masters have made prints which have hung in International Salons all over the world. We have snowscapes, landscapes, mood pictures, still lifes, abstracts, character studies and nudes. We have negatives from 2¼" x 2¼" to 5" x 7"

and all sizes in between.

Groups of 15 members each are being formed right along in three different classes. In order to keep it on a fair basis, groups are formed of members who have never had a print accepted in an International Salon, those who have had not more than two prints accepted and those who have had not more than six different prints accepted in International Salons.

What a wonderful way to improve your photography. After each person has printed from the negative, the prints are sent to the Master who made the original negative. He will comment on each print and select the winner of a beautiful salon print. The fifteen 11" x 14" prints, plus one of like size made by the Master will then make a second circuit so each member may compare his picture with that of the Master and with the other 14 prints in the group.

Included in the negative box is an article titled "How to Make a Salon Print". This article was written by one of the most prolific salon exhibitors of all time and a past master of salon prints. By reading it and applying its principles, one should, with practice, be able to improve his picture making, his composition and actual selection of what material will make a suitable salon subject.

If you are interested in improving your photography and learning to make better pictures, the Salon Workshop will lead the way and help you to make better pictures. A number of groups have already been formed. New groups are being formed now.

The well known salon exhibitors who have agreed to act as Masters of the groups are men and women, who although busy in their private affairs and individual salon exhibiting, as well as performing other valuable services for PSA, are giving freely of their time, advice and money in this new activity. I am proud and grateful to each of them and want you to know who they

Mr. John F. Barnes, Los Gatos, Calif. Mr. M. M. Deadrick, APSA, Carpinteria, Calif. Mr. J. M. Endres, APSA, Jackson, Miss. Major C. E. Emery, APSA, Annapolis, Md. Dr. R. F. Edgerton, APSA, Rochester,

Dr. Carrol C. Turner, APSA, Memphis, Tenn. Mr. S. P. Wright, APSA, Springfield, Ill. Mr. H. W. Wagner, FPSA, Worcester, Mass.

Anyone wishing to join The Salon Workshop may secure an application blank by writing the Director whose name and address appears in the masthead at the beginning of the Digest.

STANLEY D. SOHL, Associate Editor

It's December again and time for sincere greetings and best wishes for a Merry Christmas and a Happy New Year. May the new year bring to you all which is good, profitable and exciting.

I know it's almost too late to send out some International Christmas card greetings to some of your friends of other lands, but if it's possible, why not send out a few even at this late date? If you haven't started an International exchange of Christmas cards yet—start right now. You'll find it more fun and real satisfying to receive a card from, say, New Zealand, Germany, Costa Rica or some other country.

Another thing that would be nice if you know of some P. S. A. member who is not an international portfolio participant—why not send him a one year membership in some portfolio as your Christmas greeting? It would be a greeting that will grow as the months go by. As logg as we're talking gifts—why not give your wife or thusband a P. S. A. membership for this year? Good idea, because who knows, you may gain a partner in your hobby!

An Ambassador is Appointed

I'd like to quote part of a letter received by Sten Anderson, APSA, from Juan Ulises Garcia, of the Dominican Republic.

"When the Special September issue of the PSA Journal came to my desk today, I felt the happiest man in the world. I had the opportunity to read, on page 542, the praise that your outstanding work to promote the best 'friendship between The United States and the Dominican Republic has been appreciated in its real value. Even having your body not at well as we wish your coorage is an example of consecretion and valor to win that cruel battle that life is, to offer your cooperation in the organization of our Pertfolio, our Club and our work.

"I have been commissioned to communicate to you your appointment as our 'Ambassador of Good Will' among the Photographers of the United States of America, wishing you, at the same time, the best possible health, and a complete success in your mission of friendship."

Congratulations to all concerned.

New Years Resolutions for 1953

First let us resolve to be ready when our International Portfolio is due to arrive. Second let's resolve to "help" our portfolio secretaries as best we can by keeping the portfolios rolling, keep the note book up to date, etc., and thirdly let's all resolve to be "Ambassadors of Good Will" with international understanding between photographers of all lands.

Col. Charles (Joe) Perry, the director of the International Program, all the Secretaries and myself, wish for you the best in photography for 1953.

MISS EVELYN ROBBINS, Associate Editor

Chirps From The Robbins

It has been several months since we have had an article from the Portfolio Notebooks. Perhaps it has just slipped your mind, but may I put a bit of a reminder here:

Fellow Portfolio Secretaries, and fellow Portfolio members, don't forget that we are constantly looking for things from the notebooks that you find interesting, and think might interest other Portfolioists.

Send along your suggestions of items pertaining to the PSA American Portfolios, as follows: Evelyn M. Robbins, 2417 South 11th St., Springfield, Illinois. They will be very much appreciated.

"STAR DUST"

A monthly column devoted to the "Wit and Wisdom" of the Stars as taken from Note Books in the Star Exhibitor Portfolios.

By ROY E. LINDAHL, Gen. Sec'y Star Exhibitor Portfolios

"When is a snap-shot Pictorial?" When you take it from the right place at the right time with the right film and filler combination to meet the conditions. Add to this the right lens stop and exposure, the proper development to produce a workable negative,

and thesias of the subject phits the proper to extende the subject phits the proper distribution of tones to place the emphasis where it belongs. Does this sound like a tough assignment? You may rest assured that it is—the odds are about as great as placing first in a national photo contest,

"When is my Pictorial just a anapshet?"
This is easy—as easy as falling of a log!
When you FAILED on any one or more of
the above requirements, when you didn't
crop your picture to include the best part
only, and when your subject matter proves
to be devoid of interest. Did I hear you
say, "I wonder how many he has like this?"
I'll say more than you unless you have
exposed a great many negatives!

"What is a Pictorial picture anyway?" If you are still with me, let me suggest that it is the product of a mental process of perception and planning. Pictorialism is a serious business and requires a great deal more than just a light hearted approach. Those of you who were fortunate enough to have heard Mr. Fassbender's lecture at the Convention last August will recall that he said "not more than three or four good Pictorials can be produced in a year by the worker with an average amount of time at his disposal."

There is no mystery surrounding Pictorialism that cannot be solved by reading, contemplation and practice and, with this in mind, you may find that you can answer your own question as to "why is my pictorial just a snap-shot". Think for a moment before you submit or before you fillout the "Aims and Intentions" space on the print folder. Are you sure it isn't just a snap-shot? Did it receive careful consideration previous to exposure such as some thought as to why you were making it, what you were trying to say with it and what would be the most suitable title for it-or is it one of those pictures that fall in the category of a "grab-shot" which you thought "I'll give it some kind of a title after I see how it prints up."

Remember, what you say in your picture, in your remarks on the print folder, and what you write in the notebook are all your commentator has to work with generally, and careful evaluation of these things may point the way to an explanation as to why some of the commentary seemed incomplete or inconsiderate and thereby responsible for your loss of interest.

Two things that contribute greatly to pictorial weakness are choice of lighting and choice of camera position. Lighting is possibly the most important step beyond the basic factors of equipment manipulation. It has been well said a photographer must learn to think in 'light terms'. The artistic skill of the photographer can be brought to life and he can find his own interpretation for any subject if he will study the values of light and their relation to the gray scale. The composition and mood of a picture can be changed entirely by simply choosing varying light and sky conditions in an outdoor picture, and choice of type and position of lighting units when working indoors.

Camera position is equally important—your picture is there for the taking—do you just take it, or do you try to take just the best part of it? View it from as many

positions as you can making exposures from several for future study and comparison so you can get the feel of composition. You have to decide which is the best part and you must base your decision around the theme or motif of the picture. It is not easy, even when armed with experience, to immediately recognize the real center of interest-it requires practice and perseverance, and for some many trials and errors, before we really get the feel of this phase of our endeavor.

There is yet another weakness which seems to prevail in many of the pictures submitted in the portfolios, and we will try and cover it at length in the column for next month.

Comments By Commentators

(Cont. from November issue)

Through all our frustrated attempts we cannot escape the pressures of our subconscious questions-half hidden, yet not clear enough for the complete answer. What is it that, taking a common sheet of paper capable of resolving a limited number of tones, and by the use of just those few tones, creates a photograph that will hit us between the eyes?

We can expose a sheet of paper to light under controlled conditions and produce a series of greys from black to white in quite a number of steps. As we look at those greys, we do not feel the same effective potentials of quality as we experience from a good photograph. On the other hand, when we attempt to utilize those grays in a print of our own, the results are less attractive than they were in the scale itself. Why? We realize that other deficiencies exist. There is the question of composition, arrangement and design. There is the question of a poorly selected subject matter.

There are other things as well, but the main topic of discussion among all photographers-that gigantic obsession of all of us-is that elusive print quality. We feel that once we have licked the problems of print quality, all other factors will fall in line. That is not entirely true.

In some cases a very poor subject photographed with poor composition will be helped tremendously through print quality. To do this requires technical experience, but it also requires fundamental knowledge and understanding of all the other elements that make for a good picture. It is the understanding of those other elements that produces quality.

Once the print quality factor becomes less difficult, the others will become easier to conquer; not because they must fall in line naturally, but because the mind tends to be less contaminated with the worry and obstructions that have hindered it to think freely. When one problem becomes licked, the other problems are easier to attack.

Realizing this for some time, I have attempted to readjust the beginner's attitude about print quality, then slowly fill in the missing pieces of his mental thinking with basic compositional elements. It is necessary to attribute as much emotional sensitivity towards those tonal elements that resolve the subject matter in our pictures as we apply to the story that the images try to portray.

All the values of the grey scale are alive. and flexible. They are pliable and plastic strengths of influences that transmit a particular reaction of light to our senses. The greys can be molded and twisted. stretched and compressed, and shaped into forms that we call images.

The greys are not merely static photographic deposits with a name; they are more than a sensitometric result on paper because of a given printing and development time. This particular grey is not just a grey as compared with another. The greys are not merely steps from black to white and back again, but they are emotional symbols in terms of light and percentages of light, and percentages of impact. They constitute not only the size, shape and form of our picture subjects, but they also give the subjects vibrancy of emotional ap-

You might say that you have used the scale of tones to the best advantage, but have you? Would anyone dare to contend that any good print could not be printed any better? It is interesting to note that the more one knows about print quality the more it is realized that only the surface of the total attitudes have been scratched.

This realization is the wonderful and fascinating aspect of a sheet of photographic paper. Beginning with an apparently blank white surface, the silver deposits through development can be made to fluctuate in an unlimited variation of tone combinations.

As the photographer removes the sheet of sensitive paper from the light-tight envelope, he has at his fingertips a means for resolving a masterpiece of tonal pattern. That the sheet of paper is an accepted and standard medium for making a print goes without saying, but I doubt that we have taken a bit of our time to think of that sheet of paper in any other way except for its practical purpose. I sometimes feel inferior when confronted with that sheet of paper.

That paper emulsion has the ability to yield a powerful influence of attraction, not only in terms of tones and gradations, but also in design and composition; coupled with the technical necessities it can tell a powerful story as well. As I think of that sheet of paper, I sense a challenge that has no material substance that one can grasp except that which is in my own mind; and l often wonder if I can be worthy of that

This is not defeatism, it is wonder and respect for a physical constituent that has the possibilities for a wonderful picture, yet as we think of that further we realize that the sheet of paper cannot create unless we control the creation, and thereby we have revealed the clue to ultimate results.

In the beginning we are prone to allow the photographic process to do most of the work for us. We adhere to all regulations and rules of operation. Our prints achieve a certain degree of perfection, and then suddenly we sense that the quality obtained will resolve itself into nothing better unless we help the manipulations along.

If we could realize that fact at an early stage of our experience, we could progress faster and produce better prints as we practice: but in many cases we hope that the process will continue to better our work without any effort on our part. This is a fallacy.

化正规 医二氏试验 囊毒性

The photographic process once learned, and the technical variables finally under control, will not demand the individual's onw sense of judgment, too, before the photographer can admit that he is on a road towards the perfection of his dreams.

The more I think of those things, the more convinced I am that we have overlooked just those elements that we are searching for in the first place. It is true that print quality will not solve the problems of tone quality. In the absence of all ability, good meticulous darkroom technique will certainly be unable to compensate for the deficiencies of other requisites.

What is ultimately required is the broad point of view and general knowledge of all the connecting links of thought and application to the photographic field. That much knowledge seems an impossibility.

Thorough knowledge certainly is impossible for any one man to consumate, but general knowledge plus the understanding that as a human being, one's photography will only be as good as his personality is allowed to fuse with his pictures, is definitely a possibility.

In order to accomplish recognizable strides towards the right direction I believe that we must consider all the individualistic behaviorisms, thoughts and philosophies that establish ourselves as apart from other individuals. We must learn to sense that the influences of our emotional nature will contribute to the photograph we are making. We must accept the fact that the pattern of our mental attitudes have left their mark upon that paper surface in the form of the picture we have made.

Conversely then, if we wish to maneuver the process as though we were robots, we cannot hope for better results than that produced by robots. If we wish to improve our work we must attempt to define certain established methods and see how we can stretch them to our will. Just as soon as that is done our pictures will begin to look different. It is true that they may look terrible in the beginning, yet one could be very surprised to see how many of them will really look good.

(To be continued)

AN INVITATION

This is an invitation to every PSA member to participate in the PSA American Portfolios

Enrollments are now being received in the following specialized groups:

PSA Pictorial Portfolios

PSA Portrait Portfolios PSA Ministure Portfolios

PSA Control Process Portfolios
PSA Star Exhibitor Portfolios
(For PSA Award, of Merita Winners)
PSA Neture Portfolios
PSA Photo-Journalism Portfolios

For information concerning any of the foregoing activities and for enrollment blanks, write to the Director of the PSA American Portfolios, Eldridge R. Christhilf, . Hon. PSA, APSA, Suite 406, 800 Davis Street, Evanston, Illinois.

Coming Salons Agreeing to Follow PSA Recommendations

Note: M-monochrome prints, C-color prints, T-color transparencies, SS-storeo alides, L-monochrome slides, A-sachitectural prints, S-scientific or nature prints. Entry fee is \$1.00 in each class unless otherwise specified. Recognition: The monochrome portions of salons listed have initial Pictorial Division approval. Check salon list of appropriate division for recognition of other sections.

MEXICAN (M,T) Exhibited Nov. 15 to Dec. 15 at club. Data: Club Fotografica de Mexico, San Juan de Letran 80, Mexico 1, D. F., Mexico.

SANTIAGO (M.T) Exhibited Nov. 20 to Dec. 20. Data: Foto Club de Chile, Callo Huerianos 1223, Data: Foto Clui Santiago, Chile.

Sentiago, Chile.

CUBAN (M,T) Exhibited Dec. 18 to Jan. 20 at club.
Date: Club Fotografica de Cuba, O'Reilly 366,
altos, Bavana, Cuba.

SPRINGFIELD (M,T) Exhibited Jan. 4-25 at Smith
Art Museum, Data: J. E. Pholps, G. W. V. Smith
Art Museum, Springfield S, Mass.

DES MOINES (M) Closes Dec. 8. Entry fee 32.00.
Exhibited Jan. 1-31 at Des Moines Camera Club
and at Art Center. Data: Des Moines YMCA Movie
and Camera Club, YMCA, Des Moines, Iowa.

MONTREAL (M.T) Closes Dec. 12. Exhibited Jan. 9-25 at Museum of Fine Arts. Data: Mark Stein, 4355 Hingston Ave., Montreal 28, P. Q., Canada.

SINCAPORE (M.S) Closes Jan. 9. Exhibited Feb. 7-15 in British Council Hall. Data: Singapore Art Society, Raffles Museum, Singapore 6, Straits Settlements.

Fil.MiNGTON (M.C.T) Closes Jan. 11. Exhibited Feb. 1-23 at Fine Arts Art Center. Data: Edw. A. Heisler. Jr., P.O. Box 401, Wilmington, Del.

MINNEAPOLIS (M.C) Closes Jan. 13. Entry fre \$2.00.
Enhibited Fcb. 5-22 at American Swedish Institute.
Data: Warren Anderson, 123 S. 7th St., Minne-

CIRCLE OF CONFUSION (M,T) Closes Jan. 24. Exhibited Feb. 8-22 at Whittier Art Gallery. Data:
Arthur W. Maddox, 12020 Otange St., Norwalk.

ROUBAIX (M.T) M--Closes Jan. 31; T Feb. 15. Exhibited Mar. 14-29 at Galerie Dujardin. Data: Lucion Bouchart, 32 rue Philibert-Delorme, Roubaix,

WORCESTERSHIRE (M.C.T) Closes Feb. 11. Exhibited March 7.28 at City Act Cellery. Data: C. J. Morrall, 57 The Tything, Worcester, England.

ROCHESTER (M,C,T,S,ST,SS) Closes Feb. 12. Exhibited March 6-29 at Art Gallery Data: Lowell Miller, 99 Parkwood Road, Rochester 16, N. Y.

PHILADELPIIIA (M,T) Closes Feb. 14. Exhibited Mar. 7-29 at Free Library. Data: Miss Grace E. McBryer, 5814 Cedarhurst St., Philadelphia 43, Pa.

PITTSBURGH (M.T) M closes Feb. 25; T Mar 4. Exhibited Mar. 20 to Apr. 19 at Carnegic Institute Calleries. Data: Walter R. Kneeland, 3658 Perrys-villo Ave., Pittsburgh 14, Pa.

SOLIHULL (M.C.T) Closes Mar. 5. Exhibited April 11-18 at Malvern Hall. Data: C. D. Pain, 71 Beaks Hill Rd., Kings Norton, Birmingham 30, England.

MARINE (M.T) Closes March 17. Exhibited March 22 to April 17 at Mariners Museum (Newport News) and during May at Smithsonian Institution (Wash-ington, D. C.). Data: R. A. Myers, 1609 E. War-wick Rd., Warwick, Va.

SYRACUSE (M.C.T.S.ST) Closes Apr. 20. Print fee \$1.00 and return postage. Data: Allen Ruch, 1421 Butternut St., Syracuse, N. Y. OTHER SALONS

LJUBLIANA (M) Exhibited Nov. 29 to Dec. 20.
Data: Foto in Kino-amaterska Zveza, Lepi Pot 6,
Ljubljana, Jugoslavia.

NITEROI (M.C.M Press,T) Exhibited in December at Hotel Quintandinha. Data: L. A. Plmental, Sociedade Fluminense de Fotografia, Gaixa Postal 118, Niteroi, State of Rio de Janeiro. Brazil.

LINCOLN (M,A,S,L,T) Exhibited Dec. 6 to Jan. 4 at club. Data: A. J. Hawkins, Branston, Lincoln, Eng-

VASCO DE CAMPING (M) Exhibited Dec. 1952. Data: Club Vasco de Camping, San Marcial 19, San Sebastian, Spain

JAPAN (M.T) Exhibited Jan. 15-22 at Galleries of Mitsukoshi, Tokyo; later at other Japanese cities. Data: Goro Ucno, The Asahi Shimbun Bidg., Yura-

Nucho, Tokyo, Japan.

PARIS (M.C) Exhibited Jan. 10 to 25. Data: Secretary, Sectete Francaise de Musicographie, Maison de la Chimie, 28 rue St. Dominique, Paris 7, France.

LUCKNOF (M.C,T) Closes Dec. 15. Exhibited Jan., Feb. & Mar. at Allahabad, Delhi and Lucknow.

Deta: S. H. H. Renair, 63 Yahiapur, Allahabad 3, Italia.

India.

BENGAL (M) Closes Dec. 25. Exhibited Feb. 15 to
Mar. 1. Data: B. K. Muckerjee, 24B Rindusthan
Park. Calcutta 39, India.

CHARLEROI (M) Choses Feb. 18. Data: R. Populaire,
18 Rue Destree, Charleroi, Belgium.

NOTE for SALON SEGRETARIES: Send all salos
notices to R. L. Mahou, 260 Forest Avenue, Emburst,
Illinois et carliere-possible data. You need not wait
for your printed forms; a letter will do.

PSA COLOR DIVISI

MRS. BLANCHE KOLARIK, APSA 2824 S. Central Park Ave., Chicago 23

A Practical Question

A member of the Color Division who has "never sent slides out before" asked a practical question in a recent letter. The member writes:

"I note the rules say that slides must be spotted and titled, plus name and address. I have the gum dots for spotting, but I fail to see how all the rest can be written or printed in so small a space. Must the information be actually on the slide mounting or just accompany the slide?"

Yes, the information must be on the slide. It is not practical to have the information on an accompanying list only. Having the name and address on the slide itself is very important since otherwise the identity of the slide itself and its owner could easily be lost.

The problem of getting all the information on the slide requires some thought and planning. If more than one slide is submitted to a competition or exhibition, the slides should be numbered in sequence from one to four. To economize space this number can be placed on the spotting marker. The writer selects a light colored spot, so the number will show up clearly when written with black or blue ink on the spot.

Next, the title should be brief. Three or four short words or less are best for titles. If you try to describe a slide fully with five or more long words, you are certain to have difficulty getting all the information on the slide. Remember the title is not supposed to be a full description of the picture, it is merely a phrase suggested by the picture such as "Touch of Winter",
"After the Swim", "Diamonds at Dawn", "Roots of Ice", etc.

The name and address are essential on the slide, and may require some abbreviating if the name and the address are long. It may be necessary to shorten the name by use of initials, but these should be printed clearly along with last name. The address can also be shortened considerably by use of abbreviations for "North", "South", etc., also for streets and avenues. Some color slide makers have a very small gummed label printed carrying the name and address in small type. This is usually placed in the area of the mount at top of slide when the slide is held with the thumb spot in the lower left corner. However, it can be placed in any open area on the mounting outside the picture space.

By printing the information in legible but small print, and using short titles, it is easily possible to get all essential facts on the slide itself. This can be placed on the paper mask before being covered with glass or it can be placed on the special areas set aside for the purpose on some commercial mounts. When placed on the paper masks, be sure to locate the information on the masks so that the binding tape. later placed around the cover glass will not hide any of the information. Gummed labels can be used to attach information to any available area on the cover glass. G. F. J.

Camera Club Briefs

Chicago Nature CC's International Photography Exhibition each year has circulated to slide contributors a set of representative slides duplicated from among those accepted. In the coming exhibition (February) Kodachrome copies of representative accepted prints will be made so that print makers also may see a portion of the show in their own homes,

Help we appreciated: Fine Arts CC's "News" (Marshall Ross, editor), Oakland CC's "Panoram" (Bertha Brady, editor), Chicago Color CC's "Projector" (Russel Kriete, editor), and Hawthorne CC's "News" (R. M. Rindell, editor) all remind their members of the need for slides for Color Division's hospital project.

Looking for new contest subjects for your club? Consider Berkeley CC's "matched" contest: "California Green" and "California Golden", two slides making a single entry and illustrating the seasonal contrast between Spring and Fall. (Berkeley CC "Shutter", E. Pearce, editor.)

Southgate (England) CC's "Bulletin" (D. Chambers, editor) reports that there will be no Southgate International Color Slide Exhibition in 1953.

Coming Color Exhibitions

CUBA. Dec. 18-Jan. 20, deadline Dec. 2. Four slides, \$1. Forms: Club Fotografico de Cuba. O'Reilly 366.

31. Forms: Club Potogranco de Cuba. O aculy 2000, altos, por Compostelo, La Habana, Cuba. SPRINGFIELD, Jan. 4-25, deadline Dec. 12. Four slides, \$1. Forms: John Phelps, G. W. V. Smith Art Museum, Springfield 5, Mass. WILMINGTON, Feb. 1-23, deadline Jan. 11. Four slides, \$1. (No information yet as to source of forms.)

CHICAGO NATURE (slide section), February, deadline Jan. 17. Four slides (up to 3\% x 4), \$1. (Also color prints). Forms: James Kirkland, 45 W. Monroe St., Chicago S, III.

MINNEAPOLIS, Feb. 10-13, deadline Jan. 19. Feez

elides, \$1. Forms: Warren Anderson, 123 S. 7th St., Minneapolis, Minn. WORCESTERSHIRE, Mar. 7-28, deadline Feb. 11.

Four slides, \$1. Forms: C. J. Morrall, 57 The

Tything, Worcester, England.
ROCHESTER, Mar 8-22, deadline Feb. 12. Four slide \$1. Forms: Lowell Miller, 99 Parkwood Rd., Rochoster 16, N. Y.

PHILADELPHIA, Mar. 7-29, deadline Peb. 14. Four alides, 21. Forms: Mrs. Ruth Clesy, Box 427, Tully-

town, Pa.

SOLIHULL (England), Apr. 11-18, deadline Mar. 8.

Four alides (to 3½ square), \$1. Forms: C. D. Pain,

Will Rd. Eine's Solihuli Photo. Soc., 71 Beaks Hill Rd., King's Norton, Birmingham 80, England. TURIN, May 1-15, deadline Apr. 10. Four elides, \$1.

Forme: Dr. Reneto Floravanti, Corso Re Umberto

84, Turin, Italy.
BERGEN, May 10-24, dendline Apr. 28. Four elides, \$1. Forms: George Munz, 87 Homestead PL, Berger Sald. N. J. ,*,

Weterloo Color CC's "Bulletin" (A. E. Phillips, editor) reports that the club is now well ever 100 members. Waterloo (Iowa) is not a large city; imagine the number of cities of this size throughout the U. S. in which large color camera clubs can yet be organized!

Rent Problems? Perhaps you could work out something like Bethesda-Chevy Chase CC, which presents photographic courses for the YWCA in exchange for space in the "Y" building. ("Release", KPW, editor)

8000 miles apart, two new camera club associations are being formed. Boxeman CC's "Flash" reports a Montana council in process, and Waikato CC's "Snapshots" (Irene Cooper, editor) reports steps towards a New Zealand council.

Sierra CC's "Cammagram" (R. A. Munroe, editor) lists club officers, editor and address, meeting dates and place, and PSA affiliation. We wish more bulletins would have such complete information.

The Westchester Color CC ("Bulletin", A. and J. McGrotty, editors) and the New Westminster (Canada) CC ("Reflector", Bob Young, editor) are real assets to their communities. The former includes in its constitution a specific statement of purpose "a special effort to help beginners", and the Canadian club states that "owners of box cameras are especially welcome."

Many PSA competitions, etc., are available to non-PSA members. Do you, as does N. Y. Color Slide CC, notify your members accordingly? They might appreciate such information. ("Rsinbow", Robert Hawley, editor)

Art is many-sided and many-sourced. Merced CC realizes this and in the calendar in the club paper "Birdie" (Carol Wood, editor) are included Art League meetings and Natural History Society meetings, along with the club's own meetings. Thus members are encouraged to learn more in two fields which can be very helpful to photographers. Delaware CC's bulletin records the possibility of that club's going on a hike with a sketching club.

Oklahoma CC's "Hypo Check", mimeographed, uses smusing little line drawings to illustrate various items a tiny sketch of a mailbox alongside an item about mailing in dues; etc. Variety value!

San Francisco Photochromer's "Color News (Leonarda Bockman, editor) always underlines the names of members mentioned in its columns. Emphasizes the "human interest" angle.

Elementary requirements for club bulletin editor? Allyn Thayer, retiring editor of Cleveland Photographic Society's "Thru the Darkroom Door", lists them well: "ability to write simple English, spell reasonably well, possession or access to a typewriter, and willingness to get the paper out on time once a month."

Between print and slide contests, and large numbers of participants, come of the larger clubs are finding a space problem for reporting scores in their bulletins. Shorewood CC's "Skweegee" (A. C. Klein, editor), solves by listing scores every other month. (Some clubs list only top half of scores; a few list color and bw in alternate months.)

North Shore CC's hw section invites the club's slide makers to attend hw meetings: "You will find an entirely new and thrilling experience in hw work." We believe that there are many color workers who would find print making unexpectedly satisfying.

Lincoln CC's "Test Strip" (C. A. Mohrman, editor) carries a picture of the club's new president, E. A. Grone, who also was president 20 years previously.

Chatham CC's "Out of Focus" (Ken Cucksey, editor) quotes retiring president Bill Armes' quote: "I expect to pass thru this world but once. Any good therefore that I can do, or any kindness that I can show to any fellow being, let me do it now. Let me not defer or neglect it, for I shall not pass this way again."

Some Aspects Of Color Perception In Viewing Color Prints

(Continued from previous issue)

Types of Color Match

In comparing two colors, they are commonly placed side by side and viewed under suitable illumination. Another method consists in placing them in a spectrophotometer, an instrument designed for the quantitative analysis of color. The first method is entirely visual, and is therefor exposed to all of our psychophysical reactions. The second method is strictly impartial to these reactions and reveals the true character of the color according to the constituent wave lengths.

By visual means alone, a color match can be obtained in which the component wave lengths may be different, but the effect on the visual receptor system will be such that the two colors appear the same.

The distinction between the two types of color match is of considerable importance in color photography because if it was necessary to duplicate the actual physical stimuli reaching the eye, color reproduction would be a practical impossibility.

The Sensation of Culor

We frequently use the term color in a somewhat physical sense to identify an object. The use of the term in this manner is accordingly a matter of convenience, but considering the scientific definition of light, it is not correct to ascribe color to an object, but only to the light reflected from it. In this manner, we dissociate color as a distinct physical part of the object and place it as a sensation, in the psychological realm as it should be. Strictly speaking, there is no object in nature which exhibits a single characteristic color because its appearance will vary according to a number of factors, the most important of which is the spectral quality and intensity of the illumination.

Colors are identified according to three attributes: hue, brightness, and saturation. Hue is the predominant wave length or the characteristic we ordinarily refer to as the color. By this means, we differentiate between green, red, or any other "color". We realize that a color can be light green or light red, and accordingly another term, brightness, is necessary to describe this additional quality. Brightness is independent of the hue, since we can have two colors of

the same hur but of different brightness. The third attribute is the saturation and this is a measure of the extent to which the pure color appears to be diluted with neutral gray. Thus, we may consider a brilliant, vivid, green or a dull, somber green.

Ordinarily, a normal observer will experience no difficulty in detecting hue differences, but may have considerable trouble in deciding whether two colors of the same hue differ only in brightness or whether their saturation is also different. The ability to differentiate under such circumstances is of considerable importance in viewing color prints, since an excessively deep blue sky or water area may create the impression of high saturation when the real difficulty is low brightness. This confusion is typified by the frequency with which most critics use the term bright, to describe a color which is actually highly saturated.

Adaptation Phenomena

At first thought, it might seem that if a color process was available which would yield a point for point reproduction of the subject, a more satisfactory color photograph would result. We are accordingly led to believe that this failure of modern color processes to furnish an exact color reproduction of the subject is entirely responsible for what may appear to be real color differences between the reproduction and the subject.

As a matter of fact, a color process which would apply physically perfect color reproduction of the subject would still be unable to automatically compensate for the variations in lighting conditions under which the photograph might be viewed. Accordingly, we would still feel that it is not entirely satisfactory.

This state of affairs is directly related to our visual perception of color in which various adaptation phenomena occur, thus influencing our judgment. These phenomena are broadly classified as general brightness adaptation, and general color adaptation, and both are constantly at work in the process of vision.

General Brightness Adaptation

This type of adaptation allows the visual mechanism to maintain a substantially constant value despite tremendous differences in the actual illumination level. Such an experience is encountered in going out of doors on a bright winter day. For only a brief period under the circumstances are we conscious of any considerable brightness change. Thereafter, the surroundings appear at about the same brightness as indoors.

The contraction of the iris of the eye can account for some of this effect, but only to the extent of a change in the light energy falling upon the retina of not more than 16 times. General brightness adaptation accounts for an extension beyond this ratio and allows us to see at an approximately constant illumination level so that in bright light the sensitivity decreases and in dim light it increases.

From a photographic standpoint, this has the disadvantage of creating, under low illumination levels, the impression of considerably higher values, and if we are photographing an indoor scene, under-

exposure will often result. We frequently express surprise when we estimate the exposture under such conditions and immediately compare this value with an actual meter reading.

Local Brightness Adaptation

When viewing any given scene, the eye is constantly shifting from one object to another, stopping for only a brief period at each point of interest. Accordingly, a brightness readjustment occurs locally. Ordinarily this readjustment is very rapid, but sometimes a lag occurs in recovery and we are aware of an afterimage.

Lateral Brightness Adaptation

Sensitivity changes in the area of the retina are frequently accompanied by similar changes in adjoining areas. This lateral or "sideways" type of brightness adaptation is experienced when, for example, we view the same grav patch against a series of neutral backgrounds varying from white to black. As the eve proceeds in this direction, the gray patch will appear to become progressively lighter in tone, reaching a minimum against the darknest background. This effect is explained by an increase of sensitivity in the dark areas of the image formed in the eve and the extension of this into the lighter adjoining areas. Conversely, the gray patch will appear darkest against a white background. The extent of this type of adaptation will depend to a considerable degree upon the relative areas and the position of the gray patch as compared to the background.

Color Adaptation

As with brightness adaptation, there are three main types of color adaptation which may operate simultaneously in the process of viewing color photographs.

General Color Adaptation

The power of the visual mechanism to adapt in such a way that the prevailing illumination appears colorless is called general color adaptation. Accordingly, we are seldom awars of the relatively low blue component in ordinary tungsten illumination.

Local Color Adaptation

This effect is similar to the corresponding brightness effect in that it gives rise to afterimages. In this case, however, the afterimage appears in a color complementary to that of the subject. The effect occurs primarily in connection with fairly intense colored areas. If we concentrate on a brightly illuminated red color patch for 15 to 20 seconds, then suddenly shift our gaze to a white surface, the patch will appear as a blue-green afterimage. This is because the red receptors in the visual mechanism are reduced in sensitivity by prolonged exposure to intense red. When this fixation is auddenly shifted to a white field, red is subtracted from the white of the area and a blue-green or cyan afterimage results. As the receptors recover their sensitivities, the afterimage gradually fades.

Lateral Color Adaptation

The spreading of color into adjacent retinal areas is similar to the effect induced by lateral brightness adaptation. Colorwise, the tendency is toward what appears to be an actual change in the color contrast. This type of adaptation is important in viewing color photographs because it demonstrates that the apparent color of one area may be affected by the color of surrounding areas.

Color Constancy

It appears that the most outstanding of all color effects due to the various visual phenomena is that of color constancy. The character of the radiant energy reflected from a colored surface will vary considerably, depending upon the spectral distribution characteristics of the illumination. Unfortunately, we are seldom aware of the extent to which this occurs. An extreme example of this effect can be cited by considering a piece of photographic paper viewed under the red illumination in the darkroom. Under the circumstances, we still maintain the impression that the paper is white, as if seen under daylight illumination. We seldom stop to realize that the color of an object is primarily a surface characteristic, and as such it will change according to the prevailing illumination. This effect is largely due to our tendency to remember colors and to interpret them in terms of their appearance in daylight, rather than to look at them closely.

Color films, having no such powers, will maintain strict neutrality in the matter, and they will accordingly record the scene in terms of the colors exhibited under the prevailing condition of illumination.

Viewing Color Photographs

A number of the more important factors involved in the operation of the visual mechanism have been presented rather briefly to illustrate their numerical quantity, and to indicate the complexity of any situation which involves the appraisal of color photograph, by visual methods alone.

The total number of factors which affect the visual mechanism is quite large and, conceivably, these factors can operate in various groups or all together. The posible number of combinations which may apply to a given set of circumstances is not only extensive, but it is amazing that we can see anything at all.

As has been previously pointed out, our primary efforts to correctly reproduce colored objects in monochrome are directed toward correct reproduction of luminance. When viewing these photographs, however, it appears to make little difference whether luminance has been correctly reproduced or not. We seem to be able to adjust to the circumstances of incorrect monochromatic reproduction to a far greater degree than we would willingly tolerate in viewing a similar photograph in color.

Perhaps there is a distinct feeling of achievement in translating the monochromatic photograph into a mental conception of the original subject, appropriate to any set of circumstances which we might invoke

Perhaps they offer a challenge to our mental equipment in such a way that we can assign color values to the respective monochromatic areas with a far greater degree of accuracy than could be achieved by viewing the color itself.

But in the end, perhaps the mental as- produced as white.

signment of salar to monochromatic areas may be like whetting our appetites on a succulent meal during proparation, and finally being unable to sat it.

By comparison to a black-and-white photograph, the viewing of a color photograph presents a somewhat different and far more complicated situation. Here, the spectral quality and the intensity of illumination are most important factors, and this can hardly be overemphasized.

The situation so far as transparencies are concerned is much better than that in which reflection color prints are involved, and these are usually viewed under entirely inadequate conditions. In the first place, the light intensity is far too low, and secondly, the spectral quality of the illumination ordinarily used for viewing monochromatic photographs is not appropriate for viewing reflection color prints. Furthermore, for most effective presentation, the print should be viewed in surroundings considerably darker than the illumination on the print surface. In this way, the print becomes a more or less isolated array of color, and the eye will adapt in such a way that a maximum amount of gray resulting from the unwanted absorptions of the imperfect dyes or pigments will be removed from all colors. Apart from the distractions removed by viewing the print in subdued light, the print will appear more or less in the aperture mode, and without the lateral disturbances introduced by brighter colored surroundings.

Many color workers whose experience is confined only to transparencies, appear to believe that modern color processes will yield point-for-point color reproduction of the subject. They accordingly attempt to evaluate both transparencies, and reflection color prints on the basis of this misconceived idea. As previously pointed out, exact color reproduction is a physical impossibility; and even if such physically perfect reproductions were possible, they still could not account for the variable action of the psychophysical factors involved in viewing them.

Even under ideal viewing conditions, we are unable to correctly evaluate color by visual means alone, as can easily be demonstrated by a consideration of the following circumstances If two transparencies, one correctly balanced, and the other slightly magenta, are viewed one at a time over an illuminator, most observers will be unable to tell which one is correct. After seeing the first, the other may appear lightly reddish, but careful consideration of this one will convince him that the first was slightly greenish, and that the second is now quite good. When viewed side by side, color adaptation will change to an intermediate point, and neither transparency will appear correct. The same effect holds for reflection color prints.

Finally, in viewing reflection color prints in normal surroundings but under a variety of lighting conditions, all of the visual effects operate in such a manner as to make obvious any faults which the print may have. Therefore, everything in the reproduction must be as nearly correct as possible. Flesh tones, particularly, must be correct, and whites must be correctly re-

In addition to the spectral quality of the light source, the intensity of the illumination, and preferably dark surroundings, there appears to be another important requisite in viewing reflection color prints. This is the viewing distance as related to correct perspective, since this, to some extent, controls size constancy effects. For most accurate presentation, it appears that the print should be viewed at such a distance that the angle subtended at the eye should approximate that which was originally subtended by the camera lens. This introduces a somewhat variable situation which would be difficult to define in terms of a particular viewing distance. In general, however, the viewing distance would appear to be one which is considerably closer than that ordinarily used in viewing monochrome prints of equal size.

Perhaps the entire problem of color perception as it is related to the viewing of color photographs can be most conveniently summed up by the realization that nature assumes consistency in experience, and when a stimulus turns out to be different from expectations, the difference in turn will be presumed to be persistent, and a conditioned response will arise to meet it.

To overcome this situation as it relates to the viewing and interpretation of color photographs, a more flexible attitude and a reconditioning of responses consistent with the present state of our knowledge concerning them, will most likely be of tremendous help.—W. K. RAXWORTHY, APSA

Who's Who Additions

We assume that we have received all comments in connection with the last Who's Who. Apparently there are only two corrections. These are:

D. W. Grant, Franklin, Pa., 58 slides accepted in 26 shows.

Brendan McSheehy, Kew Gardens, N. Y., 21 slides accepted in 12 shows.

Museums Feature Photography

Two museums are featuring photography in special shows now open. Opened Oct. 28 and running through March at the Museum of the City of New York is "New York Street Scenes 1852" which includes a Daguerreotype gallery complete with reception room and workrooms.

The American Museum of Photography in Philadelphia is helping celebrate the 90th year of the Photographic Society of Philadelphia with a special exhibition of prints and negatives from the Museum files plus prints from the permanent collection of the Society. This exhibition opened on Nov. 17 and will remain until Dec. 23.

Prints with famous signatures will be found in this show. Names like Langeheim, Gutekunst, Ives, Goldensky, Hinton, Schreiber, Kasebier, White and Day from the past and present greats like Hogan, Hanmpfler, Mudd, Kaden and Barrows.

Coming Nature Exhibitions

At this date your columnist has received information on three nature exhibitions coming up early in the new year 1953. There is a fourth scheduled but to date the information on this one is not at hand. We would like to make mention of this one however as it is one of the older shows and from past experience should be scheduled for February 1953. This is the Eighth Chicago International Exhibition of Nature Photograph which has consistently been scheduled for the month of February for a number of years. The deadline date is not available at this time but information may be obtained from the Nature Camera Club of Chicago, James Lee Kirkland, 45 West Monroe Street, Chicago, Ill.

The next in order is the Rochester International Salon of Photography (The Seventeenth) at Memorial Art Gallery, Rochester 7, N. Y. The deadline for this one is February 12, 1953. All communications to be directed to Lowell Miller, 99 Parkwood Road, Rochester 16, N. Y.

The next is the Fifteenth Buffalo International Exhibition of Nature Photography at Buffalo Museum of Science, Humboldt Parkway, Buffalo 11, N. Y. The deadline for this exhibition being April 15, 1953. All communications to be directed to Irene Langendorfer, Salon Secretary, 419 Riley Street, Buffalo 8, N. Y.

The next is the Tenth Syracuse International Salon of Photography at The Syracuse Museum of Fine Arts, 407 James Street, Syracuse, New York. The deadline being April 20, 1953. All communications to be directed to Allen M. Ruch, 1421 Butternut Street, Syracuse 8, N. Y.

All of these exhibitions have classifications for both prints and color slides. Regulations for dimensions of color slides varies. See entry forms for infomation. Most of these exhibitions use the master mailing list of the Nature Division so all division members should receive entry forms in the mail.

From Memphis Tennessee

Your columnist received an interesting communication from the Memphis Camera Club, over the signature of Katherine Wilkinson, the club's secretary, this past week and I think it worthy of mention in this column.

The communication relates the fact that the Memphis Camera Club co-sponsored a contest, together with the Memphis Zoological Society and the Memphis Press-Scimitar, the purpose being to gather a collection of photographs of the animals in the Overton Park Zoo. These to be exhibited in the Brooks Gallery for a given time and then published in a book of zoo animals by the Zoological Society. The letter included a whole sheaf of press clippings with pictures covering the contest

from its announcement to its conclusion.

If you could all see this dossier you could appreciate the value of this contest first to the co-sponsors, to photography, and to the community in general. Of course the fact that one of the sponsors is the local press makes for the success of the project from the beginning. The nature of the project makes it interesting to the local press because of its news value; for this reason the project will receive more than its share of publicity which means that the co-sponsors will also receive their share of publicity which will reflect very favorably on the local camera club and tend to stimulate its membership. The news items appearing from time to time about the contest will keep it before the public for its entire duration preventing a lag in interest in the contest, and in photography, more specifically nature photography in view of the subject matter. Naturally the local camera shops came in for their share of the benefits.

There was no restriction on contestants. Pictures were limited to 8x10 and there were cash prizes as well as trophies. Needless to say, the first prize was won by a member of the Nature Division, Memphis being the home of Eugenia Buxton. It couldn't happen to a nicer person.

Nature Division Election

Nature Division officers for 1953-1954 will assume office along with the District Representatives of the society on January 1, 1953. The executive committee nominated the same officers presently serving the division, to succeed themselves for the ensuing two years. As you all know these officers are: Harry R. Reich, APSA, Chairman, Willard H. Farr, APSA, Co-chairman, and Ruth F. Sage, APSA, Secretary.

An issue of Nature Notes was released in October announcing the slate and indicating that nominations might be made by petition for any and all of the offices. At this writing naturally there is no way of knowing whether or not other nominations will be received. In the event other nominations are received the ballots for an election will have been mailed out before this time and the election will be in process. If no further nominations are received by the secretary of the division, the present officers will continue serving. If other nominations were received in time for the deadline the elected officers will be notified by the secretary and will assume their office as of January 1, 1953.

Winter Buds

With winter rapidly approaching, it behooves the Nature Photographer to be seriously considering winter projects to keep his camera limbered up. The winter months can be busy and profitable ones, as there is much of interest in the woods

Medal Winners of September Nature Color Stide Contest

Irma Louise Carter

and fields to investigate. Probably some of the first subjects that come to mind are anow scenes, frost patterns, tracks in the snow and sleet-encrusted trees. However, in the absence of snow, sleet and ice, there is a wealth of photogenic material on the woods awaiting your investigation in the shape of WINTER BUDS.

The winter bud may be considered as an undeveloped shoot, and is a resting stage in the life history of the tree. In this respect it is comparable to a seed, with this important exception, that the bud belongs to this generation, while the seed belongs to the next one.

Surprising as it may seem, most of our trees in this latitude stop growing by the end of July or in early August, and spend their energies for the rest of the season in building their winter buds. For the next seven months or so, these buds remain dormant. When the leaves and flowers tumble out of the buds in spring—one of the greatest miracles of nature—little do we realize that this is merely the culmination of this preparation which began the summer belore.

If you dissect a winter bud and study the intricate structure within, you will find it a marvel of compactness and completeness. Here are skillfully packed every leaf, and sometimes flowers too, of the next summer's growth in embryonic form. These are usually carefully wrapped with overlapping scales or "bracts". The buds of Beech, Poplar, Horse Chestnut, Black Oak and Sugar Maple have more than the average number of bracts. These are arranged in either an alternate or spiral pattern, matching the formula of the leaves on the twig. Basswood and Tulip have only two bracts and Willows but one. The Sycamore bud is completely surrounded by the base of the leaf stem, like the old fashioned "snuffer" on a candle, and so is invisible until the leaf drops off. White Walnut and Bitternut Hickory have "naked" buds, with no protecting bracts. Some trees, such as Poplar and Horse Chestnut, seal the bud with a wax or resin, as if for protection against loss of moisture. Others are packed with wool or silk, as in the well known

"Pussy Willow".

Buds differ greatly in size and form, from the huge ones borne by Magnelia and Horse Chestnut down to the diminutive ones of Common Locust and Kentucky Coffee Tree, which are so small as to be almost invisible. The terminal buds of most of the Oaks are bunched in a tight cluster on the end of the twig. Ash, Box Elder,

Dunes

Al Suter

Horse Chestnut and Maple have three buds on the end of the twig, one terminal and two lateral. Catalpa buds are arranged in whorls of three, while lilac and American Bladdernut have "twin" terminal buds.

Frequently we find two different kinds of buds on the same twig, as in Elm, Cottonwood, Aspen, Blue Beech and Flowering Dogwood. In this case the larger ones contain flowers (or catkins) and the smaller ones only leaves. The terminal bud is usually larger than the lateral ones, since it necessarily contains all the essential elements for the extension of the twig.

Observing the unfolding of buds in the early spring is an exciting project. Here are some that are especially interesting. Shagbark Hickory bude expand to a considerable size before they open, and the bracts turn a beautiful peach color. When they finally unfold and expose the delicate cluster of tiny leaves within, the whole resembles an exotic flower. Many a color slide of this bud has found flavor with the judges of Nature Shows. The minaretshaped flower buds of Flowering Dogwood are enclosed in four bracts. As the bud develops, these expand and eventually produce the broad petal-like members which give the flower its beauty. In fact they steal the show entirely from the little inconspicuous greenish white florets clustered in the center, which are the true flowers. Since the buds of White Walnut have no bracts, the tiny leaves just simply begin to expand. In their early stages they resemble a cluster of tiny baby hands clasped together. The buds containing the male (staminate) catkins of Cottonwood open enough to permit the catkin to push its way out a little beyond the end of the bracts. Here it waits, often for days on end, until the conditions of sun and wind are favorable for the process of pollinating. before developing further. In this stage it is an excellent color subject. Other interesting buds to watch as they develop in early spring are Tulip Tree, Sugar Maple, Juneherry, Red Oak and Horse Chestnut.

This study of buds in early spring does not necessarily have to be conducted out in the woods, but can be done in the comfort of your home, by the technique known as "forcing" them. Bring in twigs from several different kinds of trees and put them in a jar of water. Here they will develop much as they would on the parent tree. Here is a helpful tip. Since the twig is subsisting largely on the food supply contained in its woody structure, a fairly long section of a branch will develop far-

Apple Blossoms

Paul Wolf, APSA

ther than a short one. Some of the larger buds such as Hickory, Ailanthus and Sumac are excellent subjects to study. By means of this forcing process, you may have leaves and even flowers indoors, while there is still snow outside.

A series of studies of winter buds, interspersed with a few sequences of some of them unfolding, will make a valuable addition to your nature library, and will prove to you beyond question of a doubt that Buds can be Beautiful.—WILLARD H. FARR.

Recorded Nature Lectures

As previously announced the N. D. is working on two different recorded lectures at this writing. Phil Maples who is handling the recorded lecture programs for the society advises that in his opinion the various divisions should produce not less than three such programs a year. In the opinion of the writer the Nature Division should have at least a half dozen such programs ready for release during the coming year.

There are are a number of the N. D. members who I know have the material for an interesting and informative program which would be of great value to camera clubs. If YOU have such material and are willing to work out a program, please contact the writer or the secretary of the division.

PHOTO-JOURNALISM

, William A. Price

78 Elbert St., Ramsey, N. J.

Last month we mentioned that the P-J Division is working on holding regional gettogethers in various geographical areas throughout the country from time to time and some of our plans are now beginning to jell. We hope to hold some of these meetings at the nicer hotels a short way out of town from the larger cities, for a trial at least. Saturday evenings, Dutch treat for will furnish, if requested. How about some suggestions and perhaps an invitation or two from various areas?

We would like very much to hear from the West Coast also on the subject of next year's PSA convention which is to be held in Los Angeles. The P-J Division is already making plans for its part in this

convention and we know that there are a number of on-the-spot members who are mighty well qualified to take active parts and who would be glad to work on it if we could just get to them. Bob Garland who did such a fine job this year in getting together our program, will be on the Coast early next year on a pre-convention plan-ning tour. We want names and addresses of members who can be contacted by him while he is there. If you would like to work on this or know of anyone else who would, please drop a line to the P-J Division chairman, Mr. David Eisendrath, Jr., APSA, 37 Garden Pl., Brooklyn, N. Y. He will arrange for Bob Garland to contact these people personally.

There is one other matter about which Dave Eisendrath would like to receive correspondence from members and that is suggestions about people who should be considered for PSA honors. There are unquestionably many people who have been doing outstanding work in photo-journalism and in the PSA but it is impossible for the Honors Recommendations Committee to know about all of them. Dave will welcome suggested names for investigation so that outstanding and worthy people do receive consideration for PSA honors which the P-J Division might be in a position to recommend.

PSA Recorded Lecture Program

The Recorded Lecture Program of the Pictorial Division offers the following programs for your club.

No. 1 An Analysis of Recognized Salon Prints by Ragnar Hedenvall, APSA.

No. 2. Commentary on Recognized Salon Prints by Morris Gurrie No. 3. Outdoor Photography by D. Ward Pease, FPSA

No. 4. Still Life by Ann Pilger Dewey, APSA, Hon. PSA. No. 5. New Prints for Old by Bar-

bera Green, FPSA.
SPECIAL Photography of the Nude
by P. H. Oelman, FPSA

A deposit of \$25.00 should accompany an order. A service charge is made for each Lecture. The SPECIAL costs \$10.00 and should be ordered directly from Mr. Oelman. For clubs which are members of PSA but are not affiliated with the PD the charge is \$6.50. Clubs which are affiliated with the PD will be charged \$5.00. The service charge is deducted from your deposit when lecture is returned. Clubs or groups not members of PSA will be quoted prices on request to the Director.

For Nos. 1 to 5 order from Philip B. Maples, Director, Recorded Lecture Program, 29 Spring Street, Brockport, New York.

For the SPECIAL please contact: P. H. Oelman, FPSA, 2505 Moorman Avenue, Cincinnati 6, Ohio.

PSA STEREO DIVISION

FRANK RICE, APSA

228 N. LaSalle St., Chicago 1

Beverly Hills Stereo Club

The BEVERLY HILLS STEREO-SCOPE is an attractive 6-page publication just started by the B. H. Stereo Club. In the September issue, it displayed the telegram sent Dwight Elsenhower offering a life membership in the Club and stating "MAY WE HAVE A REALIST IN THE WHITE HOUSE." Ike responded with a message of appreciation.

The club elected Nancy Olson "Three Dimensional Queen for 1952." It has a project for supplying stereo slides to a veterans' hospital, and a number of other programs including monthly contests and an anhual exhibition. For information as to membership, meeting dates, etc., address President Roy Haines, 8912 W. Pico Boulevard, Los Angeles 35.

The Interocular "Pie"

It's as easy as pie; it resembles a stingy caterer's dream. Once visualized by the stereographer, it is readily recalled. It is the triangle formed between the left eye, the subject, and the right eye. The base is $2\frac{1}{2}$ "; the height of the triangle is $8\frac{1}{4}$ ". This rule of thumb is reduced to simple terms by calling it "40 to 1."

There are sound, perhaps profound psychological reasons for the universal acceptance of the 40 to 1 formula. Since mankind first held conversation around the campfire in the cave, people have grouped themselves into discussion knots. The company in your living room is best arranged for visiting within an average distance of eight feet.

The ear picks up conversation best in that smaller group, and the eyes converge inside the smaller range most readily, so that eight feet is universally accepted as the most accommodating distance for easy communication between individuals. Thus humanity was conditioned throughout history, and so are we experienced, in our lifetime, to adjust to this flexible but closely held means; 2½" to 8'4", or 40 to 1.

The stereographer may wish to reduce a distant mountain to "conversation" dimensions; or he may wish to bring an insect specimen up to human size. He may use the 40 to 1 formula and be satisfied.

If the subject is to be a piece of jewelry or a pile of pebbles and peas, and your ienses are adapted to a 10" focus, then each shot must be spaced by ½". If the picture is to be of your favorite table-top with the center-of-interest 40" away, then 1" is the best interocular for easy and satisfying viewing later.

A standard 2½" takes a portrait best at 8'4". With the Stereo Realist which has a 2¾" base, the ideal distance for the highlight in your model's eye will be 9'3".

If a mountain across a lake is two miles away, the formula $(5280x2) \div 40 = 264$ feet or 88 yards. To measure this distance

would be a waste of energy. It is sufficient that you shoot once from the shore line, and walk about 88 yards, to the next clearing. Be sure to avoid anything in the foreground except the quietest possible water. With a stereo camera, cap the left lens for the right hand shot, and the right lens for the left hand shot; that is the order in which the others are mounted.

If you shoot too close up on a portrait, you are widening the triangles and you run the danger of stereo distortion. The effect will be that you have stretched your model's neck, and decidedly lengthened her nose. What happened, of course, is that you have widened the taking base.

With the ¼" base on a ten inch shot, your viewer gives your audience a pair of eyes only ¼" apart. Naturally he refuses to believe himself to be a Lilliput, so he says that you have admirably enlarged the bug to cat-size or more.

If you separate by 88 yards, your audience rather likes the phenomenon of viewing a mountain from Brobdignagian heights, and it flatters him; but he is forced to note that actually, you have reduced the mountain to a ten foot proposition.

Personally, the writer believes that mountains are best left in their own grandeur and remote vastness, relying upon normal perspective, haze, and parallax with foreground material to enhance their greatness. But conceivably you might need to get the 3d-dimensional record of a mountain someday, and it's a 40 to 1 bet that you now have an accurate and convenient and easily remembered method to use. Paul H. Stone.

Stereoscopic Terms and Bibliography

John A. (Jack) Norling, FPSA, is Chairman of the Stereoscopic Motion Picture Committee of the Society of Motion Picture and Television Engineers, which is working on two assignments of interests to all stereo workers.—A glossary of stereoscopic terms is in the making; it is planned that the finished job will have the approval of the American Standards Association. Also a bibliography will be prepared and published by the Committee.

Jack writes—"At first glance it might be assumed that this matter of nomenclature would be a simple thing; a mere assembly of terms that have been used. It turns out that writers on the subject have by no means used a common language."

Geometric Perspective and Plastic Relief

Differential parallax is the sole cause of the stereo effect. The aids to stereo perception, such as geometric perspective, contour interferences, color perspective, etc., give a decided impression of plastic relief.

There are two schools of thought regarding pictures where all objects lie beyond stereo infinity. One says that all stereograms should have true stereo effect and that an extended leas bese must be used when the normal base fails to provide sufficient parallax difference. The other school holds that only the normal base should be used because this base corresponds to the human optical base, both the camera and optical system have approximately the same infinity point, hence the picture appears more natural than when a wide base is used to give a stereo effect which is not apparent. to the observer at the camera position.

Personally, I lean to the latter view although it cannot be denied that some beautiful and startling effects are introduced by the use of hyper stereo.-W. C. MILLAR (From Slide Circuit Note Book).

Letter To The Editor

Dear Frank:

In your October column you had a little quip picked up at the Convention: "Whether anyone can see stereo in objects beyond 150 feet was questioned."

I've decided not to let that one pass.

There must be something wrong with my eyes because I've stood atop Reddish Knob where the nearest peak was a mile away (5280 feet) and it looked like a mountain to me. And I recall a spot in southwestern Virginia where the road runs across a flood plain. A half mile to the right is a nearly straight mountain, nearly straight that is, except that a prehistoric monster strode alongside it sharpening his claws and leaving parallel gashes for upwards of two miles. Those gashes, though only a few hundred yards (600 ft.) deep and half a mile away (2140 ft.) looked like gashes to me with my eyes only 62.5 mm apart, not 88 feet like suggested several paragraphs alx ve.

I think I could prove to you mathematically that the 150 feet is a fallacy, brought on by people who pick the wrong subjects to: unsupported stereo shots. I'll grant you tha a book at 150 feet will have little of the third dimension, but a car will, or perhaps even a human body. But since all of us have different eyes and see a little differently, for some people stereo seeing may not be possible beyond 150 feet.

Vertical stereo is toughtest, yet military observers have been trained to good stereo vision at 5000 feet. I certainly wouldn't want to fly at 150 feet over enemy country at a speed suitable for identification (50-60 miles an hour) unless I had iron pants.

This, to me; is like the old contention that a camera rangefinder with a base less than three feet long couldn't be accurate. Yet I've seen high-priced cameras with a two-inch base rangefinder that worked! And funny thing about it is, it isn't the rangefinder base that determines the accuracy of a rangefinder, it is the ability to split distant objects . . . thus the accuracy of the optics and not the length of the base is the final determining factor in rangefinder accuracy.

I promised not to butt into your column unless I had something to say, Frank, so I hope you'll forgive me this once.-db.

Don: You are always welcome to our corner. F.E.R.

Flash Guide Simplified

Here is a flash guide that has made life a bit simpler for me. The fellow (no-he is not a FPSA) who makes those mail box name plates made one from my copy that looks like this-

Of course it is merely an 88 Guide for #5's or 25's and a 44 Guide for SM's or #5B bulbs. But it is very handy stuck on the flash gun. For #5 bulbs, apply the distance in feet to the first column; read the

proper I stop from the middle column. The same method in the last two columns, gives the stop for SM bulbs. Give and take a little either way of course, to suit individual taste, size of room, subject or background, color and what-have you.

There is no law against changing the guide numbers to suit yourself. I just happen to like 44 and 88.—Walten D. GOLDSMITH.

Who's Who in Stereo Photography — 1950-1952

By Jack Stolp

With this first listing of "Who's Who in Stereo Photography", the Stereo Division joins the other PSA Divisions in recognizing the achievements of those who support our exhibitions with entries and accept-

This list is historic in its entirety. It represents the first known listing of consistent stereo exhibitors; it formalizes and culminates the first years of effort of those individuals who pioneered in guiding modern stereo photography into a foothold in the competitive world; it includes the first open international stereo slide exhibition held in this country; it includes a handful of individuals who can still say they have exhibited in the first, and every. international stereo slide exhibition held here; and it clearly locates the geographical area deserving to be called the birthplace of modern amateur stereo activity.

This initial listing covers acceptances in the first five exhibitions held from 1950

thru the 1952 PSA Exhibition. These are the 1950 Second and 1951 Third Chicago (The First Chicago was essentially an invitational show), the 1950 First and 1951 Second Milwaukee, and the 1952 First &SA

A total of two acceptances, in either one or two shows, was the minimum listing requirement. A total of 177 exhibitors met these requirements, and an additional 217 exhibitors had one acceptance each. It was interesting to note in compiling the file of all exhibitors, the relatively few known names of those who had also previously exhibited in Pictorial or Color Slide. This would indicate that the stereo group is made up largely of newcomers to exhibiting activity, and that stereo is providing pleasure to individuals previously not included in the serious amateur field. It would also indicate that many Pictorial and Color Slide workers still have a new thrill awaiting them. Also, indicative of the changing and surging status of the stereo-amateur is the fact that only five exhibitors can be counted who have exhibited in all five

Now that this first listing has brought the record up to date, it is planned that this compilation will be on a yearly basis. as are the listings of the other PSA Divi-With at least four stereo shows planned for the coming year, we hope at least to equal the total of this first cumulative list.

It is likely there may be several omissions in this first list, due to differences in names of exhibitors whom we suspect to be the same person. Until such names can be reconciled to one another, it forces a multiple listing of divided acceptances, and occasionally results in an exhibitor receiving less than full credit on his exhibiting record. We strongly urge all exhibitors to be consistent in identifying themselves on their entry forms. On any questions relating to this list, or corrections, please communicate with Jack Stolp, 282 Bellehurst Drive, Rochester 17, N. Y.

The sparkle and the soft shadow both come through on Cykora!

Enlarge your favorite snow scenes on Ansco Cykora paper, and this is what you'll discover.

The brilliant sparkle of the highlights comes through to perfection on Cykora's rich emulsion—yet at the same time the crisp separation of delicate tones of shadows on the snow is retained!

It is this rare ability to record both the brilliance and the subtle middle tone gradations of a scene that makes Cykora the choice of so many successful photographers.

You'll find Cykora at your dealer's in a good selection of surfaces and evenly spaced contrast grades. For tones of pleasing warmth, develop in Ansco Ardol. For stronger, neutral black tones, use Ansco Vividol. Both developers are laboratory packaged for your convenience.

Put your favorite negatives on Cykora . . . and see how much your enlargements gain!

ANSCO, Binghamton, N. Y. A Division of General Aniline & Film Corporation. "From Research to Reality."

REMARKS

JOHN R. HOGAN, Chairman

By ROBERT J. GOLDMAN 43 Plymouth Rd., Great Neck, L. I., N. Y.

The vocations and avocations of photographers represent an interesting cross-section of life: Maurice Lank (Los Angeles) swings the wheel of a hook-and-ladder; Eugenia Buxton (Memphis) is an accomplished concert pianist; Dr. W. R. Cramer (Memphis) is a college president; Lloyd B. Abernathy (Memphis) is a motion picture director . . . George F. Johnson (State College, Pa.) was the guest speaker at the New York Color Slide Club on October 3 and presented his program "Ventures of a Country Photographer." . . .

PSA president Norria Harkness (New York) has been in Europe enjoying a much needed rest . . . A. C. Klein (Milwaukee) is scheduled to address the Photographic Guild of Detroit on December 15, his topic "The Key to Color Concepts in Photography." . . . Eugenia Buxton (Memphis) was the guest of honor at the Great Neck (Great Neck, N. Y.) Color Camera Club on October 6 for the exhibition of the prizewinning slides from the September bimonthly International Color Slide Contest sponsored by the Color Division, PSA . . .

Ethel M. Hagen The Open Cate First Place, Class 2

George and Martha Tarplee (Rochester, N. Y.) and Dr. and Mrs. Konstantin Pestrecov (Rochester) recently gave a cocktail party in honor of Mr. and Mrs. Phil Maples (Brockport, V.)—Phil is newly elected to the Board of Directors of PSA . . . Col. Charles J. Perry (El Paso, Texas) eating corn at the Maples (Brockport, N. Y.) home, butter running out both ears-picture on request . . . Gene Chase (St. Louis, Mo.) cooking dinner there . . . Dave Stanley (Paducah, Ky.), prize-

winning (\$2000 no less) photographer of aquatic ornithologia, warns all first-time visitors to the coastal area that it takes two people to photograph sea gulls, one to take the picture-and one to hold an umbrella over the photographer's head . . . Repercussions from the convention - Mrs. Faye Minton (Canal Zone) writes rave comments about the programs.

"Pops" Whitesell is reported in Baptist Hospital, New Orleans, with a broken hip suffered in a fall in his studio.

HO CAN BE A PSA MEMBER? CAN BE A PSA SPONSOR?

SALONISTS TECHNICIANS STEREOISTS NATURALISTS JOURNALISTS MOVIE MAKERS COLOR ENTHUSIASTS

YOU . . . you can be a PSA member if you have a genuine interest in photography . . . no matter what your degree of skill . . . no matter what your own photographic interest . . . You can be a member by filling out the application on the next page. One Division membership is included free, each additional Division is \$1.00.

YOU, if now a member, can sponsor your friends . . . if not a member, you can become a sponsor as soon as your application is accepted.

If you have no sponsor, the Membership Committee will pass on your application.

NEW MEMBERS

September, 1952

(Still some CMC's, members joining at the New York Convention, plus a jew who joined because of the San Diego PSA Town Meeting, marked "San Diego". Your signature on the application overless, handed to a good prospect will get your name in the aponeor column.)

How a Good Paper Grows

Photo technicians like to chart "response curves" for photographic papers. But here's a curve you've never seen before.

It's the "popularity curve" for Kodak Medalist Paper, based on the first six months or so of Medalist's sales.

It shows that when a paper really has something, the word soon gets around.

First, the alert "woat's new?" buyers get a trial supply. Then there's a lull, for testing and printmaking. And then they begin to show their prints—and tell their friends—and the rush is on.

Kodak Medalist Paper was born for success. This great paper is no accident. It began when Kodak asked serious photographic workers, amateur and professional, to describe the ideal combination of equalities they would like in a photographic paper.

Their opinions were tabulated, charted, analyzed . . . And then Kodak's research men and skilled emulsion-makers translated the dream into reality.

These are the traits you find in this ideal paper, Kodak Medalist: excellent printing speed (in between top-speed Kodabromide and moderate-speed Kodak Opal Paper) . . . a full range of contrast grades, all matched in speed . . . flexibility and contrast control in each grade, to permit precise matching of negative and paper for top quality in every print . . . rich natural warm-black tones . . . excellent response to toning . . . choice of several popular surfaces, to meet interpretive needs . . . plus ease of manipulation, tough emulsion, rugged stock, and typical Kodak dependability.

That's Kodak Medalist—a paper you need to know. See your Kodak dealer today.

EDITORIAL NOTES

Photography in Engineering and Science was the theme of a Technical Division Symposium at the 1952 National Convention in New York City in August. Because of the great interest that was evidenced, at the Symposium and afterward, the editors of Photographic Science and Technique have been asked to present as many of the papers as possible in this Symposium Issue.

Two papers from the Symposium had already been published in the October issue. Others will follow during 1953. The papers gathered together here tell a story of photography at work; digging out the secrets of mechanical operations, making time stand still or altering its pace, metering the unmeasurable, recording data for engineering use.

One of our authors, Joseph Tholl, the Cleveland authority on questioned documents, didn't know when he spoke at the 1952 Convention about the use of photography in his work that a representative of the government of Israel was in the audience. Afterwards Mr. Tholl learned he had been selected to teach document identification techniques to a photographer who will set up a laboratory in the new state of Israel for the photographic examination of questioned documents.

At the moment, according to the Cleveland Press, Mr. Tholl is busy ferreting out fraudulent X marks for his local election board from thousands of questioned ballots. Three indictments have already been returned by the Grand Jury as a result of this work and more are expected.

Our report from Stockholm on color photography processes currently available in Europe, by Dr. Heinz Gordon of the Swedish Colorphoto Corporation, seems to have been well received. Several readers of the October issue have expressed their appreciation for the publication in America of authoritative information on this subject that is so important in Europe and so little known here.

The second part of Dr. Gordon's paper, presenting the characteristics of the positive color print materials and their processing, was promised to appear in the next issue. It had to be postponed when this became our

Symposium Issue for the Photography in Engineering and Science theme. The concluding exposition of European color print materials will appear in the February 1953 issue instead.

An index to technical literature in the field of photography is almost as necessary to the technical man in quest of information as the literature itself. This final issue of volume 18B contains a complete index of the papers published during the year.

PHOTOGRAPHIC SCIENCE AND TECHNIQUE is pagenumbered separately from Section A of the PSA JOURNAL with the original intent that many readers would wish to bind the four quarterly issues that constitute a volume. A title page for Volume 18B is provided, along with the volume Index, for that purpose.

The general need for engineering data useful in the design and construction of photographic laboratories has been emphasized in a letter to the editor by Rodger J. Ross written from Bogota, Colombia where he is serving with the Canadian government's Technical Mission. "This is a large scale photographic operation," writes Mr. Ross, "the production of certificates of citizenship by means of photography."

It is a fundamental aim of Photographic Science and Technique to provide a nucleus for the development of a photographic literature that will serve the need to which Mr. Ross refers. In three full years of publication completed with this issue, we have built about that nucleus a core of authoritative information concerning technical aspects of photography. More papers dealing with specific engineering concerns in photography are scheduled for publication next year.

One of the most helpful contributions is likely to be the 1952 National Convention paper by L. E. Muehler and J. I. Crabtree, FPSA, "Materials of Construction for Photographic Processing Equipment." This paper deals with older materials as well as the new developments in stainless alloys together with plastic and other non-metallic materials. Resistivity to corrosion as well as comments on fabrication and maintenance will be described.

PHOTOGRAPHY IN HIGHWAY AREELECT

Allie C. Peed, Jr. *

ABSTRACT

Many applications of photography contribute to the advancement of highway technology. Convergence to the special photography, photographisms, and map and plan reproduction space up the bulk of photographic use in highway engineering work. In highway research, however, using photographic techniques make possible the advancement of studies that are well documented, thereby illustrated, and backed with permanent photographic records which can be easily interpreted. These records are often made in locations or at time intervals which are unavailable except through photography.

THE FEDERAL GOVERNMENT and many of the State governments have established research divisions within their highway departments in an effort to apply scientific methods to the problems of the planning and development of modern highways and the study of materials and procedures employed in this field of work. Photography is one tool used in the study of such problems. It is the purpose of this paper to describe some of the photographic techniques and innovations that find practical application in highway research, and particularly those that are unique and not generally known

Just prior to the last war an ingenious method was developed in Czechoslovia for producing minute glass spheres by grinding crushed glass in ball mills and subsequent fire polishing. Such glass spheres later were utilized in this country as the reflector components in highway paints and signs. This application stimulated a great deal of research activity in optics, glasses, plastics, and related marking materials. When the Czechoslovakian manufacturing methods became available in this country, several manufacturers began the production of reflectorized coating materials having special reflection characteristics. As a result highway officials were faced with the problem of analyzing and appraising the properties of individual commercial products.

The glass beads measure on the average about 0 12mm in diameter Consequently, the study of their proper-

ties has required the use of the microscope. Figure 1 is a typical example of the many photomicrographs made of the several forms of glass bead reflectorization. As the reasons for the differing properties of these materials were determined, it became evident that basic principles of spherical lens optics were not only applicable but that the function of a single glass sphere, as a lens system in itself, had to be analyzed geometrically before the overall properties could be interpreted. Thus, a single glass sphere became the object of considerable study. Figure 2 is one of a series of photographs of a single glass sphere with a sharply defined, well collimated beam of light incident from the left. Smoke box techniques were used to make the light rays visible in the photograph. The distance from the rear surface of the sphere to the focal point could be measured directly on the photograph. A series of these photographs made of beads having various refractive indices

and other physical properties served as the starting point for a mathematical analysis of the theory of the optical performance of spherical lenses as applied to retro-

directive reflectors.

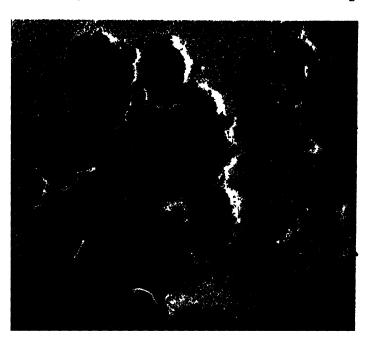

When beads of this type are used for "reflectorizing" centerlines or surfaces subjected to traffic, many are dislodged and lost unless the beads are properly imbedded in the paint binder. Rhodes and Pocock, in the course of a study of influence of interfacial tensions and wetting characteristics on retention mechanisms, designed a stereophotomacrographic camera with which they were able to photograph beaded surfaces at considerable magnification. Figure 3 shows a camera used for this purpose. Stereoscopic study of the magnified photographs was of considerable aid in determining bead retention mechanisms, depth of bedding, and other important surface characteristics. This type of "reflectorization" is essentially the same as that used with beaded motion picture screens except that the cone of reflection for the latter is purposely made much wider to accommodate the closer viewing conditions. As a result of these studies, in which photography played a major role, specifications and testing procedures have been formulated that ensure proper selection of beaded marking materials.

It was feared that because of the difficulties which had been encountered in the projection of polarized stereo images on beaded-type projection screens a similar diminution of the effectiveness of beaded-type highway sign surfaces might be experienced if polarized lights and polarizing windshields came into use. In the report of the study of this problem color photographs carefully made under actual driving conditions were most effective in demonstrating the use of such a crossed-polarizer for reducing the glare of approaching head-

lights.

Use of Photomicrographs

In the studies just mentioned, objects near the limit of resolution of the unaided eye were evaluated and therefore optical and photographic magnification in the order of 50 to 100 diameters was required to facilitate visual examination. There are instances in which even smaller objects must be examined, necessitating even higher magnifications. Since most roads are built with large

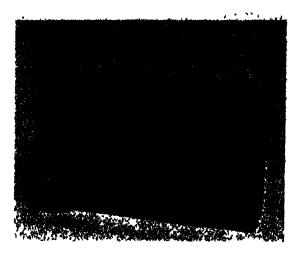

Fig. 3. Stereophotomacrographic apparatus. A 35 mm. camera with lens extension tube is mounted in the housing with integral batteries and light source. quantities of mineral aggregate, an understanding of the properties of such material is mandatory. A study was made of stone samples taken from the vertical face of four limestone quarries at one-foot vertical intervals. As a part of this work, thin sections were ground from each sample in two orientations and photomicrographs made by transmitted light. Altogether 1200 photographs were made and filed according to the position of the stone samples in the quarries. Thus the geologic and physical variations within the quarry can be ascer-

tained readily from the photographs.

In a similar project the photomicrographs were made in color since the examinations were made with the petrographic microscope and the colors obtained upon use of phase contrast techniques were most descriptive of the sandstone materials. As an adjunct to this study it was desired to determine what amount of the sandstone was granular material and what portion was matrix or cementing material. Since the granular material was generally more transparent than the cementing material, it was possible to estimate the relative proportions of matrix material from photographs made on high contrast film of the thin sections. Exposure and processing of the film could be adjusted to yield images in which the granules were opaque and the cementing materials essentially clear on the negative. An integrating densitometer was used to measure the total amount of light transmitted by such negatives and these measurements were compared with the transmission of an unexposed and a fully exposed sheet of the same type of film processed identically. The amounts of granular and cementing material then were calculated from these transmission values. This method was checked against one involving laborious planimeter measurements of a camera lucida image and was found to

PHOTOGRAPHIC SCIENCE AND TECHNIQUE

be quite accurate. By this method it was possible riso to correlate percentages of consulting material with

actual strength tests.

In highway construction work, an understanding of the supporting capacity of soils and their other engineering properties is an obvious necessity in the evaluation of foundation conditions and surface requirements. In an effort to examine all of the ingredients of the soil, electron photomicrographs were made of the smallest particles to supplement photomicrographs of the larger particles. Figure 4 is an electron micrograph of 21,000 diameters magnification which made possible the examination of form and structure of particles considerably smaller than one micron. This particular electron micrograph was made with the shadow-cast technique which produces shadows that are five times the vertical height of the object. Thus planar dimensions are measurable directly whereas vertical or thickness dimensions can be determined indirectly. Such data are important to an understanding of the engineering properties of any soil.

Photographic techniques are not limited by any means to the representation of the physical appearance of the specimen. They may be used to record other properties which indirectly describe the nature of the material under study. In the above mentioned study of soils, a knowledge of the crystallographic structure of the soil particles is of great importance as well as their exact chemical composition. Physical and chemical analyses are expensive and time consuming but photography can be used to obtain the required information more readily if it is combined with x-ray diffraction methods. Figure 5 shows three typical x-ray diffraction patterns obtained from samples of soil

constituents.

Another photographic technique is used in the interpretation of x-ray diffraction patterns. As the principal interference lines are measured and identified, their photographic opacity is measured on a transmission-type densitometer; and the "weight" of each line with respect to the others on the same pattern is taken as a relative measure of the quantity of that particular ma-

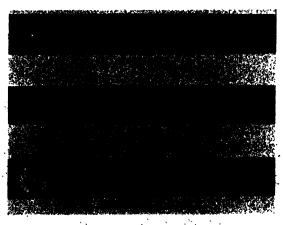

Fig. 5. Three typical x-ray diffraction patterns of soil constituents. The distance of the lines from the center point serves to identify crystallographic properties of the sample while the weight of each line is a quantitative messure of the amount of substances present in the sample. terial in the specimen. The same equipment has been used to make microradiographs of the thin sections of minerals mentioned previously. Photographic enlargements of the resulting diffraction patterns showed much of interest concerning the internal structure of the sections.

Motion Picture Applications

Use has been made of ultra high-speed motion picture techniques in the highway field. Motion pictures at normal speed have been of some value in the Marshall Stability Test which is used widely to determine the worth of asphaltic pavement mixes. This method consists of rapidly loading a four-inch cylinder of the compacted test mix until it fails or loses its ability to support further load. While the load is being applied stress and strain measurements are made simultaneously to determine the load-bearing properties of the mix. Since the loading is very rapid (most tests lasting only three to six seconds from start to failure) manual recording of the stress-strain dials is impossible. With a motion picture camera, the readings of the two dials can be recorded accurately and at the same time changes in the specimen recorded as it approaches ultimate failure.

Stop-motion Flash Techniques

Electronic-flash technique is used for recording failures of concrete test cylinders in compressive tests, or concrete beams in flexural tests. In such tests the failure of the rigid concrete specimen is usually explosive in character, and the nature of the failure of engineering interest. Although high-speed motion pictures admirably record such events, a single photograph properly spaced after the failure starts, serves the purpose just as well. Electronic-flash makes it possible to "freeze" the crack structure as well as the displaced fragments just as they appear at any selected time after the instant of failure. This type of photograph has been made using a minophone to detect the sound of the failure. Amplified electronically, the sound is used to close a relay which

Fig. 7. Condition photograph of transverse traffic paint stripes after one year of in-service testing on a highway. Official photograph Ky. Dept. of Highways.

triggers the camera and flash. The variable delay factor can be introduced electronically in the amplifier circuit, but it has been found easier to adjust the distance between the microphone and the specimen and use the transit time of the sound waves as the delay factor (each foot of removal from the specimen location introducing approximately 1/1000th second additional de-lay). Thus a contact microphone affixed to the cylinder gives a photograph essentially at the instant of failure, while a microphone five feet from the cylinder gives a picture approximately five milliseconds after the failure. Regular foil-filled flashlamps can also be used and their delay-to-peak used as the lag factor. Figure 6 is a photograph of this type made with a regular flashlamp. It will be noted that the particles flying in mid-air are not completely stopped by this type of light.

Field Photography

The use of the camera in field work is considerably older than the highway research laboratory photography, consequently a greater amount of it has been done. Bridges, dams, buildings, and roads are all permanent fixtures of the place in which they are constructed and about the only manner in which they can be described and studied elsewhere is through some sort of graphic representation. Drawings, maps, plans, and sketches are used for such purposes in the technical fields, but these are not readily understood by nontechnical persons. Photographs of the projects can be descriptive to the layman or technician in some other field who is not familiar with the symbols and convention of the engineers that are more directly concerned with this work.

In this type of photography, as in laboratory work, the photographic record not only serves as the eyes of the engineer, but it also serves as the memory. Since most of gineering projects are designed to withstand many rears of use, it is important to document the manner in which they age. Much can be learned from past con-spection that is of benefit in current work. In the highway field it takes fifteen or perhaps twenty years to establish the worth of new materials and construction matheds incorporated in full scale field perhapsed tests. Even then a comperison numb be made with most mai types of construction placed at the same sine. Photography can document the slow failure of a surface. or structure over several years time and provide a comparison with another section of different construction finished at the same time but many miles from the first.

Progressive failure of materials over shorter periods of time are of importance also. For example: traffic center-line paints are purchased by many highway departments on the basis of trial service tests. Competitive samples are placed as transversed stripes on the road at one location. The performance can best be shown by a series of documentary photographs, preferably in color, made at regular intervals throughout the duration of the test. Figure 7 shows such a series of stripes after one year of service on the road.

Most field testing and inspection of highway materials and construction can be well supplemented and documented by photographs of culverts, bridges, surfaces, shoulders, drainage ditches, and traffic facilities made by an inspector. Photographs of this type serve also as invaluable aids in tracing the history of a failure provided that photographs were made at regular inter-

vals during the life of the unit.

Highway Traffic Studies

In pattern studies of vehicular traffic and driver behavior, use is made also of photographic techniques. In a study on the influences of several different types of warning signs and pavement stripings on vehicular guidance at narrow bridges, members of the Indiana Joint Highway Research Project used a motion picture camera with electric drive mounted on top of a roadside sign or an overhead bridge member. An unusual feature of this work was the use of a temporary grid laid out on the pavement which was photographed from the camera position and then removed so that the drivers would not be distracted by an unusual pattern on the

Fig. 8. Enlargement of a single frame from 35mm sequence photographs used in the evaluation of driver behavior. Note the image of the timer and counter in the lower right hand corner. Sequence-views make it possible to determine driver responses at arterial intersections. Photograph by courtesy of the University of California Institute of Transportation and Traffic Final operation. Engineering.

pavement. When the data were evaluated in the laboratory, swo projectors were used—due to project a still frame of the grid, the other the motion pictures of the cars. These images were superimposed on the screen. As a result the cars appeared to move across the target grid and lateral placement data were easily transcribed.

In a somewhat timilar study conducted at the Institute of Transportation and Traffic Engineering at the University of California, Los Angeles, Forbes and Reiss adapted a 35mm motion picture camera to make aerial photographs in sequence from a light aircraft. The camera was arranged to yield single exposures at fixed intervals controlled by an electric intervalometer at a higher than normal shutter speed (1/250th second) and at the same time photograph through the back of the film a counter and timer in a corner of each frame. Figure 8 is a single frame from such a sequence. This apparatus was found useful in the study of driver behavior on freeways, at intersections, and traffic interchanges. Similar studies made at George Washington University used regular, large film, aerial still photographs in addition to 16mm and 35mm still and motion pictures in both color and monochrome.

Conventional aerial photography and photogrammetric techniques are finding widespread use in preliminary highway location work and in outlining of drainage areas. The low altitude strip-mapping technappolar in the second second

In a cooperative project conducted by the History Research Board, The Asphalt Institute, and the Britan of Public Roads on the structural design of nonvisid by mements, photography was used as a recording method in the field. Photography contributed to a charge in the test procedure which speeded up the testing from one test per day to an average of four tests per day. In this work, static bearing tests were made involving load-deformation data taken simultaneously from the surface, base, and sub-grade of an asphalt pavement with a variety of sizes of bearing plates. Under the revised accelerated test procedure, tedious reading of the three deflection dials and the load dial was turned over to a Robot camera. This, of course, greatly expedited the work, and, as each increment of load was added, it was only necessary to press the shutter release of the camera and to proceed to the next application of load.

PHOTOGRAPHY HELPS DEVELOP ROCKETS AND GUIDED MISSILES

R. W. Herman*

ABSTRACT

Photography plays an important role in the testing of rockets and guided missiles. The theory and history behind various data-gathering methods are described. The principal ballistic parameters are classified and basic techniques for measuring them are described, together with some of the problems involved in applying these techniques. This study forms the basis for a discussion of new and future developments in the field of measurement photography

HOTOGRAPHY PLAYS a vital role in the development of the new science of rocketry. In order to realize the full significance of this statement, it is necessary first to gain an imight into some of the problems facing the scientists responsible for the development of rockets and guided missiles. Some of these problems are encountered with other ballistics such as artillery shells or in aerodynamic fields. However, many problems are unique to rocketry as, for example, those of finding smoothly burning propellants or evolving aerodynamic designs stable under conditions of rapidly varying weight distribution.

*Metric Photographic Branch, Instrument Operations Division, Test Department, U. S. Naval Ordnance Test Station, China Lake, California. Presented at the PSA National Convention, New York, N. Y, 13 August 1952, as part of the Technical Division Symposium on Photography in Engineering and Science. Received 11 August 1952. The testing of new designs also has unique features since only meager data can be gathered from wind tunnel or static tests concerning many design factors. Testing must, therefore, be done under dynamic conditions in which the component is allowed to function under normal environmental conditions. The recording of the necessary test data becomes a difficult task under these conditions since no direct mechanical contact with the test object is possible when it is in free flight.

Visual observations of the various phenomena are, of course, entirely inadequate due to the high speed of rocket flights. Although many methods have been devised for gathering quantitative data concerning the various test objectives, the major portion of these systems use photographic materials for recording purposes. Millions of feet of photographic film and paper are used annually to record electronic measurements, such as

Fig. 1. Scale settings of the Bowen CZR-1 Acceleration Camera, derived mathematically from predicted trajectories, are set into the instrument. When the rocket is fired, it passes through the camera field of view, and the pictures can be related to these angular settings. This camera uses film which is 5-½ inches wide and takes pictures at the rate of 30, 60, 90 or 180 per second. Small projectors inside the lens housing print reference crosses on each frame. These fiducial marks are carefully calibrated to the orienting scales on a precision test range. Such a procedure is necessary, since the camera is usually pointed into the sky so that no "ground control" references are available in the picture. Official photograph U. S. Navy.

Doppler radar signals, pressure gage dials and magnetic pick-up signals. Most equipment consists of both electronic and photographic components and a given recording facility can only be called an "electronic" or "photographic" device from a consideration of the primary data-gathering emphasis. Some of the data requirements best determined by equipment which is primarily photographic in nature are described in this report.

Ballistic Requirements for Photographic Data

For the purposes of photographic instrumentation, rocket ballistics may be divided into three phases distinguished by different data emphasis as well as natural ballistic boundaries. The first phase covers the launching and initial acceleration period. Here the performance of the rocket motor is of primary interest. Since this performance is reflected in the acceleration characteristics of the missile, measurement of these characteristics gives important clues to what is happening in the rocket motors. Other important factors which can be determined photographically include such items as booster separation studies, "tip-off" or launching angle

drop of a missile during the acceleration period, rotational velocity, yaw oscillation periods, and disper-

The second phase covers the flight of the rocket after the initial acceleration. In this phase, the rocket either coasts, slowly losing speed due to frictional forces, or else the velocity gained during the acceleration period is maintained by a 'sustainer' motor. It is during this phase that the ballistician wishes to evaluate the serodynamic characteristics of the design and the functioning of the guidance mechanisms. Two types of determinations form the most important photographic contributions to these investigations. The first of these is trajectory measurements involving the determination of position versus time at a predetermined sampling rate. These data furnish information concerning the guidance behavior of the missile and, by successive differentiation, velocity and drag or deceleration values. The second is attitude measurements used to determine the orientation of the missile at selected trajectory points. These orientation measures are classified according to their relationship to the line-of-flight axis of the missile. Roll or spin describes oscillation or

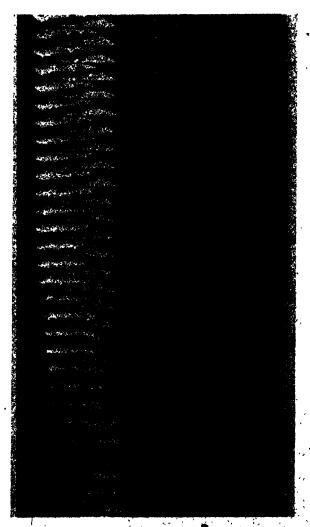

Fig. 2. The launching of a TINY TIM rocket as pictured by the Bowen Acceleration camers. The camera is oriented with the length of the frame along the trajectory, so that the ground appears at an angle along the left margin. Official photograph U. S. Navy.

rotation about this axis, while plech and you describe the vertical and horizontal components of transverse oscillations of the missile about its center of gravity. The third phase is often called "Terminal Ballistics"

and concerns the various factors involved in the ending or termination of the rocket's flight. The nature of these requirements will depend upon the use for which the rocket is designed. For example: if an anti-personnel rocket were being designed, then the terminal factors desired would probably have to do with fuze functioning and fragmentation patterns. Some of the other types of data often desired in terminal ballistic studies include such determinations as target entrance angle, target penetration and explosive order.

Reflection upon these data requirements will indicate the wide variation in instrumental design factors necessary to make all these measurements. For example, the conditions encountered in the first phase are such that the missile's path may be predicted within fairly narrow limits. This factor allows the use of fixed instruments which can be oriented accurately in such a manner that the missile will pass through the field of view. But these conditions do not hold for the second phase and the instruments must therefore follow the moving target.

Photographic Solutions to the Ballistic Requirements

Photographic methods for gathering the data indicated above are generally classified according to their primary design functions, although most cameras are

Fig. 5. The Askania cinetheodolite is used on guided missile tests to provide triangulation data for surveying the missile's position in space, usually at the rate of four times per second. The camera is tracked or pointed at the rocket by sighting through the telescope and moving the instruments by means of a handlebar. A picture of the missile is recorded simultaneously with angular scale readings which are imprinted by means of Edger. scale readings which are imprinted by means of Edgerton flash lamps. The scale images are compared to an optical scale divider and transferred to the film through omplex optical trains. Official photograph U.

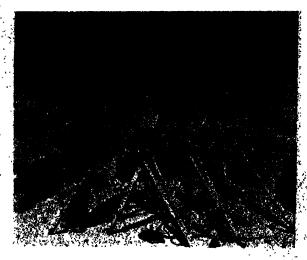

Fig. 4. Battery of three Mitchell High-speed 35mm motion picture cameras set up to record the launching of a LARK missile. Such detailed studies are valuable for determining the functioning of various components during this critical period of the flight. Official photograph U. S. Navy.

used for a variety of purposes and often several types of data can be had from the same record.

The camera most generally associated with initial phase studies is the Bowen Acceleration camera. This camera (Figure 1) was originally developed by Dr. Ira S. Bowen, currently director of the Mount Palomar Observatory, and has undergone several subsequent engineering revisions. The latest version is designated the CZR-1 and is used in conjunction with a newly developed precision three-axis orienting mount.

As its name suggests, this camera was primarily developed for acceleration measurements. There is no photographic way to determine acceleration directly. Therefore, position in space versus time is the data actually determined, and the accelerations are mathematically derived by successive differentiations. Since errors are compounded in this process, the original positional measurements must be extremely accurate if meaningful results are to be had.

The cameras are operated as "fixed" cameras—that is, no tracking is attempted. They are oriented in such a manner that the rocket will pass along the camera's field of view. The camera is known as a "ribbonframe" camera because of the shape of the pictures it takes (see Figure 2). Since the primary measurement interest is along the rocket trajectory, the frame has a long, narrow configuration, measuring five inches long by one inch or less high depending upon the frame rate chosen. The camera can be run at thirty, sixty, ninety. or 180 frames per second.

Since measurements are critically important only along the length of the frame, an important degree of freedom is released for utilization in the mechanical design of the camera, and the film is therefore kept in continuous motion throughout the exposure. The blufring which results is in a direction perpendicular to the image motion and is roughly comparable to blur due to the velocity of the rocket. The exposure time is variable

between 1/10,000 and 1/50,000 second.

The orientation of the camera is accomplished by means of a mount which allows motion about three axes; azimuth and elevation, which are mutually perpendicular with the optic axis of the camers, and roll, which is parallel to the optic axis. These motions are measured by very accurate scales. Small fiducial marks are projected on the film and these are calibrated to the scales on a precision test range. Thus, by measuring the position of a rocket image relative to the fiducial marks on the film and knowing the camera position and orientation angles, it is possible to locate a line in space along which the rocket appeared. The only other factor necessary for complete location of the missile in space is the determination of the position along this line. This is usually accomplished by means of a "deflection plane" which is measured by motion picture cameras located either behind the launcher or under the flight line.

Time is the only common denominator among all the various types of measurements made. Determinations are therefore usually made against time and can be subsequently related to one another through this common time base. Therefore, great emphasis is placed on range timing systems and the introduction of relative time into each instrument. All time is measured relative to an arbitrary "zero" time which generally coincides with the actuation of the rocket firing circuit.

Fig. 5. The M-45 Tracking camera is shown in action tracking a missile. The mount is electrically driven, controlled by the handlebars in the operator's hands. The camera mounted to the left of the operator is a Mitchell 35mm camera with special provisions for the introduction of timing. The lens used here is a 48 inch focal length f/8 astronomical doublet of exceptional quality. On the operator's right side is mounted a half-scale version of this same lens, with provision for either a 16mm Mitchell camera for documentary movies or a Fastax 16mm camera for super slow motion studies. The lenses are mounted firmly to the side plates and the cameras are mounted on precision ways for focussing motion. Communication is by two-way radio. Timing pulses are also received by means of radio. A large generator is carried on the towing truck to furnish power for the mount drive, cameras and radios. Official photograph U. S. Navy.

Timing in the CZR-i causers is introduced with investigation in the first system utilizes the fact that the file of the discounces in in commission motion. A projection system images the light from a natural lamp on the migh of the film. This lamp is triggered by the tifficial effects at the rate of 200 cycles per second before zero time. Thus, a series of little marks appear along the edge of the film which define time before and after zero time. The second system utilizes an electronic binary counter which operates a group of neon lights in such a manner that a code is photographed in each frame which indicates the time lapsed from zero time.

Several of these cameras are normally used on a test. They are so oriented that each camera covers a portion of the trajectory, but slightly overlaps the coverage of the previous camera so that a continuous record can be pieced together. It sometimes happens that dispersion is so great (that is, the path of the rocket is so unpredictable) that several cameras must be used to cover the same trajectory segment. The cameras are then oriented in such a manner that the fields lie one above the other so that a greater portion of the sky is covered. This assures that the rocket will go through the field of one of the cameras.

Several other types of cameras are also used in the first phase to study various factors. Motion picture cameras are sometimes placed directly beneath the flight line to record yaw oscillations. High speed cameras, such as the Fastax, are used to study highly transient phenomena such as booster separations. Most determinations, however, are obtained from the Bowen camera records.

Trajectory measurements are usually made by means of cinetheodolites (Figure 3). These are, essentially, surveying instruments which record all pertinent data automatically on photographic film. The operator follows the missile in a telescope attached to the cinetheodolite. Circular scales attached to the theodolite axes are photographed at accurately timed intervals through the use of Edgerton flash lamps. At the same time a photograph is taken of the missile so that errors in tracking can be measured and the scale readings corrected accordingly. Data from two or more (usually three) cameras located on first-order surveyed base lines several miles long are triangulated to determine a most probable position of the missile. The triangulations which are made during an average two-minute flight would take a good survey team a month to do with the same degree of accuracy, were such a procedure possible.

The problems involved in such an instrument program as this are enormous. No really outstanding cinetheodolites have yet been developed for rocketry. The most successful instrument so far has been the German Askania cinetheodolite which was originally developed for anti-aircraft gunnery practice. A number of these instruments were "liberated" at the close of the last war and have been extensively modified to adapt them to the stringent requirements of missile testing.

Timing in these cameras is accomplished by precision control of the time at which accordings are made. Pulses from a central control are sent out electronically to all the cameras in the network at precisely determined intervals, usually two or four times per second.

Fig. 6. Documentation of a guided missile launching is accomplished by this battery of special cameras. Sequencing devices automatically trip the shutters to give pictures of the missile at different times as it is coming off the launcher. By using large lenses and fast shutter speeds, spectacular color illustrations of launchings are obtained. Official photograph U. S. Navy.

These pulses trigger flash lamps which produce the angular recordings. The main shutters are actuated in such a manner that the pisture of the rocket is simultaneously recorded with the scales. Thus, the records are made at the same known time in all the cameras operating on the range, a factor which facilitates the data reduction process,

There are two basic approaches to the problem of measuring attitude. The most accurate method is to place a camera inside the missile and photograph ground targets. This procedure is essentially the photogrammetric process in reverse. Another variation of this method is the "solar yaw camera" or "Widget," which traces the excursions of a pinhole image of the sun as the rocket maneuvers. Usually, however, no space can be spared inside the missile and all measurements must be taken from the ground. To do this, photographs are taken of the missile from at least two positions with motion picture cameras equipped with very long focal length lenses so that the pictures will be large and easily measured. The apparent angle of the missile with respect to each camera reference system is measured and these data are then mathematically converted to attitude angles with respect to the range coordinate system.

Focal lengths as long as one hundred feet have been seriously contemplated for the lenses used with attitude cameras. Forty-foot focal length cameras are already a reality. The mechanical problems involved in tracking the missiles with such cumbersome instruments necessitate the creation of monstrous tracking mounts with powerful drive systems.

Much of the short resists the property when take conterns has constituted as sectional of short tive focal integring saids strengtons integral The M-45 exacting capture, for example, in instrument. Popularly known as the Pause the latest version of this instrument utilise 50-calibre machine gun mount for the tracking nism. This is mounted on a trailer with atabilit and leveling provisions. A refractor of distinct line length is mounted on one side of the operator and half-scale version of this same lens is mounted on the other side. Pictures for attitude purposes are recorded by means of a Mitchell 35mm chronograph camera. A 16mm Mitchell camera may be used for documentary motion pictures or a Fastax camera for super slow motion studies. Each Gooney Bird is powered by its away generator system, which is mounted on the towing truck.

The problems encountered in terminal ballistics are so many and so varied that only a few examples of some of the optical methods will be mentioned. In many applications, Bowen cameras are used to give a record of such things as target entrance velocity and detonation pictures. Sometimes high speed studies are desired to determine such things as entrance angle or fragmentation studies. These cameras are set off to the side of

the target in a fairly straightforward manner.

Some of the more unusual problems involve such things as detailed high-speed studies of the detonation of a rocket head. Since the explosion creates an enormous amount of self-luminosity, the leas must be slowed down to its smallest aperture to enable detail in the explosion to be recorded. When this is done, however, no part of the rocket which is not self-luminous will record, and important correlative detail will be lost. One solution to this problem is to use a screen with a coating of material which reflects light directly back on the course from which it comes. This screen is placed on the far side of the target from the camera and a large searchlight beamed on it from directly behind the camera. The light coming from the screen sharply silhouettes the non-luminous portions of the rocket, making them visible and easily distinguished from the explosion details.

Photography's part in helping to develop rockets and guided missiles is not limited to the making of scientific measurements. The more conventional types of photography play an important role in documentation of the research and testing programs. Thousands of still photographs and more thousands of motion picture films testify to the truth of the old adage that "one picture is worth 10,000 words.'

Rocketry plays a dominant role in National defense plans. The security of our country depends upon the success with which our scientists overcome the problems they face in the development of new defense weapons. Rocketry also holds the key which will someday open the vast new frontiers of the universe to man's exploration. It has already helped him in his quest for knowledge beyond the earth by carrying his instruments outside the atmosphere to gather data. Here again, photography plays an important part as a recording medium.

PHOTOGRAPHY IN THE TEXTILE INDUSTRY

Melvin Siegel*

ABSTRACT

High-speed still and motion pictures, and time-lapse and other types of photography, have aided in the design of textile machinery, permitted the observation and recording of various phenomena otherwise impossible to study, and facilitated recording of all types of data. Research studies of various types have been aided materially by electron micrographs, X-ray diffraction, and fluorescence, ultraviolet, and infrared photographs. Examples of such applications are discussed and illustrated.

NDIVIDUAL FIRMS within the textile industry have independently employed photography as a tool and are probably exploiting its use more than other industries, judging by the recent literature. 23, 81, 82

Microfilms, photostats, and photographs for patent purposes are applications in which photography is used routinely, as are photographs for advertising and for

use in house organs.

Some mills¹⁷ use photographs showing wear of component parts of machines as a guide to purchasing. They also make photographs of machines with various size change gears and pulleys. These are placed in the hands of production supervisors and the speed of any of the production machinery easily determined by comparison with the standard photographs, where the speed is noted. In the installation and erection of machinery, photographs are used to a considerable extent to assist in their rapid assembly.

Combination photographs (superimposed titles or numbers on the print) for designating the individual parts that go to make up an assembly are used 13 by some machinery manufacturers. These are employed in connection with installation and operating instructions, as well as to serve partly as a parts list for the ordering of

replacements.

The textile fibers that comprise a yarn are very fine and delicate. Their very small diameter is usually ex-

Fig. 1. Photograph of cloth swatch showing defect in hospital sheeting. Similar photographs are useful for studying the evenness of yarn, fullness of fabric, and as evidence in support of claims. Photograph by courtesy of U. S. Department of Commerce, National Bureau of Standards.

pressed in microns. The length of these fibers is an important consideration in the setting of yarn manufacturing machinery as well as deciding what type and size yarn may best be made. A random distribution of separate fibers from a single lot, known as a sliver diagram, permits the amount of various fiber lengths in that lot to be determined. Photography offers the only means of keeping these very delicate sliver diagrams in permanent record form.

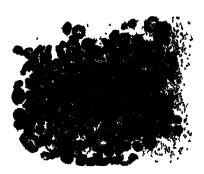

Fig. 2. Photomicrograph of a cross-section of a mixed yarn useful for identification of the various fibers as well as for quantitative analysis of the yarn. Photomicrograph by courtesy of U. S. Department of Agriculture, Southern Regional Research Laboratory.

The study of mildew on fabrics has been made by the National Bureau of Standards¹ and others. The effects of various mildew-inhibiting chemicals, and the extent of mildew growth on test specimens can be permanently recorded and measured through the use of photography.

recorded and measured through the use of photography. Photographs of cloth swatches 10 graphically show evenness of yarn, fullness of fabric, fabric defects, etc. The National Bureau of Standards (Figure 1) have done work along this line in evaluating defects in hospital sheeting. Many mills standardize the nomenclature of these defects by having their fabric defect photographs on display in their various production departments so that all personnel may realize the nature of the defects and help eliminate them. Correct identification of fabric defects has become so important in settling claims, that Goldberg has compiled a series of such photographs in book form. 16

The National Bureau of Standards have employed photography to show the extent of rug wear after subjecting samples to a known amount of abrasion.

⁶ Jean Ribbon Mills, Inc., Paterson, N. J. Presented at the PSA National Convention, New York, N. Y., 13 August 1952, as part of the Technical Division Symposium on Photography in Engineering and Science, Received 26 August 1952.

Lantern slides and motion pictures are also used to show how to operate and maintain various machines, with animation techniques when necessary. Motion pictures are used as a sales aid for export areas, so customers can view equipment in mill action under actual use, as well as to see general performance. Time and motion studies in the textile industry also make use of standard techniques employing motion picture photography.

Photomicrography

Photomicrography is employed extensively in the textile industry, from the metals and alloys used in the manufacture of machinery to the yarn in the finished fabric. All textile fibers appear different microscopically, and there are several complete photographic references available in published form⁴⁰, ⁴², ⁵⁴, ⁵⁶ to be used as an aid to identification. Photomicrographs of yarn are used for the qualitative and quantitative analysis of mixed yarn.⁵ The amount of each fiber in a blended yarn (Figure 2) can be verified by photomicrography¹⁷ in accordance with the Wool Labeling Act. This is done to determine whether the actual blend is in accordance with the requirement as there is usually a greater loss of one of the types of fibers in the manufacture of blend than in another.

Swelling studies of various fibers and yarns when wet have been the subject of investigation.³² When wet, cotton has shown an increase in area between 21% and 34% greater than the dry area. This information is basic and important for fabrics used for fire hose, military fabrics, and tarpaulins, which become more water resistant as they are wet due to this swelling and so prevent water from passing through. These data are also useful for studying fibers used for fillers for plastics, for warp yarns in carpets, and for industrial fabrics of all kinds where changes in dimension due to moisture are important in processing and in use. The increase in the area is measured from these photomicrographs, and the information gained assists in the designing of such fabrics.

Coating studies of various types have been aided by photomicrographs. In the study of fibers to which

various amounts of a latex dip, necessary for obtaining satisfactory bonding to rubber as in a tire carcass, have been applied.²⁴ Through the examination of fiber cross-section photomicrographs,⁹ the extent of the dip penetration can be followed as a function of the process variables.

Properties of fabrics may be considerably altered by impregnation with various chemical compounds. Crease resistance in fabrics is obtained by impregnating the cloth with any one of several resins. Starch sizing on a cotton yarn, as well as rot proofing, mildew proofing, fire proofing, and moisture proofing, are but a few in which the degree of impregnation in regard to depth and uniformity may be studied by means of photomicrographs.

As a guide to the selection of fibers which are more abrasion resistant, and hence will wear longer in a fabric, duPont has dyed yarns from worn fabrics with Congo Red. This dye has the property of dyeing mechanically damaged fibers a deeper color than undamaged fibers. A Photomicrographs in color of the fibers of the abraded yarn, readily show the severely damaged fibers.

Promotion of Standards

Photography has been used for the maintenance of standards in the textile industry. The Agricultural Marketing Administration of the United States Department of Agriculture and the American Society for Testing Materials have developed a series of photographic yarn standards^{27, 55} to show the uniformity of cotton yarns. These are known as the Cotton Yarn Appearance Standards and consist of five boards with four photographs on each. Each board is for a different group of yarn sizes, with four grades on each board.

Various fiber dimensions²⁸ of cotton yarns are important for the yarn spinner or manufacturer in helping him decide the type and size of yarn he should make. The American Society for Testing Materials suggests the use of photomicrographs from random cross-sections at a standard magnification. Various dimensions may then

be obtained from these photomicrographs and sheet used for statistical enalysis. Aseas of the photosical graphed cross-sections may be measured with a plantaeter, and the amount of mature and immature country determined.

The measurement of wool fiber diameters have been of great concern to the wool manufacturer. Reliable, rapid methods of measurement for the grading of wool have been developed for the examination of the causes of variability of wool products to during manufacture, for general quality control for studying wool growth and production, and for Government specifications. This cross-sections of fibers are prepared in a special fiber microtome and are placed in a projection microscope and projected at 500×. The cross-sections are compared with photographs of cross-sections of standard samples of wool (Figure 3) of which the mean fiber diameter and its standard deviation are known. **

The method has been developed so that it is suitable for routine use in mills. These standards are on a 35mm film strip. The film strip projector is suitably mounted in relation to the projection microscope so that the image of the test sample and the standard are each projected side by side for easy comparison. Such a film strip has been prepared ³⁴ and comprises 65 standard cross-sections covering 13 grades of wool with five different standard deviations of fiber diameter for each grade. By this means large numbers of fibers may be viewed and fiber contours determined very rapidly.

The use of this method for checking blends of wool for manufacturing purposes has many advantages. Fineness and uniformity are of fundamental and basic importance in determining the grade and value of wool, as well as determining the use to be made of specific lots and the most suitable blending and processing techniques. These fiber images may also be projected on photocopy paper. After processing, the photocopies may be measured and also provide a permanent record of fiber diameter and variability of the sample, as well. as a guide for making up and matching previous blends for delivery and sales purposes.

High-Speed Photography

High-speed photographs, both still and motion picture, have been of considerable aid to machine design and analysis of performance. High-speed still photo-

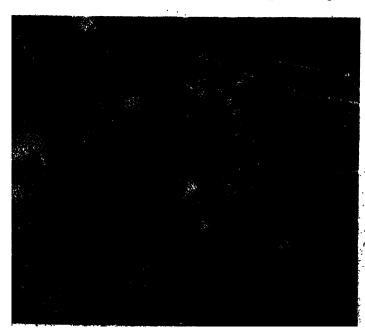

Fig. 6. Crompton & Knowles (Loom Works) high-speed camera providing 1/200,000 second exposures for recording the behaviour of fast moving parts and for measuring velocity and acceleration.

graphs made by the use of the Stobolux and the Strobotac¹⁴ permit the recording of machine operations at any instant of a mechanical cycle, with a flash duration of 1/30,000 second.

Several years ago, the Victor Ring Traveler Company made some photographic studies (Figure 4) to improve the design of the travelers they manufacture. ²¹ A traveler is used on a ring spinning frame, a machine which spins cotton yarn, and is responsible for the twist being inserted in the yarn, as well as contributing to the strength, elasticity, and other properties. The traveler may rotate as fast as 10,000 rpm, or more than a mile a minute. If these travelers were not balanced properly they would not only wear out very soon, but also produce uneven yarn. Edgerton made high-speed photographs of this apparatus in operation which aided Victor in the development of their improved travelers. The Stobolume¹⁴, a higher intensity stroboscope, has been used for loom shuttle motion photographs and studies. ⁴⁸

High-speed motion pictures (Pigure 5) have permitted an appreciation of a machine in operation at full speed with all the various forces acting which affect operation. These motion pictures permit studies of the machines to see if they are operating at peak performance and to indicate whether any changes in setting are necessary. Crompton & Knowles pioneered in the use of high-speed motion pictures as an aid to loom design and developed special apparatus (Figure 6) for that purpose. They claim that their equipment has the advantage of increased definition and clarity as their individual exposures are in the order of 1/200,000 second. They use the camera 24, 28, 46 not only to record behavior of moving parts, but also to measure velocity and acceleration of parts, like the shuttle, which as freely moving bodies have no direct connection with the loom itself.

The Eastman High-Speed camera permits the taking of as many as 3000 pictures per second, and Edgerton, Germeshausen, and Grier¹³ manufacture a High-Speed

The transfer of the second

PHOTOGRAPHIC SCIENCE AND TECHNIQUE

Scrobescope for me with the Egyptata capacia to provide a list hing fact of from 10 to 6000 finites per second when personer.

Schwarz and his associates at MIT developed the Siater Impact Tester for determining the impact strength of same and fabrics. In use, either a 25 or 500 pound weight is released from a magnet located above the ceiling. As it falls, it picks up the lower end of the specimen which is held in a floating jaw, and carries it to failure. An electric strain gauge supports the upper end of the sample and registers on an oscillograph the acting force. This almost instantaneous image on the oscillograph is then photographed (Figure 7) by means of a specially designed high-speed camera and the films later analyzed.

Time-Lapse Photography

Time-lapse photography has been used by several companies for various investigations. The Universal Winding Company²² has taken pictures at given intervals over an extended period of time (Figure 8) to record the effect of tension, diameter, temperature, humidity, and time on the winding of yarns on their winding machinery, as an aid to better machine design. The alternative to these time-lapse photographs would be manual recording which would be tedious and subject to clerical errors, and in addition, it would be impossible to record all data simultaneously.

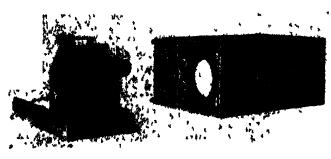

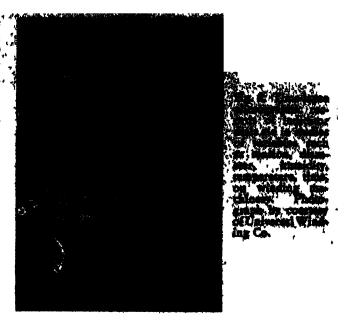

Fig. 7. Load-deformation curves for the Slater Impact Tester, registered almost instantaneously on the oscillograph screen, are recorded by a high-speed motion picture camera for study and analysis. Photograph by courtesy of Edward R. Schwarz.

The duPont Company²⁴ in the study of the recovery of rayon fibers from high compression have used time-lapse technique. Various fibers were crushed into pellets under pressure of about 10,000 lbs/sq in. It was found that the height recovery of these pellets was approximately logarithmic with time. To record this behavior and show an apparently linear rate of recovery, 15 minutes of recovery was shown on the screen in about a minute.

Von Bergen⁵⁵ has employed time-lapse photography in the study of shrinkage of fabrics at various humidities. Relaxation shrinkage is important in the tailoring of a garment, felting shrinkage in the washing of woolens, and the shrinkage caused by a change in relative humidity has been found to play an important part in the appearance of light weight men's suitings. This has been especially observed in suits worn in sections of the country where high humidities prevail. Photographs have shown considerable cloth movement in each direction of yarns on going from 20% to 90% relative hu-

midity. Going from low to high humidity, the cloth stretched; going in the opposite direction, the cloth shrunk. Depending upon the type of fabric, the cloth movement varied from 2% to 4%.

Patterns on Fabrics

A method has been developed for producing patterns on textiles by photographic means 17, 18, 50 omitting the standard equipment of very costly roller printing machines. This is a continuous process carried out in a totally enclosed chamber. A roll of cloth is passed through a sensitizing solution and dried. The fabric is then held in contact with the negative by pressure rollers. The negative is prepared in the form of an endless belt and is exposed by means of an arc light. The cloth is then developed, rinsed, and fixed (Figure 9). Techniques have been developed which permit crossprints, mixed three-tone effects, as well as photographs combined with cloth dyed in a contrasting color.

The engraving of roller printing rolls can be accomplished photographically. This permits rolls of very fine detail and gradation to be made which cannot be made with any other method. The pattern is photographed in black and white to the exact size of the roller to be used, as either a line or half-tone positive. One roller is used for each color with a separate negative for each, and usually from 5 to 12 rolls used for each pattern. Color separation is employed in only about 10% of the patterns, as it may be desired to change any color in the pattern to another without affecting the rest of the colors; and also because textile dyes when added do not react the same as does light. A sensitizing solution is applied to the roll, the positive held in contact with the roll, and exposed with an arc light. The roll is developed in water in subdued daylight. The unexposed sections of the roll are soluble in water and ate, dissolved. The sensitizer remaining on the roll is colorless, and it is then dyed so that the pattern is made visible. The roll is then air dried and baked, so that the sensitizer (which has a plastic base) then becomes acid resistant. The roll is retouched with asphaltum varnish

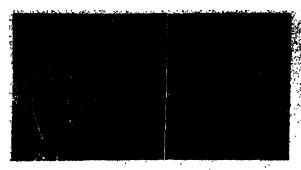

Fig. 9. Cloth patterns produced by photo-engraved printing rollers. Up to 12 rolls may be used for one pattern, each for a separate color, to obtain fine details and shadings that are impossible by other methods. Photograph by courtesy of Multitone Engraving Co.

which reinforces the acid-resistant surface. After drying, it is etched to a depth of 0.005" to 0.006", washed, and a trial print made.

Infrared, Ultraviolet and Fluorescence Photography

Certain dyes appear to be the same visually. In the infrared and ultraviolet range, however, they differ. During the war, certain dyes used for camouflage purposes were similar to the color of the foliage visually; but differed in the infrared and ultraviolet. 4, 7, 58 These could be easily detected when photographed from the air using infrared film. Dyes were later used which were not only similar to the color of the foliage visually, but in the infrared and ultraviolet as well. Photography has offered a simple means of testing the performance of a dye in ranges other than the visual.

Certain dyes which appeared to be the same as others visually, differed in their reflecting power for infrared. Certain uniform fabrics which were to be used for troops either in the tropics or polar regions were required to be either infrared reflecting or absorbing, as that characteristic affected the comfort of the G.I.'s wearing them. Again, through photography, there was a simple means of measuring the degree of absorption of infrared, and the coolness of a fabric actually "seen."

Areas of poor dye penetration can also be made visible and detected with infrared photography, as well as uneven dyeing exaggerated. Dye streaks caused by predyed abrasion may be exaggerated by infrared, as well as undyed abrasion. A study of the interior of a dyeing machine in which the presence of steam prevented a clear view of the fabric on the reel, showed a decided improvement in the appearance of details in spite of the adverse conditions.

Employing fluorescence, active mildew on wool⁴¹ can be distinguished by its brighter fluorescence over that of the wool itself. This can be used to detect and thus to prevent the destruction of wool while in storage. Photography has the advantage of being able to record weak fluorescent and phosphorescent effects which may be difficult to observe visually.

Millson & Royer have developed a method using fluorescent dyes for diffusion studies, 30 and for studying level dyeing. 29 Bocause these dyes glow in ultraviolet light, their position is revealed within each textile fiber. Slight variations in the surface structure of synthetic and natural fibers may also be detected. The penetration of dyes into textile fibers during dyeing has been studied by microscopic examination of cross-sections made from samples removed at different stages of the dyeing operation. Although this may be observed visually, all too often the light is so weak from the fluorescence that photography has to be employed so the image can be properly observed and studied.

The examination of oil-stained textiles is a well established practice, and by taking advantage of the fluorescent qualities of many oils this may be adequately

recorded by means of photography.

Electron Micrography and Radiography

The electron microscope permits magnifications of objects never before attained with good resolution. Photography offers the only means of recording. Various dye studies²¹ have been made with the use of electron micrographs as well as information about fiber structure. See Figure 10.

Sherwood^{47, 48} has shown that by using long wave length X-rays, known as soft X-rays or Grenz rays, radiographs of fabrics may be made. It is not possible to focus X-rays with a lens and thereby construct an 'X-ray microscope" to reveal structures too fine to be seen by the naked eye. The only practical procedure is to radiograph the specimen upon a fine-grained film or plate and then examine the radiograph with a lens or enlarge it photographically to a degree that will enable details to be seen completely by the unaided eye. With the use of specially prepared fine-grained plates, satisfactory enlargements up to 75 diameters to can be made. The appearance of a radiograph of a sample of cloth (Figure 11) bears some resemblance to the visual appearance of the weave. The eye can only see surface characteristics, while the radiograph shows the effects exerted by the entire thickness of the cloth in absorbing the X-rays passing through it. A tightly twisted strand

Fig. 10. Electron micrograph of a wool fiber showing the gross scale features, produced by means of the polystyrenesilica replica technique. Illustration by courtesy of the Stamford Research Laboratories of American Cyanamid Co.

of yarr will absorb X-rays more accounty then a like strand loosely twisted. X-rays may be used to detect wilks that are weighted, as lead weighted silk absorbs more of the X-rays than pure silk. Greez ray radiography of textiles can also give information about the yarn in a fabric, and the presence and character of defects in the weave or yarn. When stereoscopic radiography^{49, 50} of cloth is used, complex weaves can be readily analyzed, since it provides a method whereby the weave, suitably enlarged can be visualized in its correct spatial relationship.

Hughes suggests a technique for the examination of cord fabrics in pneumatic tires by radiography. It is a non-destructive method for obtaining useful informatio

about the internal structure.

X-ray diffraction photographs of textile fibers (Figure 12) permit the degree of orientation, both of the molecules and the axis of the fiber to be measured. The method tells the type of crystalline structure, the crystallographic spacing, the spacing of repeat units in the molecule, and the spacing between chains. These molecular properties affect certain physical properties of the fiber such as strength, elongation, elasticity, dye affinity, etc. It is probable that in the future, fibers will be built

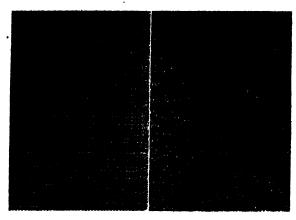

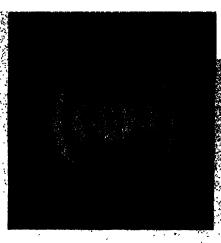

Fig. 11. Radiographs of an acetate crepe fabric before and after creping. Tightly twisted strands of yarn absorb X-rays more strongly than loosely twisted strands of the same material. Illustration by courtesy of the Kodak Research Laboratories.

to order with certain characteristic properties, and X-ray diffraction studies help considerably in analyzing these.2 Photography offers the only means of revealing and and recording these spectra.

In this brief resume, an attempt has been made to review some of the more outstanding applications in which the textile industry is making use of photography. This is by no means complete, and is offered as a guide to suggest what can be done using this versatile tool.

LETTER TO THE EDITOR

Dear Sir:

For a number of years I have been particularly interested in the application of sensitometry in the solution of practical photographic problems. It seems to me that photographers generally are just about ready to take up this subject seriously, thanks to such publications as Photographic Science and TECHNIQUE. Unfortunately, sensitometry in its pure and unadultered form is almost too much for most photographers, and for that matter, for most photographic writers. I often think of the address given at the convention of the Biological Photographic Assn. in Cleveland several years ago. The speaker tried to describe sensitometry but became so involved that he had to give up and never finished it. The subject is just too much for one article or one address, yet a segment means very little by itself.

It seems to me that what we need today is a new textbook which might be called "Photographic Engineering," not only for photographers, but as a reference for scientific workers who are using photography, and for business administrators who are considering the use of photography. I have been told by instructors in schools of photography that they would like to teach along these lines but there is no textbook. As soon as a photographer becomes responsible for a large scale photographic operation, he requires a great deal of information that can never be acquired in becoming a skilful photographic craftsman—the calculation of electrical requirements, water flow, filtration, heating, refrigeration and temperature control, the maintenance of automatic machines, illumination, image permanency, replenishment and circulation of large volumes of solution, materials for construction, modification of optical apparatus and so on. For a long time I have been working on such a project, but it presents many problems which are not easy to resolve. If you should feel like making any suggestions I would be most happy to hear them.

BOOKS RECEIVED

PROCEEDINGS OF THE LONDON CONFERENCE ON OPTICAL Instruments 1950. John Wiley & Sons, Inc., New York 16, N. Y. Published March 15, 1952, 264 pages, \$7.00.

Twenty-one papers that were presented at the Imperial College in London, July 19 to 26, 1950, are published here. The subjects discussed have been restricted by the organizing committee to deal with actual instruments, avoiding purely theoretical questions. Consequently the subjects are both timely and practical.

Of particular interest to photographic workers are three papers in the field of photographic and projection lenses. R. Kingslake deals with Some Recent Developments in Photographic Objectives. He discusses both design and materials, including High-Index glasses and plastic materials and deals with surface coatings and photometric aperture calibration. A selected bibliography is given.

H. H. Hopkins, in A Class of Symmetrical Systems of Variable Power, deals with the so-called "zoom" or vari-focal lenses in an historical review. The new symmetrical systems of variable power using Gaussian optics are particularly cited.

An f/1 aperture lens intended primarily for radiology is described by A. Warmisham in A New High Aperture Photographic Objective baving a Spherical Field. The influence of the Schmidt objective on contemporary lens design is acknowledged.

THE USE OF PHOTOGRAPHY IN TREEVISION

Herbert Barnett* and Skipwith W. Athey!

ABSTRACT

The extensive uses of photography in television are described. Motion picture photography is widely represented; applications include standard feature films, films made specifically for television, films destrying commercial messages, films for integration with live sequences, and films for background projection. Still photography is represented by slides and "opaques" (prints) for commercial messages, for titles, and for special effects, as well as scenic studies for the designer. Estimates are given of the volume of use of properties. photographic materials.

L ELEVISION AND PHOTOGRAPHY are sister arts in both of which "pictures" are "taken." Technically, the only differences between the two lie in what happens to the pictures after they are taken, but this technical distinction belies the real closeness of their relationship. On a trip through a large television studio, one would see many scenes reminiscent of a motion picture studio, many photographic techniques in active use, and many other results of the use of photography. In order to discuss the connection between television and photography, this paper organizes the use of photography in television under three main headings. Photography in the live television studio is examined first; then photography in the teleciné or film and slide studio; and thirdly, photography in the television network. It will be noted that photography fits indirectly into television in some ways which do not fall precisely under these three headings.

The Live Television Studio

The visitor to a large live television studio while it is being used for rehearsal notices upon entering that, although much of what is going on seems to be very similar to what goes on in the motion picture studio, there are definite differences. He would probably see several different sets placed around the studio, each individually illuminated by relatively low-placed lighting units. The majority of these lighting units would contain fluorescent lamps, something seldom, if ever, seen in a motion picture studio.

Since there were once no television lighting experts, the first television lighting people immigrated from many other fields. Most of these early lighting people and many of those who survive today in television work were motion picture cameramen and lighting men. Those who survive were able to develop from photographic methods a working technique modified by television's peculiar requirements.

an extremely wide range of brightness in the scene being televised. This "handling" does not mean that under these circumstances television necessarily produces a

The television system can actually handle at the camera good picture. Experience has shown that, if a tele-

vision scene is so lighted that a reasonable range of contrasts is present, limiting the total gamue of brightness from the brightest part of the scene to the dimmest, the television system can work at its best. Although a wider range of overall brightness can be tolerated, unsatisfactory and variable pictures are apt to result. The television lighting man, therefore, has to scale down to a narrow brightness range illumination that the motion picture lighting man can afford to use with impunity. In addition, the non-stop nature of television production makes careful, precise, placement of lighting units, such as can be done in regular motion picture production, essentially impossible. In motion picture production, for example, lights used for filling the shadows produced by the key or motivating lights, are placed low and almost in front of the camera and barely out of its view. With television's mobility, there is no opportunity to stop and take these lights away as the camera moves around. Therefore, a modified form of lighting has been worked out in which a general or "base" light is thrown at a relatively low angle over the entire scene. This base light enables the camera to "see its way around" the studio and to give approximately correct basic exposure to all parts of the scene. Lights to give expression and interest to the scene, such as key lights and back lights, are superimposed on the base light. It is impossible to get as interesting effects when the fill light cannot be precisely controlled, but the base-light compromise is reasonably satisfactory for most television shows.

The actual units used in television lighting are in some cases identical to those of the motion picture industry. However, television's requirement for large uniformly-illuminated areas, because of the movement from place-to-place within the scene and from scene to scene, have resulted in the widespread use of fluorescent lamps. With incandescent lamps illuminating large areas to high brightness, it is difficult to get rid of the heat from the lamps. Fluorescent lamps have the double advantage that they actually produce much less total heat for the same amount of illumination, and in addition; the subjective feeling of heat from the fluorescent lamp is considerably lower than that from incandescent lamps by an amount greater than the actual difference in total heat produced. The conditions under which the actor works are thus considerably improved with fluorescent lamps. Refinements of lighting techniques are, however, not as easily achieved with the large-source fluorescent lamps as with multiple banks of

'individual incandescent lamps. The use of the standard motion picture "juniors" and "seniors," that is 2,000-and 5,000-Watt Fresnel spotlights is, therefore, quite widespread in television production. These conventional motion picture lights are used for the key or motivating lighting which gives some direction to the illumination of the scene, and they are also used for back lighting. Even with fluorescent base light, a large area with adequate key and back light may require enough incandescent lamps to make the heat load a considerable problem.

Immense indoor areas have been properly lighted and photographed, of course, by the motion picture industry many times in the past. For many of these scenes fluorescent lamps would have been useless, particularly since the lighting units had to be located far away vertically from the scene of interest. The motion picture set is in such cases illuminated with a great many incandescent or arc lighting units with tremendous attendant quantities of heat. The expense and complications introduced by these large-scale scenes have been in keeping with the scale of the particular motion picture. This kind of immense technical activity is only justified by its application to a very expensive production. So far, the television industry has not encountered productions of this scale. The limitations of the lighting techniques which television can use for large-area illumination are acceptable on the basis that any greater expenditures have not been justified by the commercial return expected from the production.

In addition to the actors, quite a few people are found in the television studio just as in the motion picture studio, but these people do not necessarily have the same jobs. In the television studio two, three, or even four cameras may be in use. A man operates a microphone boom and several men push dollies around. The solid bank of directors, assistant directors, script girls, make-up retouchers and lighting men grouped around the camera, however, are missing. Some of these people's jobs are eliminated in television because of the pace of production and the necessity of omitting some of the fine details. Others are safely caged up in a relatively distant control room away from the actual studio floor. With simplified lighting, the tremendous lighting crews required for adjustment to final perfection of the many lighting units used in motion pictures are not seen in the television studio. As a brief example of the differences and simplifications of television operations compared to motion picture operations, consider a group of people directly responsible for the handling of the camera in

In motion picture production, if the camera is required to "dolly" in, say 20 feet, closer for a close-up after having opened with a medium shot, it is probable that three people would actually be involved with the camera itself during this dolly shot. In addition, there would, of course, be anywhere from one to six dolly pushers. We should probably find on the camera itself a camera operator panning and tilting the camera as necessary, a cameraman checking follow focus, that is setting the focus adjustment to successive marks on the lens as marked points on the floor were passed, and perhaps another assistant cameraman or the head cameraman walking alongside and by silent gestures adjusting the

exact path over which the camers was moved. In television production these people are usually replaced by a single cameraman. This versatile gentleman pushes the camera around on a special dolly or pedestal, pans and tilts it, and focuses it. He usually does all three things at once. The cameraman may be helped by a couple of dolly pushers, but he is himself responsible for the motion, adjustment, and focusing of the camera. He is too busy to be very careful about precise focus while worrying about all the other movements of the camera. For this reason it is desirable in the television studio that the camera be adjusted so that it has a fair depth of focus so that errors by the cameraman may not completely ruin the picture. Use of the television camera with quite large depth of focus immediately eliminates one of the most useful techniques of the conventional motion picture. This technique is that of using limited depth of focus to produce an apparent depth or separation of planes in the final picture.

Photographic Backgrounds for Television

Tucked away in one corner of the television studio, we might very well find a large translucent motion picture screen. This screen is intended for use as it would be in motion pictures for the projection of background or process stills or motion pictures. Because of the peculiar differences in number of frames per second of motion pictures and television, the projection of motion picture backgrounds in television is not very highly developed. It will, however, shortly become of considerably greater importance as the problems of this process are solved. An extremely high-intensity projector is necessary for either still or motion picture backgrounds. Particularly with motion pictures, it is necessary to comply with complex fire regulations in the use of an arc-lamp motion picture projector in the middle of the studio building. Since 35mm background movies are to be preferred because of more light and better picture quality, the background projector operator usually finds himself in a hermetically sealed miniature booth on wheels with automatic fire shutters. This booth is designed so that there is room for the projector, one small projectionist, and a large hot arc lamp.

Motion Picture Inserts

If we were present at a rehearsal or performance of an important commercial show, or dramatic program, sustaining or commercial, it is probable that, at various times during the program, activity in the studio would suddenly come to a complete halt for a brief period. Alternately, we might suddenly observe a tremendous frantic increase in activity as cameras, actors, and stagehands scurried around the place rearranging the studio and not being too careful about noise and confusion. Either of these symptoms indicate that the functions of the studio are temporarily suspended while a film or slide or alternate studio is in use. Perhaps the most interesting of these circumstances is that of the use of integrated film.

Such a film may be used to permit the program to leave the studio and include outside scenes which would be impossible to televise directly at the time and place that the main program must occur. For example, the hero of a television scory may be seen to put on his hat and coat and walk out the front door of an interior set. As the door closes behind him, the film is started. It is taken from outside the house and shows him closing the front door behind him and starting on down the street. His activities while outside the house are covered by the film, and when he finally goes into another building, the interior action is picked up by a live television camera in another set. During the running of this film the actor is able to move to the second set and the cameras in the television studio can be moved to televise the new set. Film integrated in this manner is actually televised over a film camera chain in a separate studio.

Commercial Motion Pictures

Another cause for one of the sudden sensations of activity in the studio might be that of the televising of a commercial message. This commercial might originate from a separate live studio in which the commercial portion of the program has been individually rehearsed. However, it may also come from a separate film studio, as almost all programs use one or another form of film as part of the commercial identification. If the film is not in the form of a specific advertisement, it may be a standardized "format" informing the audience at the opening who is paying for the program, and reminding them at the end of the program of the same thing. Of course, these films which appear to interrupt the activity of the live studio must be prepared and photographed by someone, and this is another important use of photography in television.

Photography Aids Set Design

Although its contribution may not be visible as one looks around a television studio, photography is, nevertheless, a valuable aid to the scenic part of television. As in the motion picture, still photography is an important tool in the planning of realistic settings. For a dramatic production which takes place entirely in the studio, and which may require exteriors small enough to fit in the television studio, the still camera is used as a reference device. If a typical street scene is to be constructed a still photographer may be sent out to photograph a number of such scenes from life. The scenic artist can then decide from the study of the photographs just what is wanted in the studio set. The camera is particularly valuable in assuring that realistic detail is included. For integration of a motion picture of an exterior with a live studio set, the careful use of still photography permits construction of the studio set to go on simultaneously with the film production, with the assurance that the details will be made to match both cases. In an even more fundamental manner, the scenic artist usually has a large file of photographs of typical scenes, buildings, and the like from which he derives his basic ideas for practically all the sets he de-

The Teleciné or Film Studio

A teleciné studio resembles an oversized projection room with the projectors pointing in all directions, usually all running at once as all hours of the day and night, producing a teneratic amounts of confusion. In the large television plant a ringle effective room may handle film for integration, commercials and other uses, as well as slides and stills for a large number of live studios. In addition, television programs entirely on film may originate entirely from the telecine studio.

The confusion usually observable in a sciecing account is actually well organized. With as many as eight 15mm or 16mm motion picture and three or four still projectors all capable of essentially independent operation - an elaborate system of intercommunication is needed. A particular set of projectors may be assigned to a live studio which may be several hundred feet or even several miles away from the teleciné room. Loudspeaker intercoms permit projector operators to converse with the directors at the live studios about the operation of the particular projectors assigned. The same process may be going on for different operators and different projectors in different studios all at once in one telecine. Although only one production is apt to be on the air at once, rehearsals are going on for others at the same time, and odd moments of equipment freedom are used for previewing and timing long strings of short commercials or

"plugs."
There is an alternate method of televising film in which a special projector throws a picture on a small shielded screen in the live studio. The picture is then picked up by a live studio camera. This technique has the advantage, for the small station, of avoiding the purchase of one or more special film cameras, and for the network broadcaster, of providing a flexibility and convenience in programming which is not available with a central teleciné room.

Televising Regular Motion Pictures

Feature motion pictures are made for theatre use with no intention of using them in television. In the immediate postwar period, the few feature films which could be used on television had extremely bad technical quality as viewed in the home. Because of the expense, most such feature films were transmitted from 16mm copies. These 16mm copies were what the processing laboratory would call second- or third-generation dupes. In many cases they were copies made from 16mm duplicate negatives made from release prints of the original feature film. The release prints copied were often in extremely bad condition from having been played many times in theatres. The tone range of a theatre release print on 35mm is far from optimum for further duplieation. Studies have since been made of the optimum copying methods for feature films for television use, and there are many so-called secret processes for making such optimum duplicates. Without considering the details of these processes, it can be said that they produce considerably superior results when retelevised and many 16mm copies are now carefully made for television use from special duplicate negatives.

Since the beginning of television there has been a rather vocal group of people, particularly in the processing and small scale film production fields, which has insisted that television should be produced entirely from films, and that essentially no live programs are

necessary. To a certain extent, this group has seen much of its prediction come true, and the teleciné room now aces many films specifically made for television use. The production of this type of film has been encouraged by the expense and rather low quality of the only other methods available (until recently) for the distribution of TV programs. The television sponsor or producer who distributes his show to 15, 20, 30, or even 50 different stations, considers that the audiences of these stations should see a production of technical quality equivalent to the original live show. By making film for all stations including the one which would under normal circumstances televise the live show the producer can guarantee that every station receives a program of the same technical quality.

Production of Films for Television

It was realized from the beginning that conventional motion picture methods would be entirely too expensive for the production of films for television. From this realization has come the adaptation of the more economical methods of television production to film production. Intensive rehearsal in advance, the use of several cameras, editing at the time of production, and the general technique of photographing as much of the entire show at one continuous session as possible, are all methods which have been carried over from television to motion pictures for television. Whatever the method, the production of fifteen minute, half hour, and even one-hour films for television is now a very large business. It is not an entirely lucrative business. A great many producers with one or two cameras, one or two cameramen, and an empty barn have attempted to make a quick million dollars from such films. Very few of these operators have survived. There are, however, quite a few successful producers of films made specifically for television. Their output is in the form of single films or series for 13, 26, 39, or 52 weeks fitted to the broadcasters' yearly schedule.

In actual numbers, the teleciné room handles more film commercials than any other form of film. By "film commercials" for television, is meant the relatively brief sponsors' messages which begin, end, or fill the middle of television shows, as well as the so-called spot announcements or plugs which fit between two successive full-length programs. The larger, more expensive, national television shows use a great deal of live commercial material, that is, the equipment or device being advertised is demonstrated either in the studio in which the rest of the show takes place or in a separate commercial studio. But even such programs use films for opening and closing sequences which announce the name of the manufacturer and his product. Many of the medium-size television shows use commercials entirely on film, sometimes with live verbal commentary, but often with the sound also on film. Such film may be live motion pictures or animation. Some products have become inextricably connected with the personalized and animated devices which are used in the commercials. Since many television stations, particularly the smaller ones, keep themselves alive with the spot commercials between programs, the number and commercial impor-tance of such spot films is tremendous. The production

of spot films is a field in which many extremely small motion picture producing outlits have been started. It is not necessary to have a large amount of equipment, and many such producers are one-man operations.

Television of Still Pictures

In addition to 16mm and 35mm motion picture films, a teleciné room handles still pictures. These may be in various forms. The most common forms are the standard 2" × 2" slide, which is actually a double silent 35mm frame, and approximately 4" × 5" opaque pictures. Some studios use larger and smaller opaques and others also use standard $3^1/4^n \times 4^n$ lantern slides. The bulk of the still pictures televised outside the live studio, however, are in the form of 2" × 2" seides or 4" × 5" opaques. Although some slide projectors have been made specifically for television, the 2" × 2" slide ends up more often than not in a slide projector essentially identical with one you might find in your own home. Some stations which prefer remote control operation have wheel-type or bin-type automatic slide changers for 2" × 2" slides. A practice which is just coming into use and which may become more and more widespread is the use of a flying spot scanner type of television camera for the televising of slides. The flying spot scanner should be capable of considerably superior reproduction of 2" × 2" slides, but this technique is not at present applicable to motion pictures. Improvements in the usage of the standard iconoscope camera in the teleciné room indicate, however, that it may take a new lease on life and compete directly in quality with the more complex flying spot scanner.

Most television stations have a device which they refer to as a "balop." This peculiar name is an abbreviation of the Bausch & Lomb Optical Company trade name "Baloptican" for a range of slide projectors they make. In the days when the television station built or modified most of its own equipment, a combination of one or two Balopticans was used for slide or opaque projection and the abbreviation, "balop," therefore, has gotten into wide use. Other companies now manufacture commercial slide and opaque projectors specifically for television use usually, however, managing to maintain some of the sound of the original "balop" in the name. A typical device of this type takes $4'' \times 5''$ opaque slides mounted on long strips of metal, so arranged that the slides may be advanced one after another into the field of view of the projector. Such a projector has two slide holders and the operator may dissolve from one to the other by changing the brightness of the illumination on the slide. The operation of one of these so-called balops is a highly complex and rather nerve racking job. The operator hears over headphones directions from the program director as to when to change slides mechanically and when to dissolve from one to the other. The process of keeping several long strings of slides straight is confusing to say the least. This is one of the jobs in the television studio which requires constant rotation of personnel to preserve nerves.

Size 2" × 2" television slides are, of course, produced by photographic processes. The subject material may be original photographs with additional advertising or descriptive material added by an artist, or they may be from original art work. Opaque slides are very often direct art work done on the 4° × 5° format which will be televised. Opaques may also be photographed with or without additional art work, including news photographs and advertising material. In come cases the long format of several separate slides mounted on one metal strip may be replaced by a long continuous cartoon or similar piece of art work which can be advanced slowly in the slide holder in order to give an elementary kind of animation. The majority of the opaque slides are limited to such mundane subjects as the opening and closing titles of a live or film program.

Television Recordings

One type of film material which is of major importance in many teleciné rooms and which has not been mentioned so far is the television recording. Television recordings are used by the networks in three major ways. First, they are used to provide program service to stations which are not connected to television networks. Second, they are used to permit distribution of low-cost and sustaining programs at times which may be selected at will by affiliated stations rather than arriving on some rigid schedule from the network production center, and thirdly, they are used to adjust for the time delay in traveling across the country because of the various time zones and the use of daylight saving time in some states while it is not used in others. Related to this last use is the rearrangement of program schedules as produced at major east and west coast program centers to take care of the fact that not all networks can always send all the programs they want in all directions at once on the available telephone lines.

For non-connected stations the usual practice, particularly with fairly timely commercial programs, is to make a recording and to prepare anywhere from five to thirty or even forty prints of this recording. These are then distributed in a more or less radial manner to the non-connected stations. For such multiple prints, it is apparent that 16mm film permits a considerable saving over 35mm film. For the relatively brief sustaining, that is, unsponsored, programs which the affiliated station may want to scatter through its daily program schedule, it is quite common to produce a relatively small number of prints, perhaps 5, and to "bicycle" them around from station-to-station. These programs have no particular time or commercial value, and a single print may travel to six or even ten stations over a period of weeks before it finally has been used by all affiliates who want it.

For program delay because of time differences and for surmounting the difficulties of unavailability of network facilities, it is a quite common practice to use 35mm recordings which are used only once and are retelevised directly from the negative. This has particular value because it appears that, with normally-operated film cameras, the negative televises somewhat better than the print. This contributes to the desired high pictorial quality of programs which normally would be important enough to send across country. In addition, the fact that time is not consumed for making a print saves

valuable sime when the delay is as thore as these hours or

The process of recording and reproducing relevision pictures has been described by many names, among which are "selevision recording," video seconding," kinescope recording, '(and its abbreviation "kine-recording," or just plain 'kinescoping') 'teleprameription' and 'television transcription' as well as a humber of other trade names. In the present state of the art, the only method available for reasonably high-quality television recording consists in photographing a high-quality television monitor tube, thereby producing a motion picture from the relevision program. The process of recording is in some ways complex; in other ways relatively simple. It has the tremendous advantage of producing the record in a form in which any television station may reproduce it. That is, the fact that it produces a motion picture makes this form of recording available to any television station, since the first piece of equipment that a television station needs to get pictures on the air is some kind of a film-televising device. Although other forms of television recording have been proposed, using film or magnetic tape, the basic fact as of now is that television recording is a form of motion picture photography. It is a very peculiar form of motion picture photography by conventional motion picture standards, but, nevertheless, one which has in one form or another most of the worst problems of conventional motion picture photography. Television recordings, because they are recordings, must be made with high consistency. That is, if there is anything wrong with the final recording, it is usually considered in broadcasting that the fault must be chargeable to the original program production and the recording process is assumed to be consistent and routine. Since, in addition, television recordings when reproduced have passed through the original television system, through the motion picture process and once again through the television system, the increase in noise or granularity, the decrease in sharpness, and the losses in tone scale which are inherent in each of these processes are accumulated in the final result. Since the television recording competes in the reproducing television station with live television programs and films made specifically for television, the television recording process is hard put to produce a picture which, having passed through three processes, can compete with a picture which has passed through only one or two processes.

It is probable that the television recording process employs more film than any other portion of television. A reasonable estimate of the total footage of 16mm film used for television recording by the major networks is something like ²/₃ of a billion feet per year. The major networks are now the largest customers of the film manufacturers for 16mm film. The bulk of television recording is done on 16mm film largely because of cost, although it is generally agreed that 35mm film, simply because it has four times the available picture area, does produce a higher quality motion picture or television recording than does 16mm film. However, since ²/₃ of a billion feet of 16mm film is equivalent to 1²/₄ billion feet of 35mm film, economics would indicate immediately that the use of 16mm film tends to be more widespread than that of 35mm.

Making Television Recordings

Although specific techniques differ from station to station and from network to network, the basic method of making television recordings is the same in all cases.

The process may be outlined as follows:

The standard môtion picture is projected at the rate of 24 frames per second with each frame visible twice during the projection cycle. A television picture consists of 60 interlaced fields making up 30 frames or complete pictures per second. Some trick is necessary to transform a 30 frame-per-second television picture into a 24 frame-per-second motion picture. The method currently used, the subject of a patent by Epstein of RCA, operates by exposing two fields or one complete frame of the television picture on one frame of motion picture film. During the next half-field of the television picture, the shutter of the motion picture camera is closed, either effectively by turning off the cathode ray tube being photographed or by actually closing a mechanical shutter, and the motion picture film is advanced one frame. In the middle of this particular field of the television picture, the shutter is opened again and the last half of this field, the entire next field, and the first half of the next field are all recorded on the motion picture film. During the next half-field of the television picture the shutter is closed and the film is advanced again. The process is now back to where it started.

Two television frames or four fields of exposure plus two half-fields for pull-down have occurred since the cycle started. Since the fields each last 1/60 of a second, $5 \times 1/60$ or 1/12 of a second has taken place since the beginning of the cycle. During this same 1/12 of a second the motion picture film has been exposed on two successive frames and is ready to expose another frame. At the rate of 24 frames per second, this part of motion picture process takes just 1/12 of a second, and it is apparent that the timing of the television picture has been fitted to that of the motion picture. Two half-fields have been lost in the process and this contributes a small amount to picture degradation. More important, the starting of the motion picture exposure in the middle of the field and ending it in the middle of another field requires that the timing and mechanical adjustment of the stop and start of exposure must be very precise. If this is not the case, a "join-up" or "splice" or "shutter-bar" will be apparent where the two ends of the different fields overlap or fail to meet properly. The optics, mechanics, and electronics of the television recording process, therefore, have to be quite precise. The extremely short time allowed for pull-down of the film in the camera, that is, ¹/₁₂₀ of a second, also adds to the complications. A factor which had been ignored early in the process is that of operating any type of intermittent film moving device for one half hour continuously with raw film. The combination of fast pulldown and the long period of operation resulted in collection of tremendous amounts of film dust which had been negligible in previous motion picture operations. Because of its commercial importance television recording was in full-scale use long before the difficulties raised by the nature of the process had been cleared up on anything approaching a routine basis.

Since a television recording, when reproduced, should ideally be indistinguishable from a live television pickup,

a careful balance must be made between economics and the highest possible sharpness, fidelity of tone gradation, and lack of grain or noise. Either a master positive or variable density sound recording film is usually used as the negative material. These films have the advantages of relatively high resolving power and cost of the order of 1¢ per 16mm foot compared to the 4¢ a 16mm foot cost of most negative materials for direct photography. These special films require a relatively bright picture for adequate exposure. An intense blue phosphor called the P11 is usually used on the recording monitor tube.

Since what is wanted in television recording is something that will reproduce as well as possible on the television system, the recording itself is not necessarily a very attractive motion picture film. The adjustment of exposure and processing is, therefore, not made entirely by visible adjustment for a pleasing picture either on the monitor or on the film. Although a qualified type of judgement was originally used by many makers of television recordings, present practices usually include some type of overall system brightness characteristic measurement for the determination and control of exposure and processing. In one method, an overall measurement is made from the video voltage into the recording unit to the final density on the developed videorecording negative. Separate sensitometric exposures are made on the recording negative for this test in order to permit measurement and control of the processing. Density measurements are made on the negative and compensated for whatever peculiarities of processing are shown by the separate sensitometric tests. The exposure, which means the settings of the brightness and contrast controls on recording monitor, is then adjusted on the basis of these tests. Because each monitor tube has its own individual characteristics and since minor changes from batch to batch in film characteristics are apparent when tests of this precision are made, continuous follow-up is necessary on a day-to-day routine basis to insure that recordings of uniform quality are produced by each television recording unit. From two to eight television recording units may be grouped together in one recording plant, particularly in a net-work program production center. Since all programs are usually recorded in duplicate for safety, and since the maximum length of continuous recording possible with a single unit is usually limited to one half hour by the 1200-ft rolls of film used, extra-long programs or those during which failure of part of the equipment occurs, require that the recordings from one unit of the recording equipment match those from any other unit. Maintenance of this matching is perhaps the leading television recording problem.

The sound which accompanies the television picture may be recorded on film at the same time and in the same unit as the picture recording. A separate film may be used also to record the sound, giving what is known as "double-system" recording. The sound recording under these circumstances is usually made in duplicate, either on the second film or on a synchronized magnetic tape. The use of tape permits great economies, since the duplicate or "safety." tape may be erased and reused if the original recording is satisfactory. If all the recording is done on tape, the tape may be continuously reused without any material cost except for one re-recorded

film negative per reel.

Intermediate-film Record for Theatre Television

Another important use of television recording is in the so-called intermediate-film theatre television system. In this process, a television signal arriving at a theatre is recorded on a motion picture film as a positive picture. This film is developed and dried in a very short period of time and is fed directly into a motion picture projector. The film is projected in the normal way by the motion picture projector. This rather round-about method of getting a television picture onto a large screen has the advantage over any direct-projection television system of permitting the use of the normal light source and optics of the standard motion picture projector. Assuming that the recording and developing process can be accomplished, this system produces on the motion picture screen without difficulty a picture as large and as bright as a standard motion picture. Direct-projection television systems must, however, continue to struggle against the low light output of television picture tubes in order even to approach the brightness of the standard motion picture screen.

In a few cases, television recording is done on 35mm film and is used in the existing motion picture theatre projector. In other cases, the recording is done on 16mm film, and a special high-intensity 16mm projector developed for this process is used. The rapid processor produces a dry, developed film approximately 40 seconds to one minute after entry of the exposed film. Development is carried on at a high temperature, solutions are applied by specially designed spray techniques, then carefully removed, and high speed drying techniques are so worked out as to avoid damage to the film. The recording is made from a negative image on the cathoderay monitor tube, using film of the type regularly used to produce release prints in theatres. In some experiments, sound is recorded by direct-positive variabledensity toe recording, employing a specially-shaped modulating mask, and the sound is developed along with the picture. The design of this kind of equipment is complicated by the fact that it must be operated by the regular projection-room personnel, and must conform to the usually stringent requirements of any device that is to be installed in a theatre projection room. Any special tests for exact control of the sensitometry of developing and the like must be unnecessary beyond the simplest of routine maintenance, since there is no opportunity in a motion picture projection room for such details. The performance of such equipment must conform to as high standards of consistency as are required in network television broadcasting, and at the same time, the operation must be extremely simple.

The rapid processor used in the theatre film television system just discussed has application in the network television center as well. Use of such rapid processors is becoming greater for the specialized service of short-delay recordings. Such recordings are usually made by the direct-positive method, that is, by photographing a negative monitor tube image onto positive film. At its best, the quality of such a direct-positive recording can be quite superior to that of a negative-positive film recording because of the elimination of the losses in the printing process. In addition, such a single-

film system has tremendous advantages in time-saving for providing relatively short program delays in the network distribution center.

Since television is a new art with economic factors still in a state of flux and with techniques in a painful process of development by trial and error, anyone who ventures into the television business from another field is certain to face a great deal of confusion. If this adventurer is a still photographer, he will find his art used in many ways in television, some of them direct, some of them indirect. If he assumes that he may make pictures for television in much the same way that he has made pictures for other purposes in the past, he will have trouble with the deceptive similarity of television to other fields of photography in some respects, and its complete difference in other respects. The motion picture photographer will encounter the same kinds of problems. He will find fairly straightforward film production techniques being used for films for television, modified techniques being used for commercials, and a bewilderingly different use of motion picture photography in tele-vision recording. He will be confused, for example, by the basic problem of whether a television recordist is a photographer, a broadcast engineer, a projectionist, or a mixture of all of these men.

In one sense, television lies in a No-Man's land between radio and motion pictures. To operate usefully in many of the technical aspects of television, a basic knowledge of the fields of photography and communications is really necessary. The photographer who understands his own art from a technical and artistic point of view, who develops a certain flexibility of view-point, and who is willing, within reasonable limitations, to believe what the communications technicians tell him are limitations of the art, is an extremely useful person in the television field. However, the photographer who goes into television work fully convinced that television is just like photography and who cannot adjust to the actual differences in television technique, is perhaps the most useless person around the television plant. Television and photography are sister arts and a dual respect for individual peculiarities within the family is necessary for mutual progress.

A new journal Die Farbe, edited by Dr. Ing. Manfred Richter in Berlin and published in Wiesbaden by the Verlag für Angewandte Wissenschaften GMBH, has been announced. The preface to the first edition speaks of the intent to publish papers "on the different problems of Color Science, such as color vision and its testing, color matching, light and color, evaluation of fastness, color photography, television and reproduction, color psychology and color conditioning, color standardization work and color nomenclature and terminology". Short abstracts in both German and English will inform the reader about the essential content of each article. Subscriptions cost 42 marks, in advance, for one volume of six quarterly issues, with postage additional.

PHOTOGRAPHING HIGH-SPEED CATHODE-RAY OSCILLOSCOPE TRACES

Harold J. Peake*

ABSTRACT

To meet the need for increased photographic sensitivity of eathode-ray oscilloscope recording systems, a study has been made of camera design, film types, and processing methods to determine the best combination. With the chosen combination, recordings have been made showing a rate of change of voltage of 3×10^{13} volts per second. The corresponding trace velocity on the oscilloscope screen was 13,000 inches per microsecond, well above the free-space velocity of light.

RECENT ADVANCES in the electronics art have resulted in or depended upon the means for easily generating, displaying, and recording transient voltages with everfaster rates of change of voltage. In many cases the transient voltage is generated by a natural physical phenomenon, such as the output from a phototube illuminated by a scintillating medium. In other cases the transient must be artificially generated, say by gaseous switch tubes in appropriate circuits. In either event, there remains the need for displaying and recording faithfully the waveforms of electrical events. This need exists in the fields of electricity, electronics, and nucleonics wherein display and recording for further analysis are prerequisite to progress.

Probably the most satisfactory means for obtaining permanent records of electrical phenomena is the photography of the display on a cathode-ray-tube screen. In this report, only "external" photography is considered; i.e., only the photography of the actual light output of a cathode-ray-tube phosphor. "Internal" photography, wherein the beam of a high-voltage (50-kilovolt or higher), cold-cathode demountable tube is made to impinge directly upon the photographic emulsion, has been used in some work. The bulk and complexity of the demountable oscilloscopes, including necessarily a vacuum pumping system and a high-current high-voltage supply, place them out of the class of ordinary laboratory or field instruments. Hence, an attempt has been made to exploit the use of more common devices (sealed-off cathode-ray tube, low-current high-voltage supply, etc.) in order to provide a simple, inexpensive, rapid means for recording fast transients.

The work of the investigation of transient recording may be divided into two different categories: (a) electronics and (b) photographic. Obviously, however, the two are not exclusive. The electronics problem (which is not considered here) involves the choice of cathode-ray-tube type and operating conditions as well as the provision of the necessary auxiliaries such as the

Navy Department, Naval Research Laboratory, Electricity Division, Washington 25, D. C. Presented at the PSA National Convention, New York, N. Y., 13 August 1952 as part of the Technical Division Symposium on Photography in Engineering and Science. Received 3 October 1952.

The material contained in this paper is included in a thesis to be submitted to the University of Maryland, College Park, Maryland, in partial fulfillment of the requirements for the master of science degree.

intensifier, low- and high-voltage power supplies, etc. The photographic problem includes camera design, choice of emulsion type, and evolution of processing technique. The chief mutual consideration is the choice of cathode-ray-tube phosphor (and, hence the spectral light output) and the spectral sensitivity of the photographic emulsion.

The Oscilloscope Camera

Lons Comparisons. The main criteria for the choice of an oscilloscope camera lens include high effective lens speed (large aperture, low reflectivity), essentially flat field of view, and minimized barrel vignetting

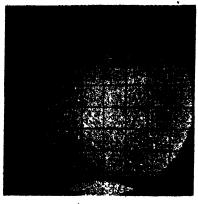

Fig. 1. Flatnessof-field test of the Wray f/1.0 lens at a 4:1 copy ratio.

(decrease in light transmission near the edge of the lens compared to the transmission in the center). In designing the camera used in the work reported here, four different lenses were tested. Of the lenses considered, only the Wray f/1.0, 2-inch lens was designed to have a flat field when used for copy work. In fact, this lens is designed to be used at the specific copy ratio of 4 to 1. Hence, the Wray lens, fitted with the Wollensak Alphax shutter, was incorporated in the final scope camera design. Figure 1 is a photograph of a sheet of rectangular coordinate paper taken with the Wray f/1.0 lens at a 4-to-1 copy ratio to check the flatness of field.

Comes Design. The camera used to record the oscilloscope traces for this investigation was the Edgerton, Germeshusen, & Grier, Inc. Type 3114 Scope Camera. A general view of the camera is shown in Figure 2. In Figure 3 the camera proper has been removed from the

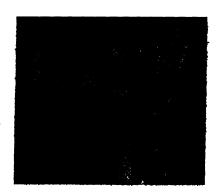

Fig. 2. Edger-on, Germeshauton, Germeshau-sen, & Grier, Inc. Type 3114 Scope Camera used in the investigation.

barrel-type body. The camera body fastens to an oscilloscope by means of metal clips which engage studs mounted on the oscilloscope front panel.

The Type 3114 camera has the Wray f/1 0, 2-inch, 4-to-1 copy ratio lens with the Wollensak Alphax shutter providing time, bulb, and exposure times ranging from one to 1/100 second. The iris diaphragm control (allowing an f/2.8 minimum aperture) and the shutter speed are adjustable by means of graduated rods protruding from the camera housing. Flash synchronizing contacts (X, or zero-delay, type) are wired to a cable connector on the camera to provide synchronized triggering of external devices or circuits when desired.

To take advantage of the wide variety of emulsion types available on sheet film, the camera takes 4×5 inch Graphic-type film holders Since the lens produces a one-inch diameter circular field in the film plane, the back of the camera is positionable, permitting five exposures on a single sheet of film. Each exposure or frame may be numbered while the frame is in position behind the lens There is mounted on the outside of the camera housing a Veeder counter, the setting of which is duplicated on an identical counter inside the camera. Pressing a push-button illuminates the inside counter (by means of a self-contained battery and flashlight bulbs), the image of which is focused on the film plane alongside the frame in position behind the f/1 0 lens

Other features of the camera include a viewing port with a hinged light-tight cover and rubber eye cup to permit viewing the oscilloscope screen with the camera

Fig. 3. Type 3114 Scope Camera, removed from berrel which engages the oscilloscope front

in place; and 24-volt denoisement accuration of the shutter release for remote upstantist.

Females. Focusing of the Type 3114 camera is accomplished by moving the camera along the two guide rods secured to the camera barrel. Thus the ion-to-barrel distance is adjusted. The back focus or lens-to-image distance, is automatically hold constant. This is done by extending the lens-mount tube the correct distance beyond the back element of the lens so the lens tube contacts the sheet film. To allow for variations in the dimensions of film holders the lens mount is movable along the lens axis, the mount being spring loaded to assure intimate contact with the film. A lever on the camera provides a means for manually positioning the lens assembly when removing a dark slide or when moving the back to a new frame position.

Since the film is nominally 121/2 inches from the cathode-ray-tube screen and since the aperture (1/1.0) is large, focusing becomes quite critical. It is extremely difficult to focus a weak, non-recurrent trace on a groundglass screen, so recourse is made to a more satisfactory means of focusing. The focusing device shown in Figure

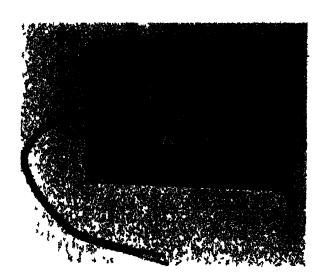

Fig. 4. Focusing aid for Type 3114 Camera which projects an illuminated line image, lying in the focal plane of a film holder, through the camera lens onto the screen of the cathode-ray tube.

4 is made by mounting four 6.3-volt lamps in a modified Graphic 4 × 5 inch film holder. These lamps surround a circular hole cut through the center partition of the holder. This hole is covered by a piece of ground glass on one side and by a transparency of a sheet of rectangular coordinate paper on the other side. This entire assembly is placed in the camera back, just as is an ordinary loaded film holder, voltage is applied to the lamps and, with the shutter open, the image of the coordinate paper is projected onto the cathode-ray-tube screen. By viewing the projected image through the camera viewing port, the camera may be focused quite critically. This method of focusing has the outstanding advantages of case of accomplishment, even in a welllighted room, and of requiring no changes in oscilloscope adjustment or operation.

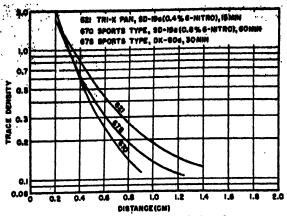

Fig. 5. Method of selection of film-development combination. Higher trace density measured at a given distance along the trace axis indicates a higher effective emulsion speed.

Tests of Films and Processing Techniques

The problem of photographically recording very weak (very high spot velocity) cathode-ray-tube traces is the problem of obtaining the highest possible effective emulsion speed commensurate with good resolution. Using a cathode-ray tube with the type P-11 phosphor, the most highly actinic light producer of the phosphors available, the problem is that of handling a serious underexposure to light predominantly in the blue region. Maximum radiant output from a P-11 screen is produced at a wavelength of 4600 Angstroms. The light-persistence characteristic of this phosphor is such that the light output decays to one per cent of the maximum within one millisecond after removal of the excitation. The effective exposure time for a single transient screen excitation is about 0.2 millisecond. Thus it may be that, due to this short exposure time, some loss in film emulsion speed is suffered due to reciprocity-law failure;² however, no evidence of such failure has been noted.

Films and Development. To discover the best combination of film and processing technique for the tracephotography application, a study of numerous combinations was made. First, the films listed below were subjected to identical exposures by means of transient traces on the DuMont type K1056-P11 cathode-ray tube:

- a. Ansco Isopan
- b. Ansco Superpan Press
- Ansco Triple S Ortho Eastman Super Panchro-Press, Type B
- Eastman Portrait Panchromatic
- Eastman Panatomic-X
- Eastman Tri-X Panchromatic
- g. Eastman Tri-X Panchromatic h. Rastman Super-XX Panchromatic
- Eastman Super Panchro-Press, Sports Type
- Eastman Ortho-X
- Eastman Super-Ortho Press
- du Pont Type 428

Each of these films was developed in each of the following Eastman developers (at 20C) for a time sufficient to produce a background density of 0.3 to 0.4:

> SD-19a3 D-11 DK-15 DK-60a X-ray

By visual examination of the character of the negatives obtained, and with the aid of density measurements made on a microdensitometer, a selection process was carried out to determine the best combination of film type, developer, and development time. For the conditions imposed here, the optimum combination is Eastman Super Panchro-Press, Sports Type film developed in Eastman DK-60a developer for 25 minutes at 20C, with intermittent agitation in a sheet-film developing

In addition to the film types tested above, Eastman Linagraph Pan and Linagraph Ortho types were also tried. Although these emulsions were available on a 35mm base only, the manufacturer's stated effective emulsion speeds were so high that samples were tested nonetheless. For this application, however, the Linagraph Pan film was found to have an effective speed about equal to Super-XX and the Linagraph Ortho has a speed considerably less than Super-XX Panchromatic.

Method of Selection. The selection of film and development combination was accomplished in several steps, each successive step resulting in the elimination of one or more combinations. For each step in the selection

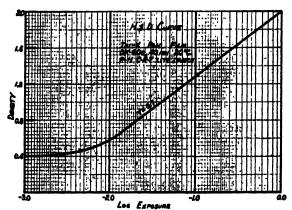

Fig. 6. Film Characteristic Curve for Eastman Tri-X Panchromatic film exposed by P-11 cathode-ray-screen illumination.

process, the procedure was to choose a few of the better film—development combinations by visual examination, then to obtain plots of recorded density versus spot position at several points along the trace by using a scanning microdensitometer. These plots gave resolution (line-width) data, an estimate of grain size and distribution, and a measure of effective film speed. Since the sweep recorded in these tests increased speed monotonically across the cathode-ray-tube screen, the effective emulsion speed is proportional to the distance along the sweep direction to the point where the trace density falls to a chosen minimum value. A sample set of density-distance curves is shown in Figure 5. These curves show an apparent superiority of Tri-X Panchromatic film developed in SD-19a; the superiority, however, is one of effective emulsion speed only, the resolution being so poor due to excessive grain size that another choice is demanded. Hence, the combination of Super-Panchro-Press, Sports Type film and DK-60m developer was chosen as best for the application in hand.

Variations. In addition to tests of developers with recommended proportions of the chemical constituents,

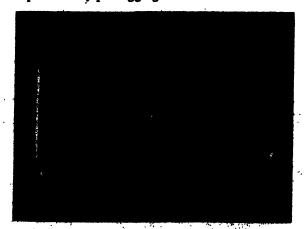

tests were performed using different amounts of Kodak Anti-fog No. 2 (6-nitrobenzemidazole nitrate) in 3D-19a and in DK-60a. Generally speaking; the only significant result observed was the variation in time required for proper development, this time being proportional to the concentration of anti-fog material. Another test performed was extended development at low temperatures (i.e., below 20C); no significant change in the developed-out image was noted for developer tem-

peratures down to 10C.

Pre-fogging. To secure maximum writing speeds photographic emulsions may be hypersensitized before exposure by any of several methods, 3.4 the most attractive being pre-exposure to light (pre-fogging). The pre-fogging must be done in such a way that (a) a detectable recorded density is obtained due to the preexposure, (b) the light is uniform over the field of view of the device used to pre-expose the film, and (c) the exposure is to a high-intensity source for a short period of time. One simple means for pre-fogging film is with a camera. Using a shutter speed of 1/100 second, Super Panchro-Press, Sports Type film was pre-exposed to a diffuse light source, the intensity of which was properly adjusted. A comparison with identically exposed film which had not been pre-fogged showed that prefogging resulted in a significant increase in the recorded trace density (above fog density) at a given trace speed. This result indicates that the effective emulsion speed

is increased by proper pre-fogging.

Latensification. Latensification 3,5,6 or sensitizing subsequent to exposure and before development, can be accomplished by one of several methods, the simplest being exposure to light. Again the exposure should be uniform and just sufficient to increase slightly the background density. Latensification is more efficient if the light intensity is adjusted to allow an exposure time of 15 minutes or more. These conditions are fulfilled by placing exposed Super Panchro-Press, Sports Type film in an open film holder about 8 feet below a 10-watt lamp with a Wratten Series 3 (dark green) filter fitted into the lamp housing and a sheet of bond paper (white) over the filter. A latensification time of about 20 minutes appeared to give the maximum effective emulsion speed increase. The increase in speed obtained by latensifying was essentially the same as

that produced by pre-fogging.

Fig. 7. Cathode-ray-tube trace Recording. Vertical deflection: 200-megacycle. oscillator output. Horizontal deflection: pulse generator output.

Investification. Developed out photographic images may be intensified by treatment in a chemical intensifier. The Eastman formula for had, it a quincing thiosulfate intensifier, was prepared and used to thest some inegatives of cathode-ray-tube traces. For a tensinguise treatment at 20C an increase of trace density (above fog density) resulted. No loss in resolution was acted. The use of In-6 produces a reddish-brown coloration in the treated negative, but the permanency of the image is not altered.

Copying. Often it is desirable to copy original negatives of cathode-ray-tube traces. Copies may be used for extended examination and data taking, thus preserving hard-to-reproduce originals. In the interests of accuracy, the distortion of the original recording inselect a suitable copying process a negative photograph of a sheet of rectangular coordinate paper was prepared. Contact prints of this negative were made on several film types including Eastman Contrast Process, Commercial, Panatomic-X, du Pont Type 428, Ansco Isopan, and lantern slide plates. The copies were processed according to manufacturers' recommendations. By means of a coordinate-comparator microscope the distortion of the linear dimensions of the original negative present in the copies was measured. Distortions up to 1% were found, the minimum distortion of 0.04% being obtained on Ansco Isopan 4 × 5 inch sheet film.

Choice of Film and Technique

The experiments described did not reveal any cumulative action due to the use of two or more of the techniques tested for increasing effective emulsion speed. In other words, for the photography of very high-speed cathode-ray-tube traces there appears to be no advantage gained by using more than one of the speed-increasing schemes on a given recording. On the basis of the tests described here, the best choice of film and processing is as follows:

Film: Eastman Super Panchro-Press, Sports Type.

Development: 25 minutes in Eastman DK-60a developer at 20C., intermittent agitation in a cut-film tank. This development produces a chemical fog of density 0.3 to

Pre-fogging: short exposure to incandescent or fluorescent light source of brightness sufficient to produce re-

corded density above fog level.

At the time of this writing, the Eastman Kodak Company is not manufacturing Super Panchro-Press, Sports Type film, having been forced by increased demand for film to reduce the number of emulsion types being produced. Until Sports Type film is again available, Eastman Tri-X Panchromatic film is the best substitute. The development time should be extended to 40 minutes. As shown in Figure 6, Tri-X Panchromatic film exposed to the light output of a P-11 cathode-ray-screen phosphor and developed as recommended here produces negatives with a background fog density of about 0.4 and a gamma of 0.7.

Sample Recordings

Whereas the maximum recordable trace velocity of a cathode-ray-tube recording system is not a measure of its capabilities compared to a different system, the

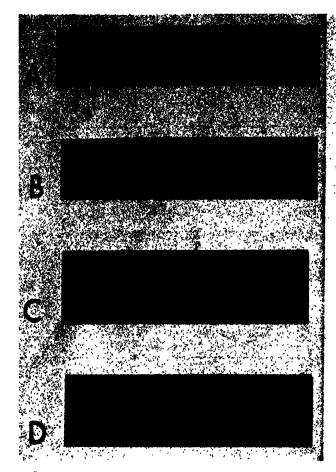

Fig. 8. A. Cathode-ray-tube trace recording. Vertical deflection: build-up of output of a 6500-megacycle pulsed magnetron. Horizontal deflection: pulse gen-

B. Cathode-ray-tube trace recording. Vertical deflection: output of a 10,000-megacycle pulsed magnetron. Horizontal deflection: pulse generator

Cathode-ray-tube trace recording. Vertical deflection: output of a 6500-megacycle pulsed magnetron. Horizontal deflection: coaxial breakdown gap fired by pulse generator output. Rate of change of horizontal-deflection voltage: 1.5×10^{13} volts per second. Trace velocity: 6500 inches per microsecond.

D. Cathode-ray-tube recording of trace with velocity greater than velocity of light. Vertical deflection: output of a 6500-megacycle pulsed magnetron. Horizontal deflection: coaxial breakdown gap fired by pulse generator output. Rate of change of horizontal-deflection voltage: 3 × 10¹² volts per second. Trace velocity: 13,000 inches per micro-second (velocity of light - 12,000 inches per microsecond).

maximum recordable velocity is a yardstick for measuring improvement of a given system. The need for highspeed trace photography arises when it is desired to record the wave-form of an electrical voltage or current which changes amplitude at a rapid rate. The actual trace velocity corresponding to any rate of signal amplitude change depends entirely upon the cathode-ray-tube design. Hence, a more realistic figure for comparing recording systems having equal resolution is the maximum recordable rate of change of applied signal. Even

is basis, however, is not a completely fair malacat it does not include the factor of convenience of with which records may be made.

All of the high-speed transient recordings shown w made on Tri-X Pancheomatic film exposed in the K.G. 8 G. Type 3114 Scope Camera. Figure 7 and all but recording D in Figure 8 represent traces very nearly four inches long; i.e., full-screen deflections on the cathode-ray tube. On Figure 8 record D, only the oneinch center portion of the trace was successfully recorded. The transient signal is applied to the horizontal deflection plates. The signal is generated by either a pulse generator or the combination of a pulse generator and coaxial breakdown gap. For timing purposes the ourput of an oscillator is applied to the vertical-deflection plates. Oscillator frequencies of 200, 6500, and 10,000 megacycles are used as noted in the figure captions.

The maximum rate of voltage change recorded (Figure 8D) is 3×10^{12} volts per second—three million volts per microsecond. The corresponding trace velocity of 13,000 inches per microsecond is in excess of the freespace velocity of light, 12,000 inches per microsecond. This trace velocity is, of course, not in violation of the relativistic increase in mass of particles moving at high velocities. The trace velocity is really a phase velocity (writing velocity), which type of velocity can and does exceed the velocity of light; e.g., phase velocity of electromagnetic waves in a waveguide. 🖫 With the present equipment and technique this rate appears to be about the maximum recordable.

The comparative ease with which good-resolution records of extremely high-speed electrical phenomena may be obtained should be of considerable aid to workers in the fields of electronics, electricity, and nucleonics.

Acknowledgments

In addition to N. W. Matthews, under whose direction the work described was performed, the author wishes to gratefully acknowledge the work of the following men: P. T. Cole, G. B. Robinson, R. W. Rochelle, C. E. Thompson, and R. L. Van Allen. Without the untiring efforts of these men the work reported herein would never have been accomplished.
